The more stringent Option 3 involves application of a tiered CEQA threshold. New sources of TACs locating in impacted communities, as identified by the BAAQMD's Community Air Risk Evaluation (CARE) Program, would have to install TBACT and/or TBPs and would be subject to a significance threshold of 5 in one million (after consideration of TBACT and/or TBPs). New sources of TACs locating in a community other than an impacted community would be subject to a significance threshold of 10 in one million. Finally, Option 4 proposes a no net increase inhalation cancer risk. Option 4 does not define a "substantial change" because any increase would be considered significant.

The first two options suggest that projects with the potential to expose receptors to TACs greater than 10 in one million excess cancers, from any source, mobile or stationary, should be considered significant. The third option suggests a more stringent significance threshold of 5 in one million, and the fourth option suggests an even more stringent threshold, which deems any increase in TACs as significant. Regardless, all four options specify that emissions from both stationary and mobile sources be included when determining project significance. As a result, the maximum threshold that could reasonably apply to the Project's stationary and mobile source TAC emissions is the BAAQMD's individual project threshold of 10 in one million.

Failure to Use District's PM2.5 Cumulative Threshold

To evaluate the cumulative impacts of the Project, the DSEIR implements criteria used to define an Air Pollutant Exposure Zone (APEZ). The DSEIR states:

> "an APEZ [is] defined as an area in which modeled air pollution exceeds 'either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter (μg/m^3) (including ambient)'" (Volume 3, Appendix AQ, p. 9).

The cancer risk cumulative threshold of 100 in one million, used in the DSEIR, is consistent with the cumulative cancer risk threshold set forth by the BAAQMD, but not, as explained above, with the individual project cancer risk threshold. However, the PM2.5 threshold of 10 μg/m^3 is inconsistent with the BAAQMD's cumulative threshold, and represents a value that is far greater than the BAAQMD's recommended value. According to the BAAQMD's May 2011 CEQA Guidelines, "a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius (or beyond where appropriate) from the fence line of a source, or from the location of a receptor, plus the contribution from the project, exceeds the following:

- Non- compliance with a qualified Community Risk Reduction Plan;
- An excess cancer risk levels of more than 100 in one million or a chronic hazard index greater than 10 for TACs; or

- 0.8 μg/m^3 annual average PM2.5."[20]

BAAQMD suggests that a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius would result in an annual average PM2.5 concentration greater than 0.8 μg/m^3. This threshold is much more stringent when compared to the 10 μg/m^3 threshold used in the DSEIR. As a result, the DSEIR should implement the recommended cumulative threshold set forth by BAAQMD, rather than the 10 μg/m^3 threshold.

Furthermore, the DSEIR uses BAAQMD thresholds to determine the significance of other air quality impacts, but then uses APEZ criteria to determine health risk significance, even though BAAQMD suggests significance thresholds for cumulative health risks. For example, the DSEIR uses BAAQMD's average daily emissions construction thresholds to determine significance of construction emissions on air quality (Volume 2, p. 5.4-25). As is apparent, there is a huge discrepancy between the 10 μg/m^3 threshold used in the DSEIR and the 0.8 μg/m^3 cumulative threshold recommended by BAAQMD. Using an alternative threshold, rather than the one set forth by BAAQMD, demonstrates that the Applicant is picking and choosing the thresholds that apply to the Project to determine significance.

Sincerely,

Paul Rosenfeld

Jessie Jaeger

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education:

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on VOC filtration.
M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.
B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience:

Dr. Rosenfeld is the Co-Founder and Principal Environmental Chemist at Soil Water Air Protection Enterprise (SWAPE). His focus is the fate and transport of environmental contaminants, risk assessment, and ecological restoration. Dr. Rosenfeld has a doctorate in soil chemistry and has evaluated odors from biosolids applications to soil and the effect of biosolids to agricultural crops. Dr. Rosenfeld has also evaluated odor emissions from the compost and food industry. His project experience ranges from monitoring and modeling of pollution sources as they relate to human and ecological health. Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing petroleum, chlorinated solvents, pesticides, radioactive waste, PCBs, PAHs, dioxins, furans, volatile organics, semi-volatile organics, perchlorate, heavy metals, asbestos, PFOA, unusual polymers, MtBE, fuel oxygenates and odor. Dr. Rosenfeld has also evaluated and modeled emissions from fracking, boilers, incinerators and other industrial and agricultural sources relating to nuisance and personal injury. Dr. Rosenfeld has evaluated greenhouse gas emissions using various modeling programs recommended by California Air Quality Management Districts.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist

Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist
Bureau of Land Management, Kremmling Colorado 1990; Scientist

Presentations:

Rosenfeld, P.E., Sutherland, A; Hesse, R.; Zapata, A. (October 3-6, 2013). Air dispersion modeling of volatile organic emissions from multiple natural gas wells in Decatur, TX. *44th Western Regional Meeting, American Chemical Society.* Lecture conducted from Santa Clara, CA.

Sok, H.L.; Waller, C.C.; Feng, L.; Gonzalez, J.; Sutherland, A.J.; Wisdom-Stack, T.; Sahai, R.K.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Atrazine: A Persistent Pesticide in Urban Drinking Water. *Urban Environmental Pollution*. Lecture conducted from Boston, MA.

Feng, L.; Gonzalez, J.; Sok, H.L.; Sutherland, A.J.; Waller, C.C.; Wisdom-Stack, T.; Sahai, R.K.; La, M.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Bringing Environmental Justice to East St. Louis, Illinois. *Urban Environmental Pollution.* Lecture conducted from Boston, MA.

Rosenfeld, P.E. (April 19-23, 2009). Perfluoroctanoic Acid (PFOA) and Perfluoroactane Sulfonate (PFOS) Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*, Lecture conducted from Tuscon, AZ.

Rosenfeld, P.E. (April 19-23, 2009). Cost to Filter Atrazine Contamination from Drinking Water in the United States" Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*. Lecture conducted from Tuscon, AZ.

Wu, C., Tam, L., Clark, J., **Rosenfeld, P**. (20-22 July, 2009). Dioxin and furan blood lipid concentrations in populations living near four wood treatment facilities in the United States. Brebbia, C.A. and Popov, V., eds., *Air Pollution XVII: Proceedings of the Seventeenth International Conference on Modeling, Monitoring and Management of Air Pollution*. Lecture conducted from Tallinn, Estonia.

Rosenfeld, P. E. (October 15-18, 2007). Moss Point Community Exposure To Contaminants From A Releasing Facility. *The 23rd Annual International Conferences on Soils Sediment and Water.* Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). The Repeated Trespass of Tritium-Contaminated Water Into A Surrounding Community Form Repeated Waste Spills From A Nuclear Power Plant. *The 23rd Annual International Conferences on Soils Sediment and Water*. Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). Somerville Community Exposure To Contaminants From Wood Treatment Facility Emissions. The *23rd Annual International Conferences on Soils Sediment and Water*. Lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld P. E. (March 2007). Production, Chemical Properties, Toxicology, & Treatment Case Studies of 1,2,3-Trichloropropane (TCP). *The Association for Environmental Health and Sciences (AEHS) Annual Meeting*. Lecture conducted from San Diego, CA.

Rosenfeld P. E. (March 2007). Blood and Attic Sampling for Dioxin/Furan, PAH, and Metal Exposure in Florala, Alabama. *The AEHS Annual Meeting.* Lecture conducted from San Diego, CA.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (August 21 – 25, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *The 26th International Symposium on Halogenated Persistent Organic Pollutants – DIOXIN2006*. Lecture conducted from Radisson SAS Scandinavia Hotel in Oslo Norway.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (November 4-8, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *APHA 134 Annual Meeting & Exposition.* Lecture conducted from Boston Massachusetts.

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference.* Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993.

Deposition and/or Trial Testimony:

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the Court of Common Pleas for the Second Judicial Circuit, State of South Carolina, County of Aiken
David Anderson, et al., *Plaintiffs*, vs. Norfolk Southern Corporation, et al., *Defendants.*
Case Number: 2007-CP-02-1584

In the Circuit Court of Jefferson County Alabama
Jaeanette Moss Anthony, et al., *Plaintiffs*, vs. Drummond Company Inc., et al., *Defendants*
Civil Action No. CV 2008-2076
Rosenfeld Deposition: September 2010

In the Ninth Judicial District Court, Parish of Rapides, State of Louisiana
Roger Price, et al., *Plaintiffs*, vs. Roy O. Martin, L.P., et al., *Defendants*.
Civil Suit Number 224,041 Division G
Rosenfeld Deposition: September 2008

In the United States District Court, Western District Lafayette Division
Ackle et al., *Plaintiffs*, vs. Citgo Petroleum Corporation, et al., *Defendants*.
Case Number 2:07CV1052
Rosenfeld Deposition: July 2009

In the United States District Court for the Southern District of Ohio
Carolyn Baker, et al., *Plaintiffs*, vs. Chevron Oil Company, et al., *Defendants*.
Case Number 1:05 CV 227
Rosenfeld Deposition: July 2008

In the Fourth Judicial District Court, Parish of Calcasieu, State of Louisiana
Craig Steven Arabie, et al., *Plaintiffs*, vs. Citgo Petroleum Corporation, et al., *Defendants*.
Case Number 07-2738 G

In the Fourteenth Judicial District Court, Parish of Calcasieu, State of Louisiana

Leon B. Brydels, *Plaintiffs*, vs. Conoco, Inc., et al*., Defendants*.
Case Number 2004-6941 Division A

In the District Court of Tarrant County, Texas, 153rd Judicial District
Linda Faust, *Plaintiff*, vs. Burlington Northern Santa Fe Rail Way Company, Witco Chemical Corporation A/K/A Witco Corporation, Solvents and Chemicals, Inc. and Koppers Industries, Inc., *Defendants*.
Case Number 153-212928-05
Rosenfeld Deposition: December 2006, October 2007
Rosenfeld Trial: January 2008

In the Superior Court of the State of California in and for the County of San Bernardino
Leroy Allen, et al., *Plaintiffs*, vs. Nutro Products, Inc., a California Corporation and DOES 1 to 100, inclusive, *Defendants*.
John Loney, Plaintiff, vs. James H. Didion, Sr.; Nutro Products, Inc.; DOES 1 through 20, inclusive, *Defendants*.
Case Number VCVVS044671
Rosenfeld Deposition: December 2009
Rosenfeld Trial: March 2010

In the United States District Court for the Middle District of Alabama, Northern Division
James K. Benefield, et al., *Plaintiffs*, vs. International Paper Company, *Defendant*.
Civil Action Number 2:09-cv-232-WHA-TFM
Rosenfeld Deposition: July 2010, June 2011

In the Superior Court of the State of California in and for the County of Los Angeles
Leslie Hensley and Rick Hensley, *Plaintiffs*, vs. Peter T. Hoss, as trustee on behalf of the Cone Fee Trust; Plains Exploration & Production Company, a Delaware corporation; Rayne Water Conditioning, Inc., a California Corporation; and DOES 1 through 100, ***Defendants.***
Case Number SC094173
Rosenfeld Deposition: September 2008, October 2008

In the Superior Court of the State of California in and for the County of Santa Barbara, Santa Maria Branch
Clifford and Shirley Adelhelm, et al., all individually, *Plaintiffs*, vs. Unocal Corporation, a Delaware Corporation; Union Oil Company of California, a California corporation; Chevron Corporation, a California corporation; ConocoPhillips, a Texas corporation; Kerr-McGee Corporation, an Oklahoma corporation; and DOES 1 though 100, ***Defendants.***
Case Number 1229251 (Consolidated with case number 1231299)
Rosenfeld Deposition: January 2008

In the United States District Court for Eastern District of Arkansas, Eastern District of Arkansas
Harry Stephens Farms, Inc, and Harry Stephens, individual and as managing partner of Stephens Partnership, *Plaintiffs*, vs. Helena Chemical Company, and Exxon Mobil Corp., successor to Mobil Chemical Co., ***Defendants.***
Case Number 2:06-CV-00166 JMM (Consolidated with case number 4:07CV00278 JMM)
Rosenfeld Deposition: July 2010

In the United States District Court for the Western District of Arkansas, Texarkana Division
Rhonda Brasel, et al., *Plaintiffs*, vs. Weyerhaeuser Company and DOES 1 through 100, ***Defendants.***
Civil Action Number 07-4037
Rosenfeld Deposition: March 2010
Rosenfeld Trial: October 2010

In the District Court of Texas 21st Judicial District of Burleson County
Dennis Davis, *Plaintiff*, vs. Burlington Northern Santa Fe Rail Way Company, ***Defendant.***
Case Number 25,151

Rosenfeld Trial: May 2009

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., ***Defendant.***
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

EDUCATION

UNIVERSITY OF CALIFORNIA, LOS ANGELES **B.S. CONSERVATION BIOLOGY & ENVIRONMENTAL SCIENCES** *JUNE 2014*

PROJECT EXPERIENCE

SOIL WATER AIR PROTECTION ENTERPRISE ***SANTA MONICA, CA***

AIR QUALITY SPECIALIST

SENIOR ANALYST: CEQA ANALYSIS & MODELING

- Calculated roadway, stationary source, and cumulative impacts for risk and hazard analyses at proposed land use projects.
- Quantified criteria air pollutant and greenhouse gas emissions released during construction and operational activities of proposed land use projects using CalEEMod and EMFAC2011 emission factors.
- Utilized AERSCREEN, a screening dispersion model, to determine the ambient air concentrations at sensitive receptor locations.
- Organized presentations containing figures and tables comparing results of particulate matter analyses to CEQA thresholds.
- Prepared reports that discuss results of the health risk analyses conducted for several land use redevelopment projects.

SENIOR ANALYST: GREENHOUSE GAS MODELING AND DETERMINATION OF SIGNIFICANCE

- Quantified greenhouse gas (GHG) emissions of a "business as usual" scenario for proposed land use projects using CalEEMod.
- Determined compliance of proposed projects with AB 32 GHG reduction targets, with measures described in CARB's Scoping Plan for each land use sector, and with GHG significance thresholds recommended by various Air Quality Management Districts in California.
- Produced tables and figures that compare the results of the GHG analyses to applicable CEQA thresholds and reduction targets.

PROJECT MANAGER: OFF-GASSING OF FORMALDEHYDE FROM FLOORING PRODUCTS

- Determined the appropriate standard test methods to effectively measure formaldehyde emissions from flooring products.
- Compiled and analyzed laboratory testing data. Produced tables, charts, and graphs to exhibit emission levels.
- Compared finalized testing data to Proposition 65 No Significant Risk Level (NSRL) and to CARB's Phase 2 Standard.
- Prepared a final analytical report and organized supporting data for use as Expert testimony in environmental litigation.
- Participated in meetings with clients to discuss project strategy and identify solutions to achieve short and long term goals.

PROJECT ANALYST: EXPOSURE ASSESSMENT OF CONTAMINANTS EMITTED BY INCINERATOR

- Reviewed and organized sampling data, and determined the maximum levels of arsenic, dioxin, and lead in soil samples.
- Determined cumulative and hourly particulate deposition of incinerator and modeled particle dispersion locations using GIS and AERMOD.
- Conducted risk assessment using guidance set forth by the Office of Environmental Health Hazard Assessment (OEHHA).
- Utilized LeadSpread8 to evaluate exposure, and the potential adverse health effects from exposure, to lead in the environment.
- Compared final results of assessment to the Environmental Protection Agency's (EPA) Regional Screening Levels (RSLs).

ACCOMPLISHMENTS

- **Recipient**, Bruins Advantage Scholarship, University of California, Los Angeles ***SEPT 2010 – JUNE 2014***
- **Academic Honoree,** Dean's List, University of California, Los Angeles ***SEPT 2013 – JUNE 2014***

The 1990 National Contingency Plan — More Detail And More Structure, But Still a Balancing Act

Lawrence E. Starfield

Editors' Summary: The 1986 Superfund Amendments required EPA to make substantial changes in the national contingency plan, EPA's principal rulemaking under the Superfund program. Congress imposed potentially conflicting mandates on EPA, such as requirements to maximize treatment and to ensure cost-effective remedies. EPA's proposed NCP revisions, issued in December 1988, were analyzed in ELR's March 1989 issue by the EPA attorney who played a principal role in drafting the proposed revisions. In this Article, the final NCP revisions, which took effect on April 9, 1990, are analyzed by the EPA attorney primarily responsible for the legal issues in the final rule. The rule and preamble, which together cover 200 pages in the Federal Register, *include EPA's response to the 1986 amendments and revisions that reflect EPA's experience with the first decade of Superfund. The author provides an overview of the framework of the final NCP, analyzes the major issues addressed by the final rule, and discusses the prinicipal changes from the 1988 proposed rule. The author observes that the true test of the NCP's success will be in the field, and that Congress should give the new regulatory framework some time to be implemented before imposing another set of mandates and deadlines.*

Mr. Starfield is an attorney-adviser in the U.S. Environmental Protection Agency's Office of General Counsel. He has worked on Superfund issues at EPA since 1987, and in the private sector from 1981-87. He is the attorney principally responsible for legal issues in the National Contingency Plan's 1990 revisions, which are the subject of this Article. The views expressed are those of the author and do not necessarily represent the views of the U.S. Environmental Protection Agency.

List of Acronyms

The following abbreviations are used in this Article:

ACLs—alternate concentration limits

ARARs—applicable or relevant and appropriate requirements

BDAT—best demonstrated available technology

CERCLA—Comprehensive Environmental Response, Compensation, and Liability Act of 1980

CRP—community relations plan

EPA—Environmental Protection Agency

ESD—explanation of significant difference

FS—feasibility study

HRS—hazard ranking system

HSWA—Hazard and Solid Waste Amendments of 1984

LDR—land disposal restrictions

MCL—maximum contaminant level

MCLG—maximum contaminant level goal

NCP—national priorities list

O&M—operation and maintenance

PA—preliminary assessment

PRPs—potentially responsible parties

RCRA—Resource Conservation and Recovery Act

RD/RA—remedial design/remedial action

RI—remedial investigation

RI/FS—remedial investigation/feasibility study

ROD—record of decision

SARA—Superfund Amendments and Reauthorization Act of 1986

SDWA—Safe Drinking Water Act

SI—site investigation

SMOA—Superfund memorandum of agreement

TAG—technical assistance grant

TBC—to be considered

WQC—water quality criteria

[20 ELR 10225]

DATELINE: Washington, D.C. February 2, 1990. EPA Administrator William K. Reilly today signed the long-awaited rule to put into place a revised structure for the operation of EPA's Superfund program for cleaning up hazardous waste sites.

While this is not the type of sensational headline to grab the attention of the average reader, it is big news to those who are potentially responsible for, who regulate, or who live near Superfund sites.[1] The lack of a catchy headline is due in part to the fact that although the rule has been long-awaited (and court-ordered), its general content has been known or surmised for some time. The 1990 national contingency plan (NCP)[2] implements requirements in the Superfund Amendments and Reauthorization Act of 1986 (SARA),[3] and thus many aspects of the rule were pre-ordained. Further, the final rule is not dramatically different from the 1988 proposed NCP, which the Environmental Protection Agency (EPA) has been using as guidance since its publication.[4] Thus, to a large degree, the process for achieving Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA)[5] remedies under the final rule should not be very different from the process that has been followed for the last year or two.

At the same time, the rule contains many highly significant changes and formalizes what were only proposed positions on how EPA will run the Superfund program. The onerous length of the NCP (the rule and preamble covered 978 double-spaced pages prior to its condensed 200 pages in the *Federal Register*) is due to the need to cover the many issues raised by SARA, plus EPA's desire to revise the program to reflect the experience of the first decade of

Superfund.[6]

The most notable changes from the 1988 proposal include the following: a more flexible standard against which private cleanup actions will be measured for determing "consistency with the NCP" for cost recovery purposes; a commitment for CERCLA cleanups to generally attain maximum contaminant level goals (MCLGs), where the MCLGs are above zero; a more limited risk range for cleanups involving carcinogenic constituents; and a presumption that variances under the Resource Conservation and Recovery Act (RCRA)[7] are appropriate for the treatment, prior to land disposal, of soils at CERCLA sites that are contaminated with restricted hazardouswastes.

The final rule also takes steps to provide greater structure to the CERCLA process, and thereby to promote consistency of process and result in remedy selection. This is accomplished through an organization of the nine remedy selection criteria into three functional categories, statements concerning the types of remedies that are "expected" to result from the process, and the placement of increased emphasis on protecting health and the environment through the use of treatment at sites. Significant revisions have also been made in the process of defining how CERCLA actions are to comply with the applicable or relevant and appropriate requirements (ARARs) of other laws, in the opportunities afforded for public participation (e.g., longer public comment periods, community interviews, and an administrative record process), and in the increased role of states as partners to EPA throughout the response action process.

However, *despite increases in detail and structure, the revised NCP remains a highly discretionary document, under which decisionmakers have the flexibility to balance relevant factors and to design remedies to meet the unique needs of specific sites.* Accordingly, many of the changes in the final rule may go further toward achieving "consistency in process" rather than "consistency in result."

This Article discusses the major changes from the 1988 proposed NCP and other significant issues in the final rule. However, to provide a clear context for the revisions, the Article first provides background on Superfund and the NCP, a summary of the major sections of the NCP, and a "road map" through the hazardous site response section of the NCP.

Background

Superfund

In 1980, Congress enacted CERCLA to provide authority for the cleanup of serious threats to public health and the environment resulting from releases of hazardous substances, pollutants, and contaminants into the environment.[8] CERCLA § 104[9] empowers EPA[10] to take response **[20 ELR 10226]** measures "consistent with the national contingency plan" to address such threats through direct funding under the Superfund (the Fund). EPA also has the authority, independent of Fund-financed response actions, to issue orders or seek judicial relief under CERCLA § 106[11] to require the abatement of releases that may be an imminent and substantial endangerment to public health, welfare, or the environment.

EPA response actions may consist of either "removal" or "remedial" actions.[12] Removal actions are generally immediate or interim measures taken to assess, evaluate, minimize, or mitigate danger to the public health or the environment.[13] In addition to including the actual removal of hazardous substance wastes, a removal action may consist of providing a temporary alternative water supply, building a fence, or conducting an investigation under § 104(b) (including a remedial investigation (RI)[14]). A remedial action is an action consistent with a long-term or "permanent" remedy at a site, such as the excavation or destruction of hazardous substances, or provision of a permanent alternative water supply.[15] The decision as to whether an action is a removal or a remedial action is not always obvious, because the definitions overlap to a significant degree. Removal and remedial actions must, "to the greatest extent possible, be in accordance with the provisions of the [NCP]."[16]

Where EPA determines that a state, political subdivision thereof, or Indian tribe has the capability to carry out a removal or remedial action under CERCLA § 104 (in accordance with the NCP) and adequate enforcement authority (under state/tribal law), the Agency may enter into a cooperative agreement or contract with the state, subdivision; or tribe to carry out specified actions at CERCLA sites.[17] The governmental entity with primary responsibility for carrying out the response action at a site is termed the "lead agency."[18]

The statute imposes liability for the costs of response actions on four classes of "responsible parties" described in

CERCLA § 107[19] — past owners and operators of the release site, present site owners/operators, certain generators of the released hazardous substances, and transporters of the hazardous substances. Pursuant to § 107(a)(4)(A),[20] the United States, states, and Indian tribes may recover all costs of removal or remedial action incurred in a manner "not inconsistent with the [NCP]." Similarly, "other necessary costs of response incurred by any other person consistent with the [NCP]" may be recovered from the four categories of liable parties.[21] The courts have generally found that liability under CERCLA is joint and several (if harm is indivisible).[22]

In addition to this basic structure, Congress added a substantial number of requirements and directions in SARA. For instance, new CERCLA § 121 sets out requirements for how remedial actions should be selected; a new § 117 provides specific opportunities for public participation in remedy selection; and subsections (h), (j), and (k) of Section 113 have been added concerning the timing and scope of judicial review and the requirement for an administrative record for all response actions.

The NCP

As noted above, many of CERCLA's requirements are tied to "compliance" or "consistency" with the NCP. The NCP has been the blueprint for governmental response actions since 1968, when it focused almost exclusively on responses to oil spills. With the enactment of CERCLA in 1980, Congress prescribed a greatly expanded role for the NCP, extending its applicability to releases of hazardous substances, pollutants, and contaminants.[23] The NCP has been revised several times, with the last major revision occurring in November 1985.[24]

With the passage of SARA in October 1986, EPA set about drafting revisions to the NCP.SARA § 105(b)[25] specifically required EPA to revise the NCP "to reflect the requirements" of SARA, and specifically to provide procedures and standards for remedial actions "which are consistent with the [SARA amendments] relating to the selection of remedial actions." The following are the major SARA requirements relating to remedy selection that the NCP was intended to incorporate:

* protect human health and the environment;[26]

* comply with ARARs under federal environmental or state environmental or facility siting laws (or justify a waiver);[27]

* select *cost-effective* remedies;[28]

[20 ELR 10227]

* utilize *permanent* solutions and alternative treatment technologies or resource recovery technologies *to the maximum extent practicable;*[29]

* address the preference for remedies in which *treatment* that tht *permanently* and significantly reduces the volume, toxicity, or mobility of hazardous substances, pollutants, and contaminants is a principal element;

* consider the short- and long-term potential for adverse human health effects from exposure in assessing the effectiveness of alternative remedial actions;[30]

* provide significant opportunities for *public participation;*[31] and

* provide for substantial and meaningful *state involvement* in the initiation and development of remedial actions.[32]

These diverse statutory requirements provided a complicated mandate for the Superfund program, due in large part to the inherent tension among some of the SARA requirements. EPA was directed to maximize treatment, yet ensure cost-effective remedies.[33] The Agency was also directed to take into account the preferences of both states and the public before selecting remedies, yet those preferences could lead to a departure from other statutory requirements (e.g., some communities might oppose an incineration alternative due to concerns over air emissions). In short, SARA pushed the Agency in several directions at one time, resulting in some difficulty in prescribing hard rules that should apply at all sites. As discussed in more detail below, EPA attempted to implement the multiple directions in the statute by incorporating a set of nine remedy selection criteria into the final NCP, which are to be applied on a site-specific basis.

The Agency's efforts to achieve consensus on how best to reconcile SARA directives were a major cause of the delay in the promulgation of the rule. In addition, the Agency took the opportunity provided by SARA to completely revise the 1985 NCP, and thus initiated many more changes than may have been contemplated by Congress when it set the statutory deadlines. In effect, the 1985 NCP is largely overhauled (especially the subparts dealing with hazardous substance response). Also, many provisions were added to reflect programmatic experience gained over the 10 years Superfund has been in operation, and other changes were made to clarify the response process and to make the NCP easier to follow. For instance, the sequence in which response activities is discussed was changed to better reflect the order in which they occur. Also, public participation requirements were integrated throughout the rule to be discussed with the activity to which they relate.

Due to these factors, the promulgation of the NCP was repeatedly delayed, and the statutory deadline[34] to promulgate a revised NCP by April 17, 1988, was not met. In the autumn of 1988, several environmental groups sued the Agency for failure to meet the statutory deadline, resulting in a timetable for final promulgation, enforceable by the U.S. District Court for the District of Columbia.[35] The revisions were proposed in the *Federal Register* on December 21, 1988,[36] and as agreed, the final revisions were delivered to the *Federal Register* on February 5, 1990, for publication. They appear in the March 8, 1990 issue of the *Federal Register.*[37]

Effective Date/Retroactivity

The 1990 revisions took effect on April 9, 1990. The rule will not be applied to actions completed before the effective date, but it will be applied to on-going actions.[38]

Ninety-Day Study of CERCLA

Several months after the proposal of the NCP in the *Federal Register,* EPA Administrator Reilly took office and began a 90-day review of the Superfund program.[39] This study was designed as an internal agency review, with a focus on the management of the Superfund program and implementation issues; it was not a review of the NCP or of the then-pending NCP rulemaking proposal. Although the two initiatives proceeded on separate tracks, they are generally consistent and do overlap (e.g., both emphasize treatment, public participation, and expedited response).

Overall Framework of the Final NCP

The 10 Subparts

The NCP is broken down into 10 subparts (and an 11th will be proposed). The following four subparts were substantially revised or added by the final rule and are critical to an understanding of the Superfund response process:

Subpart E (subpart F in the 1985 NCP), entitled "Hazardous Substance Response," is the key subpart of the NCP for Superfund responses. It sets out the elements for response to hazardous substance releases and describes the CERCLA process from site discovery through final cleanup. It is within this section that the procedure for remedy selection is discussed.[40]

Subpart F is a new subpart added to explain the role and responsibilities of states in CERCLA actions. CERCLA § 121(f)(1), added by SARA, directed EPA to promulgate regulations to provide for substantial and meaningful state involvement during response actions.[41]

Subpart H is a new subpart on participation by other persons in response actions and on the recovery of costs **[20 ELR 10228]** under CERCLA § 107(a)(4)(B). It consolidates and expands into a separate subpart the discussion of private party actions under CERCLA.[42]

Subpart I is a new subpart, added to implement the requirement in SARA (CERCLA § 113(k)) for the establishment of an administrative record.[43]

The remaining subparts relate either to oil discharges (which are generally exempt from response under CERCLA by statute[44]) or to administrative interactions among cooperating federal agencies; they are not discussed in detail in this article:

Subpart A is a general introductory section, although it also includes important definitions.[45]

Subpart B combines, without major change, Subparts B and C from the 1985 NCP and describes the interaction of executive branch agencies in responding to releases of hazardous substances or oil.[46]

Subpart C addresses preparedness activities, federal and regional contingency plans, and planning responsibilities of state and local agencies.[47]

Subpart D sets forth the phases of response to discharges of oil, and is substantially unchanged from the 1985 NCP; however, the subpart may take on increasing importance in light of the recent oil spills in Alaska and elsewhere.[48]

Subpart G designates,and sets out the responsibilities of, federal trustees who may act on behalf of the President to assess and restore damaged natural resources.[49]

Subpart J discusses the use of dispersants for oil spills; it is largely unchanged from Subpart K in the 1985 NCP.[50]

Subpart K has been reserved for a new subpart of regulations concerning federal facilities. EPA intends to propose, as an amendment to the NCP, a subpart that would act as a road map to the NCP requirements that apply to CERCLA response actions at federal facilities and would codify certain provisions of CERCLA § 120 that relate to federal facilities only.

Road Map to the CERCLA Site Response Process (Subpart E)

Site Discovery. The process begins with the discovery of a release by one of several possible mechanisms (e.g., notification requirements under CERCLA § 103(a) or (b) or under other laws, a petition from a citizen,[51] etc.)[52] In the case of an emergency (e.g., fire, explosion), a removal action will be taken to stabilize the site.

Removal Assessment. In nonemergency situations, the release is evaluated to determine if a removal action is appropriate based on a removal preliminary assessment (PA) and, if appropriate, a removal site inspection (SI).[53]

Removal Action. Where necessary to protect human health and the environment, the Agency may initiate a removal action to prevent, mitigate, or minimize the threat posed by the release. This may involve removal of surface drums, fencing of the site, the provision of temporary drinking water supplies, etc.[54] Removals may be emergency actions (taken within hours of discovery), time-critical actions, or non-time-critical actions.[55]

Remedial Site Evaluation. A remedial PA (and SI, where appropriate) is conducted on all sites in the CERCLA Information System database, CERCLIS, to see if the site is a priority for long-term remedial response.[56] These evaluations involve the collection of data for scoring the site under the hazard ranking system (HRS) model;[57] sites scoring above the threshold in the HRS[58] are placed on the national priorities list (NPL)[59] for further evaluation and possible remedial action.[60]

Remedial Priorities. The Agency evaluates releases for inclusion on the NPL based on the HRS score or one of the other methods for listing outlined in the NCP.[61] The Agency may spend Fund monies for *remedial* action only at those sites that are on the NPL. ("Fund-financed remedial action" does not include removal action or enforcement action.[62])

Remedial Investigation/Feasibilty Study. The Agency will undertake a remedial investigation and feasibility study (RI/FS) at sites that are, or appear to be, priorities for action (i.e., that are on, or are proposed for listing on, the NPL). The RI/FS, like any other investigation conducted pursuant to CERCLA § 104(b), is a removal action under CERCLA § 101(23), despite the word remedial in its name.

During the RI, the nature and extent of the threat posed by the contamination is studied; concurrently, alternative **[20 ELR 10229]** approaches are developed as part of the FS for responding to and managing the site problem.[63]

Preliminary Remediation Goal. The first step in developing alternatives during the FS is the establishment of a preliminary goal for the remediation of the site.[64] This goal is initially based on readily available information, such as a chemical-specific ARAR, or the "point of departure" in the range of acceptable risk.[65] Alternatives are then developed that are capable of attaining the preliminary remediation goal. (The goal may be modified as additional information is developed).

Screening of Remedial Alternatives. A broad list of alternatives is then reviewed and screened, with the more extreme, impracticable options being eliminated before the detailed analysis of alternatives begins. Alternatives may be eliminated during screening based on effectiveness, implementability, or "grossly excessive" cost.[66]

Analysis of Alternatives Using the Nine Criteria. The Agency then conducts a detailed analysis of the remaining alternatives (usually three-nine, depending on the complexity of the problem). The advantages and disadvantages of the alternatives are studied and compared using the following nine remedy selection criteria:[67]

* overall protection of human health and the environment;

* compliance with (or waiver of) the ARARs of other laws;

* long-term effectiveness and permanence;

* reduction of toxicity, mobility, or volume through treatment;

* short-term effectiveness;

* implementability;

* cost;

* state acceptance; and

* community acceptance.

Selection of Remedy.[68] Thenine criteria are then used to select the remedy by evaluating them in three functional categories (threshold, balancing, and modifying criteria), in order to reflect the nature and/or timing of their application. The first two criteria — protectiveness and compliance with ARARs — are identified as threshold criteria; only the alternatives that meet those criteria may be carried forward.[69]

Protective, ARAR-compliant alternatives are then "balanced" (i.e., used to evaluate tradeoffs) based on the middle five criteria (and the two modifying criteria, to the extent they are known). The Agency then attempts to select *the* remedial alternative that "utilizes permanent solutions and treatment . . . to the maximum extent practicable" and is "cost-effective" based on a comparison of the appropriate balancing or modifying criteria.[70] Alternatives are judged cost-effective if their costs are "in proportion" to their overall effectiveness; an alternative is found to achieve the maximum permanence and treatment practicable based on a balancing of the seven nonthreshold criteria, with an emphasis on the factors of "long-term effectiveness and permanence" and "reduction in mobility, toxicity or volume through treatment."[71]

EPA and the state then discuss the remedial options and issue a proposed plan, which sets out the lead agency's recommended alternative.[72] Consistent with CERCLA § 117, the public is afforded an opportunity to review and comment on the alternatives studied in the FS and the proposed plan.[73] After review of and response to public comments, and formal consideration of the two modifying criteria (state and community acceptance), the final remedy selection is documented in a record of decision (ROD).[74]

Remedial Design/Remedial Action and Operation and Maintenance. The lead agency then sets about designing, constructing, and implementing the selected remedy.[75] Often, the remedial action plan set out in the ROD will need to be modified in light of information developed during the design phase (e.g., the Agency may learn that more soil is contaminated and needs to excavated). If the remedial action to be taken differs "significantly" from the remedy selected in the ROD with respect to scope, performance, or cost, the lead agency will issue an explanation of significant differences (ESD).[76] If the action to be taken "fundamentally alters" the basic features of the remedy selected in the ROD, the lead agency will propose and take comment on a ROD amendment.[77]

Once the remedy is operational and functional (or later, for groundwater restoration remedies[78]), the state undertakes

responsibility for funding and carrying out operation and maintenance (O&M) of the remedy.[79]

Deletion From the NPL, Five-Year Review. Once EPA has determined that no further response action is appropriate, the site may be proposed for deletion, or recategorized on the NPL,[80] even where O&M is continuing. Sites at which hazardous substances remain above levels that allow for unlimited use and unrestricted exposure must be reviewed at least every five years after the initiation of the remedy (not merely after completion), consistent with CERCLA § 121(c).[81] As discussed in more detail below, the NCP discusses EPA's general policy not to delete a site at which hazardous substances remain until at least one five-year review has been performed after completion of the remedial action.

[20 ELR 10230]

Major Issues/Changes in the 1990 NCP

ARARs Issues

There were several major changes and statements in the final NCP revisions relating to ARARs, the "applicable" or "relevant and appropriate" requirements of other environmental laws. How CERCLA actions comply with ARARs often determines the cleanup standard at a site or certain parameters that the remedial approach must fulfill. Thus, a discussion of major ARARs issues is an important starting point in a review of the final NCP.

* *Background.* As defined in the final rule, "applicable" requirements are cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site.[82]

A "relevant and appropriate" requirement is a *promulgated* standard that, while not applicable to the substance, location, or action, addresses problems or situations sufficiently similar to those encountered at a CERCLA site that its use is well suited to the particular site. One example is where a federal requirement has not been adopted by a state authorized to run the federal program. Such requirement may not be applicable in the state, but it could nevertheless be relevant and appropriate to management of the CERCLA waste at issue. In another example, RCRA waste management requirements may be relevant and appropriate to a CERCLA waste that is similar to a RCRA-listed hazardous waste but is not specifically listed in the RCRA regulations[83] (and thus to which RCRA would not independently "apply").

The concept of requiring remedies to attain relevant and appropriate standards (i.e., standards that do not independently apply as a matter of law) is unique to CERCLA and has generated controversy and confusion. (Indeed, it is somewhat counter-intuitive to be required to comply with requirements that do not apply as a matter of law.) To add some consistency to the process, the final rule offers several factors to consider in determining if a requirement is relevant and appropriate under the circumstances of the release (both findings must be made).[84] However, the notion of what standards are appropriate is, almost by definition, a matter of judgment, subject to case-by-case variations. Thus, the Agency retains considerable discretion in making the ultimate decision of what standards a CERCLA remedy should attain based on potential relevance and appropriateness. (Of course, the decision that a remedy must attain a certain standard may be questioned during the comment period of the ROD.) This discretion is even broader in that the Agency may decide that only certain portions of a requirement are relevant and appropriate.[85] The ability to find that a nonapplicable requirement is not appropriate has limited the instances in which statutory waivers[86] are necessary for relevant and appropriate requirements.

There are four conditions that must be met for a requirement to be considered a potential ARAR, based either on applicability or relevance and appropriateness. First, the requirement must be promulgated (i.e., "of general applicability and enforceable").[87] Second, it must be a substantive — rather than administrative — requirement; CERCLA actions are required to meet only the procedures set out in the NCP (additional procedures of other laws are met where appropriate, as a matter of policy).[88] Third, it must be a requirement of an "environmental" law, as provided in CERCLA § 121(d)(2)(A)(i) and (ii);[89] the requirements and procedures of nonenvironmental laws are simply complied with to the extent they apply — they are not considered as part of the ARARs review process under CERCLA.[90] Fourth, ARARs are limited to on-site actions, consistent with CERCLA § 121(d)(2)(A);[91] where EPA sends wastes off site, that waste transfer must comply with the substantive and administrative requirements of *applicable* law (there would be no relevant and appropriate determination, and no waiver option).[92]

Only those requirements that pertain to a specific action are ARARs for that action.[93] The clearest case for the application of this principle is where contaminated soil is being removed from the surface at a site as part of a removal action or a first operable unit ROD; groundwater cleanup standards for the contaminants found in the soil would not pertain to the surface cleanup action, and thus would not be ARARs for that action.

ARARs may be chemical-specific (e.g., an established level for a specific chemical in groundwater), action-specific (e.g., a land disposal restriction for RCRA hazardous wastes), or location-specific (e.g., a restriction on actions that adversely affect wetlands). Thus, the concept is much broader than that of a specific cleanup level for a site.

The idea of applying the ARARs of other *federal* laws to CERCLA actions was first introduced by the 1985 **[20 ELR 10231]** NCP.[94] SARA generally incorporated the idea into CERCLA § 121(d)(2) for remedial actions, and added the requirement to meet certain ARARs of *state* law, which the final rule picks up.[95] Although not required by SARA, the final NCP also continues the 1985 policy of requiring removal actions to comply with ARARs "to the extent practicable."[96]

* *Maximum Contaminant Levels and Maximum Contaminant Level Goals as ARARs.* In the preamble to the proposed NCP, the Agency had stated that the ARAR for the cleanup of groundwater that was an actual or potential source of drinking water would generally be the maximum contaminant level (MCL).[97] This approach was based largely on the view that MCLs, as the enforceable drinking water standards under the Safe Drinking Water Act (SDWA), are relevant and appropriate to the cleanup of CERCLA sites.[98] The option of generally requiring cleanup to health-based maximum contaminant level goals (MCLGs) was rejected, based on a determination that MCLs are protective of human health, and that it would not be appropriate to require groundwater at CERCLA sites to be cleaner than the levels required for the nation's water supply. Further, MCLGs are, by definition, unenforceable, aspirational goals under the SDWA.[99] According to the proposal, MCLGs would have been attained only in unusual cases (e.g., cases involving multiple contaminants or pathways where the attainment of enforceable MCLs would result in a risk greater than the acceptable risk range).[100]

A number of commenters criticized this approach, focusing on the direction in the statute to attain MCLGs "where relevant and appropriate." These commenters argued that EPA should attain even zero-level MCLGs because MCLGs are health-based standards — not standards based on what is feasible for drinking water systems (the case for MCLs) — and thus are the appropriate standard for CERCLA cleanups. They suggested that where such levels could not be physically attained, waivers should be used.

Although EPA continues to believe that the language in the statute gives the Agency considerable discretion to decide whether it is "appropriate" to apply standards more stringent than drinking water standards to groundwater, the Agency reevaluated the MCL/MCLG question during the comment review period and sought to give greater deference to the words of the statute while not requiring attainment of standards that would be generically inappropriate.

The preamble to the final rule notes, as a threshold matter, that in addition to giving the Agency discretion as to when compliance with MCLGs might be appropriate, the first sentence in CERCLA § 121(d)(2) sets out a somewhat competing mandate: It requires on-site CERCLA remedies to attain promulgated standards or levels of control established under the SDWA (i.e., MCLs), where they are applicable or relevant and appropriate.[101]

The final NCP deals with the potential applicability of both MCLs and MCLGs by providing that MCLGs that are greater than zero shall be attained where "relevant and appropriate under the circumstance of the release." (Thus, it is expected that MCLG's above zero will generally be the cleanup level for actual and potential drinking water sources.) However, where the MCLG is set at zero (as it is for carcinogens), the relevant MCL would be used as the cleanup standard, where relevant and appropriate.[102]

This revised approach is believed to better reflect the statutory intent of CERCLA § 121, while also recognizing the practical difficulties inherent in attaining MCLGs set at zero (indeed, the Agency concluded that it is not scientifically possible to detect whether a level of zero contamination has been attained). The NCP explains that the use of an unattainable, unmeasurably zero level is not appropriate in setting actual cleanup levels to be attained under

Superfund.[103] Further, CERCLA requires protective remedies, not the complete elimination of risk.[103]

The approach adopted in the final rule also recognizes the realities of present groundwater treatment technology. While some commenters may believe that zero levels are attainable, or that EPA should require cleanup down to the levels of detection, the empirical evidence suggests that such results are far from practical. Experience with the Superfund program has shown that groundwater treatment is very difficult.[104] While groundwater remediation is proving effective in containing plumes to prevent further migration and in achieving significant mass reduction of chemicals, it may not be possible in many cases to achieve MCLs throughout the aquifers, not to mention levels of zero.

The practical impact of the change from "generally MCLs" to "generally non-zero MCLGs" is small at present, because for noncarcinogens (the body of chemicals with MCLGs above zero), the MCLs are set at the same level as the corresponding MCLGs. However, in the future, the Agency may consider setting MCLGs that are more stringent than MCLs for certain noncarcinogens. Although such an action would have no legal effect on compliance under the SDWA, it would have a potential impact on CERCLA remedies; in effect, groundwater at some **[20 ELR 10232]** CERCLA sites may be driven to be cleaner than U.S. drinking water. Of course, where a more stringent MCLG level cannot be achieved, site-specific waivers would likely be used at CERCLA sites.

It is important to note that the preamble to the final rule strongly emphasizes the importance of MCLs/nonzero MCLGs as the primary standards for the cleanup of groundwater at CERCLA sites. Alternate concentration limits (ACLs)[105] are discussed as being appropriate only where it is not practicable to meet the MCL/nonzero MCLG;[106] similarly, water quality criteria (WQC)[107] are discussed as being generally appropriate only in limited cases involving surface water.[108]

* *Freezing ARARs.* A frequent ARARs issue is whether a requirement that is made part of a selected remedy (or that drives the choice of that remedy) must be revised when a new requirement is promulgated. In the preamble to the proposed NCP, EPA took the position that requirements promulgated after the initiation of the remedial action will not be attained unless necessary to ensure protectiveness.[109] This was intended to avoid the requirement to restart work already begun.

In the final rule, the Agency reconsidered and expanded this interpretation by providing that requirements promulgated or modified after the signing of the ROD — an earlier point in the process — must be attained (or waived) only when determined to be applicable or relevant and appropriate *and* necessary to ensure protectiveness.[110] That is to say, ARARs generally freeze at the time of ROD signature.

The Agency explained that this approach is both necessary and appropriate under the statute. A contrary requirement, to reexamine potential ARARs throughout the design and implementation phases of CERCLA remedies, would threaten to subject remedial actions to constant interruption and reevaluation, significantly disrupting the cleanup process. This would be inconsistent with Congress' intent that EPA conduct cleanups expeditiously[111] and would prevent the Agency from achieving finality in the remedy selection process.

This ARARs freezing policy will not compromise protection of human health and the environment. EPA will continue to review CERCLA remedies where hazardous substances are left on site at least every five years to ensure that the remedy remains protective.[112] Further, the Agency will evaluate standards promulgated after ROD signature, as appropriate, to ensure that the selected remedy is adequately protective.

The determination of whether a remedy remains protective is a complicated issue, and guidance is expected on the matter in the near future. However, it is likely that a five-year review of protectiveness would, at a minimum, include an assessment of whether the measures put in place by the ROD continue to provide effective management, within acceptable risk levels, of the hazardous substances remaining on site. Obviously, if monitoring wells showed new contamination, additional measures might be necessary. The more difficult issue during the five-year review — or earlier, if appropriate — will be whether the protectiveness of a remedy is called into question by the promulgation of a new standard since the time of ROD signature.

For example, a substance that had been considered nonhazardous at the time of remedy selection might subsequently be listed as a hazardous waste under RCRA. If the ROD had allowed that substance to be left in place without treatment or engineering controls, the newly applicable RCRA requirements might well result in a finding that the remedy is no longer protective and that additional response action (preceded by a ROD amendment or ESD) is required. By contrast, if the newly regulated substance had been contained using engineering controls along with other hazardous substances, the additional information concerning the substance's RCRA status might not result in a finding that the remedy is no longer protective. (Such a finding might need to reflect a reexamination of the risk assessment for the site in conjunction with the new information; if the risk posed by the site continued to be within acceptable levels, no modification of the remedy would be necessary.)

As for new remedial decisions made after ROD signature, the freezing ARARs policy applies as follows: Components of a remedy not described in the ROD must attain (or waive) requirements that are identified as applicable or relevant and appropriate *at the time* the ROD amendment or explanation of significant differences (ESD) describing the component is signed.[113]

* *Definition of Placement: Application of RCRA Land Disposal Restrictions.* One of the most controversial ARARs issues is the debate over how RCRA applies to CERCLA actions; the preambles to both the proposed and final NCP spend a significant amount of time on the question.[114] Perhaps the most contentious issue within that debate is how to apply the land disposal restrictions (LDR) that were added to RCRA § 3004[115] by the Hazardous and Solid Waste Amendments of 1984 (HSWA).[116]

[20 ELR 10233]

According to RCRA § 3004(k), "land disposal" is defined for the purposes of § 3004 and LDR as including the "placement" of a specified hazardous waste in a landfill, surface impoundment, waste pile, etc.[117] Thus, where a specified waste has been "placed" in a hazardous waste management unit, land disposal has occurred and the LDR requirements are triggered. The LDR requirements ban the disposal of most hazardous wastes after a given point in time, unless EPA promulgates treatment standards for those wastes. The Agency has promulgated (or plans to promulgate) regulations for all categories of LDR wastes,[118] and it has in general required treatment using the best demonstrated available technology (BDAT) prior to lawful land disposal. Although Congress appears to have contemplated that LDR standards would apply to wastes from CERCLA cleanups (even if not immediately),[119] many in the Agency and in the regulated community have found the standards difficult to implement in the context of CERCLA cleanup actions.

A number of parties have argued that BDAT standards were designed for specific chemicals or waste streams, and that such standards are poorly suited to CERCLA cleanup actions that typically involve complex mixtures of chemicals. Further, contamination at CERCLA sites generally involves contaminated soils that are difficult and costly to treat (especially by incineration, a common BDAT technology). Indeed, many inside and outside the Agency suggest that applying the LDR requirement to CERCLA cleanups has the perverse effect of encouraging no treatment at sites because it results in a choice of extremes: either treat the material to expensive BDAT levels (which in the case of combustion technologies results in large volumes of ash remaining for disposal) or leave the material in place, thereby avoiding LDR. Interim options, such as treating the contaminated soil to safe levels that are above BDAT and then placing it back in the unit of origin, would seem to be unavailable. The preamble to the proposed rule set out EPA's interpretation that LDR-restricted waste may not be placed in a unit without treatment to BDAT, even if the waste has been partially treated and is being re-placed in the unit.[120]

In response to the numerous comments on this point, the Agency issued a supplemental notice in October 1989, requesting comment on a possible reinterpretation of RCRA § 3004(k) to the effect that if soil were excavated, treated, and "re-placed" in the unit of origin, that unit would be improved and no new "placement" of waste would be said to have occurred (and the LDR requirements would not be triggered).[121]

The preamble to the final NCP retains the 1988 interpretation that placing waste back into the unit of origin constitutes "placement" for the purposes of RCRA § 3004 (and specifically, LDR), unless the waste was treated to BDAT (or to an approved variance level).[122] However, the preamble discussion recognizes the practical problem posed by the applicability of BDAT to contaminated soil at cleanup sites and sets out a series of actions to address this issue.

First, the Agency pledges to promulgate specific BDAT standards that would be appropriate for contaminated soil and debris (the existing BDAT standards are generally developed with defined waste streams in mind). Second, to give more immediate relief, the preamble sets out the Agency's view that the BDAT standards established for certain wastestreams are generally inappropriate for contaminated soil and debris, and thus decisionmakers can "presume" that a RCRA

treatability variance is available for such materials.[123] Because on-site CERCLA actions are not subject to permitting or administrative determination requirements of other laws,[124] a variance level may be set at CERCLA sites by the regional administrator as part of the ROD process. However, the variance level will still need to be justified in the ROD, and the presumption that a variance is appropriate may be rebutted on a site-specific basis, such as where the soil is saturated with high levels of combustible organic chemicals (as discussed in the preamble to the final rule).[125]

Finally, EPA is not taking final action at this time on the supplemental proposal to reinterpret "placement."[126]

* *Point of Compliance With ARARs in Groundwater.* In discussing ARARs, it is critical to define the physical point at which protective levels must be achieved. This is especially problematic in groundwater where no fixed contaminant boundaries exist. For instance, should compliance be required at the vertical line extending from the site owner's property boundary, at the existing boundary of the contamination itself, or at all points of contamination? In the preamble to the proposed rule, EPA stated that its general policy will be to clean up contaminated groundwater (that is being used, or is reasonably likely to be used, as drinking water) throughout the contaminated plume, or where waste is left in place on the surface, up to and beyond the edge of the waste unit boundary.[127]

The preamble to the final rule reaffirms this general policy of achieving an area of attainment but also discusses the possibility of setting alternative points of compliance in certain limited cases.[128] First, where a plume of groundwater contamination is caused by releases from several distinct sources that are in close geographical proximity, the preamble contemplates that the problem may appropriately **[20 ELR 10234]** be addressed as a whole rather than source by source. Thus, the point of compliance could be drawn to encompass the proximate sources, and the contaminated plume stemming from these sources could be pulled back to that line. This option is based on an assessment that it would be impracticable to, in effect, divide a contaminant plume such that it could be drawn back to sources at several different but nearby points. Drawing the plume back to the line surrounding those sources would make more practical sense, without a loss in protection.

Second, the preamble notes that where there is little likelihood of exposure due to the remoteness of the site, it may also be appropriate to consider an alternate point of compliance, provided that contamination in the aquifer is controlled from further migration.[129] The Agency did not give guidance on when a site is sufficiently "remote" to justify such an alternate point of compliance, but the limitation in the preamble to remote areas where there is little chance of exposure suggests that this possibility will be rarely used.

Any use of an alternate point of compliance would need to be justified on a case-by-case basis, considering the statutory requirements for remedies to be protective and to prefer treatment technologies, and the general goal of the statute to clean up — rather than to maintain the status quo — at contaminated sites.[130]

* *TBCs* (criteria or guidance "to be considered"). The issue of whether government policy statements or guidance documents are ARARs has frequently arisen at CERCLA sites. To address this point, the Agency developed the concept of "TBCs," nonbinding criteria, guidance, advisories, and the like that — unlike ARARs — are not required to be attained. TBCs may, however, contain information that may be helpful in the establishment of a cleanup standard.

The proposed rule suggested that TBCs, as well as ARARs, *must* be identified in the early stages of remedy selection.[131] A number of commenters were concerned that the rule, as proposed, would require the time-consuming identification of an undefined array of advisories and policy statements. In response, the final rule makes clear that the use and identification of TBCs are discretionary, not mandatory.[132]

The significance of this change is that the identification and use of TBCs are not routinely required during the remedial development process. At the same time, the Agency may still use TBCs to assist in determining what is protective or to otherwise help in designing Superfund remedies, where appropriate, as a complement to ARARs. For instance, where there is no binding requirement as to the safe level of a contaminant, but a health advisory or guidance document exists on the point, the Agency may refer to that document to support its decision on a cleanup standard. Such a decision would have to be justified on a site-specific basis, and the public (and potentially responsible parties (PRPs)) would have an opportunity during the comment period to comment on the appropriateness of using the levels in that TBC.

* *Substantive, Not Administrative, Requirements.* The Agency has consistently interpreted the concept of ARARs as including only the substantive, not administrative, requirements of other laws.[133] The preamble to the final rule

continues this interpretation and includes the concept in the definitions of "applicable" and "relevant and appropriate" requirements.[134] This interpretation was historically based on the position that CERCLA actions must be allowed to proceed expeditiously and that compliance with administrative and procedural provisions would slow down CERCLA actions.[135] Moreover, the NCP sets out a detailed set of procedures of its own that CERCLA actions must follow; these render unnecessary the procedures of other environmental programs.

In enacting SARA, Congress codified elements of this policy. CERCLA § 121(e)(1) expressly relieves EPA of any permitting requirement for on-site CERCLA actions. In addition, Congress crafted a new § 121(d)(2), which requires CERCLA actions to attain the "standards" and "levels of control" set by other environmental laws. This section too supports the position that CERCLA actions need not follow the procedures of other laws. The substantive/administrative distinction is also consistent with the Agency's view that the provisions of other environmental laws were impliedly repealed or preempted by CERCLA for on-site CERCLA actions.[136]

Although administrative provisions, such as those calling for consultation with other agencies or the reporting of certain information, are not required, it is EPA policy to generally engage in such consultation and provide needed information (e.g., discharge monitoring reports).[137]

[20 ELR 10235]

* *Compliance With ARARs During Response Actions.* The final rule requires CERCLA remedies to comply with ARARs *during* the design and implementation of the remedial action, as well as at its conclusion.[138] This point was the subject of significant comment, as several noted that the statute merely requires CERCLA remedies to attain ARARs "at the completion of the remedial action."[139] However, as the preamble to the final rule explains, compliance with ARARs during the remedial action makes sense for many of the same reasons that compliance with ARARs makes sense at completion: The requirements of other laws help define how the activity can be carried out in a manner that is protective of health and the environment.[140] For instance, if the conduct of a remedy involves the storage of hazardous waste pending construction of a final treatment unit, it would be short-sighted at best and irresponsible at worst to be concerned with applicable waste management standards only at the end of the project. Waste managed during the remedial action should also meet the substantive standards of other applicable or relevant and appropriate laws.

Similarly, EPA is continuing its policy of attaining ARARs *during* removal actions[141] (to the extent practicable, as discussed below in the section on Removal ARARs). This policy would apply to fieldwork conducted as part of an RI/FS, which comes within the definition of a removal action.[142] EPA has issued extensive guidance on how it will comply with the ARARs of the resource protection statutes — such as the Endangered Species Act[143] and the National Historic Preservation Act[144] — during the investigative and cleanup phases of CERCLA response.[145]

The policy of attaining ARARs during remedial and removal actions does not apply to chemical-specific ARARs, such as soil cleanup levels, which can only be met at the completion of the action.[146] In addition, a statutory waiver is available for interim actions that will attain the ARAR upon completion of the total response.[147]

* *Removal Actions — Compliance With ARARs.* Most of the foregoing discussion has focused on compliance with ARARs for CERCLA *remedial* actions; the rules for short-term actions, "removals," are different based on both the statute and long-standing practice. The 1985 NCP provided that because of their time-sensitive nature, removals need meet ARARs only to the "greatest extent practicable, considering the exigencies of the situation."[148] In SARA, the ARARs concept was applied only to remedial actions.[149] To some, the omission represented an implied finding that removals need not meet the requirements of other laws (although it could also be argued that the language of SARA impliedly affirmed the existing requirement that removals should meet ARARs to the extent practicable).

In the final rule, the Agency decided that it was sound policy for removal actions to attain ARARs "to the extent practicable," while at the same time recognizing that ARARs should not interfere with the mission of removals to quickly respond to and stabilize dangerous sites.[150] The preamble to the final rule explains in greater detail how and when removal actions should meet the requirements of other laws and still fulfill their statutory mission.[151]

First, the preamble makes clear that only requirements that pertain to the specific response actions being conducted are potential ARARs. For instance, if a removal action consisted of removing leaking drums, requirements relating to potential groundwater cleanup would not be ARAR for that removal action.

Second, once requirements are said to be potential ARARs for a removal, they must be complied with "to the extent practicable considering the exigencies of the situation."[152] The preamble attempts to give greater precision to this phrase. The notion of practicability is based on two factors: the urgency of the situation and the scope of the removal action.[153] The urgency factor is rather obvious — where the time-sensitive nature of the removal is such that compliance with (or even identification of) all potential ARARs is not possible, those requirements need not be met. This will often be the case where the Agency responds to fires, explosions, or serious spills.

The "scope of the removal action" factor is more complex. It reflects the narrow purpose of removals to mitigate or minimize harm, rather than to accomplish a permanent remedy. For example, where contaminated soil is discovered near a school yard, a removal action may be taken to fence off the contaminated area, remove the top two feet of contaminated soil, and cover the area with clean topsoil. This action would address the immediate problem of preventing exposure of the school children to the contamination. However, the removal would not attempt to address all contaminated soil on site (i.e., the contamination below two feet), and thus might arguably not meet a soil cleanup level for that contaminant.

One option for addressing this problem might have been to require the removal action to continue excavation until the soil cleanup ARAR was met. However, such an approach, if applied broadly, could substantially increase the cost and time required to perform the removal action, thereby exceeding the action's intended scope.[154] In effect, **[20 ELR 10236]** a policy of requiring removals to attain ultimate cleanup standards would convert removals into remedial actions, without the additional procedures required in the NCP.[155] It would also limit the number of removals that can be performed and would greatly reduce the ability of removals to respond quickly to site problems. To date, removals have been one part of the Superfund program that has been an unqualified success, due in large part to the ability of the program to function quickly.

An alternative approach, adopted by the Agency, is to recognize that a final cleanup standard would not be practicable to meet, given the limited scope and duration of a removal. Of course, the permanent remedy of attaining soil cleanup standards may be met by subsequent *remedial* actions carried out at the site.

The preamble also notes that the six statutory waivers[156] available for CERCLA remedial actions may also be used to waive ARARs during removals.[157]

* *State ARARs Issues.* The SARA amendments added the requirement that CERCLA remedial actions must comply with applicable or relevant and appropriate requirements of state environmental and facility siting laws (as well as federal environmental laws) where those requirements are promulgated, identified in a timely manner, and more stringent than those under federal law.[158] The final NCP extends this concept of attaining more stringent state ARARs to removal actions as a policy matter. (EPA has further stated, as a matter of policy, that promulgated Indian tribal requirements may be potential ARARs.[159])

From the beginning, there have been problems in the identification of ARARs from the support agency (most often, the states). Some states have provided mere "laundry lists" of state laws and/or regulations, without specific discussion of how, if at all, they relate to the site. This has resulted in delays and wasted resources. To avoid this problem in the future, the preamble to the final NCP directs states to provide "a list of requirements with specific citations to the section of law identified as a potential ARAR, and *a brief explanation of why that requirement is considered to be applicable or relevant and appropriate to the site.*"[160] In addition, the final rule requires the identification of state ARARs no later than the detailed analysis stage of the FS.[161] These new requirements may force agencies to make key decisions on cleanup standards earlier in the process.

One of the most difficult state ARARs issues is the determination of whether legislated goals (e.g., nondegradation standards under state law) constitute substantive requirements such that they should be considered ARARs. State laws setting general goals may be considered substantive ARARs if they are promulgated and enforceable, and "directive in intent," either on their face or through regulations.[162] For example, if a state statute prohibits the degradation of surface water below a defined level, it is directive in nature and may be an ARAR. If a state law sets forth an anti-degradation goal without regulations or direction as to how to achieve it, the Agency must decide whether the goal constitutes an ARAR (e.g., is it enforceable), and then may exercise flexibility in determining how to comply with the goal. In any case, even if a remedial response is found not to comply with a state anti-degradation ARAR during the response, an interim action waiver of the state standard may be appropriate if the ARAR will be satisfied upon completion of the total remedy for the site.[163]

Risk Assessment and Risk Range

The NCP contemplates the use of risk assessments as an integral part of the process for developing remedial alternatives that are protective of human health and the environment.

Risk analysis begins during the early stages of the RI, when a "baseline risk assessment" is performed to evaluate the risk posed by a site in the absence of any remedial action.[164] It is based on a comparison with this no-action risk level that the lead agency will target levels of risk that will be adequately protective of human health for a particular site. The baseline risk assessment also helps to provide justification for performing remedial action at the site.

Concurrently, the lead agency would begin to set a "preliminary remediation goal" as part of the FS. The preliminary remediation goal is an initial statement of the desired endpoint concentration or risk level, and alternatives are developed that are capable of meeting that goal.[166] It is based on readily available information, such as chemical-specific ARARs (e.g., a drinking water standard), concentrations associated with the reference doses or cancer potency factors, or the point of departure for the Agency's acceptable risk range, discussed below.[167] The preliminary remediation goal is modified during the site evaluation process as site-specific data (including information from the baseline risk assessment or newly identified ARARs) become available.[168]

[20 ELR 10237]

Where there is only one contaminant of concern and a chemical-specific ARAR (e.g., a drinking water standard) exists for that contaminant, the remediation goal will be set at the ARAR level, and achievement of that standard will generally be deemed to be protective.[169] However, an ARAR may not be available for the contaminant of concern (or for all of several contaminants at a site), or compliance with available ARARs may not be sufficiently protective due to additive or synergistic effects from multiple pathways of exposure or multiple contaminants.[170] Thus, risk assessments will often be necessary to determine the appropriate cleanup goal. (Compliance with the available ARARs would, of course, still be required, consistent with NCP § 300.430(f)(1)(i)(A).)

Where ARARs are not available or are not sufficiently protective, EPA sets remediation goals for noncarcinogens such that the cumulative risks from exposure will not result in adverse effects to human populations (including sensitive subgroups such as children) during a lifetime or part of a lifetime, incorporating an adequate margin of safety.[171] The risks associated with potential alternatives are assessed based on the "reasonable maximum exposure scenario," which is designed to include all exposures that can be *reasonably* expected to occur.[172] The analysis considers exposures under both current use conditions as well as potential future conditions,[173] but does not focus on worst-case exposure assumptions.[174]

Where environmental effects are observed, EPAsets remediation goals based on environmental ARARs (where they exist) and levels based on a site-specific assessment of what is protective of the environment. For carcinogens, the establishment of an acceptable level of risk in cases where ARARs do not exist (or are not sufficiently protective) is especially sensitive, because such contaminants arguably pose a risk at almost any level of exposure (although that risk may be large or small depending on the amount and duration of the exposure and the type of carcinogen involved). Under the NCP, when remedies cannot entirely eliminate potential exposure to a carcinogen, the Agency may achieve protection of human health by selecting remedies that pose very small risks, (i.e., that are within an acceptable range of risk) based on a review of reliable cancer potency information such as EPA's cancer potency factors.[175]

In the proposed NCP, the Agency had defined the acceptable risk range as being from 10<-4> to 10<-7>, meaning that when the excess risk to an individual of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 and 1 in 10 million, it is judged to be an acceptable exposure.[176] As a measure of additional protection, the proposal provided that there should be a "point of departure" of 10<-6>, toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range.[177]

The final rule maintained the point of departure of 10<-6>, but narrowed the risk range to 10<-4> through 10<-6>.[178] This action was taken in response to public comment and concerns that the Superfund range went below the accepted

de minimis level used by other EPA programs and those of other federal agencies. It also reflects the limits of available analytical techniques, which cannot effectively verify for many contaminants that concentration levels corresponding to a risk of 10<-7> have actually been attained.[179]

Although this change might appear to be a lessening of protection or a lessening of the Agency's commitment to protect, it is in fact likely to have minimal if any impact on the selection of remedies at Superfund sites for two reasons. First, no CERCLA remedies have selected 10<-7> as a cleanup level to date (although one or two may have achieved it due to the efficacy of the technology). Second, the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below 10<-6>).

The use of a *range* of acceptable risk is general practice for most government programs.[180] As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the balancing phase of the remedy selection process.

Remedy Selection — Added Structure

One of the major changes between the proposed and final NCP is the attempt in the final rule to build greater structure into the remedy selection process. The Superfund program has been criticized for having a process that was too vague and incapable of quality control or review; rather, remedies were said to be selected by an arbitrary assessment of any of the nine remedy selection criteria. The process was equated with juggling nine balls and picking one out of the air.

By making a number of structural modifications in the remedy selection process, EPA seeks to accomplish two goals: first, to increase consistency in both process and result during remedy selection, and second, to improve **[20 ELR 10238]** understanding of the process on the part of the public and PRPs.

* *Categorizing the Nine Criteria During Final Remedy Selection.* The first initiative was to group the nine criteria into three functional categories and to place those categories in the text of the rule.[181]

First, the rule establishes a category of two "threshold" criteria that all remedial alternatives must meet to be considered in the final balancing: (1) "overall protection of human health and the environment" and (2) "compliance with applicable or relevant and appropriate requirements of other environmental laws (unless a waiver is justified)." These requirements cannot be compromised.

Next, the rule establishes a category of five "balancing criteria" that are used to weigh the tradeoffs among the protective, ARAR-compliant[182] remedial alternatives:

* long-term effectiveness and permanence;

* reduction of toxicity, mobility, or volume through treatment;

* short-term effectiveness (e.g., environmental impacts during the cleanup itself);

* implementability (e.g., whether the technology being considered is available within the necessary timeframe); and

* cost.

Finally, two "modifying criteria" — state acceptance and community acceptance — are considered in altering otherwise viable approaches. These criteria are listed for consideration at the end of the process because they are generally not fully known until after the public comment period on the proposed plan; however, they may be considered part of the balancing process as soon as they are known.

These categories of criteria were discussed in the preamble to the proposed NCP, but they were intended to be used during the detailed analysis stage.[183] The final rule moves the criteria into the text of the rule itself and makes them applicable to the remedy selection decision itself, thereby assuring that the final decision gives the appropriate consideration to each factor.

Although the nine criteria do afford the Agency considerable flexibility, the remedy selection process is not as wide open as it may seem. In practice, most alternatives will not show dramatic differences in all nine criteria (remember that all must be protective and ARAR-compliant to get into the balancing stage). Tradeoffs on a site-specific basis are likely to focus on one or two criteria. For instance, where alternatives are similar in cost, the balancing will focus on differences in effectiveness or implementability; where two alternatives both accomplish treatment, the key factor may be cost or short-term effects. It is highly unlikely that all of the balancing and modifying factors will be at issue in the comparison of two alternatives.

Further, during the final balancing stage, when the Agency selects the alternative that "utilizes permanent solutions and treatment to the maximum extent practicable," the final rule places special emphasis on the factors of "long-term effectiveness and permanance" and "reduction in mobility, toxicity, or volume through treatment;"[184] these two criteria will be decisive when the alternatives perform similarly with respect to other balancing criteria.[185] Thus, where Alternative A is protective at a lower cost than Alternative B, but Alternative B would result in a greater reduction in the mobility of the waste, the rule would assign added "points" to the treatment alternative. Where alternatives provide similar long-term effectiveness and permanence and a similar reduction in mobility, toxicity, or volume, the other balancing criteria will serve to distinguish among the alternatives. This prioritizing of criteria adds some greater predictability to the process.

Thus, although the nine criteria have been retained, the discretion in evaluating them has been somewhat limited by structural changes in the final rule. Those changes should also help the decisionmakers — and the reviewing public — to better understand the process of selecting a remedy from among unequal options.

* *Emphasis on Treatment.* Another major change in the remedy selection process under the 1990 NCP is the increased emphasis on treatment in CERCLA remedies. EPA sets this tone at the outset by establishing a new program goal that EPA shall select remedies that are protective over time and "minimize untreated waste."[186] The rule then goes on to set out the "expectation" that the Agency will "use treatment to address the principal threats posed by a site, wherever practicable."[187] Treatment may represent the sole remedy, or it may be part of a combination of responses, as where "hot spot" areas are treated and immobile wastes and treatment residues are controlled using engineering controls. The preamble further establishes, as a guideline, that treatment as part of CERCLA remedies should generally achieve reductions of 90 to 99 percent in the concentration or mobility of contaminants of concern.[188]

Also, as noted above, the final rule emphasizes treatment during final remedy selection by requiring that the factors of long-term effectiveness and permanence and reduction in mobility, toxicity, or volume through treatment be emphasized in the final balancing process to determine which alternative offers the maximum permanence and treatment practicable.[189]

Another way in which the final rule has been revised to encourage the selection of more treatment remedies is through the addition of an expectation that innovative treatment technology alternatives should be developed where such technologies offer the potential for "comparable" performance;[190] an innovative technology need not be shown to be superior to more proven technologies to be chosen as part of a remedy.

These factors, taken together, suggest that more treatment **[20 ELR 10239]** remedies will be selected under the 1990 NCP than was the case previously.

* *"Expectations" in the Final Rule.* A third important change in the structure of the remedy selection process is the addition of remedial expectations into the rule section of the final NCP. EPA discussed in the preamble to the proposed rule the type of remedies that were "expected" to result from the remedy selection process;[191] to highlight this important guidance, the expectations were moved into the text of the final rule.[192] These statements are not intended to *require* the selection of any particular remedy at specific sites, or to substitute for the site-specific balancing of the nine criteria during remedy selection. Rather, they are intended to educate decisionmakers and the public as to the type of remedies that EPA has selected in certain situations, so that learning will not be unnecessarily repeated and an appropriate range of alternatives may be considered.[193]

For example, it is the Agency's experience and expectation that highly mobile wastes need to be treated, and that where

highly mobile contaminants exist, the lead agency should focus on the development of treatment alternatives. Thus, the rule states that "EPA expects to use treatment to address the principal threats posed by a site, wherever practicable."[194] Similarly, it is the Agency's experience and expectation that large volumes of low contamination wastes (e.g., large municipal landfills) are most appropriately contained; thus, a focus on the development of engineering control alternatives is recommended for such cases.[195]

The expectations also recognize that in many cases, the appropriate remedy may include a combination of treatment and containment, such as where the levels of contamination vary over a site. The Agency would expect in such cases to treat hot spots of high level, mobile contaminants, and certain areas oflow contamination.[196]

There may also be sites where the expectations will not prove useful under the circumstances of the release. In any case, as noted above,the expectations are not intended to avoid the full remedy selection analysis; each remedy must still be explained and justified in a proposed plan. The preamble to the final NCP makes clear that reliance on an expectation alone is not reason enough to select a particular remedy.

Similar to expectations in the final rule are a number of "management principles" to offer programmatic guidance for the remedy selection process.[197] One of the most frequently discussed is the principle that there should be a "bias for action" at Superfund sites. This means that actions should be taken as early as possible when necessary or appropriate to achieve significant risk reduction quickly.[198] This policy may be implemented by the initiation of operable units in phases or the use of removal actions to address immediate threats at NPL sites.[199]

A second fundamental management principle is that of "streamlining" the Superfund process. The site response program has been criticized for performing unnecessarily long studies and data collection. Streamlining is a concept of tailoring the data-collection needs, the evaluation of alternatives, and the documentation of the selected remedy to reflect the scope and complexity of the site-specific problems.[200] For example, the preamble to the final rule discusses the use of a focused or streamlined FS where site problems are straightforward such that it would be inappropriate to develop a full range of alternatives (or where a removal action has limited the amount of additional work necessary).[201]

The Agency believes that the addition of these expectations and principles to the remedy selection framework will help to expedite action and lead to similar remedies at similar sites. Here, as with much of the final rule, the test will be in the implementation.

* *Fund-Balancing Waiver.* EPA also sought to add structure to the remedy selection process by identifying a threshold at which a waiver of ARARs based on a balancing of demands on the Fund would be "routinely considered." Comment was specifically solicited on this issue.[202]

As noted above, CERCLA § 121(d)(4) sets out six limited circumstances in which an environmental standard that is applicable or relevant and appropriate may be waived by EPA foran on-site action. The sixth waiver, called the Fund-balancing waiver, is available only for remedial actions undertaken using Fund monies and only where the attainment of the standard "will not provide a balance" between the need for protection of public health and the environment and the availability of amounts from the Fund to respond to other seriously contaminated sites.[203] This waiver has been used sparingly to date.[204] After a review of the public comments submitted, the preamble to the final rule provides that the Agency will routinely consider the Fund-balancing waiver in cases where the cost of an operable unit is more than four times the average operable unit cost (the average operable unit cost is now approximately $ 15 million, resulting in a trigger of approximately $ 60 million for routine consideration of this waiver).[205]

It is difficult to predict the impact or significance of this change. Certainly, it means that the Fund-balancing waiver will be considered more often. However, this is only a policy, and the policy merely states that the regions should **[20 ELR 10240]** "consider" the waiver when the cost of an operable unit exceeds the threshold.

* *Role of Cost.* The role of cost in remedy selection has been one of the most hotly disputed issues in the Superfund program. Many PRP groups argue that cost must be a major factor in deciding on an appropriate remedy and note that the requirement to select "cost-effective" remedies appears in CERCLA § 121(a) and (b). Many environmentalists and some legislators have argued that cost is given too much emphasis in remedy selection and have posited that cost should be considered only in determining the cost-efficient method for implementing a selected remedy. In effect, they argue that the proper cleanup level for a site should be set, and then a remedy should be selected to attain that level,

without consideration of cost.[206]

In the preamble to the final rule, EPA discussed the role of cost at great length.[207] The Agency stated that it agrees that cost should not be considered in setting the protective level in situations where a specific ARAR defines the cleanup level that must be achieved at the site (e.g., where an MCLG above zero is available for contaminants in drinkable groundwater). However, where ARARs are not available for the specific contaminants of concern (or where ARARs are not sufficiently protective[208]), the Agency defines protectiveness in terms of the risk range, and several alternative remedial technologies may be capable of achieving protection within that range. Under such circumstances, cost may be one of the factors to consider in choosing among the available technologies.

It is important to note, however, that cost and other factors may be considered only to distinguish among alternatives that have been found to be protective of human health and the environment and in compliance with ARARs (or to have justified a waiver).

Cost is specifically considered during the final balancing process, as the Agency attempts to satisfy two statutory mandates of CERCLA § 121(b)(1) by identifying *the* remedial alternative that utilizes "permanent solutions and treatment . . . to the maximum extent practicable" while being cost-effective. These determinations are intended to be made simultaneously; however, for ease of analysis, they are discussed separately in the NCP.

Cost-Effectiveness. The determination whether a proposed remedial alternative is cost-effective is based on an evaluation of several of the nine criteria. First, overall effectiveness is assessed based on: long-term effectiveness and permanence; reduction of mobility, toxicity, or volume through treatment; and short-term effectiveness. The overall effectiveness is then compared to the cost of the alternative to determine if they are "in proportion" to one another[209] (i.e., does the approach represent a reasonable value for the money?[210]). In making this comparison, the decisionmaker is not directed by the NCP to place special emphasis on the factors of "reduction of toxicity, mobility or volume through treatment" and "long-term effectiveness and permanence," as is required during the assessment of permanence and treatment to the maximum extent practicable (as provided in NCP § 300.430(f)(1)(ii)(E)). However, because "effectiveness" is measured based on those two factors (plus short-term effectiveness), an alternative that is high in treatment and permanence will be considered more effective and thus can justify a relatively higher cost (high effectiveness and high cost would be in proportion). The comparison of cost to effectiveness is performed for each alternative individually and for all the alternatives in relation to one another.[211] This latter analysis allows the Agency to identify alternatives that produce an incremental increase in effectiveness for a reasonable increase in cost, based on a comparison of corresponding increases for other alternatives. Several alternatives may be found to be cost-effective.[212]

Although the statute requires EPA to select cost-effective remedies, EPA has decided not to consider cost-effectiveness as a threshold criterion on a par with protectiveness and compliance with ARARs. This is based in part on the fact that unlike the "protectiveness" and "compliance with ARARs" determinations, which can be reached for each alternative individually, the cost-effectiveness finding requires a comparison of each alternative in relation to other alternatives and the consideration of several factors during a balancing phase. (The same comment is true of the statutory mandate to utilize permanent solutions and treatment to the maximum extent practicable.) In addition, the preamble to the final rule suggests that reliable information on cost will not be generally available as early in the process as is information on a remedial technology's protectiveness, and thus cost should not be used too early in the final balancing process to eliminate viable alternatives.[213]

Cost and Practicability. The statutory requirement to select *the* alternative (there is only one) that utilizes permanence and treatment to the maximum extent practicable[214] is fulfilled by selecting the protective, ARAR-compliant alternative that provides the best balance of tradeoffs among alternatives based on a review of all the balancing and modifying criteria (if the latter are known).[215] It is a subjective judgment, but the NCP sets out some parameters to help assure consistency in its application. Specifically, the NCP requires that during the balancing process, the factors of long-term effectiveness and permanence and reduction in toxicity, mobility, or volume should be emphasized, and that the "preference for treatment as a principal element" and the "bias against off-site land disposal of untreated wastes" must be considered.[216] **[20 ELR 10241]** This statutory determination is the final step in the process before a remedy is recommended in the proposed plan.

Although cost, as one of the nine criteria, is considered in making this determination, it is not expected to play a major role. The importance of almost every other criterion to this determination is emphasized by the NCP. First, the two

threshold criteria must already have been met for any alternative considered during the final balancing. Second, the rule places special emphasis on the treatment and effectiveness factors during this determination; those criteria will be "the most important, decisive factors in remedy selection when the alternatives perform similarly with respect to other balancing criteria."[217] Third, the NCP highlights the two modifying criteria[218] and "implementability"[219] as important considerations in fulfilling this statutory requirement. Thus, cost is one of only two of the nine criteria the use of which is not stressed for this determination. It is also noteworthy that cost will not always be a differentiating factor between remedial alternatives; the final remedy selection will generally focus on tradeoffs based on only one or two criteria.

Cost as a Screen. Cost may also be considered during one other aspect of the remedy selection process: screening, when alternatives that are deemed not to be viable are eliminated from more thorough consideration. The use of cost at this early stage has also been the subject of considerable comment. Many were concerned that cost would be used to screen out appropriate remedial technologies early in the process before they were given a fair evaluation and without the benefit of public review and comment.

The final NCP has been revised to narrow the circumstances under which cost may be considered when screening alternatives at the start of the evaluation process. Specifically, the final rule provides that a given alternative may be eliminated during screening if it is determined that the cost of the alternative is "grossly excessive" compared with its effectiveness.[220] This provision will allow the Agency to avoid the need to conduct resource-intensive analyses of extreme and unrealistic options, while at the same time not allowing cost to compromise consideration of viable options that may simply be more expensive than other alternatives.[221]

* *Definition of "On-site" and Application to Noncontiguous facilities.* Critical to both the type and extent of remedies that may be selected is the definition of the CERCLA site. The site definition is important because "[n]o Federal, State, or local permit shall be required for the portion of any removal or remedial action conducted *entirely onsite* . . . ."[222] Further, the process of meeting ARARs — and the substantive versus administrative distinction — only applies to on-site actions.[223] However, the term "on-site" is undefined in the statute.

In the proposed NCP, EPA took comment on several possible interpretations of "on-site" and suggested defining the term in a manner consistent with statutory intent and the practical realities of site response.[224] Specifically, the Agency sought to address situations in which a treatment plant needs to be located on uncontaminated property over a plume of contamination, or a sludge stabilization tank needs to be located next to, but not in, a sludge pit; thus, the proposal suggested defining "on-site" as the actual contamination plus limited surrounding areas.

After reviewing public comments, the Agency adopted the approach recommended in the proposal and defined "on-site" as consisting of "the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for implementation of the response action."[225] By defining the site to include contaminated areas plus those areas in "very close proximity" and "necessary" to implementation of the response, the Agency sought to give pragmatic effect to the statutory provision that on-site CERCLA remedies should not be required to obtain a permit, while not unduly expanding the commonsense concept of what actions are "entirely onsite."[226]

The exemption from permit requirements for on-site actions has even greater implications when considered in conjunction with EPA's power to address releases at noncontiguous facilities. CERCLA § 104(d)(4) allows the Agency broad discretion to treat noncontiguous facilities as one site for the purpose of taking response action.[227] The only limitations prescribed by the statute are that the facilities be reasonably related either "on the basis of geography" *or* "on the basis of the threat, or potential threat to the public health or welfare or the environment." Once the decision is made to treat two or more facilities as one site, no permit will be required for the management of waste transferred from one part of the aggregated site to the other.

[20 ELR 10242]

The preamble to the final rule recognizes the significant impact such aggregations could have, because in theory one Superfund site could come to be treated as the disposal site for many Superfund sites. Such a result could be of concern to communities, affected states, and PRPs. Thus, the Agency set out a number of factors that should be considered in deciding whether it makes sense under CERCLA to treat two or more contamination problems as one.[228]

First, the decisionmaker would look into whether the wastes from the noncontiguous facilities are appropriate for similar treatment or disposal. Second, the possible transportation risks would be evaluated (e.g., the risks might be significant where the wastes are highly volatile or the transfer would take place through heavily populated areas). Third, the views and consent of the affected state(s) and public should be solicited. And fourth, the cost-effectiveness of the aggregated response should be evaluated (including the incremental cost of transportation).[229] The Agency rejected the idea that a specific distance could be defined for saying when aggregation would or would not be appropriate. Rather, the final rule contemplates a case-by-case evaluation of all factors as part of the ROD process, with opportunity for comment by all interested parties.

During the NCP comment period, a number of PRPs raised the concern that they could face increased liability if two or more Superfund sites were treated as one.[230] Such issues could be raised during comments on the site-specific aggregation decision. Of course, liability issues potentially arise from every response action, whether waste is left on site, sent to an off-site disposal facility, or sent to a treatment or disposal facility that is part of a remedy at a noncontiguous Superfund facility. It is not obvious that the third option, with its inherent EPA oversight, poses a greater risk of liability than the first two.

State Issues

* *NPL Deferral*. Of all the issues in the proposed NCP, the one that received the most public comments was whether EPA should defer the listing of sites on the NPL based on the availability of "some" response authority under other federal or state laws. (A deferral policy already existed, and continues, for most private sites that are subject to federal or state-authorized RCRA programs, and for sites that are regulated under licenses issued by the Nuclear Regulatory Commission.[231]) Although many states argued that they have the capability to clean up sites as well as or better than the federal government, the idea of state deferral was "deferred" in the final rule.[232] Congressional staff have indicated that the concept of deferring sites from the NPL may be reviewed by Congress during CERCLA reauthorization; a possibly limited deferral for "CERCLA-quality" state programs may be considered at that time.[233]

* *Role of States in Response Actions*. The role of states in the CERCLA response process was a major part of the NCP revisions. In line with the mandate of CERCLA § 121(f), the Agency sought to spell out the opportunities and methods for state involvement throughout the site evaluation and response process; this initiative resulted in a new Subpart F to the NCP. It is meant to establish a "partnership" between the federal and state governments at CERCLA sites.

Perhaps most significantly, the final revisions set out an expanded role for states in the remedy selection portion of the process. For Fund-financed sites, a state may be designated as the lead agency where it demonstrates certain capabilities, and thereby performs the RI/FS, drafts the proposed plan and ROD, and conducts the remedial design/remedial action (RD/RA) phases of the response. This affords the states a major role over remedy selection: by drafting recommended alternatives and proposing the remedy, the state recommendations can be expected to strongly influence the final decision in many cases. (The deference accorded to a state recommendation will likely be greatest where the state has a proven track record of cleaning up sites.) At the same time, the final rule provides that for Fund-financed actions, a state may not publish a proposed plan that EPA has not approved,[234] and where the state does prepare the ROD, it must seek EPA's concurrence and adoption of the remedy specified therein.[235]

For EPA-lead sites, the states also have considerable power. First, the NCP specifically requires EPA to seek state concurrence on its remedies,[236] and in extreme cases where the state disagrees with a proposed Fund-financed remedy, it may withhold the required state assurances under CERCLA § 104(c)(3). (At EPA-lead enforcement sites, the states may challenge the waiver of ARARs under CERCLA § 121(f)(2).) The final rule also discusses dispute resolution procedures to work out state/federal conflicts.[237]

Alternatively, the state may take a non-Fund-financed, state-lead enforcement action at a site under state law (this is likely where a solvent PRP is available). EPA concurrence is not required for such actions, although it may be requested.[238] The availability of EPA concurrence on state-lead enforcement sites is significant in that it may help states to achieve settlements with PRPs.[239]

Some states — those that have implemented aggressive cleanup programs — may argue that EPA has not gone far **[20 ELR 10243]** enough in turning over remedy selection authority to the states, and indeed, this sentiment was reflected in several comments on the NCP. However, EPA specifically declined to delegate the ultimate CERCLA remedy selection power to states in the final rule.[240] The preamble explains the Agency's view that delegation of final decisionmaking

authority on remedy selection is not appropriate, and that although an expanded state role is required under CERCLA § 121(f), EPA should retainprimary responsibility for the federal Superfund program. (Indeed, the role carved out for states in § 121(f) may be argued to imply that EPA should retain final decisionmaking authority.) There is also a general concern about the propriety of allowing states to commit Fund dollars without EPA oversight. The issue of state remedy selection, like the issue of deferral to states of potential NPL sites, may be the subject of congressional attention during the reauthorization of CERCLA.[241]

* *Enhancement of Remedies*. The issue of whether a state may "enhance" an EPA-selected remedy, and under what conditions, has generated a significant amount of interest and controversy. Different people mean different things when they discuss "enhancement," and in fact, the term is often misused. Historically, the term has been used to include diverse types of potential state actions, from seeking to increase the level of cleanup, to building a larger treatment plant that may be used by the state after the CERCLA action is completed, to insisting on requirements that EPA believes are inappropriate or that could conflict with the EPA-selected remedy.

The final rule separates consideration of state-proposed actions that are (1) necessary to the selected action (those would be handled by ROD amendment or ESD); (2) not necessary to the selected action, but not inconsistent with the CERCLA remedy (these would be allowed in the Agency's discretion if the state assumed financial and oversight responsibility for the change); and (3) in conflict with EPA decisions.[242]

The preamble notes, as a threshold matter, that states already have significant opportunities during the RI/FS process leading up to remedy selection to suggest to EPA that state standards should be considered ARARs and thus attained, or that the proposed remedy should be expanded in scope. In most cases, these issues should be worked out prior to remedy selection and they are more properly viewed as remedy selection issues, not enhancement.[243] The issue of enhancing or supplementing the selected remedy is more often an issue in the context of post-ROD suggestions for change.

Where, after the ROD, the state asks EPA to change or expand the selected remedy and EPA agrees that the state's suggestions are appropriate and necessary to protect human health and the environment, the Agency may include the changes in the Fund-financed remedy through a ROD amendment or ESD (consistent with final rule § 300.435(c)(2)), in which case the Agency would share in the costs of the modified or additional activity. If the Agency concludes that the state-suggested changes or expansions are not necessary to the selected remedial action, the Agency will not modify the ROD or pay for the additional action; however, the Agency may still decide to allow the additional action to proceed concurrent with the EPA-selected remedy.

Where EPA finds that the proposed change[244] or expansion is not necessary to the EPA-selected remedy, but would not conflict or be inconsistent with it, the Agency may agree to integrate the proposed change or expansion into the planned CERCLA remedial work, but only if the state agrees to fund and oversee the necessary changes or additions. For example, the state may want a groundwater system to run longer than planned in order to attain water quality levels beyond those required under CERCLA, or the state may want to extend a water line outside the Superfund site in anticipation of expected residential or industrial development in the area. Such changes or expansions that would not conflict or be inconsistent with the EPA-selected remedy would generally be accommodated, on the condition that the state fund and supervise the change or expansion.

In instances where the state requests, and pays for, an incremental increase in the cleanup level, a lively debate can be expected between the state and any PRPs over whether the costs of such enhancements may be recovered in a cost recovery action. The state would be expected to argue that even if the cleanup is more than the minimum required under the NCP, it is "not inconsistent with the NCP" for purposes of cost recovery under CERCLA § 107(a)(4)(A). Interestingly, while CERCLA § 107(a)(4)(B) allows private parties to recover only "necessary" costs consistent with the NCP, the word "necessary" is absent from the cost recovery provision of CERCLA § 107(a)(4)(A), which applies to states.

Finally, where a state-proposed change or expansion would conflict or be inconsistent with the EPA-selected remedy, it would not be appropriate to allow the state to proceed without EPA approval.[245] Indeed, to do so would be tantamount to giving the states a veto power over EPA remedial action decisions.

* *Superfund Memorandum of Agreement*. A major step in facilitating an EPA/state partnership under the NCP is

expected to be the development of the Superfund **[20 ELR 10244]** Memorandum of Agreement (SMOA). SMOAs are voluntary, general agreements (not site-specific) that may be used to establish the general framework for the EPA/state working relationship, to define the roles of the lead and support agencies, and to provide for EPA oversight. They are the recommended method for working out the interrelationship between state and federal authorities.

In the proposed rule, EPA had suggested making SMOAs prerequisites to certain actions under CERCLA (e.g., the designation of a state as lead agency for a non-Fund financed action).[246] However, a number of states strongly opposed a "requirement" to enter into a SMOA, and the final rule makes clear that SMOAs are not required as a condition for the state acting as lead agency. Instead, the final NCP provides that a number of issues — including annual EPA/state consultations, review by the support agency, timetables for the identification of ARARs, and dispute resolution — "may" be agreed to by the state and region in a SMOA. Where there is no SMOA, the rule sets out minimum requirements that would apply.[247]

* *State Cost Share for O&M.* One of the most sensitive issues for states in the final NCP has been the extent of state responsibility to pay O&M costs for CERCLA remedial actions. For remedial actions, the federal and state governments share costs according to the formula in CERCLA § 104(c)(3), generally 90 percent federal, 10 percent state.[248] Once the remedy has been constructed and is operational, the costs and responsibility for operating and maintaining the remedy transfer to the state. The final rule provides that states are responsible for assuring the "operation and maintenance of implemented remedial actions for the expected life of those actions."[249] The preamble explains that this position is consistent with the statute and long-standing EPA policy.[250]

SARA added to CERCLA a new § 104(c)(6), providing that for the purposes of CERCLA § 104(c)(3) — which includes the cost share provision — treatment or other measures necessary to restore ground or surface water quality would be considered remedial action as compared with O&M until protective levels are attained or for 10 years, whichever is earlier. By virtue of being included in the term "remedial action," restoration measures would qualify for the federal cost share.

A number of states commented that this section should be read expansively to include any measures that contribute to full restoration (e.g., the maintenance of caps and leachate collection systems). They argued that if such measures are not maintained, water quality could degrade and restoration would not occur. The final NCP takes the position that "treatment or other measures *necessary* to restore ground and surface water" do not include source control maintenance measures (like landfill cap maintenance or leachate collection systems) or measures whose primary purpose is to provide drinking water.[251] Although EPA recognized that a failure to maintain source control maintenance measures could result in some additional contamination of ground or surface water, those measures are not appropriately considered "necessary for restoration" and therefore "remedial actions" under CERCLA § 104(c)(6). Rather, they fall within the category of normal operation and maintenance activities.

The legislative history cited in the preamble to the final rule suggests that Congress sought, through § 104(c)(6), to correct an imbalance in the manner in which water body contamination was treated as compared with surface contamination.[252] In the case of surface cleanup, an action would be considered remedial — and subject to a cost share — throughout construction of engineering controls, excavation of the contaminated area, or until protective levels were otherwise achieved. However, for ground and surface water, actions were considered remedial only up to the point where the treatment plant was built and operational, regardless of remaining contaminant levels in the water. The solution adopted was to include within the definition of "remedial action" those ground and surface water restoration efforts taken up to the point that protective levels were achieved, or for 10 years, if earlier. The 10-year time limitation was added out of the recognition that groundwater remedies will generally take many years to complete and would be a major drain on the Superfund program if EPA were required to fund them.[253]

In the preamble to the final rule, EPA explained that the states' view would lead to results that are inconsistent with the intent of Congress and with common sense. If source control maintenance and other O&M activities are necessary for restoration, restoration can never be considered complete as long as O&M is required. This is clearly not the intent of Congress, since § 104(c)(6) contemplates that restoration may be considered complete when protective levels are achieved if in less than 10 years, even if O&M continues. The states' interpretation would also lead to a situation where virtually all on-site O&M activities could be characterized as remedial action under § 104(c)(6), on the theory that if they were not maintained, they might degrade the ground/surface water; such a result would appear to exceed the limited intent of Congress.

The final NCP also takes notice of the fact that groundwater pump-and-treat technologies may reach a point at which restoration activities no longer result in significant reductions in contaminant concentrations. Thus, the rule provides that restoration may be considered complete for the purposes of CERCLA § 104(c)(6) when protective levels are achieved, in 10 years, *or* when such a steady-state situation is reached.[254]

Finally, the preamble to the final rule states that EPA will consider funding O&M for "temporary or interim measures" to control or prevent further releases, where no final remedy for a unit has yet been selected (e.g., maintenanceof a *temporary* landfill cap).[255] The rationale **[20 ELR 10245]** behind this policy is that interim measures may be necessary to stabilize a site while EPA is deciding on a final remedy; such measures are, in effect, part of the remedy. However, if EPA selects a final solution for an operable unit (e.g., a final cap on a contaminant source), the maintenance of that unit would be considered normal O&M for which the state would be responsible.

Administrative Record Issues (Subpart I)

This subpart implements CERCLA § 113(k) by setting out the rules for establishing an administrative record file and by explaining what material may be included in, or excluded from, the administrative record.

* *Purposes of a Record.* The administrative record for a site serves two basic purposes. First, it constitutes the record for judicial review. CERCLA § 113(j) specifically provides that judicial review of the adequacy of any CERCLA response will generally be limited to the record assembled by the Agency (rather than allowing for *de novo* review), although courts may go beyond the record and allow for the introduction of supplementary materials in limited cases. The public and PRPs have opportunities throughout the process to add materials to the administrative record file, particularly during the formal public comment period. All response decisions not dictated by CERCLA or the NCP should be justified in the administrative record.

The second fundamental purpose of establishing a record (and file) is to provide interested parties an opportunity to review the response actions proposed for a site, so that they may meaningfully participate in the response selection process.

* *Administrative Record File vs. Administrative Record.* The rule makes a distinction between the administrative record "file" and the administrative record. This is because typically, the formal record for judicial review is not compiled until after EPA selects a response action;[256] the administrative record file is the mechanism for compiling the formal record, and making it publicly available, as early in the process as possible. Further, the Agency encourages the placement of even potentially relevant materials into the administrative record file, leaving the process of reviewing documents for relevance until the later compilation of the formal record.

The administrative record file should not be confused with the information repository for a site. Although some of the same documents may be contained in both files, and both provide the public with relevant information, they are fundamentally different. The information repository contains *general* documents that relate to a Superfund site and to the Superfund program, including background information and policy guides. By contrast, the administrative record file contains site-specific data, comments, and other documents used in the selection of a *particular* response action.[257]

For remedial actions, the administrative record file will be established after the start of the RI;[258] for removal actions with a planning period of at least six months, the record file will be established when the engineering evaluation/cost analysis is made available;[259] and for removals with a planning period of less than six months, the administrative record file will be made available no later than 60 days after initiation of the action.[260] Except for emergency removals completed within 30 days of initiation, the administrative record file must be located at or near the site and at another central location for public review.[261]

* *What Is In/Out of the Administrative Record.* The formal administrative record is compiled based on a review of the administrative record file and will include those documents that "form the basis for the selection of a response action,"[262] consistent with the mandate in CERCLA § 113(k) for the establishment of "an administrative record upon which the President [or his delegate, EPA] shall base the selection of a response action." The record will typically include factual information/data; analyses of factual information; policy and guidance documents; public participation documents, including public comments; decision documents throughout the process; orders; and responses to comments.[263]

At the same time, irrelevant, duplicative, and certain predecisional documents (e.g., staff-level options papers and drafts of final documents) would not necessarily be included in the administrative record, unless such documents contain information that forms the basis of selection of the response action and the information is not otherwise included in the administrative record.[264] A contrary policy of including deliberative and predecisional documents in the record could have a chilling effect on the free exchange of ideas within EPA. Privileged information that formed the basis for a response action decision will be included in a confidential section of the administrative record.[265]

Although some commenters expressed the concern during the rulemaking that the final administrative record may not include all appropriate materials, the preamble to the final rule emphasizes that the record will include appropriate information even if it does not support the selected remedy. For example, comments submitted during the formal public comment period must be considered by the Agency and will be included in the record, even if they are ultimately rejected.[266] In addition, as a matter of policy, EPA will attempt to consider significant comment submitted prior to the comment period. However, to the extent a party wishes to ensure that its comments will be considered by the Agency and made part of the record, **[20 ELR 10246]** those comments should be submitted (or resubmitted during the formal public comment period on the proposed plan).[267]

Interested persons may also submit technical studies or other information to EPA throughout the process leading up to final remedy selection,[268] and the Agency will generally consider such information, if relevant and timely submitted. Such studies would then be placed in the administrative record file. Agency consideration of such studies will usually be reflected in subsequent documents or analyses performed by the Agency and included in the record file. Subject to the qualifications discussed above, information placed in the record file for a proposed response action and relevant to the selection of that response action, whether in support of or in opposition to the selected response action, will become part of the final administrative record for the response selection decision.[269] Again, if there are questions as to whether all or part of a study was considered by the Agency or whether it will be a part of the final record, parties may wish to refer to the studies during the public comment period.

* *Adding Documents Post-ROD.* After the ROD is signed, certain classes of documents may be added to the administrative record files, including documents relating to remedy selection issues that the ROD reserves or does not address; ESD notices; documents relating to ROD amendments; and certain public comments that substantially support the need to significantly alter the response action.[270] EPA may also establish separate comment periods on issues or documents of concern, and such documents — and the comments on them — will be made a part of the administrative record.[271]

The need to add documents to the record after remedy selection is a logical reflection of the fact that the ROD does not resolve or even contemplate all issues concerning the response action; indeed, as noted above, the ROD may specifically reserve certain issues. In addition, it is common, if not inevitable, for issues to arise during the design and implementation phases of the remedy, requiring the Agency to refine, modify, or clarify aspects of the response action. Documents relating to these activities are necessary components of the record for reviewing the Agency's action.

Public Participation

The new administrative record provisions are an important component of the Agency's efforts to increase public involvement and awareness of CERCLA actions. In addition to those provisions, the final NCP also incorporates new community relations requirements, in response to the mandate in CERCLA § 117. Unlike the 1985 NCP, in which community relations requirements were addressed separately in one section,[272] the 1990 revisions incorporate community relations requirements into each of the sections relating to the different phases of response (i.e., removal actions, RI/FSs, selection of remedy, and RD/RA).[273]

During Removal Actions. The amount of public participation required by the NCP during removal actions has been greatly expanded from the simple requirements in the 1985 NCP to designate a spokesman and to develop a formal community relations plan for removal actions extending beyond 45 days. The NCP now includes requirements regarding the preparation and availability of an administrative record file, a comment period, and interviews with local officials and interested persons.[274] However, the timing and extent of the public participation required vary depending on whether the removal is considered an emergency, time-critical, or non-time-critical action.[275] The extent of public participation also depends, to a large degree, on the needs and wishes of the public. NCP sets out the basic community relations requirements that EPA has found through experience to be necessary and allows for greater involvement

where public interest is high.[276] For example, the final rule allows for an extended comment period upon request.[277]

During the RI/FS. The final rule also increased the opportunities for public participation during the investigatory and alternatives assessment stages of the process. The revisions expand the use of the community relations plan (CRP) to provide greater opportunities for public participation in decisionmaking, require information repositories as well as administrative record files, more prominently discuss the availability of technical assistance grants (TAGs),[278] and provide for interviews of members of the local community to better assess the views of affected residents, officials and other interested parties.[279]

During Remedial Actions. Similarly, the 1990 NCP revisions increase community relations and participation efforts during remedial actions. The revisions implement CERCLA § 117 by requiring the preparation and publication of a proposed plan, describing the remedial alternatives analyzed, and proposing a recommended alternative.[280] In a change from the proposed rule, the final revisions allow the public 30 days to comment on the proposed plan, plus at least an additional 30 days upon simple request.[281]

Under the final rule, the Agency will respond to significant comments received during the formal public comment period on the proposed plan for remedial response, as required under CERCLA § 117. In addition, the final rule **[20 ELR 10247]** "encourages" the lead agency to respond to significant comments submitted *prior* to the public comment period.[282]

Post-ROD. After the ROD has been signed and the design phase begins, the CRP will be reviewed and, where appropriate, revised to describe public involvement opportunities during RD/RA.[284]

There are several possible opportunities for public comment and involvement during implementation of the remedy. If the Agency decides to amend the ROD, a new proposed plan/public comment period will be established.[285] This would generally occur where the Agency changes the remedy in a fundamental way, such as deciding that incineration instead of containment should be performed due to new information on the levels of organic constituents in the waste. In effect, such a change constitutes a new remedy selection, and the public would have a strong interest in providing views to the Agency. On the other hand, if the Agency changes the remedy in a significant but nonfundamental fashion, an ESD notice may be issued, consistent with CERCLA § 117(c).[286]

Neither the statute nor the NCP revisions require a new public comment period in the event that an ESD notice is issued. This is based in large part on the recognition that design and implementation will, in almost all cases, result in some refinements or modifications of the selected remedy. It would be very disruptive to require a new formal public comment and response to comment for alterations in the scope or cost of an already reviewed remedy (e.g., where 25 percent more soil needs to be excavated and treated, or where several more monitoring wells need to be installed). Further, additional comment is arguably unnecessary because the Agency will already have received the public's views of the basic remedial approach. Again, if the changes rise to the level of a *fundamental* change in the remedy, a formal ROD amendment would be required. (In any case, the Agency has the ability to provide additional public comment periods in appropriate cases,[287] and may well do so where ESDs relate to contentious issues.)

Moreover, the public is not without an avenue to voice concerns where EPA issues an ESD notice. The ESD will be made available to the public, and concerned parties may submit comments to the Agency. The final rule specifically provides that the lead agency "is required" to consider comments submitted by interested persons after the close of the public comment period if the comments contain "significant" new information that could not have been submitted during the public comment period and which "substantially support the need to significantly alter the response action."[288]

Admittedly, this is not an invitation to frequent public comment after the remedy has started, but it is consistent with the need for the Agency to get on with the business of accomplishing cleanups. If public comments — including PRP comments — could, by right, require formal response and a halt in Agency action, the program would be subject to endless delays. Such a result would be inconsistent with both the intent in CERCLA to accomplish cleanups expeditiously and the express provision in CERCLA § 113(h) that no judicial review of CERCLA response actions may be obtained prior to enforcement or completion of the response action. The provision does, however, give the public (and PRPs) the opportunity to raise significant issues to EPA at any point in the RD/RA process.

PRP Issues

Several specific issues not already discussed may hold special interest for PRPs.

Private Party Cost Recovery Actions ("Consistency With the NCP"). One of the most important issues to private parties is the ability to recover their cleanup costs under CERCLA's cost recovery provision (§ 107). CERCLA § 107(a)(4)(B) provides that parties other than the federal government, states, or Indian tribes may recover necessary costs of response that are incurred consistent with the NCP.[289] The issue of when a private party action is "consistent with the NCP" has long been a contentious one, both in and out of the courts.[290] EPA addressed this issue in a new Subpart H;[291] the approach taken in the final rule represents a dramatic change from both the proposed rule and from the 1985 NCP.

The proposed rule provided that any person may undertake a response action to reduce or eliminate a release of a hazardous substance. It also set out a list of those NCP provisions for which compliance would be required for a private party response action to be considered consistent with the NCP for purposes of cost recovery actions under CERCLA § 107.[292]

In the final rule, EPA defines "consistency with the NCP" as whether a private party cleanup has, *when evaluated as a whole*, achieved "substantial compliance" with potentially applicable NCP requirements and resulted in a CERCLA-quality cleanup.[293] (CERCLA § 107(a)(4)(B) **[20 ELR 10248]** also requires that the private party show that the costs incurred were "necessary" cleanup costs.)

This is a major change. The 1985 and the proposed NCP had required provision-by-provision comparisons between the elements of private actions and specific requirements in the NCP. This approach had allowed (if not encouraged) the parties that were responsible for the pollution to attempt to pick apart basically sound remedies, and thereby avoid paying their share of the cleanup costs. The revised approach calls for a less technical determination of whether a cleanup, when evaluated as a whole, appears to be along the lines contemplated by CERCLA (i.e., whether it is in "substantial compliance" with specified NCP requirements and has resulted in a CERCLA-quality cleanup). The rule specifically states that cost recovery actions should not be defeated based on immaterial or insubstantial deviations from the detailed set of NCP provisions (whether federal or private).[294]

The final rule does retain the list of potentially relevant NCP provisions that has appeared in prior rules,[295] but as guidance, not as a list of fixed requirements.[296] The retention of this list is intended to help parties who are uncertain as to what portions of the NCP might apply to them.[297] It also provides some standard against which the substantial compliance test can be applied. (A private party can eliminate any uncertainty about achieving substantial compliance by meeting the full set of requirements identified by EPA as potentially relevant to private actions.)

A new element in the rule is the requirements for "CERCLA-quality cleanups." This determination is to be made based on a comparison of the action with the principal mandates of SARA: the basic remedy selection requirements of CERCLA § 121(b)(1) (i.e., the remedial action must be "protective of human health and the environment," utilize "permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable," and be "cost-effective"); the requirement to attain ARARs in § 121(d)(2); and the requirement to provide for meaningful public participation in § 117.[298]

EPA set this less restrictive test for cost recovery actions based on a belief that it is important to encourage private parties to perform voluntary cleanups of sites, and to remove unnecessary obstacles to their ability to recover their costs from the parties that are liable for the contamination. As noted above, many voluntary cleanups are being contested based on allegations that cleanups failed to meet the letter of the NCP, even if the spirit of the regulation was satisfied. The Agency concluded that such hyper-technical challenges were not in the best interest of environmental protection. At the same time, the new standard reflects the Agency's view that it is also important to encourage only environmentally sound cleanups, not any cleanup. The requirement for "CERCLA-quality cleanups" was intended to achieve this goal.

The NCP recognizes that in the final analysis, the courts will decide, on a case-by-case basis, whether cleanup actions are consistent with the NCP.[299] However, the establishment of which requirements apply to private actions and to what extent they must be met (literally or substantially) appear to be within the Agency's authority (CERCLA § 105(a) and

(b) authorize EPA to develop NCP procedures and requirements). Thus, the final rule attempts to set out a more lenient standard for review than that contained in previous rules.

* *Enforcement Issues.* The NCP sets out few enforcement-specific requirements. This is largely because of the need to maintain discretion in CERCLA's enforcement program. However, there are a number of enforcement issues addressed in the NCP that will be of interest to PRPs.

Perhaps the foremost enforcement issue is the perceived problem of dual enforcement under federal and state law. In effect, responsible parties want greater certainty that when they carry out a remedy under CERCLA, or under state law (in a non-Fund-financed, state-lead enforcement action), the cleanup will not be second-guessed by the other authority. The NCP has attempted to address this concern in part through the provisions of Subpart F.[300]

The major thrust of Subpart F is to set up a partnership between EPA and the states from the beginning to the end of a CERCLA action. The rule describes a formal process for concurrence between EPA and the states on remedies, and even provides for the availability of EPA concurrence on a non-Fund-financed, state-lead enforcement remedy.[301] (This latter possibility may help the states in concluding consent agreements with PRPs.) At EPA-lead enforcement sites, the NCP specifically requires EPA to notify the state of negotiations and to allow the state to participate.[302] When disagreements arise, the NCP contemplates the use of a dispute resolution process, preferably set out in a SMOA.[303] (The SMOA is hoped to be an important tool in minimizing inconsistencies between EPA and the state.) Thus, the new procedures and policies outlined in the NCP are intended to result in greater coordination of EPA and state efforts and enforcement strategies. Where irreconcilable conflicts occur despite these procedures, issues of federal preemption and interpretations of CERCLA § 122(e)(6) may become important.[304]

A related question raised by some commenters is whether **[20 ELR 10249]** a state may require a PRP to do more than EPA has ordered. To a large extent, the coordination steps outlined above are intended to avoid such a situation. However, the state may in some cases want EPA to go beyond its selected remedy; that issue is addressed above in the discussion on state issues and enhancement of remedies.

Another enforcement-related point is the Agency's position on whether a PRP may obtain access to a site to perform its own sampling as a basis for commenting on the EPA (or state-lead) action. The NCP preamble states that EPA opposes "unrestricted" access to a site by PRPs, on the grounds that unrestricted access, sampling, and testing could present a health threat to those residing on or near the site;[305] it could also jeopardize the efficient completion of the CERCLA action. PRPs do have the opportunity to perform the RI/FS under CERCLA § 104(a)(1);[306] if they decline, they may be deemed to have given up the right to be on-site at all times. (This may serve as an incentive for PRPs to get involved in the CERCLA process at the earliest stages.)

This is not to say that the PRPs have no opportunity for access where they decline to perform the RI/FS. The lead agency may be receptive, in appropriate cases, to PRP requests for limited access under supervision, to the same extent that the agency would allow access to community groups that are monitoring CERCLA actions under TAGs. Even where the PRPs do not have physical access to the site, they do have the opportunity to review government data and studies through the administrative record file, and the lead agency has a significant interest in assuring that the file is complete. EPA and the state will ultimately be able to recover their investigative and cleanup costs only if their actions are adequately justified in the administrative record. PRPs will have the opportunity to comment on information in the administrative record file during the comment period on the proposed plan.

* *Effect of Final Rule on Ongoing Actions.* Also of interest to PRPs will be the effect of the new revisions on ongoing actions. It is important to note that, starting on the effective date (April 9, 1990), the NCP applies to all CERCLA actions, even those that commenced prior to that date under the 1985 NCP.[307] (The exception is made for administrative record requirements, which apply to ongoingactions only "to the extent practicable."[308]) The preamble explains that this should not pose a hardship to ongoing actions, because most of the revisions were already common practice or are easily accommodated. Specifically, the final rule does not differ dramatically from the December 1988 proposed rule, which has been treated as guidance by the Agency. Further, the major changes from the 1985 NCP were those mandated by SARA, and those changes are (or should be) already reflected in ongoing actions. In addition, some of the more obvious problems of changing from an old system to a new one have been avoided by the provision on freezing ARARs — only standards that were identified as applicable or relevant and appropriate at the time of ROD signature must be attained even if new requirements are promulgated, except to the extent the new requirements call into

question the protectiveness of the selected remedy.[309]

A contrary decision — to grandfather ongoing actions — could inappropriately open the way for many actions to avoid important requirements. The preamble notes that many Superfund actions, especially groundwater restoration efforts, are long-term in nature (generally taking from 10 to 30 years), and even RI/FSs can take from one to two years to complete;[310] the mere fact that such actions have already been started does not justify a permanent waiver of new requirements.

* *Deletion From the NPL.* Historically, the first question asked by parties when they learn that their site has become a target of attention under CERCLA is, "How do we get off the National Priorities List?" The answer has always been limited: finish the cleanup of the site or show that no cleanup is necessary. The final NCP gives some indication that the process may be even more difficult in the future, or at least, slower.

EPA has indicated that the number of sites deleted from the NPL should not be viewed as the measure of success of the Superfund program. This is due in large part to the fact that although many NPL sites have been substantially cleaned up, they require long periods of time before remediation can be formally completed (such that deletion is appropriate). This is typically the case for sites where groundwater contamination is involved: The sources of the contamination (e.g., drums, lagoons, waste piles) have been removed or controlled, but groundwater treatment continues. NPL deletion is also an inappropriate barometer of the program's success because it ignores the success of the removal program, which has resulted in addressing immediate threats at hundreds of sites.

To better communicate the information on the number of sites that have been "substantially" cleaned up, the final rule establishes a new "Construction Completion" category for remedies that have been implemented and are operating properly, including sites awaiting deletion; sites awaiting five-year review and/or deletion; and sites undergoing long-term remedial action to achieve cleanup levels identified in the ROD (e.g., pumping and treating of groundwater).[311]

The language in the preamble to the final rule suggests that PRPs should not look for rapid deletion of sites subject to five-year review (i.e., sites where hazardous substances remain as part of the remedy).[312] EPA has stated through policy, and now has reaffirmed in the preamble to the NCP, that the Agency does not intend to delete sites from the NPL where hazardous substances remain until at least one five-year review has been conducted **[20 ELR 10250]** under CERCLA § 121(c) after completion of the remedial action.[313] The Administrator's Management Review of Superfund specifically suggested this approach.[314]

Although it may appear to be a major shift in the rules of the game (i.e., how to get out of Superfund) it is too early to evaluate the effect of this policy. First, the regulations, even in 1985, gave EPA the discretion to delete *or recategorize* NPL sites "where no further response is appropriate,"[315] and in that sense the new policy was always a potential approach. Second, it is unclear that the policy will be used to severely delay the deletion of sites that have been cleaned up to EPA's specifications. For instance, the requirement that a "five-year review" be conducted before deletion does not necessarily mean that five years must go by after remedy completion before a site may be deleted under the policy. The statute requires a review "no less often than each 5 years," and thus in appropriate cases, a review may follow the previous one by less than five-years (note that the first five-year review at a site must begin after the "initiation" — not completion — of the remedial action).[316]

Even after a site is deleted from the NPL, the Agency has authority to take further action at the site in appropriate cases, without the need to go through a new HRS scoring.[317]

* *No Expanded NPL Deferral Policy.* The issue of an expanded deferral policy is also of considerable interest to private parties. To some, the option of deferring NPL sites to states offered PRPs the possibility of working out reasonable cleanups with state officials in a less public, less expensive, and often less cumbersome, process than under CERCLA. Similarly, deferral to other federal programs could have allowed PRPs to work out cleanups under the standards and procedures of other laws.[318]

As discussed above, the Administrator decided to "defer" the idea of expanding the NPL deferral policy to include deferral to other federal authorities, state authorities, and enforcement orders.[319] It is expected that the concept will be reviewed by Congress during CERCLA reauthorization, and there are some indications that a limited deferral for

"CERCLA-quality" programs may be considered at that time.

Federal Agency Issues

Federal agencies wear several hats under CERCLA. They can be the lead agency for cleanup, acting as the delegate of the President; they can be the designated trustee for certain natural resources; and they can serve as an expert agency, providing guidance to the lead agency on appropriate ways to handle specific waste types.[320] The NCP discusses each of these roles.

* *Applicability of the NCP.* Facilities owned or operated by federal agencies or departments are subject to the requirements of the NCP in the same manner and to the extent they are applicable to private parties, except for those requirements that apply only to Fund-financed activities.[321]

In addition, there are certain requirements imposed by statute that apply specifically and separately to federal facility sites. For instance, the final NCP specifically codifies the provision in CERCLA § 120(e)(4) that remedies for federal facility sites that are on the NPL should be selected jointly by EPA and the federal agency that owns or operates the facility, except that in the case of disagreement, the EPA Administrator selects the remedy.[322] However, most requirements that are specific to federal sites will be discussed in a new Subpart K to the NCP, discussed below.

* *Subpart K Proposal.* The Agency plans to propose a new subpart to the NCP to create a "road map" for how the requirements of the NCP apply to federal agencies, which may be both the PRP and the cleanup authority (as the delegate of the President) at their own sites. Subpart K may also codify certain provisions of CERCLA § 120 that apply uniquely to federal facilities.

The issue that is expected to be of most concern in Subpart K is how cleanup requirements will apply at federal facility sites that are not on the NPL (at which EPA has no formal role in the selection of remedial actions[323]). The role of the states at non-NPL federal facilities could, if addressed in Subpart K, be a contentious issue.[324] Of course, the public will be afforded an opportunity to comment on Subpart K when it is proposed in the *Federal Register.*

* *Natural Resource Trustees.* Subpart G to the NCP discusses the role of certain federal agencies as trustees for natural resources.[325] Upon notification of actual or **[20 ELR 10251]** threatened injury to natural resources, the trustee may conduct resource surveys and assessments, seek the restoration of the resource, or take other actions.[326]

CERCLA authorizes the use of the Fund to clean up releases, but SARA § 517 restricts the use of Fund monies for the *restoration* or rehabilitation of natural resources. The task of restoring resources is left to the natural resource trustee, who under CERCLA § 107(f) has the authority to sue PRPs for such damages and to restore affected resources with such monies. However, the statute and the NCP do provide for extensive coordination between the primary CERCLA cleanup action and any restoration activity that may be deemed necessary by the trustee.[327]

* *Expertise and Support for EPA Cleanups.* Finally, the NCP provides a major role for other federal agencies in providing expertise to the lead agency to facilitate response actions under CERCLA.[328] Subpart B of the NCP also groups certain federal agencies into a National Response Team, which is responsible for national response and preparedness planning,[329] and the NCP establishes Regional Response Teams of federal, state, and local agencies, which are responsible for regional preparedness and planning as well as for providing advice and support to response site managers.[330]

Separate NCP Rulemakings

There are several rulemakings that are planned or in progress to further revise the NCP.

Revised Hazard Ranking System

On December 23, 1988, EPA proposed to revise the HRS, Appendix A to the NCP. The HRS is the model by which releases are assigned a numerical score for use in placing priority releases on the CERCLA NPL.[331] CERCLA § 105(c) had called for revisions by April 17, 1988.

CERCLA "Off-site" Transfer Rule

On November 29, 1988, EPA proposed to add § 300.440 to the NCP setting out requirements for the transfer of wastes from CERCLA sites.[332] The proposed rule would implement the requirements of CERCLA § 121(d)(3) and the "revised off-site policy," which currently provides that wastes from CERCLA-funded or authorized actions may only be transferred to properly permitted off-site facilities that are in compliance with applicable law and do not have uncontrolled releases of hazardous substances.[333] Regulations on this issue were suggested in the Conference Report on SARA, but not by the language of the statute.

Subpart K to the NCP

As discussed above, the Agency intends to propose a new Subpart K to the NCP relating to CERCLA actions at federal facility sites.

Conclusions

The task of revising the rules of operation for the nation's Superfund program has been a formidable one for EPA. The Agency has had to reconcile competing mandates in fulfilling its responsibilities. For instance, the statute calls for the accomplishment of expeditious remedies, yet it requires substantial involvement of the public and the states, detailed administrative records, and a long study and alternatives-assessment process prior to remedy selection. The statute also calls for a maximum use of costly treatment technologies, while at the same time requiring selected remedies to be cost-effective.

By one measure, the NCP is an unqualified success: It contains "something for everyone." States can be expected to be happy with an expanded partnership role throughout the process; PRPs can be happy with the less restrictive private cost recovery standard, and with some more realistic expectations and principles for more streamlined decisionmaking; environmentalists should be heartened by the increased emphasis placed on selecting treatment-oriented remedies under this rule; community groups should be encouraged by the increased opportunities for participation in the process; and the interested public overall should be pleased by efforts to add some structure and predictability to a process that has historically been viewed as wide open.

At the same time, each of these constituencies is likely to be dissatisfied with parts of the final rule (indeed, in some cases precisely the part that pleased some other interest group). Such a reaction would not be unexpected from a process that seeks consensus, and a statute that includes a separate provision for each of several competing constituencies; indeed, such a reaction may be an indication that the Agency has charted a proper middle course.

However, the real measure of the NCP's success, and of the success of the Superfund program more broadly, will be in the implementation — not the words — of the final rule. Implementation is especially critical in this program because so many issues are addressed in guidance, rather than in binding rules. As noted earlier, although detail and structure have been added to the remedy selection process, the NCP remains a highly discretionary document, affording significant flexibility to the site-specific decision-maker. It is too early to tell how consistently those rules and policy statements will be applied.

Whether the new NCP is given a fair test in the field may depend, to a large degree, on Congress. The shadow on the horizon is the up-coming reauthorization of CERCLA. It would be unfortunate if Congress sought too quickly to try to remedy perceived problems before giving the new NCP regulatory framework some time to be understood and put to work. Perhaps the last thing the Superfund needs is another ambitious set of mandates and deadlines, like those in SARA, that would again turn Agency energies to rewriting the rules, rather than applying them in the field.

The final NCP has been long in coming. Only time will tell if it was worth the wait.

1. "Superfund" (the Fund) is the commonly used name for the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), 42 U.S.C. §§ 9601-9675, ELR STAT. CERCLA 001-075. The name stems from the fund established by CERCLA that may be used to directly finance cleanup actions. The Fund was originally established under CERCLA § 221, 42 U.S.C. § 9631 (1982), but was modified in 1986 by SARA § 517, and recodified at § 9507 Chapter 98 of the Internal Revenue Code.

2. 55 Fed. Reg. 8666-8865 (Mar. 8, 1990) (to be codified at 40 C.F.R. § 300).

The 1990 National Contingency Plan -- More Detail And More Structure, ... file:///H:/Mission Bay/Research/article_2011_10_20.10222.htm

3. Pub. L. No. 99-499, 100 Stat. 1613 (Oct. 17, 1986). On the 1986 amendments generally, see Atkeson et al., *An Annotated Legislative History of the Superfund Amendments and Reauthorization Act of 1986 (SARA)*, 16 ELR 10360 (Dec. 1986).

4. 53 Fed. Reg. 51394 (Dec. 21, 1988). Virtually every section of the 1985 NCP relating to hazardous site response was revised or reorganized in the proposed NCP revisions, and most of those changes have been finalized in the 1990 revisions.

5. 42 U.S.C. §§ 9601-9675, ELR STAT. CERCLA 001-075.

6. Courageous readers will note that the bulk of the preamble consists of responses to public comment or lengthy discussions of policy issues that are not necessarily included in the rule. This reflects the practice of the Superfund program to give guidance in the preamble to its rulemakings; the Agency believed that most of the responses to comment were important enough to be included in the published package (which can then be easily cited), rather than included in a support document that is available only from the Superfund docket.

7. 42 U.S.C. §§ 6901-6992K, ELR STAT. RCRA 001-050.

8. The term "hazardous substance" is defined in CERCLA § 101(14), 42 U.S.C. § 9601(14), ELR STAT. CERCLA 007, to include any substance listed as hazardous under a number of other environmental statutes, including the Clean Air Act, the Clean Water Act, and RCRA. The term "pollutant or contaminant" is defined in § 101(33), 42 U.S.C. § 9601(33), ELR STAT. CERCLA 009, and generally includes any substance capable of endangering the health of humans or other organisms.

9. 42 U.S.C. § 9604, ELR STAT. CERCLA 012.

10. Although Congress placed the authority for administering CERCLA with the President, most of that authority was delegated to the Administrator of EPA (for nonfederal sites). Exec. Order No. 12580, 52 Fed. Reg. 2923, ELR ADMIN. MATERIALS 45031 (Jan. 29, 1987).

11. 42 U.S.C. § 9606, ELR STAT. CERCLA 024.

12. CERCLA § 101(25), 42 U.S.C. § 9601(25), ELR STAT. CERCLA 009.

13. *Id.* § 101(23), 42 U.S.C. § 9601(23), ELR STAT. CERCLA 008.

CERCLA 040; *see also* NCP § 300.800(d),.800(e). This issue is discussed in more detail *infra* at text accompanying notes 307-10.

39. Reilly, *A Management Review of the Superfund Program* (June 1989).

40. 55 Fed. Reg. at 8839 (to be codified at 40 C.F.R. § 300.400-.440). Hereinafter sections of the final rule will be referred to as "NCP § 300. "; finalrule sections from the 1985 NCP will be referred to as "40 C.F.R. § 300. (1985)."

41. NCP § 300.500-.525.

42. NCP § 300.700-.825.

43. NCP § 300.800-.825.

44. CERCLA § 101(14) defines a "hazardous substance" to generally exclude "petroleum, including crude oil or any fraction thereof," as well as natural gas and natural gas liquids. However, where a hazardous substance is intermingled with a petroleum product, or where a petroleum product is specifically listed under one of the statutes in § 101(14), response authority under CERCLA is available. *See* Memorandum from Francis S. Blake, General Counsel, to J. Winston Porter, Assistant Administrator for Solid Waste and Emergency Response, Scope of the CERCLA Petroleum Exclusion Under Sections 101(14) and 104(a)(2) (July 31, 1987).

The 1990 National Contingency Plan -- More Detail And More Structure, ... file:///H:/Mission Bay/Research/article_2011_10_20.10222.htm

45. NCP § 300.1-.7.

46. NCP § 300.100-.185. This subpart deals with federal agencies as arms of the executive branch, offering their expertise on matters relevant to releases (e.g., the Nuclear Regulatory Commission with respect to waste containing radioactive elements, or the Fish and Wildlife Service regarding threatened species). This should be distinguished from planned Subpart K, which will set out the responsibilities of federal agencies when taking cleanup actions at their own facilities.

47. NCP § 300.200-.220.

48. NCP § 300.300-.335.

49. NCP § 300.600-.615.

50. NCP § 300.900-.920.

51. CERCLA § 105(d), 42 U.S.C. § 9605(d), ELR STAT. CERCLA 023.

52. NCP § 300.405.

53. NCP § 300.410.

54. NCP § 300.415.

55. Time-critical removal actions commence in fewer than six months after discovery of the release, while non-time-critical removal actions commence after a planning period of more than six months. 53 Fed. Reg. at 51409. Very few CERCLA removal actions fall into the non-time-critical category.

56. NCP § 300.420.

57. 40 C.F.R. pt. 300, app. A.

58. A rulemaking is presently under way to revise the HRS, consistent with CERCLA § 105(c), 42 U.S.C. § 9605(c), ELR STAT. CERCLA 023. *See* 53 Fed. Reg. 51962 (Dec. 23, 1988).

59. 40 C.F.R. pt. 300,app. B.

60. Monies from the Fund may be spent only for remedial actions at those releases listed on the NPL. *See* 40 C.F.R. § 300.66(c)(2), .68(a) (1985); NCP § 300.425(b)(1).

61. NCP § 300.425.

62. *See* NCP § 300.425(b)(1), .425(b)(2); 55 Fed. Reg. 8698 (Mar. 8, 1990); 54 Fed. Reg. 13298 (Mar. 31, 1989); 54 Fed. Reg. 10522 (Mar. 13, 1989).

63. NCP § 300.430(a)(2), .430(d), .430(e).

64. NCP § 300.430(e)(2)(i).

65. 55 Fed. Reg. 8712-13 (Mar. 8, 1990); *see infra* text accompanying notes 164-80.

66. NCP § 300.430(e)(7).

67. NCP § 300.430(e)(9).

68. NCP § 300.430(f).

69. NCP § 300.430(f)(1)(i).

70. CERCLA § 121(b)(1), NCP § 300.430(f)(1)(ii)(D) and (E).

71. NCP § 300.430(f)(1)(ii)(E).

72. If the state is the lead agency but EPA does not agree with the proposed plan, EPA may take back the lead on the project. *See* NCP § 300.515(e)(1).

73. NCP § 300.430(f)(2).

74. NCP § 300.430(f)(5). For a list of all CERCLA RODs, see ELR ADMIN. MATERIALS 30003:3.

75. NCP § 300.435.

76. CERCLA § 117(c), 42 U.S.C. § 9617(c), ELR STAT. CERCLA 043; NCP § 300.435(c)(2)(i).

77. NCP § 300.435(c)(2)(ii). The different circumstances warranting an ESD as compared with a ROD amendment are discussed below at text accompanying notes 284-88.

78. *See* NCP § 300.435(f)(3), and discussion below on state cost share for O&M.

79. CERCLA § 104(c)(3), 42 U.S.C. § 9604(c)(3), ELR STAT. CERCLA 013; NCP § 300.510(c)(1).

80. NCP § 300.425.

81. NCP § 300.430(f)(4)(ii).

82. NCP § 300.5.

83. 40 C.F.R. § 261.31-.33.

84. NCP § 300.400(g)(2)(i)-.400(g)(2)(viii).

85. The Agency has specifically discussed this interpretation with respect to the standards for closure of hazardous waste management units under RCRA. *See* 53 Fed. Reg. 51445-46 (Dec. 21, 1988).

86. CERCLA § 121(d)(4), 42 U.S.C. § 9621(d)(4), ELR STAT. CERCLA 052. There are six limited circumstances under which an ARAR may be waived. *See supra* note 27, and 55 Fed. Reg. 8747-50 (Mar. 8, 1990). Although waivers have been used rarely to date, the Agency is considering their more frequent application in the future. *See, e.g.,* the discussion below in the section "Remedy Selection — Fund Balancing Waiver."

87. NCP § 300.400(g)(4).

88. 55 Fed. Reg. 8756-57 (Mar. 8, 1990). This issue is discussed in more detail below, in the section "ARARs Issues — Substantive, Not Administrative, Requirements."

89. 42 U.S.C. § 9621(d)(2)(A)(i) and (ii), ELR STAT. CERCLA 052.

90. Thus, they will not be considered potentially relevant and appropriate requirements, and they cannot be waived under CERCLA § 121(d)(4), 42 U.S.C. § 9621(d)(4), ELR STAT. CERCLA 052. One advantage of being considered a potential ARAR is that the requirement is on a list that is routinely considered by site managers (*see* 55 Fed. Reg. at 8764-66). Thus, the likelihood of early attention to the requirement is high.

91. 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052.

92. Off-site transfers must also comply with EPA's off-site policy (EPA/OSWER Directive No. 9834.11, Nov. 13, 1987) and CERCLA § 121(d)(3), 42 U.S.C. § 9621(d)(3), ELR STAT. CERCLA 052. A new section of the NCP has been proposed to codify the off-site requirements in that policy and section of the statute. *See* 53 Fed. Reg. 48218 (Nov. 29, 1988).

93. 55 Fed. Reg. 8695-96 (Mar. 21, 1990).

94. 40 C.F.R. § 300.68(i)(1) (1985). Note, however, that under 40 C.F.R. § 300.65(f) and .68(i) (1985), remedies were required to meet the ARARs of federal environmental and public health laws; the statute and the final NCP limit ARARs to environmental laws.

95. NCP § 300.400(g)(4); *see* discussion below in "State ARARs Issues."

96. NCP § 300.415(i); *see also* 40 C.F.R. § 300.65(f) (1985).

97. 53 Fed. Reg. at 51441.

98. MCLs are independently applicable only to public drinking water systems. SDWA § 1401(1), 42 U.S.C. § 300f(1), ELR STAT. SDWA 002; 50 Fed. Reg. 46880 (Nov. 13, 1985). Hence, their use as potential ARARs for contaminated groundwater is based on an analysis that under CERCLA § 121(d)(2)(A)(i), they may be relevant and appropriate requirements in determining groundwater restoration levels. Similarly, MCLGs are not independently applicable (they are unenforceable goals). However, the statute requires the attainment of MCLGs where "relevant and appropriate under the circumstances of the release." CERCLA § 121(d)(2)(A), 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052.

99. *See* NRDC v. EPA, 812 F.2d 721, 723, 17 ELR 20418 (D.C. Cir. 1987); SDWA § 1412, 42 U.S.C. § 300g-1, ELR STAT. SDWA 002; 50 Fed. Reg. 46880-81 (Nov. 13, 1985); 49 Fed. Reg. 2437 (June 12, 1984).

100. 53 Fed. Reg. 51441 (Dec. 21, 1988).

101. 55 Fed. Reg. 8751-52 (Mar. 8, 1990). ARARs are defined as the "promulgated" (i.e., enforceable) requirements of other laws. NCP § 300.400(g)(4). MCLs are the enforceable requirements of the SDWA. 50 Fed. Reg. 46881 (Nov. 13, 1985).

102. NCP § 300.430(e)(2)(i)(B), (C).

103. 55 Fed. Reg. 8751-52 (Mar. 8, 1990).

104. *See* Memorandum of Jonathan Z. Cannon, Acting Assistant Administrator for Solid Waste and Emergency Response, *Considerations in Ground Water Remediation at Superfund Sites*, EPA/OSWER Directive No. 9355.4-03 (Oct. 18, 1989).

105. CERCLA § 121(d)(2)(B)(ii), 42 U.S.C. § 9621(d)(2)(B)(ii), ELR STAT. CERCLA 052.

106. 55 Fed. Reg. 8754 (Mar. 8, 1990).

107. CERCLA § 121(d)(2)(B)(i), 42 U.S.C. § 9621(d)(2)(B)(i), ELR STAT. CERCLA 052.

108. 55 Fed. Reg. 8754-55 (Mar. 8, 1990).

109. 53 Fed. Reg. 51440 (Dec. 21, 1988).

110. NCP § 300.430(f)(1)(ii)(B); 55 Fed. Reg. 8757 (Mar. 8, 1990).

111. *See* S. REP. NO. 848, 96th Cong., 2d Sess. 56 (1980), *reprinted in* 1 SENATE COMM. ON ENVIRONMENT & PUBLIC WORKS, 97th Cong. 2d Sess., *A Legislative History of the Comprehensive Environmental Response, Compensation and Liability Act of 1980*, at 363 (Comm. Print 1983):

The paramount purpose of this section [104] is the protection of public health, welfare and the environment. It is recognized that government response will often be necessary prior to receipt of evidence which conclusively establishes the substances or materials released or the origin of their release, discharge or disposal. Because delay will often exacerbate an already serious situation, the bill authorizes the President to respond when a substantial threat of release may exist.

Courts have also recognized the congressional intent to promote the "prompt cleanup of hazardous waste sites." Dickerson v. EPA, 834 F.2d 974, 978, 18 ELR 20305, 20306 (11th Cir. 1987); J. V. Peters & Co. v. EPA, 767 F.2d 263, 264, 15 ELR 20646 (6th Cir. 1985).

112. CERCLA § 121(c), 42 U.S.C. § 9621(c), ELR STAT. CERCLA 051; 40 C.F.R. § 300.430(f)(4)(ii); 53 Fed. Reg. 51430, 51507 (Dec. 21, 1988).

113. NCP § 300.430(f)(1)(ii)(B)(2).

114. *See* 53 Fed. Reg. 51443-47 (Dec. 21, 1988); 55 Fed. Reg. 8759-62 (Mar. 8, 1990).

115. 42 U.S.C. § 6924, ELR STAT. RCRA 012.

116. Pub. L. No. 98-616, 88 Stat. 3221.

117. 42 U.S.C. § 6924(k), ELR STAT. RCRA 013.

118. *See, e.g.*, 53 Fed. Reg. 31138 (Aug. 17, 1988) (standards for first-third wastes issued); 54 Fed. Reg. 26594 (June 23, 1989) (standards for second-third wastes issued); 54 Fed. Reg. 48372 (Nov. 11, 1989) (standards for third-third wastes proposed).

119. *See, e.g.*, RCRA § 3004(d)(3), which provides that for four years after the effective date of the HSWA, the restrictions in subsection (d) would not apply to "any disposal of contaminated soil or debris resulting from a response action taken under § 104 or 106 of [CERCLA] or a corrective action under this title." 42 U.S.C. § 6924(d)(3), ELR STAT. RCRA 013.

120. 53 Fed. Reg. 51444 (Dec. 21, 1988). However, movement of hazardous waste entirely within a unit would not constitute placement or "land disposal" under RCRA Subtitle C. *Id.*

121. 54 Fed. Reg. 41566 (Oct. 10, 1989).

122. 55 Fed. Reg. 8759-60 (Mar. 8, 1990).

123. *Id.* at 8760-61. Variances from BDAT are available under RCRA where the treatment technology is deemed not to be "appropriate" to the waste. 40 C.F.R. § 268.44.

124. *See* CERCLA § 121(e)(1), (d)(2); discussion at 53 Fed. Reg. 51443 (Dec. 21, 1988).

125. 55 Fed. Reg. 8762 (Mar. 8, 1990). EPA has issued detailed guidance on treatability variance levels for specific types of contaminants. *See* Superfund LDR Guidance No. 6A, *Obtaining a Soil and Debris Treatability Variance for Remedial Actions*, EPA/OSWER Directive No. 9347.3-06FS (July 1989).

126. 55 Fed. Reg. 8762 (Mar. 8, 1990).

127. 53 Fed. Reg. 51426 (Dec. 21, 1988).

128. 55 Fed. Reg. 8753 (Mar. 8, 1990).

129. *Id.* at 8734.

130. CERCLA § 121(b), 42 U.S.C. § 9621(b), ELR STAT. CERCLA 051. CERCLA also appears to contemplate the restoration of groundwater. CERCLA § 104(c)(6), 42 U.S.C. § 9604(c)(6), ELR STAT. CERCLA 013.

131. *See, e.g.*, proposed § 300.430(b)(7), 53 Fed. Reg. 51504 (Dec. 21, 1988).

132. *See, e.g.*, NCP § 300.400(g)(3), .415(i), .430(b)(9); 55 Fed. Reg. 8744-45 (Mar. 8, 1990).

133. *See* discussion in the preamble to the proposed rule at 53 Fed. Reg. 51443 (Dec. 21, 1988), and in *CERCLA Compliance With Other Laws Manual*, EPA/OSWER Directive No. 9234.1-01, at p. 1-11 (Interim Final Guidance, Aug. 8, 1988).

134. NCP § 300.5; 55 Fed. Reg. 8756 (Mar. 8, 1990).

135. *See supra* note 111. In addition to enacting an express permit waiver in CERCLA § 121(e)(1), discussed below, Congress recognized the need to allow cleanups to move forward without delay by enacting § 113(h), which delays judicial review of CERCLA response actions until EPA takes an enforcement or cost recovery action, until the action has been completed, or until an action has been filed under CERCLA § 106(b).

136. *See* 50 Fed. Reg. 47910-18 (Nov. 20, 1985); 50 Fed. Reg. 5865 (Feb. 12, 1985); Memorandum of Francis S. Blake, General Counsel, to Lee M. Thomas, Administrator, "CERCLA Compliance With Other Environmental Laws" Opinion (Nov. 22, 1985). The implied repeal theory is based in large part on the existence of the ARARs process under CERCLA § 121(d)(2) and (d)(4), which defines how and to what extent the requirements of federal and state environmental laws should apply to on-site CERCLA remedial actions. Based on these provisions, CERCLA remedies will incorporate (or waive) the standards of other environmental laws, as appropriate under CERCLA. Thus, although other environmental laws do not independently apply to CERCLA response actions, the substantive requirements of such laws will be applied to such actions, consistent with CERCLA § 121(d) and NCP § 300.400(g).

137. *See, e.g.*, *CERCLA Compliance With Other Laws Manual: Part II*, EPA/OSWER Directive No. 9234.1-02, at p. 4-1 (Interim Final Guidance, Aug. 1989):

While EPA interprets CERCLA § 121(e) to exempt lead agencies . . . from complying with the administrative requirements for on-site remedial activities, it is strongly recommended that lead agencies, nonetheless, consult as specified with administering agencies for on-site actions. The administering agencies have the expertise to determine the impacts of a remedial action on particular aspects of the environment and what steps should be taken to avoid and mitigate adverse impacts.

138. NCP § 300.435(b)(2).

139. CERCLA § 121(d)(2)(A), 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052.

140. 55 Fed. Reg. 8755 (Mar. 8, 1990).

141. *Id.* at 8695.

142. CERCLA §§ 101(23), 104(b); 42 U.S.C. §§ 9601(23), 9604(b); ELR STAT. CERCLA 052.

143. 16 U.S.C. §§ 1531-1544, ELR STAT. ESA 001-027.

144. *Id.* §§ 470-470w-6.

145. *See* EPA/OSWER Directive No. 9234.1-02,*supra* note 137, at ch. 4.

146. 55 Fed. Reg. 8755 (Mar. 8, 1990).

147. CERCLA § 121(d)(4)(A), 42 U.S.C. § 9621(d)(4)(A), ELR STAT. CERCLA 052; NCP § 300.430(f)(1)(ii)(C)*(1)*.

148. 40 C.F.R. § 300.65(f) (1985).

149. *See* CERCLA § 121(d)(2), 42 U.S.C. § 9621(d)(2), ELR STAT. CERCLA 052.

150. NCP § 300.415(i).

151. 55 Fed. Reg. 8695-96 (Mar. 8, 1990).

152. NCP § 300.415(i).

153. NCP § 300.415(i)(A) and (B).

154. "Removal" actions are defined in CERCLA § 101(23) as actions to "prevent, minimize or mitigate damage" or to conduct investigations, whereas "remedial" actions are defined in CERCLA § 101(24) as actions consistent with a "permanent" remedy at the site. Further, CERCLA § 104(c)(1) provides that Fund-financed removal actions may not continue after $ 2 million have been obligated or 12 months have elapsed, except under limited circumstances spelled out in that section. Both sections of the statute suggest that removals are generally intended to be short-term, nonpermanent actions. (Although in some cases, a removal action may result in a permanent solution to a contamination problem.)

155. For instance, as discussed below, there are additional public participation requirements associated with remedial actions.

156. CERCLA § 121(d)(4), 42 U.S.C. § 9621(d)(4), ELR STAT. CERCLA 052; NCP § 300.430(f)(1)(ii)(C).

157. 55 Fed. Reg. 8695; 8747 (Mar. 8, 1990).

158. CERCLA § 121(d)(2)(A)(ii), 42 U.S.C. § 9621(d)(2)(A)(ii), ELR STAT. CERCLA 052; NCP § 300.400(g)(4). (Note that "promulgated" is defined in the rule as being "of general applicability and legally enforceable." *Id.*) Under the 1985 NCP, state requirements were merely considered TBCs. 40 C.F.R. § 300.68(i)(4) (1985).

159. 55 Fed. Reg. 8741-42 (Mar. 8, 1990).

160. *Id.* at 8746; *see* NCP § 300.400(g)(5).

161. NCP § 300.515(d)(1).

162. *See* discussion at 53 Fed. Reg. 51438 (Dec. 21, 1988); 55 Fed. Reg. 8746 (Mar. 8, 1990).

163. CERCLA § 121(d)(4)(A), 42 U.S.C. § 9621(d)(4)(A), ELR STAT. CERCLA 052; NCP § 300.430(f)(1)(ii)(C)(*1*).

164. NCP § 300.430(d)(1).

165. 55 Fed. Reg. 8709 (Mar. 8, 1990). The baseline risk assessment consists of an exposure assessment component and a toxicity assessment component. It has superseded the "endangerment assessment," because the two have the same goal, function, and methodology. *Id.*

166. *Id.* at 8713.

167. NCP § 300.430(e)(2)(i), .430(e)(2)(i)(A)(2); 55 Fed. Reg. 8713 (Mar. 8, 1990).

168. 55 Fed. Reg. 8712 (Mar. 8, 1990).

169. This is in deference to the determination of another environmental protection program that the ARAR level is protective. (Cleanup to a level more stringent than the single ARAR might be appropriate to assure protectiveness where the Agency finds, for example, on a site-specific basis, that the contaminant poses a risk over more than one pathway of exposure. *Id.* at 8713.)

170. *Id.*

171. *Id.* at 8712-13. These levels are set based on reliable toxicity information, such as EPA's reference doses.

172. *Id.* at 8712.

173. NCP § 300.430(d)(4); 55 Fed. Reg. 8709-11 (Mar. 8, 1990). In effect, cleanups will be based on "likely" residential, industrial, or other uses. The Superfund program is in the process of developing generic exposure assumptions for such use categories.

174. 55 Fed. Reg. 8713 (Mar. 8, 1990).

175. *Id.*

176. 53 Fed. Reg. 51425-26 (Dec. 21, 1988).

177. Exposure factors, uncertainty factors, and technical factors may determine where to set remedial action goals within the risk range. *See* 55 Fed. Reg. 51426 (Mar. 8, 1990).

178. NCP § 300.430(e)(2)(i)(A)(*2*).

179. 55 Fed. Reg. 8716-17 (Mar. 8, 1990).

180. *See, e.g. id.* at 8717 n.9.

181. NCP § 300.420(f)(1)(i)(A)-(C); 55 Fed. Reg. 8724 (Mar. 8, 1990).

182. The analysis of compliance with ARARs does not necessarily resolve the issue of how stringent the remedy must be. As discussed below in the section on the "role of cost," where chemical-specific ARARs are not available to define the protective cleanup level for the relevant contaminants, the Agency will select among the alternative technologies that will result in remedies within the acceptable risk range; the balancing criteria aid in selecting among such viable, protective alternatives.

183. *See* 53 Fed. Reg. 51428-29 (Dec. 21, 1988).

184. NCP § 300.430(f)(1)(ii)(E).

185. 55 Fed. Reg. 8725 (Mar. 8, 1990).

186. NCP§ 300.430(a)(1)(i).

187. NCP § 300.430(f)(1)(iii)(A).

188. 55 Fed. Reg. 8721 (Mar. 8, 1990).

189. NCP §§ 300.430(f)(1)(ii)(E).

190. NCP § 300.430(a)(1)(iii)(E).

191. *See* 53 Fed. Reg. 51422 (Dec. 21, 1988).

192. NCP § 300.430(a)(1)(iii).

193. 55 Fed. Reg. 8702-03 (Mar. 8, 1990).

194. NCP § 300.430(f)(1)(iii)(A). "Principal threats" include liquids as well as highly toxic or highly mobile contamination.

195. NCP § 300.430(f)(1)(iii)(B).

196. NCP § 300.430(a)(1)(iii)(C). The rule also sets out expectations concerning the development of innovative technologies; the use of institutional controls, primarily a supplement to more active measures; and the restoration of groundwater to its beneficial uses, wherever practicable. NCP § 300.430(a)(1)(iii)(D)-(F).

197. NCP § 300.430(a)(1)(ii); 55 Fed. Reg. 8703 (Mar. 8, 1990).

198. NCP § 30.430(a)(1)(ii)(A).

199. *See, e.g.*, Memorandum from Don R. Clay, Assistant Administrator for Solid Waste and Emergency Response, *Interim Guidance on Addressing Immediate Threats at NPL Sites* (Superfund Management Review: Recommendation No. 22), EPA/OSWER Directive No. 9200.2-03 (Jan. 30, 1990).

200. NCP § 30.430(a)(1)(ii)(C).

201. 55 Fed. Reg. 8712, 8714 (Mar. 8, 1990).

202. 53 Fed. Reg. 51440 (Dec. 21, 1988).

203. CERCLA § 121(d)(4)(f); NCP § 300.430(f)(1)(ii)(C)(*6*).

204. The Fund-balancing waiver has been invoked in only one case and considered in another. *See* Freedman, *supra* note 23, at 10132 n.261.

205. 55 Fed. Reg. 8749-50 (Mar. 8, 1990).

206. *See, e.g.*, Senate Subcomm. on Superfund, Ocean, and Water Protection, *Lautenberg-Durenberger Report on Superfund Implementation: Cleaning Up the Nation's Cleanup Program*, 57-64 (May 1989).

207. 55 Fed. Reg. 8726-30 (Mar. 8, 1990).

208. *See* discussion above in "Risk Assessment and Risk Range."

209. NCP § 300.430(f)(1)(ii)(D); 55 Fed. Reg. 8728 (Mar. 8, 1990).

210. 55 Fed. Reg. 8728 (Mar. 8, 1990); *see also* 53 Fed. Reg. 51422 (Dec. 21, 1988).

211. 55 Fed. Reg. 8728 (Mar. 8, 1990); 53 Fed. Reg. 51427-28 (Dec. 21, 1988).

212. Alternatives with grossly excessive costs will be eliminated during screening, as discussed below.

213. 55 Fed. Reg. 8728 (Mar. 8, 1990). This decision not to use cost as a major factor in eliminating "viable" options prior to balancing is not necessarily inconsistent with the Agency's use of cost during screening, discussed below, to eliminate extreme (nonviable) options with "grossly" excessive cost.

214. CERCLA § 121(b)(1), 42 U.S.C. § 9621(b)(1), ELR STAT. CERCLA 052.

215. NCP § 300.430(f)(1)(ii)(e); 55 Fed. Reg. 8729 (Mar. 8, 1990).

216. The "permanence" offered by a remedy is an important element of this determination. The preamble to the final NCP notes that the maximum permanence practicable is judged along a continuum, based on the degree of long-term effectiveness and permanence afforded by a remedy. 55 Fed. Reg. 8720 (Mar. 8, 1990).

217. *Id.* at 8725.

218. *Id.*

219. *Id.* at 8729.

220. NCP § 300.430(e)(7)(iii); 55 Fed. Reg. 8714-15 (Mar. 8, 1990).

221. Cost may also be used to screen out an alternative that uses a similar technology and provides similar effectiveness and implementability to another alternative, but at a greater cost. In effect, this avoids the need to carry variations of the same technology through the detailed analysis phase.

222. CERCLA § 121(e)(1), 42 U.S.C. § 9621(e)(1), ELR STAT. CERCLA 053.

223. CERCLA § 121(d)(2)(A), 42 U.S.C. § 9621(d)(2)(A), ELR STAT. CERCLA 052 ("With respect to any hazardous substance, pollutant or contaminant that will remain onsite . . .").

224. 53 Fed. Reg. 51406-08 (Dec. 21, 1988); *see also* discussion in Freedman, *supra* note 23, at 10125-26.

225. NCP § 300.400(e).

226. 55 Fed. Reg. 8688-89 (Mar. 8, 1990). This definition of "on-site" in the NCP is also significant in that it defines, by extension, the term "off-site," and thus affects the scope of CERCLA policy on the transfer of CERCLA wastes off site. Currently, such transfers are regulated under the revised off-site policy, EPA/OSWER Directive No. 9834.11 (Nov. 13, 1987), and CERCLA § 121(d)(3), which provide generally that wastes from CERCLA-funded or authorized actions may only be transferred to properly permitted off-site facilities that are in compliance with applicable law, and do not have uncontrolled releases of hazardous substances. Regulations to implement the off-site policy and § 121(d)(3) have been proposed (53 Fed. Reg. 48219 (Nov. 29, 1988)).

227. As noted in CERCLA § 104(d)(4), "where two or more noncontiguous facilities are reasonably related on the basis of geography, or on the basis of the threat, or potential threat to the public health or welfare or the environment, the President may, in his discretion, treat these related facilities as one for the purposes of this section." 42 U.S.C. § 9604(d)(4), ELR STAT. CERCLA 015.

228. 55 Fed. Reg. 8690 (Mar. 8, 1990).

229. As a matter of policy, and as part of the hazard ranking system process for site evaluation, EPA applies more restrictive criteria to potential site aggregations at the NPL listing stage than it does at the remedial response stage. *See* 48 Fed. Reg. 40663 (Sept. 8, 1983).

230. 55 Fed. Reg. 8691 (Mar. 8, 1990).

231. *See, e.g.*, 53 Fed. Reg. 51416 (Dec. 21, 1988) (proposed NCP); 53 Fed. Reg. 23978 (June 24, 1988); 48 Fed. Reg. 40658 (Sept. 8, 1983).

232. 55 Fed. Reg. 8667 (Dec. 21, 1988).

233. A recent report by GAO on the capability of State response programs revealed disparities in the abilities of states to clean up sites, but recognized that many states have well-developed response programs. *See* GAO REP. NO. GAO/RCED-89-164, HAZARDOUS WASTE SITES: STATE CLEANUP STATUS AND ITS IMPLICATIONS FOR FEDERAL POLICY (Aug. 1989).

234. NCP § 300.515(e)(1).

235. NCP § 300.515(e)(2)(i); 55 Fed. Reg. 8782 (Mar. 8, 1990).

236. NCP § 300.515(e)(2)(i).

237. 55 Fed. Reg. 8781-82 (Mar. 8, 1990).

238. NCP § 300.515(e)(2)(ii).

239. However, there are limitations on the ability of a state to take independent actions. If EPA undertakes (or has already begun) an RI/FS at a site, CERCLA § 122(e)(6) would not allow a PRP to take remedial action at the site without the prior authorization of EPA, and on its face, that section would also appear to proscribe PRP remedial actions ordered by a state. Further, where EPA does not concur on a state remedy, EPA will not be deemed to have approved the state decision, resulting in less certainty for the PRPs. NCP § 300.515(e)(2)(ii). A state may also be limited in its ability to carry out an independent state-ordered action if that action physically conflicts with an action ordered by EPA, under general principles of federal supremacy.

240. 55 Fed. Reg. 8783 (Mar. 8, 1990). Several commenters suggested that CERCLA § 104(d)(1) may be read in

conjunction with CERCLA § 104(c)(4) (relating to the selection of remedial actions) to allow EPA to authorize states to select remedies at specific sites through cooperative agreements or Superfund contracts.

241. During the original passage of CERCLA in 1980, Congress rejected the idea of establishing a program of federal grants to states as the means of cleaning up hazardous waste sites. *See* Freedman, *supra* note 23, at 10134 & n.274.

242. NCP § 300.515(f); 55 Fed. Reg. 8783-85 (Mar. 8, 1990).

243. As noted above, where EPA and the state disagree on a remedy selection, a state has the option of withholding its CERCLA § 104 assurances,thereby preventing the remedy from proceeding as a Fund-financed action (although EPA could initiate an enforcement action), and for EPA enforcement actions, a process is available for states to challenge a decision by EPA to waive an ARAR (CERCLA § 121(f)(2)(B)). These are, however, extreme measures, and the Agency's goal is to reach agreement with states through the normal remedy selection process. The final rule specifically sets out a procedure for dispute resolution with the states in order to foster agreement on ARARs. NCP § 300.515(d)(3), .515(d)(4); 55 Fed. Reg. 8781-82 (Mar. 8, 1990).

244. These proposed "changes" could include the attainment of a particular state standard that EPA found not to be an ARAR, or waived.

245. As noted above, a state's ability to proceed unilaterally where EPA is undertaking a CERCLA response action may be limited. *See supra* note 239.

246. Proposed NCP § 300.515(a)(3), 53 Fed. Reg. 51511 (Dec 21, 1988).

247. *E.g.*, NCP § 300.505(d)(4); *see* 55 Fed. Reg. 8776-77 (Mar. 8, 1990).

248. The exception to this formula is where the State operated the site, at the time of disposal, in which case the state's cost share may be 50 percent or greater. CERCLA § 104(c)(3)(C)(ii), 42 U.S.C. § 9604(c)(3)(C)(ii), ELR STAT. CERCLA 013.

249. NCP § 300.510(c)(1).

250. CERCLA § 104(c)(3), 42 U.S.C. § 9604(c)(3), ELR STAT. CERCLA 013; 55 Fed. Reg. 8778 (Mar. 8, 1990).

274. NCP § 300.415(m).

275. The distinctions between these types of removal actions are discussed above at *supra* note 55. *See also* 53 Fed. Reg. 51409 (Dec. 21, 1988).

276. 55 Fed. Reg. 8767 (Mar. 8, 1990).

277. NCP § 300.415(m)(4)(iii).

278. NCP § 300.430(c)(2)(iv); 55 Fed. Reg. 8769 (Mar. 8, 1990). *See generally* CERCLA § 117(e), 42 U.S.C. § 9617(e), ELR STAT. CERCLA 043; 54 Fed. Reg. 49848 (Dec. 1, 1989); 53 Fed. Reg. 9736 (Mar. 24, 1988).

279. NCP § 300.430(c).

280. NCP § 300.430(f)(3).

281. NCP §§ 300.430(f)(3)(i)(C); 55 Fed. Reg. 8770 (Mar. 8, 1990).

282. NCP § 300.820(b)(2).

If EPAdecides to adopt a final ROD that differs significantly from the proposed plan and those changes could not have been reasonably anticipated based on existing information, additional comment will be solicited on a revised proposed plan.[283]

283. NCP § 300.430(f)(3)(ii)(B).

284. NCP § 300.435(c)(1).

285. NCP § 300.435(c)(2)(ii).

286. NCP § 300.435(c)(2)(i). Both the preamble to the final rule and the preamble to the proposed rule discuss when an ESD, as compared with a ROD amendment, would be appropriate. *See* 55 Fed. Reg. 8772-73 (Mar. 8, 1990); 53 Fed. Reg. 51451-52 (Dec. 21, 1988); *see also Interim Final Guidance on preparing Superfund Decision Documents,* EPA/OSWER Directive No. 9355.3-02 (May 1989).

287. NCP § 300.825(b).

288. NCP § 300.825(c); 55 Fed. Reg. 8773 (Mar. 8, 1990).

289. The issue of whether a local government comes within CERCLA § 107(a)(4)(A) or (B) was not decided by the NCP, but rather was left to the courts. *See* 55 Fed. Reg. 8799 (Mar. 8, 1990).

290. District courts have issued interpretations at both ends of the spectrum on this issue. *Compare* General Elec. Co. v. Litton Bus. Sys., 715 F. Supp. 949, 962, 19 ELR 21433, 21438 (W.D. Mo. 1989) (holding that consistency with the NCP "does not necessitate strict compliance with its provisions") *and* Amland Properties Corp. v. Aluminum Co. of Am., 711 F. Supp. 784, 796, 19 ELR 21180, 21184 (D.N.J. 1989) (rejecting arguments that "substantial compliance" with the NCP is sufficient). The split in the courts on this issue was also discussed in the preamble to the proposed rule; 53 Fed. Reg. 51462 (Dec. 21, 1988).

291. NCP § 300.700.

292. 53 Fed. Reg. 51461 (Dec. 21, 1988).

293. NCP § 300.700(c)(3).

294. NCP § 300.700(c)(4).

295. NCP § 300.700(c)(5)-.700(c)(7).

296. 55 Fed. Reg. 8792-93 (Mar. 8, 1990).

297. There are a number of NCP requirements that do not make sense for private parties, such as the requirements for state assurances (§ 300.510), or other provisions related to use of the Fund. Similarly, there are self-imposed restrictions on governmental actions that are not relevant to private actions, such as the requirement that a site be listed on the NPL before Fund-financed remedial action may be taken (300.425(b)(1)).

298. 55 Fed. Reg. 8793 (Mar. 8, 1990). Note that compliance with these mandates was already necessary under the proposed rule, which required private parties to strictly comply with the detailed provisions of the NCP, including provisions codifying these statutory mandates. *See* proposed rule § 300.430(f)(3)(ii) (protectiveness and ARARs); .430(f)(3)(iii) (cost-effectiveness and permanence/treatment); and .430(f)(2) (public participation).

299. 55 Fed. Reg. 8794 (Mar. 8, 1990).

300. *See id.* at 8785-86.

301. NCP § 300.515(e)(2)(i) and (ii). However, the rule maintains the Agency's long-standing position that EPA silence on a state-conducted remedy cannot be construed as EPA concurrence. 55 Fed. Reg. 8786 (Mar. 8, 1990); 53 Fed. Reg. 51458 (Dec. 21, 1988).

302. NCP § 300.520.

303. NCP § 300.515(d)(3)-.515(d)(4); 55 Fed. Reg. 8781-82 (Mar. 8, 1990).

304. 42 U.S.C. § 9622(e)(6); ELR STAT. CERCLA 052; *see* 55 Fed. Reg. 8783 (Mar. 8, 1990); 54 Fed. Reg. at 10523-24 (Mar. 13, 1989).

305. 55 Fed. Reg. 8688 (Mar. 8, 1990). The rule states that a PRP may be designated as EPA's representative for the purpose of access only where that PRP has agreed to conduct response activities pursuant to an administrative order or consent decree. NCP § 300.400(d)(3).

306. 42 U.S.C. § 9604(a)(1); ELR STAT. CERCLA 052; *see* 55 Fed. Reg. 8688 (Mar. 8, 1990). CERCLA § 104(a)(1) sets out certain preconditions before a PRP may conduct an RI/FS. The PRP must show that it will carry out the work

promptly and properly, and it must agree to reimburse the Fund for any oversight costs.

307. 55 Fed. Reg. 8795 (Mar. 8, 1990).

308. CERCLA § 113(k)(2)(C), 42 U.S.C. § 9613(k)(2)(C), ELR STAT. CERCLA 052; NCP § 300.800(d), (e).

309. NCP § 300.430(f)(1)(ii)(B).

310. 55 Fed. Reg. 8795 (Mar. 8, 1990).

311. NCP § 300.425(d)(6); 55 Fed. Reg. 8699-8700 (Mar. 8, 1990).

312. 55 Fed. Reg. 8699-8700 (Mar. 8, 1990).

313. *See* Memorandum of Jonathan Z. Cannon, Acting Assistant Administrator for Solid Waste and Emergency Response, Performance of Five-Year Reviews and Their Relationship to the Deletion of Sites From the National Priorities List (NPL) (Superfund Management Review: Recommendation No. 2) (Oct. 30, 1989); Memorandum from Henry L. Longest II, Director, Office of Emergency and Remedial Response, Update to "Procedures for Completion and Deletion of National Priorities List Sites" — Guidance Document Regarding the Performance of Five-Year Reviews (Superfund Management Review: Recommendation No. 2), EPA/OSWER Directive No. 9320.2-3B (Dec. 29, 1989).

314. Reilly, *supra* note 39, at 7, 1-11.

315. 40 C.F.R. § 300.66(c)(7) (1985); NCP § 300.425(e).

316. CERCLA § 121(c), 42 U.S.C. § 9621(c), ELR STAT. CERCLA 051.

317. *See, e.g.*, CERCLA §§ 105(e), 121(c), 42 U.S.C. §§ 9605(e), 9621(c), ELR STAT. CERCLA 023, 051; 40 C.F.R. § 300.66(c)(8) (1985); NCP § 300.425(e)(3).

318. However, under at least one of the deferral options, all cleanups would have to have been of "CERCLA-quality." 53 Fed. Reg. 51417-18, 51419 (Dec. 21, 1988).

319. 55 Fed. Reg. 8667 (Mar. 8, 1990).

320. Where a federal agency sent wastes to a facility for treatment, storage, or disposal, the agency also may be identified as a PRP under CERCLA.

321. CERCLA § 120(a)(2), 42 U.S.C. § 9620(a)(2), ELR STAT. CERCLA 048. Federal facility cleanups may not be financed by the Fund. *See* CERCLA § 111(e)(3); Exec. Order No. 12580, § 9(i), 52 Fed. Reg. 2923, ELR ADMIN. MATERIALS 45031 (Jan. 29, 1987).

322. NCP § 300.430(f)(4)(iii), 52 Fed. Reg. 2923 (Jan. 29, 1987), ELR ADMIN. MATERIALS 45031.

Written comments should be sent to:
Sarah Jones, Environmental Review Officer | 1650 Mission Street, Suite 400 | San Francisco, CA 94103
or sarah.b.jones@sfgov.org

Approach to Analysis. In general, the proposed project could result in two types of air quality impacts. First, the project could result in air pollution through increased generation of air pollutants, due to increased vehicle travel, new stationary sources (i.e., four new diesel emergency generators, four emergency fire pumps, and one additional relocated diesel emergency generator), and construction activity. Second, the project site could increase the sensitive receptors in proximity to existing or new sources of air pollution, increasing air pollution exposure and hazard. This section describes the methodology used to evaluate project impacts related to consistency with the clean air plan, criteria pollutants, and local health risks and hazards.

Air Quality Plan. The applicable air quality plan is the BAAQMD's 2010 Clean Air Plan, which identifies measures to reduce emissions and reduce ambient concentrations of air pollutants; safeguard public health by reducing exposure to air pollutants that pose the greatest health risk, with an emphasis on protecting the communities most heavily affected by air pollution; and reduce greenhouse gas emissions to protect the climate. Consistency with the Clean Air Plan can be determined if the project supports the goals of the Clean Air Plan, includes applicable control measures from the Clean Air Plan, and if the project would not disrupt or hinder implementation of any control measures from the Clean Air Plan. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of an applicable air quality plan.

Criteria Air Pollutants. As described above under Regulatory Framework, the SFBAAB experiences low concentrations of most pollutants when compared to federal or State standards and is designated as either in attainment or unclassified for most criteria pollutants with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the State or Federal standards. By its very nature regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.[28]

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. **Table IV.F-5** identifies criteria air pollutant significance thresholds followed by a discussion of each threshold. Projects that would result in criteria pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

Table IV.F-5: Criteria Air Pollutant Significance Thresholds

Pollutant	Construction Thresholds Average Daily Emissions (pounds per day)	Operational Thresholds Average Daily Emissions (pounds per day)	Operational Thresholds Annual Average Emissions (tons per year)
ROG[a]	54	54	10
NOx	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not applicable	

[a] Reactive organic gas

Source: Bay Area Air Quality Management District, 2011.

The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NO_x, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day).[29] These levels represent emissions by

Impacts

This section analyzes the impacts related to air quality that could result from implementation of the proposed projects. The section begins with the significance criteria, which establish the thresholds for determining whether an impact is significant. The latter part of this section presents the impacts associated with the proposed projects. Project and cumulative impacts are considered, and mitigation measures are identified, as appropriate. The potential for the projects to expose persons to odors was addressed in the Initial Study (see page 97 of the Initial Study, included as Appendix A), and therefore is not discussed in this section.

Significance Criteria. Implementation of the SFMOMA Expansion and Fire Station Relocation and Housing Project would have a significant effect on air quality if it would:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal, State, or regional ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in a cumulative air quality impact in combination with past, present and reasonably foreseeable future projects in the vicinity.

The BAAQMD provides various quantitative thresholds that can be used to better define the above criteria. For ROG,[16] NO_x[17] or $PM_{2.5}$ an operational net increase of 54 pounds per day (or 10 tons per year) would be considered significant, while a net increase of PM_{10} of 82 pounds per day (or 15 tons

[16] Reactive Organic Gases (ROG) are classes of organic compounds that transform with heat and sunlight to form smog or ozone. The criteria air pollutant SO_2 is a reactive organic gas.

[17] Nitrogen Oxide (NO_x) refers to NO and NO_2. NO_2 is the indicator of the larger form of nitrogen oxides.

per year) would be significant. The BAAQMD also has construction related CEQA thresholds, including maximum average daily emissions for ROG and NO_x of 54 pounds per day, maximum PM_{10} exhaust emissions of 82 pounds per day and maximum $PM_{2.5}$ emissions of 54 pounds per day. (Implementation of the BAAQMD's best management practices are required to reduce fugitive dust PM_{10} and $PM_{2.5}$ emissions during construction to a less-than-significant level.) CO concentrations would be significant if the project leads to or contributes to CO concentrations exceeding the State Ambient Air Quality Standard of 9 ppm averaged over 8 hours and 20 ppm for 1 hour (i.e., if it creates a "hot spot"). Generally, if a project results in an increase in ROG, NO_x, or PM that exceeds the significance criteria, then it would also be considered to contribute considerably to a significant cumulative effect. For projects that would not lead to a significant increase of ROG, NO_x, or PM emissions, the cumulative effect is evaluated based on a determination of the consistency of the project with the regional Clean Air Plan.

For health risks and hazards resulting from emissions of TACs, the BAAQMD recommends either that a project be found to be in compliance with a "qualified community risk reduction plan," or that significance thresholds be used for both construction and operational emissions based on commonly-used standards employed in health risk assessment. The thresholds for project-specific impacts are an increase in lifetime cancer risk of 10 chances in one million, an increase in the non-cancer risk equivalent to a chronic or acute "hazard index" greater than 1.0, or an increase in the annual average concentration of $PM_{2.5}$ in excess of 0.3 $\mu g/m^3$. The City of San Francisco's threshold is more restrictive at 0.2 $\mu g/m^3$. The BAAQMD also recommends cumulative thresholds for cancer risk of 100 in one million, a hazard index greater than 10.0, and a $PM_{2.5}$ concentration greater than 0.8 $\mu g/m^3$. Unlike the volume-based thresholds for criteria pollutants noted above, the toxic air contaminant thresholds are used for specific receptor locations when a risk analysis is required for specific project components, such as stationary sources (common in industrial operations) or the use of diesel-powered equipment, including construction equipment.

It should be noted that the emission thresholds were established based on the attainment status of the air basin in regard to air quality standards for specific criteria pollutants. Because the concentration standards were set at a level that protects public health with an adequate margin of safety according to

The engine would likely be located in the basement with vents for exhaust and intake being oriented toward the north property line at or above the first floor. Development of the proposed project would introduce additional vehicular traffic in the project vicinity.

APPROACH TO ANALYSIS

This section discusses the thresholds for determining whether a project would result in a significant air quality impact. Table IV.G.4: Air Quality Significance Thresholds, below, summarizes the air quality thresholds of significance. The table is followed by a discussion of each threshold.

Table IV.G.4: Air Quality Significance Thresholds

	Construction Thresholds	Operational Thresholds	
Pollutant	**Average Daily Emissions (lb/day)**	**Average Daily Emissions (lb/day)**	**Annual Average Emissions (tons/year)**
Criteria Air Pollutants			
ROG	54	54	10
NOx	54	54	10
PM_{10}	82	82	15
$PM_{2.5}$	54	54	10
CO	Not Applicable	9.0 ppm (8-hour average) or 20.0 ppm (1-hour average)	
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	
Health Risks and Hazards for New Sources			
Excess Cancer Risk	10 per one million		
Chronic or Acute Hazard Index	1.0		
Incremental annual average $PM_{2.5}$	0.3 µg/m^3		
Health Risks and Hazards for Sensitive Receptors (Cumulative from Sources within 1,000-foot zone of influence) and Cumulative Thresholds for New Sources			
Excess Cancer Risk	100 per one million		
Chronic Hazard Index	10.0		
Annual Average $PM_{2.5}$	0.8 µg/m^3		

Although BAAQMD's adoption of significance thresholds in 2010 and 2011 are the subject of recent judicial actions, the Planning Department has determined that Appendix D of the BAAQMD *CEQA Air Quality Guidelines*,[26] in combination with BAAQMD's *Revised Draft*

concentrations of $PM_{2.5}$ from roadway sources within 500 feet of a project site would exceed a concentration of 0.2 micrograms per cubic meter (µg/m^3) (annual average).[3] This action level (of 0.2 µg/m^3) represents about 8 percent to 10 percent of the range of ambient $PM_{2.5}$ concentrations in San Francisco based on monitoring data, and is based on epidemiological research that indicates that such a increase in concentration can result in an approximately 0.28 percent increase in non-injury mortality, or an increased mortality rate of approximately 20 "excess deaths" per year per one million population in San Francisco.[4,5] If this standard is exceeded, Article 38 requires that the project applicant design the project to minimize air pollutants indoors or install a filtered air supply system, with high-efficiency filters.

The project site, at 8 Washington Street, is located within the Potential Roadway Exposure Zone, as mapped by DPH. In consultation with DPH, an Air Quality Assessment was prepared for the proposed project. Results of the assessment indicate that the project site does not exceed a $PM_{2.5}$ concentration greater than 0.2 micrograms per cubic meter.[6] Thus, the proposed project is not required to install a filtered air supply system as per the Health Code.

IMPACTS

SIGNIFICANCE THRESHOLDS

The Planning Department Initial Study Checklist, which incorporates Appendix G of the state CEQA Guidelines, provides a framework of topics to be considered in evaluating potential impacts under CEQA.

Implementation of a project could have a potentially significant impact related to air quality if the project were to:

[3] For purposes of evaluation of potential effects of $PM_{2.5}$ exposure, DPH also recommends analysis where there are more than 50,000 daily vehicles within 330 feet (100 meters) of the site, or more than 10,000 daily vehicles within 165 feet (50 meters). These latter two conditions are included to capture equivalent impacts from lesser concentrations of traffic in smaller areas than the ARB-recommended standard of 100,000 daily vehicles within 500 feet (150 meters) (CARB, *Air Quality and Land Use Handbook: A Community Health Perspective*, 2005).

[4] "Excess deaths" (also referred to as premature mortality) refer to deaths that occur sooner than otherwise expected, absent the specific condition under evaluation; in this case, exposure to $PM_{2.5}$.

[5] San Francisco Department of Public Health, Occupational and Environmental Health Section, Program on Health, Equity, and Sustainability, "Assessment and Mitigation of Air Pollutant Health Effects from Intra-urban Roadways: Guidance for Land Use Planning and Environmental Review," May 6, 2008. Twenty excess deaths per million based on non-injury, non-homicide, non-suicide mortality rate of approximately 714 per 100,000. Although San Francisco's population is less than one million, the presentation of excess deaths is commonly given as a rate per million population.

[6] Patrick Fosdahl, MS, REHS, San Francisco Department of Public Health, Letter to Paul Osmundson re: 8 Washington Street Air Quality Assessment, April 28, 2009. A copy of this letter is on file as part of Case No. 2007.0030E and available for public review at the Planning Department, 1650 Mission Street, Suite 400.

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable Federal or State ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; or
- Create objectionable odors affecting a substantial number of people.

For project-level impact analysis, the BAAQMD recommends various thresholds and tests of significance. BAAQMD significance thresholds are summarized in Table IV.E-3. However, on December 15, 2010, the District's Board of Directors revised the effective date for the risk thresholds for new receptors from January 1, 2011 to May 1, 2011. All other CEQA thresholds of significance adopted by the Board of Directors on June 2, 2010 remain effective as of June 2, 2010. In addition, BAAQMD Resolution No. 2010-06, which was approved by the BAAQMD Board of Directors on June 2, 2010, clarifies that it is BAAQMD's policy that the revised significance thresholds be applied to those of projects whose notices of preparation are issued (and environmental analyses begun) after June 2, 2010.[7] The following analysis of air quality impacts from the 8 Washington Street project is based on BAAQMD's most recent thresholds of significance and the BAAQMD CEQA Air Quality Guidelines, May 2011.

IMPACT EVALUATION

Project-related air quality impacts fall into two categories: short-term impacts due to construction, and long-term impacts due to project operation. First, during project construction, the project would affect local particulate concentrations primarily due to fugitive dust sources, as well as construction equipment exhaust. Over the long term, the project would result in an increase in emissions primarily due to increased motor vehicle trips and an emergency back up generator as required per the fire code. On-site stationary sources (such as natural gas boilers for water and space heating) and area sources (such as landscaping and use of consumer products) would result

[7] It is BAAQMD's policy that the risk and hazards thresholds for siting new receptors be applied to projects whose NOP was prepared after May 1, 2011.

Table IV.E-3: BAAQMD Air Quality Project-Level Thresholds of Significance

Pollutant	Construction-Related	Operational-Related	
Criteria Air Pollutants and Precursors (Regional)	Average Daily Emissions (lbs/day)	Average Daily Emissions (lbs/day)	Maximum Annual Emissions (tons/year)
ROG	54	54	10
NO_x	54	54	10
PM_{10} (Exhaust)	82	82	15
$PM_{2.5}$ (Exhaust)	54	54	10
PM_{10}/$PM_{2.5}$ (Fugitive Dust)	Best Management Practices	None	
Local CO	None	9.0 ppm (8-hour average), 20.0 ppm (1-hour average)	
Risks and Hazards (Individual Projects)	Same as Operational Thresholds	Compliance with a Qualified Community Risk Reduction Plan OR Increased cancer risk of >10.0 in a million OR Increased non-cancer risk of >1.0 Hazard Index (Chronic or Acute) Ambient $PM_{2.5}$ increase > 0.3 µg/m^3 annual average	
Risks and Hazards (Cumulative Threshold)	Same as Operational Thresholds	Compliance with a Qualified Community Risk Reduction Plan OR Cancer: > 100 in a million (from all local sources) Non-cancer: >10.0 Hazard Index)from all local sources) $PM_{2.5}$ > 0.8 µg/m^3 annual average (from all local sources)	
Odors	None	5 confirmed complaints per year averaged over 3 years	

Notes: CO = carbon monoxide; lb/day = pounds per day; NO_X = oxides of nitrogen; $PM_{2.5}$= fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM_{10} = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less; ppm = parts per million; ROG = reactive organic gases.

Source: Bay Area Air Quality Management District, *CEQA Air Quality Guidelines*, May 2011.

in lesser quantities of pollutant emissions. This section addresses both project-specific impacts, and whether the project will make a cumulatively considerable contribution to cumulative air quality impacts; in each instance, the text makes clear whether the analysis addressed project-specific or cumulative impacts. .

The proposed project would include residential and retail uses not typically associated with noxious odors. Therefore, the proposed project would not create objectionable odors affecting a substantial number of people, and odors are not discussed further in this section.

Impact AQ-1: Construction of the proposed project would not violate an air quality standard or contribute to an existing or projected air quality violation, either individually or cumulatively. *(Less than Significant)*

Demolition, grading, and new construction activities would temporarily affect local air quality during project construction, causing temporary increases in criteria pollutants. These include emissions generated from construction activities, combustion emissions of criteria air pollutants (reactive organic gases [ROG], nitrogen oxides [NOx], carbon monoxide [CO], sulfur oxides [SOx], and PM_{10} and $PM_{2.5}$) primarily from operation of construction equipment and worker vehicles, and evaporative emissions (ROG) from asphalt paving and architectural coating applications.

Construction-related emissions of criteria air pollutants and precursors were modeled in accordance with BAAQMD-recommended methodologies. Emissions of criteria air pollutants and precursors were modeled based on California Emissions Estimator Model (CalEEMod) defaults for construction equipment and the anticipated schedule for construction of the proposed project. The project applicant provided outlines of construction phasing and scheduling which were used to run CalEEMod. Construction would involve demolition of 4,900 sq. ft. of existing structures and construction of 165 residential units along with 41,900 sq. ft. of commercial/retail space and 185,000 sq. ft. of parking garage. Demolition and construction would occur over a 28-month period assumed to occur between January 1, 2012 and May 1, 2014.

Table IV.E-4 summarizes the modeled construction-related emissions of each criteria air pollutant and precursor. As shown in the table, construction-related emissions would be below the BAAQMD thresholds of significance. Thus, construction of the proposed project would have a less-than-significant effect on air quality standards.

Table IV.E-4: Estimated Average Daily Construction Emissions

	Projected Emissions (Pounds per Day)[1]			
	ROG	**NO_X**	**PM_{10}**	**$PM_{2.5}$**
Average Daily Emissions	35.63	47.63	2.01	2.01
BAAQMD Threshold	54	54	82	54

Note:
[1] Emission factors were generated by the URBEMIS 2007 (v. 9.2.4) model for San Francisco County for summer conditions.

Source: Donald Ballanti, *Criteria Air Pollutant Impact Report for the 8 Washington Street Project, San Francisco*, April 2011.

Project emissions would not exceed the BAAQMD construction criteria air pollutant thresholds of significance. BAAQMD CEQA guidance provides that, if a project results in an increase in ROG, NOx, $PM_{2.5}$, or PM_{10} of more than their respective daily or annual mass thresholds, then it would also be considered to contribute considerably to a significant cumulative air quality impact. Since construction of the project would not exceed the daily mass emissions thresholds, the project would not contribute considerably to a significant cumulative effect with respect to construction-related criteria pollutant emissions, and cumulative construction criteria air pollutant impacts would be less than significant.

Impact AQ-2: The proposed project would not result in significant impacts related to fugitive dust resulting from project construction activities. *(Less than Significant)*

Project-related demolition, excavation, grading and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Dust can cause watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, grading and

Environmental Review Officer | 1650 Mission Street, Suite 400 | San Francisco, CA 94103

Plan represents the Bay Area's most recent triennial assessment of the region's strategy to attain the state one-hour ozone standard.

AIR RESOURCE BOARD (ARB) IDLING REGULATIONS

In 2005, the ARB approved a regulatory measure to reduce emissions of toxic and criteria air pollutants by limiting the idling of new heavy-duty diesel vehicles. The regulations generally limit idling of commercial motor vehicles (including buses and trucks) within 100 feet of a school or residential area for more than five consecutive minutes or periods aggregating more than five minutes in any one hour.[155] Buses or vehicles also must turn off their engines upon stopping at a school and must not start their engines more than 30 seconds before beginning to depart from a school. In addition, state law SB 351 (adopted in 2003) prohibits locating public schools within 500 feet of a freeway or busy traffic corridor.

Regional and Local Air Quality Planning

BAY AREA AIR QUALITY MANAGEMENT DISTRICT (BAAQMD)

The BAAQMD is the regional agency with jurisdiction for regulating air quality within the nine-county Bay Area Air Basin. ABAG, MTC, county transportation agencies, cities and counties, and various non-governmental organizations also join in the efforts to improve air quality through a variety of programs. These programs include the adoption of regulations and policies, as well as implementation of extensive education and public outreach programs.

BAAQMD is responsible for managing region-wide emissions to meet federal and State air quality standards in the Bay Area Air Basin. Specifically, BAAQMD has the responsibility to monitor ambient air pollutant levels throughout the Air Basin and to develop and implement strategies to attain the applicable federal and State standards. As mentioned above, the BAAQMD, in cooperation with the MTC and Association of Bay Area Governments (ABAG), adopted the 2010 Clean Air Plan on September 15, 2010, to replace the Bay Area 2005 Ozone Strategy.

In 1999, BAAQMD adopted its *CEQA Guidelines* as a guidance document to provide lead government agencies, consultants, and project proponents with uniform procedures for assessing air quality impacts

[155] There are 12 exceptions to this requirement (e.g., emergency situations, military, adverse weather conditions, etc.), including: when a vehicle's power takeoff is being used to run pumps, blowers, or other equipment; when a vehicle is stuck in traffic, stopped at a light, or under direction of a police officer; when a vehicle is queuing beyond 100 feet from any restricted area; or when an engine is being tested, serviced, or repaired.

and preparing the air quality sections of environmental documents for projects subject to CEQA. In June 2010, BAAQMD board adopted revised thresholds of significance for air quality impacts. BAAQMD is the regional agency for air quality. Therefore, the Air District's guidelines and thresholds are commonly used in CEQA analysis, and are normally relied upon by the Planning Department for its significance determinations.

SAN FRANCISCO GENERAL PLAN AIR QUALITY ELEMENT

The San Francisco *General Plan* (*General Plan*) includes the 1997 Air Quality Element. The objectives specified by the City include the following:

- ***Objective 1:*** Adhere to state and federal air quality standards and regional programs.
- ***Objective 2:*** Reduce mobile sources of air pollution through implementation of the Transportation Element of the *General Plan*
- ***Objective 3:*** Decrease the air quality impacts of development by coordination of land use and transportation decisions.
- ***Objective 4:*** Minimize particulate matter emissions from road and construction sites.
- ***Objective 5:*** Link the positive effects of energy conservation and waste management to emission reductions.

SAN FRANCISCO DUST CONTROL ORDINANCE

The San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6 collectively constitute the Construction Dust Control Ordinance. The Ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco comply with specified dust control measures. This requirement applies to all site preparation work that has the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil whether or not the activity requires a permit from the Department of Building Inspection (DBI).

Dust suppression activities may include (1) watering all active construction areas sufficiently to prevent dust from becoming airborne and (2) more frequent watering when wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. If not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating run-off in any area of land clearing, and/or earth movement). During excavation and dirt-moving activities, contractors shall wet sweep or vacuum the streets, sidewalks, paths, and intersections where work is in progress at the end of the workday. Inactive stockpiles (where no disturbance occurs for more than seven days) greater than 10 cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and soil shall be covered with a 10 millimeter (0.01 inch) polyethylene plastic (or equivalent) tarp, braced down, or use other equivalent soil stabilization techniques.

For project sites greater than one half-acre in size, the Ordinance requires that the project sponsor submit a Dust Control Plan for approval by the San Francisco Health Department. Interior-only tenant improvements, even if over one-half acre, that will not produce exterior visible dust are exempt from the site-specific Dust Control Plan requirement. As both project sites are greater than one-half acre, this requirement would apply to the proposed project, or either variant.[156]

SAN FRANCISCO HEALTH CODE PROVISIONS REGARDING ROADWAY GENERATED POLLUTANTS

Article 38 of the San Francisco Health Code requires an Air Quality Assessment be prepared for new residential projects of 10 or more units located in proximity to high-traffic roadways, as mapped by DPH, in order to determine whether residents would be exposed to potentially unhealthful levels of PM2.5. Consistent with CARB guidance, the San Francisco Department of Public Health (DPH) has identified that a potential public health hazard for sensitive land uses exists when such uses are located within a 150-meter (approximately 500-foot) radius of any roadway that experiences 100,000 vehicles per day. If a proposed project's air quality assessment shows that annual average concentration of PM2.5 from roadway sources would exceed a concentration of 0.2 micrograms per cubic meter (annual average), then the project sponsor must install a filtered air supply system, with high-efficiency filters, designed to remove at least 80 percent of ambient PM2.5 from habitable areas of residential units.

The project sites are located within the Roadway Exposure Zone, and is therefore subject to Article 38. Accordingly, DPH conducted an exposure analysis for PM2.5, which found that both project sites exceeded the current action level of 0.2 ug/m3. The highest level at 801 Brannan was 0.57 ug/m3 and the highest level at One Henry Adams was 0.39 ug/m3. Based on these results, the proposed project, or either variant, is required to incorporate filtration into the building design as discussed above (see also Mitigation Measure M-AQ-8, page 284).[157]

[156] The 801 Brannan site is approximately 5.21 acres. The One Henry Adams site is approximately 1.65 acres.

[157] Thomas Rivard, San Francisco Department of Public Health, Toxic Air Contaminant Exposure Analysis for the 801 and One Henry Adams Streets Project, Letter from Thomas Rivard to Stu During, December 23, 2008.This letter is on file and available for public review at the San Francisco Planning Department, 1650 Mission Street, Fourth Floor, San Francisco, as part of Case File 2000.618E.

IMPACTS

Air quality impacts from land development projects result from project construction and operation. Construction emissions, primarily dust generated by earthmoving activities and criteria air pollutants emitted by construction vehicles, would have a short-term effect on air quality. Operational emissions, generated by project-related traffic and by combustion of natural gas for building space and water heating, would continue to affect air quality throughout the lifetime of the project.

Significance Criteria

A project would have a significant air quality effect on the environment if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation.
- Result in a cumulatively considerable net increase of any criteria air pollutant for which the project region is non-attainment under an applicable federal, state, or regional ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).
- Expose sensitive receptors to substantial pollutant concentrations.
- Create objectionable odors affecting a substantial number of people.

As stated above, in 2010 BAAQMD adopted new significance thresholds for air quality for CEQA analysis. Under the new BAAQMD *CEQA Air Quality Guidelines* and thresholds,[158] the significance thresholds for criteria air pollutant emissions from project construction and operations have generally been lowered. The new thresholds are as follows: for ROG, NOx, and PM2.5, a net increase of 54 pounds per day or 10 tons per year (tpy) would be considered significant, while for PM10, a net increase of 82 pounds per day or 15 tpy would be considered significant. For CO, an increase would be considered significant if it leads to or contributes to CO concentrations exceeding the State Ambient Air Quality Standard (SAAQS). Quantification of the CO concentrations would not be required if a project is consistent with the local congestion management program and plans, and if traffic volumes at affected intersections are below 44,000 vehicles per hour, or below 24,000 vehicles per year in tunnel-like conditions. For construction-period impacts, the same thresholds apply for ROG, NOx, PM2.5, and PM10, except that the thresholds for PM2.5 and PM10 apply only to exhaust emissions. There are no quantitative thresholds for construction dust emissions; instead, impacts are considered less than significant if the

[158] BAAQMD, *California Environmental Quality Act (CEQA) Air Quality Guidelines*, June 2010; and adopted Thresholds of Significance, June 2010. Available online at http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Updated-CEQA-Guidelines.aspx, accessed May 2, 2011.

BAAQMD Best Management Practices are employed to control dust during construction activities, including demolition and excavation.

BAAQMD considers projects that exceed these criteria air pollutant standards also to result in a cumulatively considerable air quality impact upon the region. According to BAAQMD, no further cumulative analysis should be required beyond the analysis of whether a proposed project's impacts would contribute considerably to ambient levels of pollutants or GHGs,[159] with the exception of the following cumulative risk and hazard analysis for toxic air contaminants.

For health risks and hazards resulting from emissions of toxic air contaminants, BAAQMD recommends either that a project be found to be in compliance with a "qualified community risk reduction plan," or that significance thresholds be used for both construction and operational emissions based on commonly used standards employed in health risk assessment. The following are thresholds for project-specific impacts: (1) an increase in lifetime cancer risk of 10 chances in one million, (2) an increase in the non-cancer risk equivalent to a chronic or acute "Hazard Index" greater than 1.0,[160] or (3) an increase in the annual average concentration of PM2.5 in excess of 0.3 micrograms per cubic meter. BAAQMD also recommends cumulative thresholds of 100-in-one-million cancer risk, a Hazard Index greater than 10.0, and a PM2.5 concentration greater than 0.8 micrograms per cubic meter. Unlike the volume-based thresholds for criteria air pollutants noted above, the toxic air contaminant thresholds are used for specific receptor locations when a risk analysis is required for specific project components, such as stationary sources (common in industrial operations) or the use of diesel-powered equipment, including construction equipment.

Approach to Analysis

The URBEMIS model was used to determine the proposed project's criteria air pollutant emissions as well as those from the two variants. A Health Risk Assessment was also conducted to determine if the proposed project would expose sensitive receptors to substantial levels of pollution. The results of these analyses are presented in an Air Quality Technical Report for this project (AQTR).[161] This methodology section summarizes the approaches, while more detail is provided in the impact analysis.

[159] *Ibid.*

[160] Hazard Index represents the ratio of expected exposure levels to an acceptable reference exposure levels.

[161] Donald Ballanti, Certified Consulting Meteorologist, *Air Quality Impact Report and Health Risk Assessment for the 801 Brannan and One Henry Adams Project* (AQTR), San Francisco, March 4, 2011, p. 4-5. This analysis is available for public review at the San Francisco Planning Department, 1650 Mission Street, Fourth Floor, San Francisco as part of Case File 2000.618E.

- Pave, apply water at a minimum three times daily in dry weather, or apply non-toxic soil stabilizers to all unpaved access roads, parking areas, and staging areas;
- Sweep daily (with water sweepers) all paved access roads, parking areas, and staging areas;
- Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public street areas;
- Hydroseed or apply non-toxic soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more);
- Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles (dirt, sand, etc.);
- Limit traffic speeds on unpaved roads to 15 miles per hour;
- Install sandbags or other erosion control measures to prevent silt runoff to public roadways;
- Replant vegetation in disturbed areas as quickly as possible;
- Install wheel washers for all exiting trucks, or wash off the tires of all trucks and equipment prior to leaving the site;
- Install wind breaks, or plant trees/vegetative wind breaks at windward side(s) of construction areas;
- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 mph; and
- Limit the area subject to excavation, grading, and other construction activity at any one time.
- Post a publicly visible sign with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond shall respond and take corrective action within 48 hours. The Air District's phone number shall be visible to ensure compliance with applicable regulations.

Therefore, compliance with the Dust Control Ordinance would reduce construction dust that the proposed project, or either variant, would generate to a less-than-significant level.

The proposed project, or either variant, must also comply with California Occupational Safety and Health Administration (Cal/OSHA) regulations, standards and procedures and California Department of Health Services (DHS) Lead Work Practice Standards. These regulations are designed to minimize worker and general public exposure to hazardous building materials.

The above regulations and procedures, already established and enforced as part of the permit review process, would ensure that any potential air emissions impacts due to dust, asbestos, lead, PM10, PM2.5, or other hazardous materials associated with construction of the proposed project, or either variant, would be ***less than significant***.

Impact AQ-2: Construction emissions under the proposed project, or either variant, would not violate an air quality standard or contribute significantly to an existing or projected air quality violation. (Less than Significant)

The air quality technical report prepared for this project provides the results of construction criteria air pollutant emissions modeling conducted for the proposed project, or either variant, and these results are summarized below. Construction phasing and scheduling information obtained from the project sponsor was used to run the construction module of the URBEMIS-2007 model. The construction phasing for the 801 Brannan and One Henry Adams sites are different, so a separate construction analysis was performed for each site. Construction at the 801 Brannan site would involve demolition of a 137,000 square foot building and construction of 585 residential units along with 30,417 square feet of commercial space. Demolition and construction would occur over a 24-month period assumed to occur between fall 2012 and fall 2014. Construction at the One Henry Adams site would involve demolition of three buildings totaling 29,164 square feet and construction of 239 residential units along with 9,070 square feet of commercial space. Demolition and construction would occur over an 18-month period assumed to occur between fall 2012 and summer 2014. Construction phasing and activity under either variant would not differ substantially, if at all, from that of the proposed project.

The volume of construction debris for each phase was estimated based on the square footage and height of buildings. Default values in the URBEMIS Program for truck capacity and trip length were utilized. URBEMIS default values were also used for equipment types and numbers during each phase of construction. As directed by current BAAQMD CEQA guidance, a surrogate five percent reduction in off-road exhaust emissions of NOx, PM10, and PM2.5 was used to account for standard mitigation measures required of all projects.[166] The URBEMIS-2007 program calculated annual emissions for each year of construction. The totals for each site were added, and the maximum annual emissions was divided by the number of construction days (22 days per month, 260 per year) for the year to obtain the average daily construction emission in pounds per day. The volume of construction debris under either variant would be the same as under the proposed project.

Table 19 on the following page shows that the highest estimated average daily construction emissions of criteria air pollutants (ROG, NOx, PM10, PM2.5) in pounds per day over the three phases of construction would not exceed the project-level BAAQMD thresholds of significance, either singly or cumulatively. Therefore, construction emissions of criteria air pollutants under the proposed project, or either variant, would be ***less than significant***.

[166] BAAQMD, *CEQA Air Quality Guidelines*, June 2010, *op. cit*. Table 8-4, page 8-6 and Appendix B, page B-11.

Table 19
Average Daily Construction Emissions of Criteria Air Pollutants
(Pounds per Day)

	ROG	NOx	PM10	PM2.5
801 Brannan site	28.0	22.07	17.27	4.36
One Henry Adams site	20.50	13.63	6.45	1.81
Total	48.50	35.70	23.77	6.17
BAAQMD Threshold of Significance	**54.00**	**54.00**	**82.00**	**54.00**

Notes:
- ROG = Reactive Organic Gases
- NOx = Nitrogen Oxides
- PM10 = Particulate Matter, 10 microns
- PM2.5 = Particulate Matter, 2.5 microns

Source: Donald Ballanti, *Air Quality Impact Report and Health Risk Assessment for the 801 Brannan/1Henry Adams Project*, San Francisco, March 2011, Table 1.

Impact C-AQ-3: Construction of the proposed project, or either variant, would not violate air quality standards or generate a cumulatively considerable increase in criteria air pollutant emissions. (Less than Significant)

BAAQMD CEQA guidance indicates that if an action does not result in a significant impact, then it would not contribute considerably to a significant cumulative effect. During construction of the proposed project, the highest average daily emissions of criteria air pollutants would not exceed the BAAQMD thresholds of significance (see Table 19) and there are no other nearby proposals with overlapping construction schedules that would generate a cumulatively considerable increase in criteria air pollutant emissions. Therefore, construction of the project, or either variant, would not contribute considerably to a significant cumulative impact on criteria air pollutant emissions, and would result in a ***less-than-significant*** impact.

Impact AQ-4: Operation of the proposed project, or either variant, would violate air quality standards with respect to, or generate a cumulatively considerable increase in, criteria air pollutants. (Significant and Unavoidable)

Operational emissions associated with the proposed project were calculated using the URBEMIS-2007 program. URBEMIS-2007 is a program developed specifically to quantify mobile and area source emissions from projects in California. Inputs to the URBEMIS-2007 program include trip generation rates, vehicle mix, average trip length by trip type and average speed. Default trip lengths and average trip speeds for San Francisco County were used. Project trip generation estimates from the project transportation report were used. URBEMIS-2007 requires that a project size be input for each land use.

In 1988, California passed the California Clean Air Act (California Health and Safety Code Sections 39600 et seq.), which, like its federal counterpart, called for the designation of areas as attainment or nonattainment, but based on state ambient air quality standards rather than the federal standards. As indicated in Table 32, the Bay Area Air Basin is designated as "nonattainment" for state ozone, PM_{10}, and $PM_{2.5}$ standards. The Air Basin is designated as "attainment" for all other pollutants listed in the table.

California Air Resources Board

CARB is the state agency responsible for regulating air quality. CARB's responsibilities include establishing state ambient air quality standards, emissions standards, and regulations for mobile emissions sources (e.g., autos, trucks, etc.), as well as overseeing the efforts of countywide and multi-county air pollution control districts, such as the BAAQMD, which have primary responsibility over stationary sources.

Bay Area Air Quality Management District

The BAAQMD regulates air quality through its planning and review activities. The district has permit authority over most types of stationary emission sources and can require stationary sources to obtain permits; it can also impose emission limits, set fuel or material specifications, or establish operational limits to reduce air emissions. The BAAQMD regulates new or expanding stationary sources of toxic air contaminants. However, the district has no direct regulatory authority over mobile sources (e.g., cars and trucks), nor does it have permit authority over transportation terminals, such as the new Transit Center, currently under construction to replace the Transbay Terminal.

Air Quality Plans to Achieve Compliance with State Standards

Air quality plans developed to meet federal requirements are referred to as State implementation Plans. The federal Clean Air Act and the California Clean Air Act require plans to be developed for areas designated as non-attainment (with the exception of areas designated as non-attainment for the State particulate matter standards plans for which are not required by California Code of Regulations). In September 2010, BAAQMD adopted the *2010 Bay Area Clean Air Plan*, which updated the *2005 Ozone Strategy*, and also to function as a "multi-pollutant plan to protect public health and the climate."[222] This plan includes ozone control measures and also consider the impacts of these control measures on particulate matter (PM), air toxics, and Greenhouse Gas Emissions (GHGs) in a single, integrated plan.

The *2010 Clean Air Plan* explains how the Basin will achieve compliance with the State one-hour air quality standard for ozone as expeditiously as practicable and how the region will reduce transport of ozone and ozone precursors to neighboring air basins. The Strategy also discusses related air quality issues of interest including the BAAQMD's public involvement process, climate change, fine particulate matter, BAAQMD's Community Air Risk Evaluation program, local benefits of ozone control measures, the environmental review process, national ozone standards, and photochemical modeling.

[222] BAAQMD, *2010 Clean Air Plan*, September 2010. Available on the internet at: http://www.baaqmd.gov/Divisions/Planning-and-Research/Plans/Clean-Air-Plans.aspx.

In 1999, BAAQMD adopted its *CEQA Guidelines – Assessing the Air Quality Impacts of Projects and Plans*, as a guidance document to provide lead government agencies, consultants, and project proponents with uniform procedures for assessing air quality impacts and preparing the air quality sections of environmental documents for projects subject to CEQA. These BAAQMD Guidelines were revised and updated in June 2010, as the *BAAQMD CEQA Air Quality Guidelines*.

The 2010 *BAAQMD CEQA Air Quality Guidelines* is an advisory document and local jurisdictions are not required to utilize the methodology outlined therein, but the document is commonly relied upon by local agencies, including the San Francisco Planning Department.[223] The document describes the criteria that BAAQMD uses when reviewing and commenting on the adequacy of environmental documents. It recommends thresholds for use in determining whether projects would have significant adverse environmental impacts, identifies methodologies for predicting project emissions and impacts, and identifies measures that can be used to avoid or reduce air quality impacts. In practice, most local agencies rely on the *BAAQMD CEQA Air Quality Guidelines* when assessing the significance of air quality impacts.

Air Quality Plans to Achieve Compliance with Federal Standards

In response to the EPA re-designation of the basin for the 1-hour federal ozone standard to nonattainment, the BAAQMD, ABAG, and MTC were required to develop an ozone attainment plan to meet this standard. The *1999 Ozone Attainment Plan* was prepared and adopted by these agencies in June 1999. However, in March 2001, the EPA proposed and took final action to approve portions of the 1999 ozone plan and disapprove other portions, while also making the finding that the Bay Area had not attained the national 1-hour ozone standard. As a result, a revised Ozone Attainment Plan was prepared and adopted in October 2001. The 2001 Ozone Attainment Plan amends and supplements the 1999 plan. The 2001 Ozone Attainment Plan contains control strategies for stationary and mobile sources. The adopted mobile-source control program was estimated to substantially reduce volatile organic compound and NOx emissions between 2000 and 2006, reducing emissions from on- and off-road diesel engines (including construction equipment). In addition to emission reduction requirements for engines and fuels, the 2001 Ozone Attainment Plan identified 28 transportation control measures to reduce automobile emissions, including improved transit service and transit coordination, new carpool lanes, signal timing, freeway incident management, and increased state gas tax and bridge tolls.

San Francisco Policies and Ordinances

San Francisco General Plan Air Quality Element

The Air Quality Element of the *San Francisco General Plan* is composed of six sections, each of which focuses on different aspects of air quality improvement efforts. They are: (1) adherence to air quality standards, (2) improvements related to mobile sources, (3) land use planning, (4) public awareness, (5) reduction of dust, and (6) energy conservation. The overarching goal of the Air Quality Element is to "Give high priority to air quality improvement in San Francisco to protect its population from adverse

[223] BAAQMD, *CEQA Guidelines*, May 2011. See footnote 205, p. 370.

(2) Would the projected rate of increase in vehicle miles traveled or vehicle trips under the plan would be less than or equal to the projected rate of population increase under the plan.

If the two foregoing questions can be answered in the affirmative, the plan would neither:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation; nor
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).[228]

Community Risk and Hazard Impacts

This analysis also responds to the criterion that asks whether the proposed plan would:

- Expose sensitive receptors to substantial pollutant concentrations.

For plan-related health risks and hazards resulting from emissions of toxic air contaminants, BAAQMD recommends that overlay zones be established around existing and proposed land uses that emit TACs. These overlay zones should be included in proposed plan policies, land use maps, and implementing ordinances. Additionally, the plan must "identify goals, policies, and objectives to minimize potential impacts."[229]

Odors

For odors, a plan must identify the location of existing and planned odor sources in the Plan area. The plan must also include policies to reduce potential odor impacts in the Plan area. Typical odor sources of concern include wastewater treatment plants, sanitary landfills, transfer stations, composting facilities, petroleum refineries, asphalt batch plants, chemical manufacturing facilities, fiberglass manufacturing facilities, auto body shops, rendering plants, and coffee roasting facilities. Given that the draft Plan would not locate sensitive receptors within close proximity to these types of facilities and would not include development of such facilities, it can be reasonably concluded that no odor impact would occur. Therefore, impacts related to odor are not discussed further in this EIR.

Transit Tower

Project level thresholds of significance set by the BAAQMD reflect the level at which a project's individual emissions would result in a cumulatively considerable contribution to an existing air quality problem; therefore, if project impacts identified are significant, impacts would also be cumulatively considerable. As stated in the BAAQMD *CEQA Air Quality Guidelines*:

> Past, present and future development projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact.

[228] The bulleted statements are the first three significance criteria in the City's CEQA Initial Study checklist.
[229] BAAQMD *CEQA Air Quality Guidelines* (see footnote 205, p. 370); p. 9-71.

> No single project is sufficient in size to, by itself, result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a project's contribution to the cumulative impact is considerable, then the project's impact on air quality would be considered significant.[230]

According to BAAQMD, no further cumulative analysis should be required beyond the analysis of whether a proposed project's impacts would contribute considerably to ambient levels of pollutants or greenhouse gases,[231] with the exception of the above-noted cumulative risk and hazard analysis for toxic air contaminants.

Criteria Air Pollutants

The BAAQMD-recommended significance thresholds for criteria pollutant emissions from operations of an individual project, such as the proposed Transit Tower, are as follows: for ROG, NOx and $PM_{2.5}$, a net increase of 54 pounds per day or 10 tons per year would be considered significant, while for PM_{10}, a net increase of 82 pounds per day or 15 tons per year would be considered significant. For CO, an increase would be considered significant if it leads to or contributes to CO concentrations exceeding the State Ambient Air Quality Standard, although quantification would not be required if a project is consistent with the local congestion management program and plans and traffic volumes at affected intersections are below 24,000 vehicles per hour. For construction-period impacts, the same thresholds apply for ROG, NOx, $PM_{2.5}$, and PM_{10}, except that the thresholds for $PM_{2.5}$ and PM_{10} apply only to exhaust emissions, and thresholds are specifically based on average daily emissions. There are no quantitative thresholds for construction dust emissions; instead, impacts are considered less than significant if standard best management practices are employed to control dust during construction activities, including demolition and excavation.

Community Risk and Hazard Impacts

With respect to risk and hazard impacts. BAAQMD recommends either that a project be found to be in compliance with a "qualified Community Risk Reduction Plan," or that significance thresholds be used for both construction and operational emissions based on commonly used standards employed in health risk assessment. The thresholds for project-specific impacts are: an increase in lifetime cancer risk of 10 chances in one million, an increase in the non-cancer risk equivalent to a chronic or acute "Hazard Index" greater than 1.0,[232] or an increase in the annual average concentration of $PM_{2.5}$ in excess of 0.3 micrograms per cubic meter. BAAQMD also recommends cumulative thresholds of 100 in one million cancer risk, a chronic Hazard Index greater than 10.0, and a $PM_{2.5}$ concentration greater than 0.8 micrograms per cubic meter. Unlike the volume-based thresholds for criteria pollutants noted above, the toxic air contaminant thresholds are used for specific receptor locations when a risk analysis is required for specific project components, such as permitted stationary sources (boilers, emergency generators, etc.), non-permitted sources such as the new Transit Center, or the use of diesel-powered

[230] BAAQMD *CEQA Air Quality Guidelines* (see footnote 205, p. 370); p. 2-1.
[231] *Ibid*.
[232] Hazard Index represents the ratio of expected exposure levels to an acceptable reference exposure levels.

sources, and would also generate emissions of both criteria air pollutants and toxic air contaminants in construction equipment exhaust. Over the long term, the project would result in an increase in emissions primarily due to increased motor vehicle trips, as well as from operation of on-site stationary sources—in this case, a backup generator. Area sources (such as landscaping and use of consumer products) would result in lesser quantities of pollutant emissions.

Construction Air Quality Impacts

Impact AQ-6: Construction of the Transit Tower would result in emissions of criteria air pollutants, including ozone precursors, that would contribute to an existing or projected air quality violation or result in a cumulatively considerable increase in criteria pollutants, and could expose sensitive receptors to construction dust. (Less than Significant)

Demolition, grading and new construction activities would temporarily affect local air quality during the project's proposed 3-year construction schedule, causing temporary increases in particulate dust and other pollutants. Emissions generated from construction activities include combustion emissions of criteria air pollutants (reactive organic gases [ROG], nitrogen oxides [NOx], carbon monoxide [CO], sulfur oxides [SOx], and PM_{10} and $PM_{2.5}$) primarily from operation of construction equipment and worker vehicles, evaporative criteria pollutant emissions (ROG) from asphalt paving and architectural coating applications, and dust (including PM_{10} and $PM_{2.5}$) primarily from "fugitive" sources; that is, dust generated by construction activities and that escapes from the construction site.

Criteria Air Pollutants

Criteria pollutant emissions of ROG, NOx, PM_{10}, and $PM_{2.5}$ from construction equipment would incrementally add to the regional atmospheric loading of these pollutants during project construction. The BAAQMD *CEQA Air Quality Guidelines* recommend the quantification of project related exhaust emissions and comparison of the emissions to its new significance thresholds. Therefore, daily project construction exhaust emissions that would be associated with the proposed project have been estimated and are presented in **Table 34**.

As indicated in Table 34, emissions from project construction would not exceed the BAAQMD's significance thresholds. Even though construction-related emissions would not exceed the BAAQMD's significance thresholds for criteria pollutants, Implementation of Improvement Measure I-AQ-6 would further reduce the less-than-significant emissions from construction vehicles, and would be consistent with the BAAQMD's basic emissions control measures for all projects.

Improvement Measure

I-AQ-6 **Construction Vehicle Emissions Minimization:** To reduce construction vehicle emissions, the project sponsor shall incorporate the following into construction specifications:

- All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

TABLE 34
TRANSIT TOWER PROJECT CONSTRUCTION EXHAUST EMISSIONS ESTIMATES

	Estimated Daily Emissions (pounds per day)[a]			
Construction Phase and Year	**ROG**	**NOx**	**PM10[b]**	**PM2.5[b]**
2013	14.4	43.1	1.9	1.7
2014	2.9	12.1	0.6	0.6

Fugitive Dust

For fugitive dust, the BAAQMD recommends a "best management practices" approach for dust control. Project-related demolition, excavation, grading and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Although there are federal standards for air pollutants and implementation of state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. California has found that particulate matter exposure can cause health effects at lower levels than national standards. The current health burden of particulate matter demands that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. According to the California Air Resources Board, reducing ambient particulate matter from 1998 – 2000 levels to natural background concentrations in San Francisco would prevent over 200 premature deaths.

Dust can be an irritant causing watering eyes or irritation to the lungs, nose and throat. Demolition, excavation, grading and other construction activities can cause wind-blown dust to add to particulate matter in the local atmosphere. Depending on exposure, adverse health effects can occur due to this particulate matter in general and also due to specific contaminants such as lead or asbestos that may be constituents of soil.

In response, as noted under Regulatory Setting (p. 383), the San Francisco Board of Supervisors approved a series of amendments to the *San Francisco Building* and *Health Codes* generally referred hereto as the Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008) with the intent of reducing the quantity of dust generated during site preparation, demolition and construction work in order to protect the health of the general public and of onsite workers, minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI).

Level of Significance After Mitigation

Implementation of the above measure would result in the maximum feasible reduction of diesel emissions that would contribute to construction-period health risk, thereby lowering both lifetime cancer risk and the concentration of $PM_{2.5}$ to which receptors would be exposed. Furthermore, the above analysis indicates that use of interim Tier 4 diesel construction equipment or Tier 2/ Tier 3 equipment with Level 3 VDECS would reduce the health risk to a level that would not exceed any of the significance thresholds identified by the BAAQMD. It is also noted that construction emissions could be lower if newer equipment is employed or less powerful or smaller diesel equipment is used than assumed in the analysis. Emissions could also be higher if more or larger diesel equipment is used. Depending on the regulations in place at the time construction begins, and depending on the precise mix of diesel-powered construction equipment employed, it is possible that the impact would be reduced to a less-than-significant level. However, because it cannot be stated with certainty that either cancer risk or $PM_{2.5}$ concentration would be reduced to below the BAAQMD-recommended significance thresholds, and because of the uncertainty concerning the availability and feasibility of using construction equipment that meets the requirements of Mitigation Measure M-AQ-7, this impact is conservatively judged to be **significant and unavoidable**.

Operational Air Quality Impacts

Impact AQ-8: Operation of the proposed Transit Tower would not conflict with *2010 Clean Air Plan*, result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment, either individually or cumulatively. (Less than Significant)

Based on the project transportation analysis,[253] the proposed project would generate approximately 4,000 vehicle trips per day. Operational emissions from project traffic and from operation of the proposed building were calculated using the URBEMIS 2007 (version 9.2.4) model, and are presented in **Table 35**. As shown in Table 6, emission increases attributable to the proposed project would be substantially below the significance thresholds established by the BAAQMD. Therefore, the project's effects of regional criteria pollutant emissions would be less than significant.

The proposed project would be generally consistent with the San Francisco General Plan, as proposed for amendment by the draft Transit Center District Plan. Additionally, the General Plan, Planning Code, and City Charter implement various Transportation Control Measures identified in the 2010 Bay Area Clean Air Plan through the City's Transit First Program, bicycle parking requirements, transit development impact fees applicable to commercial uses, and other actions. The draft Plan would also be consistent with the Transportation Control Measures in the 2010 Clean Air Plan, as described in the analysis under Impact AQ-1, above, and the Transit Tower would be an integral part of the proposed Plan. In light of the above, the project would not make a considerable contribution to cumulative air quality impacts, nor

[253] AECOM, *Transit Tower Transportation Impact Study* (see footnote 155, p. 276).

TABLE 35
TRANSIT TOWER ESTIMATED DAILY REGIONAL EMISSIONS (2016)

	Projected Emissions (Pounds per Day)[1,2]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area-Source Emissions	1.1	7.4	0.02	0.02
Mobile-Source (Vehicle) Emissions	23.7	26.5	55.1	10.4
TOTAL	24.7	33.9	55.1	10.4
BAAQMD Threshold	54	54	82	54

NOTES:
1 Emission factors were generated by the URBEMIS 2007 (v. 9.2.4) model for San Francisco County, and assume a default vehicle mix. All daily estimates are the average of summer and winter conditions. Traffic generated emissions based on trip generation from the project transportation study.
2 Columns may not total due to rounding.

SOURCE: Environmental Science Associates, 2011.

would it interfere with implementation of the 2010 Clean Air Plan, which is the applicable regional air quality plan developed to improve air quality and to effectively meet the state and federal ambient air quality standards.

Mitigation: None required.

Local Air Quality Impacts

Impact AQ-9: Operation of the proposed Transit Tower would not result in emissions of carbon monoxide that would exceed state or federal standards, either individually or cumulatively. (Less than Significant)

The San Francisco Bay Area Air Basin is designated as "attainment" for carbon monoxide (CO). As stated in the 2010 update of the BAAQMD *CEQA Air Quality Guidelines*, "Emissions and ambient concentrations of CO have decreased dramatically in the Bay Area Air Basin with the introduction of the catalytic converter in 1975. No exceedances of the CAAQS or NAAQS for CO have been recorded at nearby monitoring stations since 1991."[254] Accordingly, as noted in the Significance Criteria, BAAQMD states that CO impacts may be determined to be less than significant if a project is consistent with the applicable congestion management plan and would not increase traffic volumes at local intersections to more than 24,000 vehicles per hour, for locations, such as the project site, in heavily urban areas, where "urban canyons" formed by buildings tend to reduce air circulation. The project would be consistent with applicable congestion management planning and, as described under Impact AQ-1, above, the greatest

Table 5.8-2. California ambient standards tend to be at least as protective as national ambient standards and are often more stringent.

In 1988, California passed the California Clean Air Act (California Health and Safety Code Sections 39600 et seq.), which, like its federal counterpart, called for the designation of areas as attainment or nonattainment, but based on state ambient air quality standards rather than the federal standards. As indicated in Table 5.8-2, the Bay Area Air Basin is designated as "nonattainment" for state ozone, PM_{10}, and $PM_{2.5}$ standards. The Bay Area Air Basin is designated as "attainment" for most other pollutants listed in the table.

The California Clean Air Act requires that air districts in which state air quality standards are exceeded prepare a plan that documents reasonable progress towards attainment. A three-year update is required. In the Bay Area, this planning process is incorporated into the BAAQMD Clean Air Plan, as discussed in Section 5.8.2.3, Local Regulations, below under Regional Air Quality Planning.

5.8.2.3 Local Regulations

Regional Air Quality Planning

The BAAQMD is the regional agency responsible for air quality regulation within the San Francisco Bay Area Air Basin. The BAAQMD regulates air quality through its planning and review activities and has permit authority over most types of stationary emission sources. The BAAQMD can require stationary sources to obtain permits, and can impose emission limits, set fuel or material specifications, or establish operational limits to reduce air emissions. The BAAQMD regulates new or expanding stationary sources of toxic air contaminants.

For state air quality planning purposes, the Bay Area is classified as a serious nonattainment area for ozone. The "serious" classification triggers various plan submittal requirements and transportation performance standards. One such requirement is that the BAAQMD updates the *Clean Air Plan* (CAP) every three years to reflect progress in meeting the air quality standards and to incorporate new information regarding the feasibility of control measures and new emission inventory data. The Bay Area's record of progress in implementing previous measures must also be reviewed. On September 15, 2010, the BAAQMD adopted the most recent revision to the CAP—the 2010 CAP. The goals of the 2010 CAP are to:

- Update the Bay Area 2005 Ozone Strategy in accordance with the requirements of the California Clean Air Act to implement "all feasible measures" to reduce ozone;
- Consider the impacts of ozone control measures on PM_{10} and $PM_{2.5}$, TACs, and greenhouse gases (GHGs) in a single, integrated plan;
- Review progress in improving air quality in recent years; and
- Establish emission control measures to be adopted or implemented in the 2009–2012 timeframe.

In June 2010, BAAQMD issued its *CEQA Air Quality Guidelines*, replacing former guidelines adopted in December 1999, and adopted new thresholds of significance (BAAQMD Thresholds) to assist lead agencies in determining when potential air quality impacts would be considered significant under CEQA. Updated in May 2011,[20] these guidelines include recommendations for analytical methodologies to determine air quality impacts and identify mitigation measures that can be used to avoid or reduce air quality impacts. The analysis herein uses the BAAQMD Thresholds and the *CEQA Air Quality Guidelines* to determine the proposed project's significance with respect to air pollutant emissions.

Local Air Quality Planning

San Francisco General Plan Air Quality Element

The *San Francisco General Plan* (General Plan) includes the 1997 Air Quality Element.[21] The objectives specified by the City include the following:

> *Objective 1*: Adhere to state and federal air quality standards and regional programs.
>
> *Objective 2*: Reduce mobile sources of air pollution through implementation of the Transportation Element of the General Plan.
>
> *Objective 3*: Decrease the air quality impacts of development by coordination of land use and transportation decisions.
>
> *Objective 4*: Minimize particulate matter emissions from road and construction sites.
>
> *Objective 5*: Link the positive effects of energy conservation and waste management to emission reductions.

San Francisco Construction Dust Control Ordinance

San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6, which collectively comprise the Construction Dust Control Ordinance, require that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from the Department of Building Inspection (DBI).

Pursuant to Health Code Article 22B, Section 1247, all departments, boards, commissions, and agencies of the City and County of San Francisco — including the Port of San Francisco — that authorize construction or improvements on land under their jurisdiction under circumstances where no building, excavation, grading, foundation or other permits are required to be obtained under the San Francisco Building Code shall adopt rules and regulations to ensure that the same dust control requirements that are set forth in this article are followed.

20 Bay Area Air Quality Management District, *California Environmental Quality Act Air Quality Guidelines*, updated May 2011.

21 San Francisco Planning Department, Air Quality Element of the *San Francisco General Plan*, July 1997, updated in 2000.

Dust suppression activities may include watering of all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. If not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating runoff in any area of land clearing and/or earth movement). During excavation and earth-moving activities, contractors must wet sweep or vacuum the streets, sidewalks, paths, and intersections where work is in progress at the end of the work day. Inactive stockpiles (where no disturbance occurs for more than seven days) greater than 10 cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base and soil must be covered with a 10-millimeter (0.01-inch) polyethylene plastic (or equivalent) tarp, braced down, or other equivalent soil stabilization techniques must be used.

For project sites greater than one-half acre in size, the ordinance requires that the project sponsor submit a Dust Control Plan for approval by the San Francisco Health Department. Interior-only tenant improvements, even if over one-half acre, that will not produce exterior visible dust are exempt from the site-specific Dust Control Plan requirement.

San Francisco Health Code Provisions

The City and County of San Francisco adopted Article 38 of the San Francisco Health Code in 2008, requiring that an Air Quality Assessment be prepared for new residential projects of ten or more units located in proximity to high-traffic roadways, as mapped by the Department of Public Health, to determine whether residents would be exposed to potentially unhealthful levels of $PM_{2.5}$.

San Francisco Clean Construction Ordinance

The San Francisco Board of Supervisors adopted the Clean Construction Ordinance in 2007, which became effective in 2009. The Clean Construction Ordinance is implemented for public works projects in the City of San Francisco or City-financed construction projects. The ordinance amended the Administrative Code to add Section 6.25 to require City contractors to adopt clean construction practices including use of biodiesel fuels and emission controls. The ordinance also requires departments that are authorized to award contracts to compare bids on the basis that the work will be performed using cleaner off-road diesel equipment and biodiesel fuel. The proposed projects would be subject to the Clean Construction Ordinance.

5.8.3 Impacts and Mitigation Measures

5.8.3.1 Significance Criteria

The City has not formally adopted significance standards for impacts related to air quality, but generally considers that implementation of the project could have a potentially significant impact related to air quality if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan;

- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; or
- Create objectionable odors affecting a substantial number of people.

As described above, the BAAQMD issued CEQA Air Quality Guidelines,[22] including Air Quality CEQA Thresholds of Significance, in June 2010 and updated them in May 2011. These guidelines provide reference thresholds for considering whether a project would have a significant air quality impact. The guidelines, published for assessing impacts relative to these thresholds, also provide recommended procedures for evaluating potential air quality impacts during the environmental review process. Additionally, the BAAQMD has adopted new risk and hazard exposure thresholds for the siting of new sensitive receptors that apply to projects for which the Notice of Preparation (NOP)was issued*)* and environmental analysis began subsequent to May 1, 2011. However, neither the proposed AC34 events nor the proposed cruise terminal would permanently locate a new sensitive receptor, and this threshold is not applicable to the proposed projects. The following analysis has been conducted in accordance with BAAQMD's *CEQA Air Quality Guidelines* (May 2011).

AC34 Event and Cruise Terminal Construction Impact Criteria

Under the BAAQMD CEQA thresholds, a project would have a significant air quality impact if it would result in average daily construction-related emissions of ROG, NOx, or $PM_{2.5}$ (non-inclusive of fugitive dust[23]) of 54 pounds (25 kilograms) average daily emissions or greater. There is a separate emission threshold for PM_{10} (non-inclusive of fugitive dust[24]) of 82 pounds (37 kilograms) average daily emissions. The thresholds for PM_{10} and $PM_{2.5}$ are inclusive only of construction exhaust emissions. BAAQMD guidance regarding construction-related emission of fugitive dust identifies implementation of best management practices as its threshold of significance.[25] The BAAQMD *CEQA Air Quality Guidelines* identify a list of eight "Basic Construction Mitigation Measures Recommended for All Proposed Projects" and consider implementation of these measures as meeting the best management practices requirements for fugitive dust emissions.[26]

22 BAAQMD, *CEQA Air Quality Guidelines*, May 2011, http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines%20May%202011.ashx.
23 Fugitive dust consists of very small liquid and solid particulate matter that is suspended in the air by the wind and human activities. Fugitive dust originates primarily from the soil.
24 Fugitive dust is PM suspended in the air by the wind and human activities. It originates primarily from the soil and is not emitted from exhaust pipes, vents, or stacks.
25 BAAQMD, *CEQA Air Quality Guidelines*, Table 2-1.
26 BAAQMD, *CEQA Air Quality Guidelines*, Table 8-2.

The 2010 BAAQMD CEQA thresholds indicate that a project would also have a significant air quality impact if construction activities would result in an incremental increase in localized annual average concentrations of $PM_{2.5}$ exceeding 0.3 micrograms per cubic meter ($\mu g/m^3$) within a 1,000-foot radius from the property line of the construction area or a receptor. A project would also have a significant air quality impact if it would expose persons to substantial levels of TACs (including DPM), such that the probability of contracting cancer for the Maximally Exposed Individual (MEI)[27] exceeds 10 in one million or if it would expose persons to TACs such that a non-cancer Hazard Index of 1.0 would be exceeded. A Hazard Index is a summation of the non-cancer hazard quotients for all chemicals to which an individual is exposed.

AC34 Event and Cruise Terminal Operational Impact Criteria

For the AC34 event and Cruise Terminal project impact operational analyses, the 2011 BAAQMD *CEQA Air Quality Guidelines* include various thresholds and tests of significance. For ROG, NOx, and $PM_{2.5}$, a net increase equal to or greater than 10 tons per year (maximum annual) or 54 pounds average daily emissions is considered significant, while for PM_{10} a net increase equal to or greater than 15 tons per year (maximum annual) or 82 pounds average daily emissions is considered significant.

For CO emissions, an increase would be considered significant if it leads to or contributes to CO concentrations exceeding the state ambient air quality standard, although quantification would not be required if a project is consistent with the local congestion management program and plans and traffic volumes at affected intersections are below 44,000 vehicles per hour or 24,000 vehicles per year in tunnel-like conditions.

Under the 2010 BAAQMD thresholds, project operations would also have a significant air quality impact if they would result in an incremental increase in localized annual average concentrations of $PM_{2.5}$ exceeding 0.3 micrograms per cubic meter.

Additionally, a project would also have a significant air quality impact if project operations would expose persons to substantial levels of TACs, such that the probability of contracting cancer for the MEI exceeds 10 in one million or if the project would expose persons to TACs such that a non-cancer Hazard Index of 1.0 would be exceeded.

Cumulative Impact Criteria

The 2011 BAAQMD *CEQA Air Quality Guidelines* state that if the individual emissions from a project would result in an increase in ROG, NOx, $PM_{2.5}$, or PM_{10} that exceeds the project-level significance criteria, then the project would also be considered to contribute considerably to a significant cumulative effect. Cumulative air quality impacts relative to emissions of $PM_{2.5}$ and TACs are new concepts contained in BAAQMD's updated thresholds.

27 The Maximally Exposed Individual is the person with the highest exposure in a given population.

With regard to cumulative impacts from $PM_{2.5}$, a significant cumulative air quality impact would occur if localized annual average concentrations of $PM_{2.5}$ would exceed 0.8 micrograms per cubic meter at any receptor from project operations in addition to existing emission sources and cumulative emissions sources within a 1,000-foot radius of the property line of the source or receptor.

With regard to cumulative impacts from TACs, a significant cumulative air quality impact would occur if the probability of contracting cancer for the MEI would exceed 100 in one million or if the project would expose persons to TACs such that a non-cancer chronic Hazard Index of 10.0 would be exceeded at any receptor as a result of project operations, in addition to existing emission sources and cumulative emissions sources within a 1,000-foot radius of the project site.

However, a project's construction or operational impacts would be considered to result in a considerable contribution to an identified cumulative health risk impact if the project's construction or operation activities would exceed the project-level health risk significance thresholds identified above.

5.8.3.2 Approach to Analysis

The air quality impact analysis is organized to address potential impacts from the AC34 events and the Cruise Terminal project separately. Construction and operational emissions are assessed individually as recommended by BAAQMD guidance. Cumulative air quality impacts are discussed with regard to the near-term cumulative construction and operational impacts of the AC34 venues and pier improvements including near-term construction-related effects of the cruise terminal. The cruise terminal would be completed and in operation after the AC34 events end, and long-term (year 2035) operational cumulative impacts are assessed only with respect to the cruise terminal.

Evaluation of air quality impacts from operational and construction air emission sources of the proposed projects under the BAAQMD *CEQA Air Quality Guidelines* requires the quantification of the estimated mass emissions of criteria air pollutants such as ROG, NO_x, PM_{10}, and $PM_{2.5}$. In addition, an evaluation of potential human health effects from the emission of specific toxic air contaminants (TACs) present in the ROG or PM emissions is also required. The following sections describe the emissions estimation, air dispersion modeling, and risk characterization methodologies that were used to evaluate project-related emissions.

Analytical Approach for Construction Emissions

Construction exhaust emissions of criteria air pollutants and toxic air contaminants (TACs, in order to evaluate health risks and hazards) were estimated by first collecting extensive information on all of the different types of air emissions sources involved in project construction and the level of activity anticipated from these sources during each phase of construction. This information was then combined with emission factors applicable to each source type to generate

Impact AQ-2: Construction of the America's Cup facilities would result in emission of criteria pollutants and precursors that would violate an air quality standard or contribute substantially to an existing or projected air quality violation. (Significant and Unavoidable with Mitigation)

A number of temporary and some permanent facilities would be constructed in preparation for the America's Cup events at various locations as described in Chapter 3, Project Description.

Demolition of existing structures would occur at Piers 27-29 and Piers 30-32 in 2012. Installation of temporary floating docks would occur at Piers 30-32, Pier 80, and Marina Green for the AC34 2012 events. Other construction activities in 2012 would include construction of the new cruise terminal building "cold shell" and paving/concrete improvements at Piers 27-29, and installation of the team base at Piers 30-32 and/or Pier 80. Emissions would also result from construction and erection of facilities at spectator locations. For the AC34 2013 events, construction of temporary floating docks and/or wave attenuators would occur at several locations (e.g., Piers 30-32, 32-36, 27-29, 26-28, 23, and 1; Piers 9-15 water basin; Rincon Point Open Water Basin; Piers 17-19; and Fort Mason). Mooring anchoring would be installed at Brannan Street Wharf Open Water Basin and Piers 27-29, and dredging would occur at Brannan Street Wharf Open Water Basin and Pier 28. The team base would remain at Piers 30-32. In addition, all temporary floating docks, wave attenuators, the communications barge, associated pilings and mooring anchoring, and the Pier 80 and Piers 30-32 team bases would be removed in 2013 after completion of the AC34 events. Phase 2 buildout of the new cruise terminal at Piers 27-29 would also start at the end of 2013 for proposed operation of the new cruise terminal in 2014, the impacts of which are addressed in Impacts AQ-9 and AQ-10, below, relative to the Cruise Terminal project.

Criteria and ozone precursor pollutant (NO_x, ROG, PM_{10}, $PM_{2.5}$) emissions from construction equipment exhaust would incrementally add to the regional atmospheric loading of these pollutants during project construction. The BAAQMD *CEQA Air Quality Guidelines* recommend the quantification of project-related criteria pollutant exhaust emissions from construction, separate from operational emissions, and comparison with significance thresholds included in the guidelines. Daily engine exhaust emissions from construction activities associated with the proposed project are compared with emission BAAQMD significance thresholds in **Table 5.8-5**. Emissions were estimated separately for construction scheduled to occur in 2012 and 2013 and then combined. Total construction emissions were divided by the number of construction days to derive average daily emissions for comparison against BAAQMD significance threshold levels. The BAAQMD construction significance thresholds for criteria pollutants are established in terms of average daily emissions, and this is how emissions are reported in Table 5.8-5.

The emissions presented in Table 5.8-5 would be generated by many different construction sources including off-road construction equipment such as loaders, backhoes, pile drivers, and cranes; in-water construction sources such as assist tugs, barges and dredge equipment; and on-road trucks. The predominant source of emissions would be off-road equipment, which would generate approximately double the emissions of in-water construction sources at most locations, except those where dredging would occur; in dredging locations, in-water construction would be the predominant emissions source. At all locations, emissions from on-road trucks would be substantially lower than emissions from either off-road or water sources.

TABLE 5.8-5
AC34 AVERAGE DAILY CONSTRUCTION-RELATED EMISSIONS

	Average Daily Construction Emissions (pounds/day)			
	ROG	NOx	PM10	PM2.5
Cruise Terminal Phase I and AC34 Construction

SOURCE: ENVIRON, 2011

Construction of the America's Cup facilities would result in emission of criteria pollutants and precursors that, with the exception of NOx, would be at levels below the BAAQMD thresholds of significance. However, the estimated construction emissions of NOx would exceed the BAAQMD significance threshold, resulting in a significant air quality impact.

Impact Summary

Construction of the America's Cup facilities would result in emission of NOx that would exceed BAAQMD thresholds of significance, a *significant* impact. Implementation of **Mitigation Measure M-AQ-2a** (Construction Vehicle Emissions Minimization) and **M-AQ-2b** (Off-Road Construction Equipment), requiring use of off-road equipment that meets the most stringent U.S. EPA standards, as available, and the requirements specified under the Clean Construction Ordinance would reduce the severity of the impact. However, as discussed below, the ability of the mitigation measures to reduce the impact to less than significant depends on the feasibility of implementing the measures.

A discussion of available mitigation and associated feasibility of implementation is presented with the mitigation measures below. The results indicate that limited emission reduction would be expected due to lack of available feasible mitigation. Therefore, this impact would remain *significant and unavoidable with mitigation*.

Mitigation Measure M-AQ-2a: Construction Vehicle Emissions Minimization

To reduce construction vehicle emissions, the project sponsors shall incorporate the following into construction specifications:

- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure, Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.

Operational Impacts

Impact AQ-4: Operations of the America's Cup facilities would violate an air quality standard or contribute substantially to an existing or projected air quality violation. (Significant and Unavoidable with Mitigation)

Operations of the America's Cup events during 2012 and 2013 would involve a wide variety of activities, both on water and on land, as well as helicopter activities. On-water activities would include boat and yacht trips (e.g., race-sponsored spectator vessels, race support vessels, small and large private spectator boats, and assist tugs). Boat lifts would be used at several locations. On-land activities would include generators and other equipment used at race-sponsored viewing sites and on-road vehicle trips. Helicopters would be used for broadcasting and media operations and would follow each race route. In addition, the increase in cruise ship emissions at Pier 27 during 2013 associated with the loss of the shore power hookup (which would be relocated and disconnected until completion of the AC34 events at Piers 27-29) during the America's Cup are included in the AC34 operational emissions total. No existing emissions were assumed for the AC34 event itself, as all emissions associated with the event were assumed to be new, additional emissions.

Criteria and ozone precursor pollutant (ROG, CO, NOx, PM_{10}, and $PM_{2.5}$) emissions associated with these activities were estimated for 2012 and 2013 using methods and data sources described previously and in Appendix AQ. Emissions for 2012 and 2013 were summed and divided by the total number of days of race operations to determine daily average emissions that were then compared with BAAQMD *CEQA Air Quality Guidelines* threshold levels as presented in **Table 5.8-7**. Because a variety of activities would occur throughout the AC34 event period, the number of days of "race operations" in each year was determined on the basis of the length of time that major operations are scheduled to take place (assumed to be 20 days in 2012 and 50 days in 2013 for vessel and on-road traffic and 80 days in 2012 and 90 days in 2013 for other sources), not simply the number of days on which actual races are scheduled.

As shown in Table 5.8-7, estimated average daily emissions of ROG, NOx, PM_{10}, and $PM_{2.5}$ would exceed the BAAQMD significance thresholds. Over 90 percent of daily PM and daily ROG emissions shown in Table 5.8-7 are attributable to operation of private spectator and race-support vessels. Daily emissions of NOx have substantial contributions from all sources except assist tugs.

Annual emissions from AC34 operations in 2012 and 2013 were also tabulated and compared to the BAAQMD threshold levels shown in Table 5.8-7. Emissions of ROG, NOx, PM_{10}, and $PM_{2.5}$ are predicted to exceed the BAAQMD significance thresholds. As per the above discussion of daily average emissions, over 90 percent of the annual ROG and particulate emissions would be generated by private spectator and race-support vessel operations.

America's Cup operations would result in emission of criteria pollutants and precursors that could exceed BAAQMD thresholds of significance for NOx, ROG, PM_{10}, and $PM_{2.5}$; this would be a significant air quality impact.

Impacts and Mitigation Measures

Significance Criteria

In 1999, the BAAQMD adopted its *CEQA Guidelines – Assessing the Air Quality Impacts of Projects and Plans*, as a guidance document to provide lead government agencies, consultants, and project proponents with uniform procedures for assessing air quality impacts and preparing the air quality sections of environmental documents for projects subject to CEQA. These BAAQMD guidelines were revised and updated in May 2011 and May 2012, as the *BAAQMD CEQA Air Quality Guidelines*.

The 2011 *CEQA Air Quality Guidelines* is an advisory document intended to assist lead agencies in evaluating the air quality impacts of projects and plans in the Air Basin during the environmental review process.[29] The document describes the criteria that the BAAQMD uses when reviewing and commenting on the adequacy of environmental documents. It recommends thresholds for use in determining whether projects would have significant adverse environmental impacts, identifies methodologies for predicting project emissions and impacts, and identifies measures that can be used to avoid or reduce air quality impacts. In practice, most local agencies rely on the *BAAQMD CEQA Air Quality Guidelines* when assessing the significance of air quality impacts.

BAAQMD's adoption of the significance thresholds for CEQA air quality analysis is the subject of recent judicial actions. In a ruling dated March 5, 2012, Alameda County Superior Court Judge Frank Roesch found that, in adopting updated significance thresholds for air quality impacts, the BAAQMD violated CEQA by not first studying the potential environmental impacts of its new rules, and required that the thresholds be rescinded pending formal CEQA review.[30]

Western SoMa Community Plan and Rezoning of Adjacent Parcels

Criteria Air Pollutants

The significance thresholds for assessment of a planning document, such as the proposed *Western SoMa Community Plan* and the Rezoning of Adjacent Parcels, involve an evaluation of whether:

(1) The plan would be consistent with the control measures contained in the current regional air quality plan (the *2010 Clean Air Plan*) and would support the primary objectives of that plan and would not hinder implementation of that plan; and

(2) The projected rate of increase in vehicle miles traveled or vehicle trips under the plan would be less than or equal to projected rate of population increase under the plan.

If the two foregoing questions can be answered in the affirmative, the Draft Plan would neither:

- Conflict with or obstruct implementation of the applicable air quality plan;

30 *California Building Industry Association v. Bay Area Air Quality Management District*, 2012. Statement of Decision. Case No. RG10-548693. Superior Court of the State of California in and for the County of Alameda.

- Violate any air quality standard or contribute substantially to an existing or projected air quality violation; nor
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).[31]

Community Risk and Hazard Impacts

This analysis responds to the criterion that asks whether the proposed Draft Plan would:

- Expose sensitive receptors to substantial pollutant concentrations.

For plan-related health risks and hazards resulting from emissions of TACs, the BAAQMD *CEQA Air Quality Guidelines* (2011) recommend that overlay zones be established around existing and proposed land uses that emit TACs and $PM_{2.5}$. These overlay zones should be included in proposed plan policies, land use maps, and implementing ordinances. Additionally, the plan must "identify goals, policies, and objectives to minimize potential impacts."[32]

Odors

The Proposed Project would result in a significant impact with respect to odors if it would:

- Create objectionable odors affecting a substantial number of people.

For odors, a proposed land use plan must identify the location of existing and planned odor sources. The proposed land use plan must also include policies to reduce potential odor impacts. Typical odor sources of concern include wastewater treatment plants, sanitary landfills, transfer stations, composting facilities, petroleum refineries, asphalt batch plants, chemical manufacturing facilities, fiberglass manufacturing facilities, auto body shops, rendering plants, and coffee roasting facilities. BAAQMD identifies a screening distance for new sources of potential odors, such as wastewater treatment plants, landfills and transfer stations, refineries, asphalt and chemical plants, food processing facilities, and the like, of 1 or 2 miles, depending on use. In general, such setback distances would avoid the potential for significant odor impacts.

Proposed Transportation Improvements and 350 Eighth Street Project

For the proposed transportation improvements to be undertaken in the Draft Plan Area and for an individual development project such as the 350 Eighth Street project, the City relies on the quantitative thresholds of significance. **Table 4.G-3**, on the following page, summarizes these thresholds of significance. A discussion of each threshold is provided below.

[31] The bulleted statements are the first three significance criteria in the City's CEQA Initial Study checklist.
[32] BAAQMD, *CEQA Air Quality Guidelines*, May 2011. Available online at http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Updated-CEQA-Guidelines.aspx, accessed on April 19, 2012; p. 9-71.

TABLE 4.G-3
AIR QUALITY SIGNIFICANCE THRESHOLDS

Pollutant	Construction Thresholds: Average Daily Emissions (pounds/day)	Operational Thresholds: Average Daily Emissions (pounds/day)	Operational Thresholds: Annual Average Emissions (tons/year)
Criteria Air Pollutants			
ROG	54	54	10
NO_x	54	54	10
PM_{10}	82	82	15
$PM_{2.5}$	54	54	10
CO	Not Applicable	9.0 ppm (8-hour average) or 20.0 ppm (1-hour average)	
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	
Health Risks and Hazards for New Sources			
Excess Cancer Risk	10 per 1 million	10 per 1 million	
Chronic or Acute Hazard Index	1.0	1.0	
Incremental annual average $PM_{2.5}$	0.3 µg/m³	0.3 µg/m³	
Health Risks and Hazards for Sensitive Receptors (Cumulative from all sources within 1,000 foot zone of influence) and Cumulative Thresholds for New Sources			
Excess Cancer Risk	100 per 1 million		
Chronic Hazard Index	10.0		
Annual Average $PM_{2.5}$	0.8 µg/m³		

ppm – parts per million
µg/m3 – microgram per cubic meter

Ozone Precursors

As discussed previously, the Air Basin is currently designated as nonattainment for ozone and particulate matter (PM_{10} and $PM_{2.5}$). The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, is based on the state and federal Clean Air Acts' emissions limits for stationary sources. The federal New Source Review program was created under the federal Clean Air Act to ensure that stationary sources of air pollution are constructed in a manner that is consistent with attainment of federal health based ambient air quality standards. Similarly, to ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors, ROG and NO_x, the offset emissions level is an annual average of 10 tons per year (or 54 lbs. per day).[33] These levels represent emissions by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

[33] BAAQMD, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*. October 2009; p. 17.

Although this regulation applies to new or modified stationary sources, land use development projects result in ROG and NO_x emissions as a result of increases in vehicle trips, architectural coating, and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of land use projects and those projects that result in emissions below these thresholds, would not be considered to contribute to an existing or projected air quality violation or result in a cumulatively considerable net increase in ROG and NO_x emissions. Because construction activities are temporary in nature only the average daily thresholds are applicable to construction phase emissions.

Particulate Matter (PM_{10} and $PM_{2.5}$)

The BAAQMD has not established an offset limit for $PM_{2.5}$ and the current federal Prevention of Significant Deterioration (PSD) offset limit of 100 tons per year for PM_{10} is too high and would not be an appropriate significance threshold for the Bay Area considering the nonattainment status of PM_{10}. However, the federal New Source Review emissions limits for stationary sources in nonattainment areas provide for appropriate thresholds. For PM_{10} and $PM_{2.5}$, the emissions limit under New Source Review is 15 tons per year (82 pounds per day) and 10 tons per year (54 pounds per day), respectively. These emissions limits represent levels at which a source is not expected to have an impact on air quality.[34] Similar to ozone precursor thresholds identified above, land use development projects typically result in particulate matter emissions as a result of increases in vehicle trips, space heating and natural gas combustion, landscape maintenance, and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of a land use project. Those projects that result in emissions below the New Source Review emissions limits would not be considered to contribute to an existing or projected air quality violation or result in a cumulatively considerable net increase in PM_{10} and $PM_{2.5}$ emissions. Because construction activities are temporary in nature only the average daily thresholds are applicable to construction-phase emissions.

Other Criteria Pollutants

Regional concentrations of CO in the Bay Area have not exceeded the state standards in the past 11 years and SO_2 concentrations have never exceeded the standards. The primary source of CO emissions from land use projects is vehicle traffic. Construction-related SO_2 emissions represent a negligible portion of the total basin-wide emissions and construction-related CO emissions represent less than five percent of the Bay Area total basin-wide CO emissions.[35] As discussed previously, the Bay Area is in attainment for both CO and SO_2. Furthermore, the BAAQMD has demonstrated, based on modeling, that in order to exceed the California ambient air quality standard of 9.0 ppm (8-hour average) or 20.0 ppm (1-hour average) for CO, project traffic in addition to existing traffic would need to exceed 44,000 vehicles per hour at affected intersections (or 24,000 vehicles per hour where vertical and/or horizontal mixing is limited). Therefore, given the Bay Area's attainment status and the limited CO and SO_2 emissions that could result from a land use projects, land use projects would not result in a cumulatively considerable net increase in CO or SO_2, and quantitative analysis not required.

34 *Ibid.*, p. 16.
35 *Ibid.*, p. 27.

these mid-block streets are very low, these improvements would result in minimal changes in traffic patterns, particularly because most traffic on these streets is presumably local. To the extent that the pedestrian improvements might discourage existing cut-through traffic, the volumes in question are so small as to not represent a meaningful impact relative to vehicular emissions. Therefore, no substantial air quality impacts would ensue, and the impact of installation of pedestrian improvements would be less than significant.

Mitigation: None required.

Impacts of the 350 Eighth Street Project (Project-Level Analysis)

Air quality impacts from the proposed 350 Eighth Street project would fall into two categories: short-term impacts due to construction, and long-term impacts due to project operation. These potential impacts are consistent with those described above for development in the Project Area as a whole. First, during project construction, the 350 Eighth Street project would affect local particulate concentrations primarily due to fugitive dust sources, and would also generate emissions of both criteria air pollutants and TACs from construction equipment exhaust. Over the long term, the 350 Eighth Street project would result in an increase in emissions primarily due to increased motor vehicle trips, as well as from operation of on-site stationary sources—in this case, a backup generator. Area sources (such as landscaping and the use of consumer products) would generate lesser quantities of air pollutants.

Construction Air Quality Impacts

Impact AQ-10: Construction of the 350 Eighth Street project would not result in emissions of criteria air pollutants, including ozone precursors, that would contribute to an existing or projected air quality violation or result in a cumulatively considerable increase in criteria pollutants, and would not result in substantial construction dust. (Less than Significant)

Demolition, grading and new construction activities would temporarily affect local air quality during the 350 Eighth Street project's proposed three-year construction schedule, causing temporary increases in particulate dust and other pollutants. Emissions generated from construction activities include combustion emissions of criteria air pollutants (ROG, NOx, CO, SOx, and PM_{10} and $PM_{2.5}$) primarily from construction equipment and worker vehicles, evaporative criteria pollutant emissions (ROG) from asphalt paving and architectural coating applications, and dust (including PM_{10} and $PM_{2.5}$) primarily from "fugitive" sources; that is, dust generated by construction activities and that escapes from the construction site.

Criteria Air Pollutants

Criteria pollutant emissions of ROG, NOx, PM_{10}, and $PM_{2.5}$ from construction equipment during construction of the 350 Eighth Street project would incrementally add to the regional atmospheric loading of these pollutants. The Planning Department requires quantification of project-related exhaust emissions and comparison of the emissions to applicable significance thresholds.

The HRA for the proposed Plan included an estimate of construction criteria air pollutant impacts specific to the 350 Eighth Street Project. Average daily criteria air pollutant emissions from project construction were estimated using the California Emissions Estimator Model (CalEEMod). Averaged daily construction criteria air pollutant emissions are based on estimates of construction phasing and equipment expected to be used, as provided by the project sponsor. Where project-specific data were not available (e.g., equipment horsepower and load factors) default assumptions from CalEEMod and ARB's 2011 In-Use Off-Road Equipment Emissions Inventory Model were used to estimate construction emissions. Additional modeling parameters are detailed in the HRA prepared for the proposed project. Average daily emissions are presented in **Table 4.G-5**, page 4.G-54. The methodology used to estimate construction-period emissions is described under "Approach to Analysis" on page 4.G-26.[74]

TABLE 4.G-5
350 EIGHTH STREET PROJECT CONSTRUCTION EXHAUST EMISSIONS ESTIMATES

	Estimated Daily Emissions (pounds per day)[a]			
Construction Phase	**ROG**	**NOx**	**PM10[b]**	**PM2.5[b]**
Demolition	28	88	16	16

[b] Vehicle exhaust only.
[c] Based on 730-day construction schedule

SOURCE: Environ International, 2012

As indicated in Table 4.G-6, emissions from the construction of 350 Eighth Street project would not exceed the applicable significance thresholds for criteria pollutants, and construction-related air pollutant impacts would be less than significant.

Fugitive Dust

Dust can be an irritant causing watering eyes or irritation to the lungs, nose and throat. Demolition, excavation, grading and other construction activities can cause wind-blown dust to add to particulate matter in the local atmosphere. Depending on exposure, adverse health effects can occur due to this

[74] CalEEMod output sheets are presented in the health risk assessment (see footnote 53), which is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2008.0877E.

standard are infeasible. It should be noted that, for specialty equipment types (e.g., drill rigs, shoring rigs and concrete pumps), it may not be feasible for construction contractors to modify their current, older equipment to accommodate the particulate filters, or for them to provide newer models with these filters pre-installed.

Significance after Mitigation: Implementation of the above measure would result in the maximum feasible reduction of diesel emissions that would contribute to construction-period health risk, thereby lowering both lifetime cancer risk and the concentration of $PM_{2.5}$ to which receptors would be exposed. However, Tier 4 equipment is not readily available at this time. Both federal (EPA) and ARB Interim Tier 4 standards took effect in January 2011 for new equipment, and it is anticipated that it will take several years, at a minimum, for this equipment to be placed in widespread use, because heavy construction equipment typically has a useful life of 15 years or more. Meanwhile, as also noted above under "Toxic Air Contaminant (TAC) Regulations," ARB has delayed implementation of emissions standards for existing off-road diesel engines, including requirements that construction equipment use so-called Best Available Control Technology or that each operator's fleet of equipment meet a specified average emissions standards. Moreover, retrofitting of off-road equipment with Level 3 VDECS is not yet required by ARB.

It is noted that construction emissions could be lower if newer equipment is employed or less powerful or smaller diesel equipment is used than assumed in the analysis. Emissions could be higher if more or larger diesel equipment is used. Depending on the regulations in place at the time construction begins, and depending on the precise mix of diesel-powered construction equipment employed, it is possible that the impact would be reduced to a less-than-significant level. However, because it cannot be stated with certainty that estimated excess cancer risk from construction emissions would be reduced to below the applicable significance thresholds, and because of the uncertainty concerning the availability and feasibility of using construction equipment that meets the performance requirements of Mitigation Measure M-AQ-11, this impact is conservatively judged to be **significant and unavoidable**.

Operational Air Quality Impacts

Impact AQ-12: Operation of the proposed 350 Eighth Street project would not conflict with the *2010 Clean Air Plan,* violate or contribute to violation of an air quality standard, or result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment, either individually or cumulatively. (Less than Significant)

Based on the Proposed Project transportation analysis,[78] the 350 Eighth Street project would generate approximately 1,870 vehicle trips per day. Operational emissions from project traffic and from operation of the proposed building were calculated using the CalEEMod (version 2011.1.1) model, and are presented in **Table 4.G-6**, page 4.G-59. As shown in Table 4.G-7, emission increases attributable to the 350 Eighth Street project would be substantially below the applicable significance thresholds. Therefore, the 350 Eighth Street project's effects of regional criteria pollutant emissions would be less than significant.

[78] LCW Consulting, *Western SoMa Community Plan Transportation Study, June 15, 2012*

TABLE 4.G-6
350 EIGHTH STREET PROJECT ESTIMATED DAILY REGIONAL EMISSIONS (2016)

	Daily Projected Emissions (Pounds per Day)[a,b,c]

NOTES:
[a] Emission factors were generated by the CalEEMod (v. 2011.1.1) model for San Francisco County, and assume a default vehicle mix. All daily estimates are the average of summer and winter conditions. Traffic generated emissions based on trip generation from the project transportation study.
[b] Columns may not total due to rounding.
[c] Emergency generator emissions not included, as they were modeled in the SCREEN3 model and found to amount to less than 0.002 pounds per day of any pollutant averaged over the course of the year, and less than 0.02 pounds per day of any pollutant on a day when the generator is tested.

SOURCE: Environ International, 2012; Environmental Science Associates, 2012.

The proposed 350 Eighth Street project would be generally consistent with the *San Francisco General Plan*, as proposed for amendment by the *Western SoMa Community Plan*. Additionally, the General Plan, Planning Code, and City Charter implement various Transportation Control Measures identified in the *2010 Clean Air Plan* through the City's Transit First Program, bicycle parking requirements, transit development impact fees applicable to commercial uses, and other actions.

Consistency with this *2010 Bay Area Clean Air Plan* is the basis for determining whether the proposed project would conflict with or obstruct implementation of an applicable air quality plan. A consistency analysis of the proposed project in relation to the goals and objectives of the *Clean Air Plan* focuses on the proposed project's support of the primary goals in the *Clean Air Plan*, the proposed project's implementation of applicable control measures in the *Clean Air Plan*, and evaluation of any potential disruption to or hindrance of implementation of the *Clean Air Plan*. In determining whether a proposed project or plan would conflict with the *Clean Air Plan*, three criteria area evaluated: would the Project implement the applicable control measures in the *Clean Air Plan*; would the Project disrupt or hinder implementation of any of these control measures; and would the Project support the primary goals of the *Clean Air Plan*?

Setting

The Bay Area Air Quality Management District (BAAQMD) is the regional agency with jurisdiction over the nine-county San Francisco Bay Area Air Basin (SFBAAB), which includes San Francisco, Alameda, Contra Costa, Marin, San Mateo, Santa Clara and Napa counties and portions of Sonoma and Solano counties. BAAQMD is responsible for attaining and maintaining air quality in the SFBAAB within federal and state air quality standards, as established by the federal Clean Air Act (CAA) and the California Clean Air Act (CCAA), respectively. Specifically, the BAAQMD has the responsibility to monitor ambient air pollutant levels throughout the SFBAAB and to develop and implement strategies to attain the applicable federal and state standards. The CAA and the CCAA require plans to be developed for areas that do not meet air quality standards, generally. The most recent air quality plan, the *2010 Clean Air Plan*, was adopted by the BAAQMD on September 15, 2010. The *2010 Clean Air Plan* updates the *Bay Area 2005 Ozone Strategy* in accordance with the requirements of the CCAA to implement all feasible measures to reduce ozone; provide a control strategy to reduce ozone, particulate matter, air toxics, and GHGs in a single, integrated plan; and establish emission control measures to be adopted or implemented. The primary goals of the *2010 Clean Air Plan* are to:

- Attain air quality standards;

- Reduce population exposure and protect public health in the San Francisco Bay Area; and
- Reduce GHG emissions and protect the climate.

The *2010 Clean Air Plan* represents the most current applicable air quality plan for the SFBAAB. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of an applicable air quality plan.

Criteria Air Pollutants

In accordance with the state and federal CAAs, air pollutant standards are identified for the following six criteria air pollutants: ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2) and lead. These air pollutants are termed criteria air pollutants because they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. In general, the SFBAAB experiences low concentrations of most pollutants when compared to federal or state standards. The SFBAAB is designated as either in attainment[40] or unclassified for most criteria pollutants with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the state or federal standards. By its very nature regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.[41]

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. Table 3, page 71, identifies air quality significance thresholds followed by a discussion of each threshold. Projects that would result in criteria air pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

[40] "Attainment" status refers to those regions that are meeting federal and/or state standards for a specified criteria pollutant. "Non-attainment" refers to regions that do not meet federal and/or state standards for a specified criteria pollutant. "Unclassified" refers to regions where there is not enough data to determine the region's attainment status.

[41] Bay Area Air Quality Management District (BAAQMD). *California Environmental Quality Act Air Quality Guidelines*. May 2011. Page 2-1.

Table 3
Criteria Air Pollutant Significance Thresholds

Pollutant	Construction Thresholds	Operational Thresholds	
	Average Daily Emissions (lbs./day)	Average Daily Emissions (lbs./day)	Annual Average Emissions (tons/year)
ROG	54	54	10
NO_x	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	

Ozone Precursors. As discussed previously, the SFBAAB is currently designated as non-attainment for ozone and particulate matter (PM_{10} and $PM_{2.5}$[42]). Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG) and oxides of nitrogen (NO_x). The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, are based on the state and federal Clean Air Acts emissions limits for stationary sources. The federal New Source Review (NSR) program was created by the federal CAA to ensure that stationary sources of air pollution are constructed in a manner that is consistent with attainment of federal health based ambient air quality standards. Similarly, to ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors, ROG and NO_x, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day).[43] These levels represent emissions by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

Although this regulation applies to new or modified stationary sources, land use development projects result in ROG and NO_x emissions as a result of increases in vehicle trips, architectural coating and construction activities. Therefore, the above thresholds can be applied to the construction and operational

[42] PM_{10} is often termed "coarse" particulate matter and is made of particulates that are 10 microns in diameter or larger. $PM_{2.5}$, termed "fine" particulate matter, is composed of particles that are 2.5 microns or less in diameter.

[43] BAAQMD, Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance. October 2009. At page 17.

phases of land use projects and those projects that result in emissions below these thresholds, would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ROG and NO_x emissions. Due to the temporary nature of construction activities, only the average daily thresholds are applicable to construction phase emissions.

Particulate Matter (PM_{10} and $PM_{2.5}$). The BAAQMD has not established an offset limit for $PM_{2.5}$. However, the emissions limit in the federal NSR for stationary sources in nonattainment areas is an appropriate significance threshold. For PM_{10} and $PM_{2.5}$, the emissions limit under NSR is 15 tons per year (82 lbs. per day) and 10 tons per year (54 lbs. per day), respectively. These emissions limits represent levels at which a source is not expected to have an impact on air quality.[44] Similar to ozone precursor thresholds identified above, land use development projects typically result in particulate matter emissions as a result of increases in vehicle trips, space heating and natural gas combustion, landscape maintenance, and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of a land use project. Again, because construction activities are temporary in nature, only the average daily thresholds are applicable to construction-phase emissions.

Fugitive Dust. Fugitive dust emissions are typically generated during construction phases. Studies have shown that the application of best management practices (BMPs) at construction sites significantly control fugitive dust.[45] Individual measures have been shown to reduce fugitive dust by anywhere from 30 percent to 90 percent.[46] The BAAQMD has identified a number of BMPs to control fugitive dust emissions from construction activities.[47] The City's Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008) requires a number of measures to control fugitive dust to ensure that construction projects do not result in visible dust. The BMPs employed in compliance with the City's Construction Dust Control Ordinance is an effective strategy for controlling construction-related fugitive dust.

(retail, likely restaurant). During the project's approximately 20-month construction period, construction activities would have the potential to result in fugitive dust emissions, criteria air pollutants, and DPM, as discussed further below.

Impact AQ-1: The proposed project's construction activities would generate fugitive dust and criteria air pollutants, but would not violate an air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Less than Significant)

Fugitive Dust

Project-related demolition, excavation, grading, and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Although there are federal standards for air pollutants and implementation of state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. California has found that particulate matter exposure can cause health effects at lower levels than national standards. The current health burden of particulate matter demands that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. According to the California Air Resources Board, reducing ambient particulate matter from 1998-2000 levels to natural background concentrations in San Francisco would prevent over 200 premature deaths.

Dust can be an irritant causing watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, grading, and other construction activities can cause wind-blown dust to add to particulate matter in the local atmosphere. Depending on exposure, adverse health effects can occur due to general particulate matter and specific contaminants such as lead or asbestos that may be constituents of soil.

In response, the San Francisco Board of Supervisors approved a series of amendments to the San Francisco Building and Health Codes generally referred hereto as the Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008) with the intent of reducing the quantity of dust generated during site preparation, demolition and construction work in order to protect the health of the general public and of onsite workers, to minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI).

The Ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from DBI. The Director of DBI may waive this requirement for activities on sites less than one half-acre that are unlikely to result in any visible wind-blown dust.

The project sponsor and the contractor responsible for construction activities at the project site shall use the following practices to control construction dust on the site or other practices that result in equivalent dust control that are acceptable to the Director. Dust suppression activities may include watering all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. If not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating run-off in any area of land clearing, and/or earth movement). During excavation and dirt-moving activities, contractors shall wet sweep or vacuum the streets, sidewalks, paths and intersections where work is in progress at the end of the workday. Inactive stockpiles (where no disturbance occurs for more than seven days) greater than 10 cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and soil shall be covered with a 10 millimeter (0.01 inch) polyethylene plastic (or equivalent) tarp, braced down, or use other equivalent soil stabilization techniques.

These regulations and procedures set forth by the San Francisco Building Code would ensure that potential dust-related air quality impacts would be reduced to a level of insignificance.

Criteria Air Pollutants

As discussed above, construction activities would also result in emissions of criteria air pollutants. To assist lead agencies in determining whether short-term construction-related air pollutant emissions require further analysis as to whether the project may exceed the criteria air pollutant significance thresholds shown in Table 4, the BAAQMD, in their *CEQA Air Quality Guidelines* (May 2011), has developed screening criteria. If all the screening criteria are met by a proposed project, then the lead agency or applicant does not need to perform a detailed air quality assessment of the project's air pollutant emissions, and construction of the proposed project would result in less-than-significant criteria air pollutant impacts. Projects that exceed the screening sizes may require further project-level quantification to determine whether criteria air pollutant emissions may exceed significance thresholds. The *CEQA Air Quality Guidelines* note that the screening levels are generally representative of new development on greenfield[56] sites without any form of mitigation measures taken into consideration. In

[56] Agricultural or forest land or an undeveloped site earmarked for commercial, residential, or industrial projects.

addition, the screening criteria do not account for project design features, attributes, or local development requirements that could also result in lower emissions. For projects that are mixed-use, infill and/or proximate to transit service and local services such as the proposed project, emissions would be expected to be less than the greenfield-type project that the screening criteria are based upon.

The proposed project would include 67 residential units and approximately 2,845 square feet of ground-floor commercial space (retail, likely restaurant). The proposed project would be below the criteria air pollutant screening sizes for mid-rise residential (494 units) identified in the BAAQMD's *CEQA Air Quality Guidelines*. The guidelines do not have screening criteria for generic commercial, retail, or restaurant uses; however, the screening criteria for various applicable retail and restaurant uses are at a minimum of 5,000 square feet (24-hour convenience market) or 8,000 square feet (fast food restaurant without drive-through).

Thus, quantification of construction-related criteria air pollutant emissions is not required, and the proposed project's construction activities would not exceed any of the significance thresholds for criteria air pollutants, and would result in a less-than-significant construction criteria air pollutant impact.

Impact AQ-2: The proposed project's construction activities would generate toxic air contaminants, including diesel particulate matter, which would expose sensitive receptors to substantial pollutant concentrations. (Less than Significant with Mitigation)

Off-road equipment (which includes construction-related equipment) was once estimated to be the second largest source of ambient DPM emissions in California. However, newer and more refined emission inventories have substantially lowered the estimates of DPM emissions from off-road equipment such that off-road equipment is now considered the sixth largest source of DPM emissions in California.[57] This reduction in emissions is due, in part, to effects of the economic recession and the decline in construction. Also, more refined emissions estimation methodologies are showing decreases in emissions. For example, revised particulate matter (PM) emission estimates for the year 2010, for which DPM is a major component of total PM, have decreased by 83 percent from previous estimates for the SFBAAB.[58] Approximately half of the reduction can be attributed to the economic recession and

Date:	March 20, 2013
Case No.:	**2007.0385E**
Project Title:	**345 Brannan Street**
Zoning:	Mixed Use Office District 65-X Height and Bulk District
Block/Lot:	3788/039
Lot Size:	24,110 square feet
Project Sponsor:	Charles Bloszies, (415) 834-9002
Staff Contact:	Don Lewis, (415) 575-9095, don.lewis@sfgov.org

PROJECT DESCRIPTION:

The "L"-shaped project site is located mid-block between Stanford and Third Streets on the block bounded by Brannan Street to the north, Third Street to the west, Townsend Street to the south, and Second Street to the east within the South of Market area. The proposed project involves the removal of an existing 94-space surface parking lot and construction of a new, five-story, 65-foot-tall, office building totaling approximately 116,615 square feet in size with 26 below-grade parking spaces. The project sponsor proposes two options for the ground-floor. Option 1 would include ground-floor retail/restaurant use, while Option 2 would include ground-floor office use. Under Option 1, the building would contain 95,585 square feet of office use and 7,000 square feet of ground-floor retail/restaurant use. Under Option 2, the building would contain 102,585 square feet of office use. Under both options, approximately 825 square feet of private open space would be provided on the second floor and approximately 4,000 square feet of common open space would be provided on the roof deck. Pedestrian access would be from Brannan Street and vehicular access to the underground parking garage would be from Stanford Street. The proposed project would require Planning Commission authorization under Planning Code Section 321 (Office Development Annual Limit), Section 329 (Large Project Authorization), and Section 295 (Shadow). The project site is located within the Eastern Neighborhoods Plan Area.

FINDING:

This project could not have a significant effect on the environment. This finding is based upon the criteria of the Guidelines of the State Secretary for Resources, Sections 15064 (Determining Significant Effect), 15065 (Mandatory Findings of Significance), and 15070 (Decision to prepare a Negative Declaration), and the following reasons as documented in the Initial Evaluation (Initial Study) for the project, which is attached.

Mitigation measures are included in this project to avoid potentially significant effects. See pages 127-134.

Setting

The Bay Area Air Quality Management District (BAAQMD) is the regional agency with jurisdiction over the nine-county San Francisco Bay Area Air Basin (SFBAAB), which includes San Francisco, Alameda, Contra Costa, Marin, San Mateo, Santa Clara, and Napa Counties and portions of Sonoma and Solano Counties. The BAAQMD is responsible for attaining and maintaining air quality in the SFBAAB within federal and state air quality standards, as established by the federal Clean Air Act (CAA) and the California Clean Air Act (CCAA), respectively. Specifically, the BAAQMD has the responsibility to monitor ambient air pollutant levels throughout the SFBAAB and to develop and implement strategies to attain the applicable federal and state standards. The CAA and the CCAA require plans to be developed for areas that do not meet air quality standards, generally. The most recent air quality plan, the *2010 Clean Air Plan*, was adopted by the BAAQMD on September 15, 2010. The *2010 Clean Air Plan* updates the *Bay Area 2005 Ozone Strategy* in accordance with the requirements of the CCAA to implement all feasible measures to reduce ozone; provide a control strategy to reduce ozone, particulate matter, air toxics, and greenhouse gases in a single, integrated plan; and establish emission control measures to be adopted or implemented. The 2010 Clean Air Plan contains the following primary goals:

- Attain air quality standards;
- Reduce population exposure and protect public health in the San Francisco Bay Area; and
- Reduce greenhouse gas emissions and protect the climate.

The *2010 Clean Air Plan* represents the most current applicable air quality plan for the SFBAAB. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of an applicable air quality plan.

Criteria Air Pollutants

In accordance with the state and federal CAAs, air pollutant standards are identified for the following six criteria air pollutants: ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead. These air pollutants are termed criteria air

pollutants because they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. In general, the SFBAAB experiences low concentrations of most pollutants when compared to federal or state standards. The SFBAAB is designated as either in attainment[24] or unclassified for most criteria pollutants with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the state or federal standards. By its very nature, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.[25]

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. Table 1, below, identifies air quality significance thresholds followed by a discussion of each threshold. Projects that would result in criteria air pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

Ozone Precursors. As discussed previously, the SFBAAB is currently designated as non-attainment for ozone and particulate matter (PM10 and PM2.5[26]). Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG) and oxides of nitrogen (NOx). The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, are based on the state and federal Clean Air Acts emissions limits for stationary sources. The federal New Source Review (NSR) program was created by the federal CAA to ensure that stationary sources of air pollution are constructed in a manner that is consistent with attainment of federal health based ambient air quality standards. Similarly, to ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NOx, the offset emissions level is an annual average of 10 tons per

24 "Attainment" status refers to those regions that are meeting federal and/or state standards for a specified criteria pollutant. "Non-attainment" refers to regions that do not meet federal and/or state standards for a specified criteria pollutant. "Unclassified" refers to regions where there is not enough data to determine the region's attainment status.

25 Bay Area Air Quality Management District (BAAQMD), *California Environmental Quality Act Air Quality Guidelines*, May 2011, page 2-1.

26 PM_{10} is often termed "coarse" particulate matter and is made of particulates that are 10 microns in diameter or smaller. $PM_{2.5}$, termed "fine" particulate matter, is composed of particles that are 2.5 microns or less in diameter.

year (or 54 pounds (lbs.) per day).[27] These levels represent emissions by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

Although this regulation applies to new or modified stationary sources, land use development projects result in ROG and NOx emissions as a result of increases in vehicle trips, architectural coating and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of land use projects and those projects that result in emissions below these thresholds, would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ROG and NOx emissions. Due to the temporary nature of construction activities, only the average daily thresholds are applicable to construction phase emissions.

Table 1
Criteria Air Pollutant Significance Thresholds

Pollutant	Construction Thresholds	Operational Thresholds	
	Average Daily Emissions (lbs./day)	Average Daily Emissions (lbs./day)	Annual Average Emissions (tons/year)
ROG	54	54	10
NO_x	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	

Particulate Matter (PM_{10} and $PM_{2.5}$). The BAAQMD has not established an offset limit for $PM_{2.5}$. However, the emissions limit in the federal NSR for stationary sources in nonattainment areas is an appropriate significance threshold. For PM_{10} and $PM_{2.5}$, the emissions limit under NSR is 15 tons per year (82 lbs. per day) and 10 tons per year (54 lbs. per day), respectively. These emissions limits represent levels at which a source is not expected to have an impact on air quality.[28] Similar to ozone precursor thresholds identified above, land use development projects typically result in particulate matter emissions as a result of increases in vehicle trips, space heating and natural gas combustion, landscape maintenance, and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of a land use project. Again, because

27 BAAQMD, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October 2009, page 17.

28 BAAQMD, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October 2009, page 16.

construction activities are temporary in nature, only the average daily thresholds are applicable to construction-phase emissions.

Fugitive Dust. Fugitive dust emissions are typically generated during construction phases. Studies have shown that the application of best management practices (BMPs) at construction sites significantly control fugitive dust.[29] Individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent.[30] The BAAQMD has identified a number of BMPs to control fugitive dust emissions from construction activities.[31] The City's Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008) requires a number of measures to control fugitive dust to ensure that construction projects do not result in visible dust. The BMPs employed in compliance with the City's Construction Dust Control Ordinance is an effective strategy for controlling construction-related fugitive dust.

Local Health Risks and Hazards

In addition to criteria air pollutants, individual projects may emit toxic air contaminants (TACs). TACs collectively refer to a diverse group of air pollutants that are capable of causing chronic (i.e., of long-duration) and acute (i.e., severe but of short-term) adverse effects to human health, including carcinogenic effects. A TAC is defined in California Health and Safety Code §39655 as an air pollutant which may cause or contribute to an increase in mortality or serious illness, or which may pose a present or potential hazard to human health. Human health effects of TACs include birth defects, neurological damage, cancer, and death. There are hundreds of different types of TACs with varying degrees of toxicity. Individual TACs vary greatly in the health risk they present; at a given level of exposure, one TAC may pose a hazard that is many times greater than another.

Unlike criteria air pollutants, TACs do not have ambient air quality standards but are regulated by the BAAQMD using a risk-based approach. This approach uses a health risk assessment to determine which sources and pollutants to control as well as the degree of control. A health risk assessment is an analysis in which human health exposure to toxic substances is estimated, and

Construction Air Quality Impacts

Project-related air quality impacts fall into two categories: short-term impacts due to construction and long term impacts due to project operation. The following addresses construction-related air quality impacts resulting from the proposed project.

Impact AQ-1: The proposed project's construction activities would generate fugitive dust and criteria air pollutants, but would not violate an air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Less than Significant)

Construction activities (short-term) typically result in emissions of fugitive dust, criteria air pollutants, and DPM. Emissions of criteria pollutants and DPM are primarily a result of the combustion of fuel from on-road and off-road vehicles. However, ROGs are also emitted from activities that involve painting or other types of architectural coatings or asphalt paving activities. The proposed project includes the removal of the surface parking lot and the construction of a five-story office building. During the project's approximately ten to twelve month construction period, construction activities would have the potential to result in fugitive dust emissions, criteria air pollutants and DPM.

Fugitive Dust

Project-related demolition, excavation, grading, and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Although there are federal standards for air pollutants and implementation of state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. California has found that particulate matter exposure can cause health effects at lower levels than national standards. The current health burden of particulate matter demands that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. According to the California Air Resources Board, reducing ambient particulate matter from 1998-2000 levels to natural background concentrations in San Francisco would prevent over 200 premature deaths.

Dust can be an irritant causing watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, grading, and other construction activities can cause wind-blown dust to add to particulate matter in the local atmosphere. Depending on exposure, adverse health effects can occur due to this particulate matter in general and also due to specific contaminants such as lead or asbestos that may be constituents of soil.

In response, the San Francisco Board of Supervisors approved a series of amendments to the San Francisco Building and Health Codes generally referred hereto as the Construction Dust Control

Ordinance (Ordinance 176-08, effective July 30, 2008) with the intent of reducing the quantity of dust generated during site preparation, demolition and construction work in order to protect the health of the general public and of onsite workers, minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI).

The Ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from DBI. The Director of DBI may waive this requirement for activities on sites less than one half-acre that are unlikely to result in any visible wind-blown dust.

In compliance with the Construction Dust Control Ordinance, the project sponsor and the contractor responsible for construction activities at the project site would be required to use the following practices to control construction dust on the site or other practices that result in equivalent dust control that are acceptable to the Director. Dust suppression activities may include watering all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. If not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating run-off in any area of land clearing, and/or earth movement). During excavation and dirt-moving activities, contractors shall wet sweep or vacuum the streets, sidewalks, paths, and intersections where work is in progress at the end of the workday. Inactive stockpiles (where no disturbance occurs for more than seven days) greater than 10 cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and soil shall be covered with a 10 millimeter (0.01 inch) polyethylene plastic (or equivalent) tarp, braced down, or use other equivalent soil stabilization techniques.

For projects over one half-acre, such as the proposed project, the Dust Control Ordinance requires that the project sponsor submit a Dust Control Plan for approval by the San Francisco Department of Public Health. DBI will not issue a building permit without written notification from the Director of Public Health that the applicant has a site-specific Dust Control Plan, unless the Director waives the requirement. Interior-only tenant improvement projects that are over one-half acre in size that will not produce exterior visible dust are exempt from the site-specific Dust Control Plan requirement.

The site-specific Dust Control Plan would require the project sponsor to: submit of a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 miles per hour; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project sponsor would be required to designate an individual to monitor compliance with these dust control requirements.

Compliance with these regulations and procedures set forth by the San Francisco Building Code would ensure that potential dust-related air quality impacts would be reduced to a level of insignificance.

Criteria Air Pollutants

As discussed above, construction activities would result in emissions of criteria air pollutants from the use of off- and on-road vehicles and equipment. To assist lead agencies in determining whether short-term construction-related air pollutant emissions require further analysis as to whether the project may exceed the criteria air pollutant significance thresholds shown in Table 1, above, the BAAQMD, in its *CEQA Air Quality Guidelines* (May 2011), developed screening criteria. If a proposed project meets the screening criteria, then construction of the proposed project would result in less-than-significant criteria air pollutant impacts. A project that exceeds the screening criteria may require a detailed air quality assessment to determine whether criteria air pollutant emissions would exceed significance thresholds. The *CEQA Air Quality Guidelines* note that the screening levels are generally representative of new development on greenfield[40] sites without any form of mitigation measures taken into consideration. In addition, the screening criteria do not account for project design features, attributes, or local development requirements that could also result in lower emissions. For projects that are mixed-use, infill, and/or proximate to transit service and local services, emissions would be expected to be less than the greenfield-type project that the screening criteria are based upon.

40 A greenfield site refers to agricultural or forest land or an undeveloped site earmarked for commercial, residential, or industrial projects.

The proposed project involves the removal of a surface parking lot and construction of a five-story office building with potential ground-floor retail use. The proposed project would be below the criteria air pollutant screening sizes for a General Office Building (277,000 square feet) and Quality Restaurant[41] (277,000 square feet) identified in the BAAQMD's *CEQA Air Quality Guidelines*. Thus, quantification of construction-related criteria air pollutant emissions is not required, and the proposed project's construction activities would not exceed any of the significance thresholds for criteria air pollutants, and would result in a less-than-significant construction criteria air pollutant impact.

Impact AQ-2: The proposed project's construction activities would generate toxic air contaminants, including diesel particulate matter, but would not expose sensitive receptors to substantial pollutant concentrations. (Less than Significant)

Off-road equipment (which includes construction-related equipment) is a large contributor to DPM emissions in California, although since 2007, the ARB has found the emissions to be substantially lower than previously expected.[42] Newer and more refined emission inventories have substantially lowered the estimates of DPM emissions from off-road equipment such that off-road equipment is now considered the sixth largest source of DPM emissions in California.[43] This reduction in emissions is due, in part, to effects of the economic recession and refined emissions estimation methodologies. For example, revised particulate matter (PM) emission estimates for the year 2010, which DPM is a major component of total PM, have decreased by 83 percent from previous estimates for the SFBAAB.[44] Approximately half of the reduction can be attributed to the economic recession and approximately half can be attributed to updated assumptions independent of the economic recession (e.g., updated methodologies used to better assess construction emissions).[45]

41 Although the retail use of the proposed project Option 1 has not yet been determined, a Quality Restaurant represents a best estimate at this time and is closest to any of uses list on Table 3-1.

PRELIMINARY MITIGATED NEGATIVE DECLARATION

Date:	March 27, 2013
Case No.:	2011.0702E
Project Title:	101 Polk Street Residential Development
Block and Lot:	0811/002 & 003
Zoning:	C-3-G (Downtown Commercial General) 120-X Height and Bulk District
Lot Size:	13,200 square feet
Project Sponsor:	Marc Babsin, Emerald Fund, (415) 489-1313 marcb@emeraldfund.com
Staff Contact:	Andrea Contreras, (415) 575-9044 andrea.contreras@sfgov.org

PROJECT DESCRIPTION:

The project site (site) is located at 101 Polk Street, at the northwest corner of Polk and Hayes Streets in the Downtown/Civic Center area of San Francisco, approximately one-half block south of San Francisco City Hall, one block north of Market Street, and about three blocks from the Civic Center Bay Area Rapid Transit (BART) Station. The site is bordered by Hayes Street to the south, Lech Walesa Alley to the north, and Polk Street to the east. The 13,200-square-foot site is currently in use as a surface parking lot. The project sponsor proposes to build a 13-story, 162 unit residential building on the site. A subterranean garage would contain vehicle and bicycle parking, and would be accessible from the adjacent Lech Walesa Alley. Street frontage along Polk and Hayes Streets would consist of walk-up residential units, as well as the building's lobby and leasing area. The proposed project would require three exceptions per Planning Code Section 309 for parking (Code Section 151.1) and rear yard requirements (Code Section 134 (d)), as well as the continuation of existing wind comfort level exceedances (Code Section 148). A Conditional Use Authorization would also be required per Planning Code Sections 215, 124(f), and 303 to allow dwelling unit density in excess of one unit per 125 square feet of lot area and to exempt the on-site inclusionary dwelling units from the floor area ratio limits.

FINDING:

This project could have a significant effect on the environment. This finding is based upon the criteria of the Guidelines of the State Secretary for Resources, Sections 15064 (Determining Significant Effect), 15065 (Mandatory Findings of Significance), and 15070 (Decision to Prepare a Negative Declaration), and the following reasons as documented in the Initial Evaluation (Initial Study) for the project, which is attached.

Mitigation and improvement measures are included in this project to avoid potentially significant effects. See pp.143-150.

measures to reduce ozone; provide a control strategy to reduce ozone, particulate matter, air toxics, and GHGs in a single, integrated plan; and establish emission control measures to be adopted or implemented. The primary goals of the 2010 Clean Air Plan are to:

- Attain air quality standards;
- Reduce population exposure and protect public health in the San Francisco Bay Area; and
- Reduce GHG emissions and protect the climate.

The 2010 Clean Air Plan represents the most current applicable air quality plan for the SFBAAB. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of an applicable air quality plan.

Criteria Air Pollutants

In accordance with the state and federal CAAs, air pollutant standards are identified for the following six criteria air pollutants: ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO2), sulfur dioxide (SO2) and lead. These air pollutants are termed criteria air pollutants because they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. In general, the SFBAAB experiences low concentrations of most pollutants when compared to federal or state standards. The SFBAAB is designated as either in attainment[35]or unclassified for most criteria pollutants with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the state or federal standards. By its very nature regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.[36]

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. Table 6, identifies air quality significance thresholds followed by a discussion of each threshold. Projects that would result in criteria air pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

[35] "Attainment" status refers to those regions that are meeting federal and/or state standards for specified criteria pollutant. "Non-attainment" refers to regions that do not meet federal and/or state standards for a specified criteria pollutant. "Unclassified" refers to regions where there is not enough data to determine the region's attainment status.

Ozone Precursors

As discussed previously, the SFBAAB is currently designated as non-attainment for ozone and particulate matter (PM_{10} and $PM_{2.5}$)[37]. Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG) and oxides of nitrogen (NO_x). The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, are based on the state and federal Clean Air Acts emissions limits for stationary sources. The federal New Source Review (NSR) program was created by the federal CAA to ensure that stationary sources of air pollution are constructed in a manner that is consistent with attainment of federal health based ambient air quality standards. Similarly, to ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation Two, Rule Two requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors, ROG and NO_x, the offset emissions level is an annual average of ten tons per year (or 54 pounds (lbs.) per day).[38] These levels represent emissions by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

Although this regulation applies to new or modified stationary sources, land use development projects result in ROG and NOx emissions as a result of increases in vehicle trips, architectural coating and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of land use projects and those projects that result in emissions below these thresholds, would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ROG and NOx emissions. Due to the temporary nature of construction activities, only the average daily thresholds are applicable to construction phase emissions.

[37] PM_{10} is often termed "coarse" particulate matter and is made of particulates that are 10 microns in diameter or larger. $PM_{2.5}$, termed "fine" particulate matter, is composed of particles that are 2.5 microns or less in diameter.

[38] BAAQMD, Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance, page 16. October 2009.

Construction Air Quality Impacts

Impact AQ-1: The proposed project's construction activities would generate fugitive dust and criteria air pollutants, but would not violate an air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Less than Significant)

Construction activities (short-term) typically result in emissions of fugitive dust, criteria air pollutants, and DPM. Emissions of criteria pollutants and DPM are primarily a result of the combustion of fuel from on-road and off-road vehicles. However, ROGs are also emitted from activities that involve painting or other types of architectural coatings or asphalt paving activities. The proposed project includes demolition of a surface parking lot and construction of a new 13-story building with 162 residential units and 635 square feet of commercial space (leasing office). During the project's approximately 18-month construction period, construction activities would have the potential to result in fugitive dust emissions, criteria air pollutants.

Fugitive Dust

Project-related demolition, excavation, grading, and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Although there are federal standards for air pollutants and implementation of state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. California has found that particulate matter exposure can cause health effects at lower levels than national standards. The current health burden of particulate matter demands that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. According to the California Air Resources Board, reducing ambient particulate matter from 1998-2000 levels to natural background concentrations in San Francisco would prevent over 200 premature deaths.

Dust can be an irritant causing watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, grading, and other construction activities can cause wind-blown dust to add to particulate matter in the local atmosphere. Depending on exposure, adverse health effects can occur due to general particulate matter and specific contaminants such as lead or asbestos that may be constituents of soil.

In response, the San Francisco Board of Supervisors approved a series of amendments to the San Francisco Building and Health Codes generally referred hereto as the Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008) with the intent of reducing the quantity of dust generated during site preparation, demolition and construction work in order to protect the health of the general public and of onsite workers, to minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI).

The Ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from DBI. The Director of DBI may waive this requirement for activities on sites less than ½ acre

that are unlikely to result in any visible wind-blown dust. The project would disturb 9,000 cubic yards of soil and would be required to implement dust control measures.

The project sponsor and the contractor responsible for construction activities at the project site shall use the following practices to control construction dust on the site or other practices that result in equivalent dust control that are acceptable to the Director. Dust suppression activities may include watering all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 mph. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. If not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating run-off in any area of land clearing, and/or earth movement). During excavation and dirt-moving activities, contractors shall wet sweep or vacuum the streets, sidewalks, paths and intersections where work is in progress at the end of the workday. Inactive stockpiles (where no disturbance occurs for more than seven days) greater than 10 cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and soil shall be covered with a 10 millimeter (0.01 inch) polyethylene plastic (or equivalent) tarp, braced down, or use other equivalent soil stabilization techniques. Compliance with these regulations and procedures set forth in the San Francisco Building Code would ensure that potential dust-related air quality impacts would remain *less than significant*.

Criteria Air Pollutants

As discussed above, construction activities would also result in emissions of criteria air pollutants. To assist lead agencies in determining whether short-term construction-related air pollutant emissions require further analysis as to whether the project may exceed the criteria air pollutant significance thresholds shown in Table 6, the BAAQMD, in their CEQA Air Quality Guidelines (May 2011), has developed screening criteria. If all the screening criteria are met by a proposed project, then the lead agency or applicant does not need to perform a detailed air quality assessment of the project's air pollutant emissions, and construction of the proposed project would result in less-than-significant criteria air pollutant impacts. Projects that exceed the screening sizes may require further project-level quantification to determine whether criteria air pollutant emissions may exceed significance thresholds. The CEQA Air Quality Guidelines note that the screening levels are generally representative of new development on greenfield[50] sites without any form of mitigation measures taken into consideration. In addition, the screening criteria do not account for project design features, attributes, or local development requirements that could also result in lower emissions. For projects that are mixed-use, infill and/or proximate to transit service and local services such as the proposed project, emissions would be expected to be less than the greenfield-type project that the screening criteria are based upon.

The proposed project would include 162 residential units and approximately 635 square feet of ground floor commercial space (leasing office). The proposed project would be below the criteria air pollutant screening sizes for mid-rise residential (494 units) identified in the BAAQMD's CEQA Air Quality

[50] Agricultural or forest land or undeveloped site earmarked for commercial, residential, or industrial projects.

Operational Air Quality Impacts

Land use projects typically result in emissions of criteria air pollutants and toxic air contaminants primarily from an increase in motor vehicle trips. However, land use projects may also result in criteria air pollutants and toxic air contaminants from combustion of natural gas, landscape maintenance, use of consumer products, and architectural coating. The proposed project includes landscaped areas, a leasing office, and residences, which would involve the use of consumer products. Construction of the proposed project would include the use of architectural coatings, and the operation of the proposed project would also result in 591 vehicle trips per day. [59]

Impact AQ-3. The proposed project would result in emissions of criteria air pollutants, but not at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Less than Significant)

As discussed above in Impact AQ-1, the BAAQMD in their *CEQA Air Quality Guidelines* (May 2011), has developed screening criteria to determine whether a project requires an analysis of project-generated criteria air pollutants. If all the screening criteria are met by a proposed project, then the lead agency or applicant does not need to perform a detailed air quality assessment. The proposed project includes 162 residential units and approximately 635 square feet of ground-floor commercial space (leasing office). The proposed project would be below the criteria air pollutant screening sizes for mid-rise residential (494 units) and the lowest potential screening criteria for various commercial uses (5,000 square feet for a 24-hour convenience market or 8,000 square feet for a fast-food restaurant without drive-through) identified in the BAAQMD's CEQA Air Quality Guidelines. Thus, quantification of project-generated criteria air pollutant emissions is not required, and the proposed project would not exceed any of the significance thresholds for criteria air pollutants, and would result in a *less-than-significant* impact with respect to criteria air pollutants.

Impact AQ-4: The proposed project would generate toxic air contaminants, including diesel particulate matter, and would expose sensitive receptors to substantial air pollutant concentrations. (Less than Significant with Mitigation)

As discussed above, the San Francisco Planning Department and DPH, in partnership with BAAQMD, has modeled and assessed air pollutant impacts from mobile, stationary and area sources within the City. This assessment has resulted in the identification of air pollutant hot spots, or areas within the City that deserve special attention when siting uses that either emit toxic air contaminants or uses that are considered sensitive to air pollution. The project site is partially within a hot spot (and is considered within a hot spot for CEQA purposes) and sensitive land uses exist in the residential uses adjacent to the project site. With its inclusion of 162 residential units, the proposed project would site new sensitive land uses within this potential air pollutant hot spot.

PROJECT DESCRIPTION:

The site for the proposed Hall of Justice (HOJ) Rehabilitation and Detention Facility (RDF) project is located in San Francisco's South of Market neighborhood, at the intersection of Bryant and Sixth streets, and consists of eight parcels: Assessor's Block 3759, Lots 9 through 12, 14, 43, 45, a portion of Lot 42, and portions of the Harriet Street and Ahern Way rights-of-way. The western portion of the project site (the HOJ site), located at 850 Bryant Street, contains the existing eight-story, 117-foot-tall (105 feet to the rooftop plus an additional 12-foot-tall mechanical penthouse), 610,000-gsf HOJ, constructed between 1958 and 1961. The existing HOJ serves as one of the primary County Jail Facilities for the San Francisco Sheriff's Department. County Jails No. 3 (CJ#3) and No. 4 (CJ#4) are located on the 6th and 7th floors of the existing HOJ. Other uses within the existing HOJ include the justice center for the San Francisco County Superior Court, the Chief Medical Examiner and morgue, and the current operational headquarters for the San Francisco Police Department. County Jails No. 3 (CJ#3) and No. 4 (CJ#4) are located on the 6th and 7th floors of the existing HOJ. Directly east of the HOJ site is the project building site, which is bounded by Ahern Way to the north, Sixth Street to the east, Bryant Street to the south, and Harriet Street to the west. The 40,276-sf project building site contains two vacant lots, areas of surface parking, and five existing buildings: a one-story, 6,000-gsf office building, constructed in 1956 (444 Sixth Street); a one-story, 5,100-gsf commercial building, constructed in 1959 (450 Sixth Street); a three-story, 7,150-gsf,

- Reduce GHG emissions and protect the climate.

The *2010 Clean Air Plan* represents the most current applicable air quality plan for the SFBAAB. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of air quality plans.

Criteria Air Pollutants

In accordance with the state and federal CAAs, air pollutant standards are identified for the following six criteria air pollutants: ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead. These air pollutants are termed criteria air pollutants because they are regulated by developing specific public health- and welfare-based criteria as the basis for setting permissible levels. In general, the SFBAAB experiences low concentrations of most pollutants when compared to federal or state standards. The SFBAAB is designated as either in attainment[78] or unclassified for most criteria pollutants with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the state or federal standards. By its very nature, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.[79]

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. **Table 12: Criteria Air Pollutant Significance Thresholds** identifies air quality significance thresholds. This table is followed by a discussion of each threshold. Projects that would result in criteria air pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

[78] "Attainment" status refers to those regions that are meeting federal and/or state standards for a specified criteria pollutant. "Non-attainment" refers to regions that do not meet federal and/or state standards for a specified criteria pollutant. "Unclassified" refers to regions where there is not enough data to determine the region's attainment status for a specified criteria air pollutant.

Ozone Precursors

As discussed previously, the SFBAAB is currently designated as non-attainment for ozone and particulate matter. Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG) and oxides of nitrogen (NO_x). The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, are based on the state and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NO_x, the offset emissions level is an annual average of 10 tons per year (or 54 pounds [lbs] per day).[80] These levels represent emissions by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

Although this regulation applies to new or modified stationary sources, land use development projects result in ROG and NO_x emissions as a result of increases in vehicle trips, architectural coating and construction activities. Therefore, the above thresholds can be applied to the construction and operational phases of land use projects, and those projects that result in emissions below these thresholds would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ROG and NO_x emissions. Due to the temporary nature of construction activities, only the average daily thresholds are applicable to construction phase emissions.

City of San Francisco Health Code Article 30

San Francisco Health Code Article 30 requires all diesel backup generators used by facilities within the City and County of San Francisco to be registered through the Department of Public Health. The regulation also requires all new backup diesel generators to have air emissions control technologies as determined by the BAAQMD, be limited in their nonemergency use, and have records kept of all operations. The regulation also provides for enforcement for violations of the regulation requirements.

City of San Francisco Health Code Article 38

San Francisco adopted San Francisco Health Code Article 38 in 2008, with revisions taking effect December 2014. The revised code requires that sensitive use developments within the Air Pollutant Exposure Zone incorporate Minimum Efficiency Reporting Value (MERV) 13 equivalent ventilation systems to remove particulates from outdoor air. This regulation also applies to conversion of a nonsensitive use to a sensitive use (e.g., student housing).

4.8.3 Impacts and Mitigation Measures

Significance Thresholds

For purposes of this EIR, the Proposed Project would result in a significant impact related to air quality, if it would:

- Conflict with or obstruct implementation of the applicable air quality plan
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation
- Result in a cumulatively considerable net increase of any criteria air pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)
- Expose sensitive receptors to substantial pollutant concentrations
- Create objectionable odors affecting a substantial number of people

By its very nature, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to result, by itself, in nonattainment of air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality impacts. If a project's contribution to cumulative air quality impacts is considerable, then the project's impact on air quality would be considered significant.[283]

[283] BAAQMD, *California Environmental Quality Act Air Quality Guidelines* (May 2011), p. 2-1.

Land use projects may contribute to regional criteria air pollutants during the construction and operational phases of a project. Table 4.8-9, Criteria Air Pollutant Significance Thresholds, p. 4.8-27, identifies air quality significance thresholds for criteria air pollutants. Projects that would result in criteria air pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

Table 4.8-9 Criteria Air Pollutant Significance Thresholds

	Construction Threshold	Operational Threshold	
	Average Daily Emissions (lb/day)	Average Daily Emissions (lb/day)	Maximum Annual Emissions (ton/year)
Criteria Air Pollutants			
ROG	54	54	10
NO_X	54	54	10
PM_{10}	82	82	15
$PM_{2.5}$	54	54	10
CO	Not Applicable	9.0 ppm (8-hr average) or 20.0 ppm (1-hr average)	
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not Applicable	

Ozone Precursors. As discussed previously, the SFBAAB is currently designated as nonattainment for ozone and particulate matter. Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG)[284] and NO_X. The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants, which may contribute to an existing or projected air quality violation, is based on the state and federal Clean Air Act's emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NO_X, the offset emissions level is an annual average of 10 tons per year (or 54 pounds [lb] per day).[285] These levels represent emissions by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

Particulate Matter (PM_{10} and $PM_{2.5}$). The federal New Source Review (NSR) program was created by the federal CAA to ensure that stationary sources of air pollution are constructed in a manner

[284] ROG or VOCs are defined as any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions. Although there are slight differences in the definitions of ROG and VOCs, the two terms are often used interchangeably.

BUSINESS & REAL ESTATE MARCH 17, 2015

New 'green diesel' rolls out for Sacramento motorists

HIGHLIGHTS

Sacramento motorists will be among the first in California to be offered a new "high-performance renewable diesel fuel" produced by Redwood City-based Propel Fuels.

Diesel HPR, made from 98 percent recycled plant and animal fats and oils, is being introduced at 18 Propel Fuels pumps in Sacramento, the Bay Area and Fresno.

Darren Johnson, operations manager of Northern California at Propel Fuels, finishes polishing up the pumps that will open at a Valero station. Diesel HPR is a performance fuel that meets the specifications for use in all diesel engines. | **Renée C. Byer** - rbyer@sacbee.com

BY MARK GLOVER
mglover@sacbee.com

Sacramento motorists on Wednesday will be among the first in California to be offered a new "high-performance renewable" diesel fuel

among the first in California to be offered a new "high-performance renewable" diesel fuel – produced largely from recycled plant and animal oils.

This new generation of diesel biofuel, by Redwood City-based Propel Fuels Inc., is manufactured almost entirely from various plant- and animal-based waste, including vegetable oils, animal fats, industrial tallow and restaurant byproducts.

Rob Elam, co-founder and CEO of Propel, said Tuesday that "California carbon market regulation has created a market to attract these renewable fuels."

According to Propel, renewable diesel fuel can produce up to 70 percent less carbon emissions than petroleum-based diesel.

The formal launch of the company's "Diesel HPR" – short for High Performance Renewable – will be at 10:15 a.m. Wednesday with ribbon-cutting ceremonies at the Propel fueling site at 1101 Broadway in Sacramento. Among those scheduled to speak is Mary Nichols, chairwoman of the California Air Resources Board.

"This renewable diesel joins a growing suite of new, cleaner transportation fuels in California, thanks to our low carbon fuel standard and forward-thinking companies like Propel," said Nichols in a statement ahead of the official launch.

The new fuel, which is selling for $2.89 a gallon at the Broadway station, can be used in any diesel vehicle.

Propel's renewable diesel is made overseas in Singapore by Neste Oil Corp., a Finland-based refining and marketing company. According to the U.S. Department of Energy's Alternative Fuels Data Center, the combustion quality of renewable or "green diesel" results in similar or better vehicle performance compared with conventional diesel fuel.

Propel has 45 fueling stations in California and Washington state, most of which are stand-alone pumps at regular gas stations, such as Chevron, Shell or Valero.

Initially, its Diesel HPR will only be available at 18 fueling sites throughout Sacramento, the Bay Area and Fresno.

In addition to the Broadway station, the new fuel is selling at nine other local locations: 8062 Florin Road and 8090 Folsom Blvd. in Sacramento; 705 Harbor Pointe Place in West Sacramento; 7741 Auburn Blvd. and 7901 Madison Ave. in Citrus Heights; 9190 E. Stockton Blvd. in Elk Grove; 6700 Five Star Blvd. in Rocklin; 999 Sunrise Ave. in Roseville; and 151 Main St. in Placerville.

Propel CEO Elam said similar diesel fuel has been offered in "very low blend rates" in other parts of the nation, "but we think we make the highest-tech diesel in the market." Diesel HPR is made from 98 percent renewable content, while biodiesel is 20 percent renewable and 80 percent petroleum.

Call The Bee's Mark Glover, (916) 321-1184.

I'm not a fan of HPR. Used it for a couple of months with no problem, then major engine power loss. Switched back to diesel and car is better. I drive an old Mercedes.

NEW RFP to Upgrade CalEEMod - Open to Submit Bid by April 13, 2015 (/docs/default-source/caleemod/upgrades/2015-rfp-caleemod-final.pdf?sfvrsn=2) (PDF, 3MB)

CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects. The model quantifies direct emissions from construction and operations (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. The mobile source emission factors used in the model (EMFAC2011) includes the Pavley standards and Low Carbon Fuel standards into the mobile source emission factors. Further, the model identifies mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from measures chosen by the user. The GHG mitigation measures were recently developed and adopted by the California Air Pollution Control Officers Association (CAPCOA).

The model was developed in collaboration with the air districts of California. Default data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions. The model is free of charge and will be periodically updated when modifications are warranted.

The model is an accurate and comprehensive tool for quantifying air quality impacts from land use projects throughout California. The model can be used for a variety of situations where an air quality analysis is necessary or desirable such as California Environmental Quality Act (CEQA) documents, National Environmental Policy Act (NEPA) documents, pre-project planning, compliance with local air quality rules and regulations, etc.

EXHIBIT 19

San Francisco Ordinance No. 27-06 which took effect on July 1, 2006 enacted a new Chapter of the Environment Code and made amendments to the Building Code, the Health Code and the Police Code in order to establish a comprehensive program to effectuate the City's goals. The text of each code is included below.

- **ENVIRONMENT CODE:**
  - Created Chapter 14 entitled "Construction and Demolition Debris Recovery Ordinance" [see page 1, below]

- **BUILDING CODE**:
  - Amended Section 106.3.2.2 [see page 12, below]
  - Amended the title of Chapter 13 from "Energy Conservation to "Resource Conservation" [The text of this Chapter is not included below since only the title was amended]
  - Added Chapter 13B entitled "Construction and Demolition Debris Recovery Program" [see page 13, below]

- **HEALTH CODE**:
  - Added Section 288 [see page 14, below]
  - Added Section 288.1 [see page 15, below]

- **POLICE CODE**:
  - Amended Section 39-1 [see page 15, below]

* * * * *

ENVIRONMENT CODE

CHAPTER 14: CONSTRUCTION AND DEMOLITION DEBRIS RECOVERY ORDINANCE*

Sec. 1400. Findings.

Sec. 1401. Definitions.

Sec. 1402. Requirements.

Sec. 1403. Reserved.

Sec. 1404. Registration Requirement for Facilities and Transporters.

Sec. 1405. Registration Criteria.

Sec. 1406. General Terms and Conditions for Registered Facilities and Transporters.

Editor's note: *; Ordinance 27-06, File No. 051142, Approved February 16, 2006, from which Chapter 14 of this Code derives, shall take effect on July 1, 2006.

SEC. 1400. FINDINGS.

The Board of Supervisors finds and declares the following:

A. People who live in, work in or visit San Francisco generate 1.8 million tons of solid waste annually with more than half of these materials recovered through waste prevention, recycling and composting.

B. The State of California through its California Integrated Waste Management Act of 1989, Assembly Bill 939 (AB 939), requires that each local jurisdiction in the state divert 50% of discarded materials (base year 1990) from landfill. Every city and county in California, including the City, could face fines up to $10,000 a day for not meeting the above mandated goal.

C. The Source Reduction and Recycling Element (SRRE) for San Francisco adopted by the Board of Supervisors in 1992, recognized the importance of recovering wood, metals, and inerts from construction and demolition activities in order to meet the state mandated waste reduction goal.

D. The Board of Supervisors adopted Resolution No. 679-02 setting a goal of 75% diversion from landfill by 2010 and promoting the highest and best use of recovered materials and authorizing the Commission on the Environment to adopt a zero waste goal, which it set as 2020.

E. The Green Building Ordinance, Chapter 7 of the Environment Code, establishes LEEDTM Silver level as the standard for all City building projects, which can include the goal of diverting 75% of construction and demolition debris from landfill for each project.

F. There are facilities both within the City and in nearby surrounding areas that can effectively reuse, recycle or otherwise recover the constituent elements of the materials generated by construction and demolition activity and thereby divert such materials from landfill.

G. Construction and demolition waste recovery programs reduce the amount of materials generated and hauled to landfill, decrease worker exposure to hazards, improve worker safety, reduce truck trips and traffic and improve air quality, thereby enhancing the health, safety and welfare of San Franciscans.

H. This Chapter requires construction and demolition debris to be transported by a registered vehicle and processed by a registered facility in order to ensure proper handling and to recover an additional estimated 100,000 tons from landfill disposal annually.

I. State law requires the California Integrated Waste Management Board to adopt a model construction and demolition debris ordinance and requires that Board to take into account a city's efforts to encourage or require recovery of construction and demolition debris in determining whether a city has met the mandated 50% recovery rate and other solid waste reduction and recycling requirements. This Chapter would help the City maintain the levels required by the state mandate and achieve the City's goals of 75% landfill diversion by 2010 and zero waste by 2020.

J. In keeping with the Precautionary Principle, codified in Chapter 1 of the Environment Code, this Chapter requires proper handling of construction debris as a deterrent to unsafe and wasteful practices. In this way, the City will create and maintain a healthy, viable environment for current and future generations, and will become a model of sustainability.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1401. DEFINITIONS.

For the purposes of this Chapter, the following words have the following meanings:

(a) "Alternative Daily Cover" or "ADC" shall mean materials, other than soil, that have been approved by the California Integrated Waste Management Board or a successor agency for use as an overlay on an exposed landfill face.

(b) "Bio-mass Conversion" shall mean the controlled combustion, when separated from other solid waste and used for producing electricity or heat, of wood, woodchips, woodwaste, tree and brush prunings. Bio-mass conversion does not include the controlled combustion of recyclable pulp or recyclable paper materials, sludge, medical or hazardous waste.

(c) "Construction and Demolition Debris" shall mean building materials and solid waste generated from construction and demolition activities, including, but not limited to, fully-cured asphalt, concrete, brick, rock, soil, lumber, gypsum wallboard, cardboard and other associated packaging, roofing material, ceramic tile, carpeting, fixtures, plastic pipe, metals, tree stumps, and other vegetative matter resulting from land clearing and landscaping for construction, deconstruction, demolition or land developments. This term does not include; refuse regulated under the 1932 Refuse Collection and Disposal Initiative Ordinance or sections of the Municipal Code that implement the provisions of that ordinance; materials excavated from the public right-of-way; or, unless otherwise specified in Section 1402(b), materials source separated for reuse or recycling. Hazardous waste, as defined in California Health and Safety Code section 25100 et seq., as amended, is not Construction and Demolition Debris for purposes of this Chapter.

(d) "Department" shall mean the San Francisco Department of the Environment.

(e) "Director" shall mean the Director of the Department of the Environment or his or her designee.

(f) "Facility" shall mean a facility that receives and processes construction and demolition debris into its component material types for reuse, recycling, and disposal of residuals.

(g) "Person" shall mean a natural person, a firm, joint stock company, business concern, association, partnership or corporation or governmental entity, including the City and County of San Francisco and its departments, boards and commissions for projects within the geographic boundaries of the City, and its or their successors or assigns.

(h) "Recover" or "Recovery" shall mean any activity, including source reduction, deconstruction and salvaging, reuse, recycling and composting, which causes materials to be recovered for use as a resource and diverted from disposal.

(i) "Registered Transporter" or "Registered Facility" shall mean a person who holds a valid registration issued by the Director pursuant to this Chapter.

(j) "Transport" or "Transportation" shall mean transportation of construction and demolition debris, "Transport" or "Transportation" does not include transportation of less than one cubic yard of construction and demolition debris or transportation in a vehicle that has no more than two axles and no more than two tires per axle.

(k) "Transporter" shall mean a person that transports construction and demolition debris as defined in this Chapter. "Transporter" does not include a person that owns the property at which the construction and demolition debris was generated.

(l) "Vehicle" shall mean a vehicle used to transport construction and demolition debris as those terms are defined in this Chapter.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1402. REQUIREMENTS.

(a) Except as provided in this Chapter, no person, other than the owner of the property where the construction and demolition debris was generated, may transport and no person may process

construction and demolition debris unless that person has a registration from the Department as provided in this Chapter. Except as provided in this Chapter, all construction and demolition debris, regardless of transport or volume, must be processed at a registered facility.

(b) A person conducting full demolition of an existing structure must submit a waste diversion plan to the Director which provides for a minimum of 65% diversion from landfill of construction and demolition debris, including materials source separated for reuse or recycling which would otherwise not be subject to this Chapter. The plan may propose to use facilities and transporters that are not registered under this Chapter. The waste diversion plan must be submitted to the Director at the time the person applies for a demolition permit from the Department of Building Inspection and must include the following information: a list of all material types and volumes anticipated from the demolition; the market or destination for each material; the estimated recovery rate (diversion from landfill) by material or market; and the anticipated transporter for each material type. The Director shall make a determination as to the adequacy of the plan within five (5) business days and shall notify the Department of Building Inspection of its decision.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1403. RESERVED.

SEC. 1404. REGISTRATION REQUIREMENT FOR FACILITIES AND TRANSPORTERS.

(a) A person subject to Section 1402 shall apply for a registration by filing with the Director an application form prescribed by the Director, which contains the following information, and the information set forth in Section 1405.

(i) For construction and demolition debris processing facilities: the name and address of the person who owns the facility; the name and address of the person who operates the facility; a statement that the owner or operator has all permits, authorizations or licenses required by any local, state or federal agency to operate the facility and all necessary insurance.

(ii) For transporters of construction and demolition debris: the name and address of the person who owns the vehicle(s); a statement that the vehicle(s) and each operator has all permits, authorizations or licenses and any insurance required by any local, state or federal agency to operate the vehicle(s). An owner of a vehicle may obtain a single registration covering all vehicles and all debris boxes or other containers, provided that each vehicle is clearly and prominently marked as belonging to that owner (with the name of the business entity). The owner of the vehicle(s) is responsible for compliance by any operator of a vehicle owned by that person being used to transport construction and demolition debris.

(b) The person who owns the facility or the vehicle(s) must certify the accuracy of the information submitted in the application form under penalty of perjury.

(c) The Director must act on an application form within 15 days of receipt.

(d) If the Director determines that the information required by the application form is not complete, the Director will provide written notice to the potential registrant of the remaining information needed.

(e) If the Director determines that the application form is complete, the Director shall issue a registration containing the following minimum information: a reference to the general terms and conditions specified in Section 1406; the name and address of the registrant, the name and address of the facility (if applicable); the effective and expiration date of the registration; and a registration number assigned by the Director.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1405. REGISTRATION CRITERIA.

The owner of the facility or the transporter shall include the following information in the application form described in Section 1404.

(a) **For Facilities**.

(i) The facility meets an overall minimum recovery rate of 65 percent for construction and demolition debris (based on the most recent month), which may include materials used as ADC or bio-mass conversion, provided that the facility can demonstrate that the use as ADC or bio-mass conversion is the highest and best use. The recovery rate will be determined by the total quantity of materials delivered to established recycling and composting markets divided by the total quantity received by the registered facility. Highest and best use for ADC does not include ADC which is generated by intentional crushing or grinding of construction and demolition debris that has not been processed to remove wood, metal, wallboard, glass and other materials for which markets or uses other than ADC are available. Consistent with this section, the Director shall adopt regulations pursuant to Section 1412 to specify how the recovery rate will be calculated and when ADC or bio-mass conversion is considered to be the highest and best use of a particular material.

(ii) The facility has and is implementing a hazardous waste load checking program to minimize hazardous waste accepted at the facility.

(iii) The facility has no outstanding notices of violation from any federal, state or local agency that could affect the permits, authorizations or licenses required for its continued operation.

(iv) The facility agrees to submit annual reports to the Director on forms and by dates specified by the Director pursuant to Section 1412. The reports must include, with respect to San Francisco materials only, the following information; the total quantity of material received at the registered facility, the breakdown of all of the specific recycled commodities, the end use of the recycled commodity (reuse, recycling, composting, ADC, bio-mass conversion) landfill destination for residuals, and the recovery ratio for the report period by processing area.

(v) For each truckload received at a discrete facility processing area, the facility agrees to provide each vehicle with a uniquely numbered receipt specifying, at a minimum, the facility name and processing area, the quantity of material received and the current recovery rate for that processing area. The

receipt will also include the identity of the transporter and the permit application number issued by the Department of Building Inspections, if any, associated with that load.

(vi) The facility agrees to comply with the provisions of this Chapter; provide documentation to support the information in the application form, including the Section 1404(b) certification, to the Director upon request; and allow the Director to make inspections of the facility in order to verify the information in the application form and required reports.

(b) **For Transporters**.

(i) The owner has no outstanding notices of violation from any federal, state or local agency that could affect the permits, authorizations or licenses required for continued operation of his or her vehicles.

(ii) The owner agrees to submit to the Director, upon request, the receipts specified in subsection (a)(v).

(iii) The owner agrees that for each truckload of materials delivered to a facility, the operator of the vehicle will provide to the facility the permit application number, if any, associated with that load.

(iv) The owner of the vehicle agrees to comply with the provisions of this Chapter; provide documentation to support the information in the application form, including the Section 1404(b) certification, to the Director upon request; and allow the Director to make inspections of vehicles in order to verify the information in the application form and reports.

(v) The owner agrees that all vehicles will operate in accordance with state and federal laws and motor carrier regulations and in accordance with best business practices to ensure against leakage and unsafe loads. All Construction and Demolition Debris must be transported in either a fully enclosed vehicle or container and must be covered to minimize any potential spillage or littering.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1406. GENERAL TERMS AND CONDITIONS FOR REGISTERED FACILITIES AND TRANSPORTERS.

The following terms and conditions shall apply to each registration:

(a) A registration is valid for two years.

(b) Each registrant must submit a registration renewal on a form specified by the Director thirty (30) days prior to the expiration date of the registration. Except as provided in this subsection, if a registrant submits a properly completed renewal form thirty (30) days prior to the expiration date, the current registration will continue in full force and effect until the Director issues a registration or all administrative and judicial appeals have been exhausted or the time for appeal has expired. A person may not renew a registration during a period of suspension, either by filing a renewal form or by operation of law. At the end of the suspension period, the person may apply for a registration.

(c) All records required to be kept by registered facilities and transporters shall be kept for at least three (3) years.

(d) A registration is not transferable.

(e) A registration does not take the place of any license required by state, federal or local law nor does compliance with the requirements of this Chapter relieve any party of compliance with any other applicable State, federal or local law.

(f) A copy of proof of registration shall be prominently displayed at any registered facility and kept in a registered vehicle.

(g) Within thirty (30) days of a change of any of the information required on a registration or renewal form, a registrant must file an amendment to the registration on a form prescribed by the Director.

(h) Each registrant must notify the Director, in writing, within twenty-four (24) hours of the time a permit, authorization or license required by any local, state or federal agency to operate the facility or vehicle terminates, expires or is revoked or suspended.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1407. TRADE SECRETS.

(a) If a person believes that any information required to be reported or disclosed by this Chapter contains a trade secret, the person shall provide the information to the Director and shall notify the Director in writing of that belief, detailing the basis of the belief as to each specific item of information the person claims is a trade secret. For purposes of this Chapter, "trade secret" shall have the same meaning as it has under state law. The person designating information as a trade secret shall specify a name and street address for notification purposes and shall be responsible for updating such information. The Director shall not disclose any properly substantiated trade secret which is so designated by a person except as required by this Chapter or as otherwise required by law.

(b) Information designated as trade secret may be disclosed to an officer or employee of the City and County of San Francisco, the State of California, or the United States of America for use in connection with the official duties of such officer or employee acting under authority of law for the protection of health, without liability on the part of the City.

(c) When the Director or other City official or employee receives a request for information that has been designated as, or which the City determines may be, a trade secret, the City shall notify the person or business of the request. The City may request further evidence or explanation from the person as to why the information requested is a trade secret. If the City determines that the information does not constitute a trade secret, the City shall notify the person or business of that conclusion and that the information will be released by a specified date in order to provide the person or business the opportunity to obtain a court order prohibiting disclosure.

(d) In adopting this Chapter, the Board of Supervisors does not intend to authorize or require the disclosure to the public of any trade secrets protected under the laws of the State of California.

(e) This Section is not intended to empower a person or business to refuse to disclose any information, including but not limited to trade secrets, to the Director or other City Departments required under this Chapter.

(f) Notwithstanding any other provision of this Chapter, any officer or employee of the City and County of San Francisco, or former officer or employee or contractor with the City or employee thereof, who by virtue of such employment of official position has obtained possession or has had access to information, the disclosure of which is prohibited by this Section, and who, knowing that disclosure of the information is prohibited, knowingly and willfully discloses the information in any manner to any person or business not entitled to receive it, shall be guilty of a misdemeanor.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1408. RESERVED.

SEC. 1409. LIST OF REGISTERED FACILITIES AND REGISTERED TRANSPORTERS.

The Director will maintain a current list of registered facilities and registered transporters available at the Department's Office and on its website. The Director will update the list at least every sixty (60) days. The Director will work with the Department of Building Inspection and other City departments to ensure availability of this information to the public.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1410. ENFORCEMENT.

(a) The Director has authority to administer all provisions of this Chapter and to enforce its provisions by any lawful means available for such purpose. The Department of Building Inspection shall work together with the Director to coordinate enforcement of this Chapter with enforcement of relevant provisions of the Building Code.

(b) In order to carry out the provisions of this Chapter, the Director has the authority to inspect any registered facility or registered transporter. This right of entry will be exercised only at reasonable hours, and with the consent of the owner of the vehicle or facility or with a proper inspection warrant. The Director will inspect each registered facility and transporter at least once annually.

(c) **Suspension of registration**. Whenever the Director finds that information in a person's application, registration or any required report is inaccurate, a person does not have the appropriate permits, authorizations or licenses to operate the registered facility or vehicle, or that a person is violating or has violated this Chapter or the terms of a registration, the Director may issue an order suspending the registration as provided in this Section. The Director's order to suspend must include a written statement of the reasons for the suspension and must provide the person with an opportunity to respond in writing before the order becomes effective. The order shall provide the effective date and end date of the suspension. The suspension period will be no more than: one (1) month for the first violation; six (6) months for the second; and twelve months (12) for any subsequent violations. The Director's decision shall be final.

(d) A final decision of the Director to suspend a registration may be appealed to the Board of Appeals in the manner prescribed in Article 1 of the San Francisco Business and Tax Regulations Code. Any person who fails to appeal the Director's decision to the Board of Appeals within the time specified may not challenge a decision or final order of the Director in any judicial proceedings brought to enforce the decision or order or for other remedies.

Within ninety (90) days of the decision of the Board of Appeals, a person may file with a Court of competent jurisdiction a petition for writ of mandate to review the Board of Appeals decision, provided that the responsible party has exhausted its administrative remedies. Any person who fails to file a petition within this 90-day period may not challenge a decision or final order of the Board of Appeals in any judicial proceedings brought to enforce the decision or order or for other remedies. Section 1094.5 of the California Code of Civil Procedure shall govern any proceedings conducted pursuant to this Section. In all proceedings pursuant to this Section, the Court shall affirm the Board of Appeal's decision if it is based upon substantial evidence in the whole record. This Section does not prohibit the Court from granting any appropriate relief within its jurisdiction.

(e) The Director may request the City Attorney or the District Attorney, as the case may be, to commence an action to enforce this Chapter.

(i) **Civil Penalties**. Any person who violates this Chapter shall be civilly liable to the City and County of San Francisco for a civil penalty in an amount not to exceed one-thousand dollars ($1,000) for each day in which the violation occurs. Each day that such violation continues shall constitute a separate violation. For a second violation of the Chapter, the civil penalty will be not less than one thousand dollars ($1,000) and not more than five thousand dollars ($5,000) for each day in which the violation occurs. In determining civil penalties, the court shall consider the extent of harm caused by the violation(s), the nature and persistence of the violation(s), the length of time over which the violation(s) occur(s), the frequency of past violations, any action taken to mitigate the violation, and the financial burden to the violator.

(ii) **Criminal Penalties**. Each violation shall be considered a separate misdemeanor punishable by a fine not exceeding than one thousand dollars ($1,000), or imprisonment not to exceed six (6) months in the County Jail, or both. In determining criminal penalties, the court shall consider the extent of harm caused by the violation(s), the nature and persistence of the violation(s), the length of time over which the violation(s) occur(s), the frequency of past violations, any action taken to mitigate the violation, the financial burden to the violator, and such other factors as deemed relevant and material.

f) Remedies under this Section are in addition to and do not supersede or limit any and all other remedies, civil or criminal.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1411. REPORTS.

Within two (2) years of the effective date of this Chapter, the Director shall report to the Commission on the Environment on the results of this ordinance, including the quantity recovered from landfill, and any recommended amendments of the ordinance.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1412. FORMS, REGULATIONS AND GUIDELINES.

(a) Consistent with the intent of this Chapter, and after consultation with other City departments, public notice and a public meeting, the Director may adopt forms, regulations, and guidelines as directed by this Chapter and as necessary and appropriate to implement this Chapter.

(b) The Department shall provide assistance and consulting to persons subject to this Chapter regarding compliance with this Chapter.

(c) The Director, consistent with this Chapter, may waive any specific requirement of this Chapter if the person seeking the waiver has demonstrated that strict application of the specific requirement would create practical difficulties not generally applicable to other persons in similar circumstances. The Director shall specify in writing the basis for any waiver under this Section.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1413. COST OF IMPLEMENTATION.

The Director shall determine the cost of implementing this Chapter. The Director may request that relevant City departments provide work orders to the Director to cover the cost of implementing and maintaining the program required by this Chapter.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1414. RESERVED.

SEC. 1415. DISCLAIMER OF LIABILITY.

The degree of protection required by this Chapter is considered to be reasonable for regulatory purposes. The standards set forth in this Chapter are minimal standards and do not imply that compliance will ensure proper handling of construction and demolition debris. This Chapter shall not create liability on the part of the City, or any of its officers or employees for any damages that result from reliance on this Article or any administrative decision lawfully made in accordance with this Chapter. All persons handling construction and demolition debris within the City should be and are advised to conduct their own inquiry as to the handling of such materials. In undertaking the implementation of this Chapter, the City is assuming an undertaking only to promote the general welfare. It is not assuming, nor is it imposing on its officer and employees, an obligation for breach of which it is liable in money damages to any person who claims that such breach proximately caused injury.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1416. DUTIES ARE DISCRETIONARY.

Subject to the limitations of due process and applicable requirements of State or federal laws, and notwithstanding any other provisions of this Code whenever the words "shall" or "must" are used in establishing a responsibility or duty of the City, its elected or appointed officers, employees or agents, it is the legislative intent that such words establish a discretionary responsibility or duty requiring the exercise of judgement and discretion.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

SEC. 1417. SEVERABILITY.

If any section, subsection, sentence, clause, or phrase of this Chapter is for any reason held to be invalid or unconstitutional by a decision of any court of competent jurisdiction, such decision shall not affect the validity of the remaining portions of the Chapter. The Board of Supervisors hereby declares that it would have passed this Chapter and each and every section, subsection, sentence, clause, or phrase not declared invalid or unconstitutional without regard to whether any portion of this Chapter would be subsequently declared invalid or unconstitutional.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

BUILDING CODE   SECTION 106.3.2.2

Section 106.3.2.2. Add the following section:

[Amended 2-7-2006 by Ord. No. 27-06]

22

106.3.2.2 Demolition. An application for a permit to demolish a building or structure shall not be deemed complete until (a) the applicant declares under penalty of perjury that every party who has a recorded interest in the property that is the subject of the application has been notified of the filing of the application. See Section 110, Table 1-L - Public Information - for fee to defray the cost of maintaining records of such declarations and other attendant costs and (b) the Department receives written notice from the Department of the Environment that the Department of the Environment has approved the applicant's waste diversion plan in accordance with Chapter 14 of the Environment Code.

CHAPTER 13B
CONSTRUCTION AND DEMOLITION DEBRIS RECOVERY PROGRAM

SECTION 1301B — TITLE

[Added 2-7-2006 by Ord. No. 27-06]

This chapter shall be known as the "Construction and Demolition Debris Recovery Program."

SECTION 1302B — RECOVERY OF CONSTRUCTION AND DEMOLITION DEBRIS.

[Added 2-7-2006 by Ord. No. 27-06]

Under the requirements set forth herein and in Chapter 14 of the Environment Code, all construction and demolition debris in amounts of one cubic yard or greater generated in the course of a construction or demolition project must be transported off the site by a registered transporter, unless transported by the owner of the site, and handled, processed and otherwise managed by a registered facility for recovery of the materials. All persons subject to these requirements, including an applicant for any building or demolition permit shall comply with the requirements for construction and demolition debris recovery set forth in Chapter 14 of the Environment Code.

SECTION 1303B — DEFINITIONS.

[Added 2-7-2006 by Ord. No. 27-06]

"Construction and Demolition Debris" shall mean building materials and solid waste generated from construction and demolition activities, including, but not limited to, fully-cured asphalt, concrete, brick, rock, soil, lumber, gypsum wallboard, cardboard and other associated packaging, roofing material, ceramic tile, carpeting, fixtures, plastic pipe, metals, tree stumps, and other vegetative matter resulting from land clearing and landscaping for construction, deconstruction, demolition or land developments. This term does not include refuse regulated under the 1932 Refuse Collection and Disposal Initiative Ordinance or sections of the Municipal Code that implement the provisions of that ordinance; materials from the public right-of-way; or, unless specified in Chapter 14 of the Environment Code, materials source separated for reuse or recycling. Hazardous waste, as defined in

California Health and Safety Code section 25100 et seq., as amended, is not Construction and Demolition Debris for purposes of this Chapter.

"Registered Transporter" or "Registered Facility" shall mean a person who holds a valid registration issued by the Director of the Department of the Environment pursuant to Chapter 14 of the Environment Code. "Transporter" does not include a person that owns and operates only vehicles with no more than two axles and no more than two tires per axle.

SECTION 1304B — PERMIT CONDITION.

[Added 2-7-2006 by Ord. No. 27-06]

The provisions of Chapter 14 of the Environment Code and any approvals or conditions imposed in writing by the Department of the Environment are conditions of the permit issued by the Department under section 106.1, and a violation of Chapter 14 or such approvals or conditions shall be deemed non-compliance with the permit.

SECTION 1305B — PERMIT NOTIFICATION.

[Added 2-7-2006 by Ord. No. 27-06]

Permit application materials shall bear notice of and reference to the above requirements and the owner's responsibility for compliance with such requirements.

Endnotes

1	This section contains a change from the original publication of the 2001 San Francisco Building Code.

* * * * *

HEALTH CODE SECTIONS 288 AND 288.1

SEC. 288. CONSTRUCTION AND DEMOLITION DEBRIS.

No commercial establishment, dwelling, householder or other person or entity, including the City and County of San Francisco, shall place out for regular refuse collection any construction and demolition debris. Unless otherwise required by Chapter 14 of the Environment Code or acceptable in an on-site residential or commercial recycling or composting collection program, construction and demolition debris must be disposed of at a construction and demolition debris facility registered pursuant to Chapter 14 of the Environment Code. For purposes of this section, construction and demolition debris means building materials and solid waste generated by construction and demolition activities, including but not limited to: fully-cured asphalt, concrete, brick, rock, soil, lumber, gypsum wallboard, cardboard and other associated packaging, roofing material, ceramic tile, carpeting, fixtures, plastic pipe, metals, tree stumps, and other vegetative matter resulting from land clearing and landscaping for construction, deconstruction, demolition or land developments. Construction and demolition debris does not include any refuse regulated under the 1932 Refuse Collection and Disposal Initiative Ordinance or sections of the Municipal Code that implement the provisions of that ordinance.

Hazardous waste, as defined in California Health and Safety Code section 25100 et seq., as amended, is not construction and demolition debris for purposes of this section.

SEC. 288.1. PENALTY.

Any person, firm or corporation violating any of the provisions of Section 288 of this Article shall be guilty of an infraction and, upon conviction thereof, shall be punished for the first offense by a fine of not less than $80 nor more than $100; and for a second offense by a fine of not less than $150 nor more than $200; and for each additional offense by a fine of not less than $250 nor more than $500. In the alternative, any person, firm or corporation violating any of the provisions of Section 288 of this Article may be assessed an administrative penalty not to exceed $300 for each violation. Such penalty shall be assessed, enforced and collected in accordance with Section 39-1 of the Police Code.

(Added by Ord. 27-06, File No. 051142, App. 2/16/2006)

POLICE CODE SECTION 39-1

SEC. 39-1. PROCEDURE FOR ASSESSMENT AND COLLECTION OF ADMINISTRATIVE PENALTIES FOR SPECIFIED LITTERING AND NUISANCE VIOLATIONS.

(a) This Section shall govern the imposition, assessment and collection of administrative penalties imposed pursuant to Sections 37, 38 and 63 of the Police Code, Sections 41.13, 283.1, 287, 288.1 and 600 of the Health Code, and Sections 170, 173, 174, 174.2, 184.63 and 724.5 of the Public Works Code.

(b) The Board of Supervisors finds:

(1) That it is in the best interest of the City and its citizens to provide an alternative, administrative penalty mechanism for enforcement of the littering and nuisance violations covered by this section in addition to the existing enforcement mechanisms authorized under the California Penal Code; and

(2) That the administrative penalty scheme established by this section is not intended to be punitive in nature, but is instead intended to compensate the public for the injury and damage caused by the prohibited conduct. The administrative penalties authorized under this section are intended to be reasonable and not disproportionate to the damage or injury to the City and the public caused by the prohibited conduct.

(c) Administrative Citation. Where an officer or employee designated in Section 38 determines that there has been a violation of a local litter or nuisance law that authorizes imposition of an administrative penalty, the officer or employee may issue an administrative citation to the person and/or entity responsible for the violation. For purposes of this Section, an entity is responsible if an officer, employee or agent of the entity commits the violation. The citation shall inform the person or entity responsible of the date, time, place and nature of the violation and the amount of the proposed penalty, and shall state that the penalty is due and payable to the City Treasurer within 15 City business days from the date of the notice, if not contested within the time period specified. The citation shall also state that the person or entity responsible has the right, pursuant to Subsection (d), to request administrative review of the citing officer or employee's determination as to the violation and assessment of penalties, and shall set forth the procedure for requesting administrative review. The Director shall serve the administrative citation as follows:

1. Where there is a nexus between the violator and a specific property:

(A) One copy of the Notice shall be posted in a conspicuous place upon the building or property.

(B) One copy of the Notice shall be served upon each of the following:

(i) The person, if any, in real or apparent charge and control of the premises or property involved;

(ii) The owner of record.

Service required by subparagraph (B) may be made by personal service or by certified mail.

2. Where the issuing officer or employee is unable to ascertain a nexus between the violation and property within the City, a completed copy of the administrative citation may be served on the individual who has committed the violation by personal service or by certified mail.

3. For purposes of this Section, there is a nexus where activity on the property has caused, contributed to, or been a substantial factor in causing, the violation.

(d) Request for Hearing; Hearing.

(1) A person or entity that has been issued an administrative citation may request administrative review in order to contest the citation issued in accordance with this section. Administrative review shall be initiated by filing a request for administrative review with the Director of Public Works within 15 City business days from the date of the citation. Failure to request a hearing within the time specified in the citation shall be deemed an admission that the cited person or entity committed the violation identified in the administrative citation.

(2) Whenever administrative review is requested pursuant to this Section, the Director of Public Works shall, within five City business days of receipt of the request, notify the requestor of the date, time, and place of the administrative review hearing by certified

mail. Such hearing shall be held no later than thirty (30) calendar days after the Director receives the request, unless time is extended by mutual agreement of the affected parties.

(3) The administrative review hearing shall be conducted by a neutral hearing of officer from outside the Department of Public Works and the department whose employee issued the citation, assigned by the Director of Administrative Services. The Director of Administrative Services may issue rules as needed to implement this requirement. The parties may present evidence and testimony to the hearing officer. All testimony shall be under oath. The hearing officer shall ensure that a record of the proceedings is maintained. The burden of proof to uphold the violation shall be on the City, but the administrative citation shall be prima facie evidence of the violation.

(4) The hearing officer shall issue a decision including a summary of the issues and the evidence presented, and findings and conclusions, within ten (10) calendar days of the conclusion of the hearing. The hearing officer may uphold the penalty imposed by the citation, reduce the penalty, or dismiss the citation. A copy of the decision shall be served by certified mail upon the person or entity contesting the violation. The decision shall be a final administrative determination. An aggrieved party may seek judicial review of the decision pursuant to California Code of Civil Procedure Sections 1094.5 and 1094.6.

(e) Payment and Collection of Penalty.

(1) Where a person or entity has not made a timely request for administrative review, the penalty shall be due and payable to the City Treasurer on or before 15 City business days from the date of issuance.

(2) Where a person or entity has made a timely request for administrative review, and the penalty has been upheld in whole or in part upon review, any administrative penalty imposed by the hearing officer shall be due and payable not later than ten City business days from the date of the notice of decision issued under subparagraph (d)(4).

(3) If a penalty due and payable under paragraphs (1) or (2) remains unpaid after the specified due date, the Director of Public Works shall send the violator written notice that the penalty is overdue. Penalties that remain unpaid 30 days after the due date shall be subject to a late payment penalty of ten percent (10%) plus interest at the rate of one percent (1%) per month on the outstanding balance, which shall be added to the penalty amounts from the date that payment is due. Persons and entities against whom administrative penalties are imposed shall also be liable for the costs and attorney's fees incurred by the City and County in bringing any civil action to enforce the provisions of this section, including obtaining a judgment for the amount of the administrative penalty and other costs and charges.

(4) Where there is a nexus between the violation and property in the City owned by the violator, the Director shall further inform the violator that if the amount due is not paid

within 30 days from the date of the notice, the Director shall initiate proceedings to make the amount due and all additional authorized costs and charges, including attorneys fees. a lien on the property. Such liens shall be imposed in accordance with Chapter l0, Article XX of the Administrative Code.

(f) The revenues generated by penalties from an administrative citation issued pursuant to this Section may be expended only by the department that is responsible for issuing the administrative citation, except that each department other than Public Works that issues administrative citations pursuant to this Section shall reimburse the Department of Public Works for the costs incurred by the Department of Public Works in administering review of those citations issued by the other department. The revenues from administrative citations issued by Class 8280 Environmental Control Officers and 8282 Senior Environmental Control Officers may be expended exclusively by the Department of Public Works for the purpose of funding litter enforcement and abatement except where the use or expenditure of those revenues is specifically directed by law to another program within the Department of Public Works.

(Added by Ord. 87-03, File No. 030482, App. 5/9/2003; amended by Ord. 27-06, File No. 051142, App. 2/16/2006)

Planning
Information:
415.558.6377

Date:	March 4, 2015
Case No.:	**2014.0653E**
Project Title:	**Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County**
Zoning:	Not Applicable – Agreement Citywide in Scope
Block/Lot:	Not Applicable
Project Sponsor:	Jack Macy, Department of the Environment, (415) 355-3751
Staff Contact:	Paul Maltzer – (415) 575-9038 paul.maltzer@sfgov.org

To Whom It May Concern:

This notice is to inform you of the availability of the environmental review document concerning the proposed project as described below. The document is a preliminary negative declaration (PND), containing information about the possible environmental effects of the proposed project. The PND documents the determination of the Planning Department that the proposed project could not have a significant adverse effect on the environment. Preparation of a negative declaration does not indicate a decision by the City to carry out or not to carry out the proposed project.

Project Description: The proposed project consists of an Agreement between the City of San Francisco and Recology to change the disposal site for San Francisco's municipal solid waste (MSW). Currently, Recology, the company that collects San Francisco's waste, transports San Francisco's MSW to the Altamont Landfill, located in eastern Alameda County, for disposal. San Francisco's existing agreement with Waste Management, Inc., operator of the Altamont Landfill, will expire around 2016. The proposed project consists of an Agreement to authorize the transportation of MSW from San Francisco to the existing Recology Hay Road Landfill located in unincorporated Solano County, at 6426 Hay Road, near State Route 113, southeast of Vacaville, where it would be disposed. San Francisco and Recology would enter into an Agreement for the transportation and disposal of five million tons of San Francisco's MSW at the Recology Hay Road Landfill. MSW would be transported by long haul semi-trucks, primarily from the Recology San Francisco transfer station located at 501 Tunnel Avenue, with several additional trucks hauling residual wastes for disposal from Recology's Recycle Central facility, located at Pier 96 in San Francisco, as is presently the case. At current rates of disposal, it is estimated that the Agreement would have a term of approximately 13 – 15 years. No new construction or changes in current Recology operations within San Francisco are proposed. No new construction or change in existing permits would be required at the Recology Hay Road Landfill in Solano County. The proposed project would correspond with the cessation of transport of San Francisco's MSW to Altamont Landfill. The Agreement between San Francisco and Recology to authorize the proposed change in disposal sites would need to be approved by the San Francisco Board of Supervisors.

The PND is available to view or download from the Planning Department's Negative Declarations and EIRs web page (http://www.sf-planning.org/sfceqadocs). Paper copies are also available at the Planning Information Center (PIC) counter on the ground floor of 1660 Mission Street, San Francisco.

If you have questions concerning environmental review of the proposed project, contact the Planning Department staff contact listed above.

Within 30 calendar days following publication of the PND (i.e., by 5:00 p.m. on **April 3, 2015**, any person may:

1) Review the PND as an informational item and take no action;
2) Make recommendations for amending the text of the document. The text of the PND may be amended to clarify or correct statements and may be expanded to include additional relevant issues or to cover issues in greater depth. This may be done **without** the appeal described below; **OR**
3) Appeal the determination of no significant effect on the environment to the Planning Commission in a letter which specifies the grounds for such appeal, accompanied by a $547 check payable to the San Francisco Planning Department.[1] An appeal requires the Planning Commission to determine whether or not an Environmental Impact Report must be prepared based upon whether or not the proposed project could cause a substantial adverse change in the environment. Send the appeal letter to the Planning Department, Attention: Sarah B. Jones, 1650 Mission Street, Suite 400, San Francisco, CA 94103. **The letter must be accompanied by a check in the amount of $547.00 payable to the San Francisco Planning Department, and must be received by 5:00 p.m. on April 3, 2015.** The appeal letter and check may also be presented in person at the PIC counter on the first floor of 1660 Mission Street, San Francisco.

In the absence of an appeal, the negative declaration shall be made final, subject to necessary modifications, after 30 days from the date of publication of the PND. If the PND is appealed, the final negative declaration (FND) may be appealed to the Board of Supervisors. The first approval action, as identified in the Initial Study, would establish the start of the 30-day appeal period for the FND pursuant to San Francisco Administrative Code Section 31.16(h).

Members of the public are not required to provide personal identifying information when they communicate with the Commission or the Department. All written or oral communications, including submitted personal contact information, may be made available to the public for inspection and copying upon request and may appear on the Department's website or in other public documents.

1 Upon review by the Planning Department, the appeal fee may be reimbursed for neighborhood organizations that have been in existence for a minimum of 24 months.

Emission Factors for Greenhouse Gas Inventories

Last Modified: 4 April 2014

Red text indicates an update from the 2011 version of this document.

Typically, greenhouse gas emissions are reported in units of carbon dioxide equivalent (CO_2e). Gases are converted to CO_2e by multiplying by their global warming potential (GWP). The emission factors listed in this document have not been converted to CO_2e. To do so, multiply the emissions by the corresponding GWP listed in the table below.

Gas	100-year GWP
CH_4	25
N_2O	298

Source: Intergovernmental Panel on Climate Change (IPCC), Fourth Assessment Report (AR4), 2007. See the source note to Table 9 for further explanation.

Table 7 Business Travel Emission Factors

Vehicle Type	CO_2 Factor (kg / unit)	CH_4 Factor (g / unit)	N_2O Factor (g / unit)	Units
Passenger Car [A]	0.368	0.018	0.013	vehicle-mile
Light-duty Truck [B]	0.501	0.024	0.019	vehicle-mile
Motorcycle	0.197	0.070	0.007	vehicle-mile
Intercity Rail (i.e. Amtrak) [C]	0.144	0.0085	0.0032	passenger-mile
Commuter Rail [D]	0.174	0.0084	0.0035	passenger-mile
Transit Rail (i.e. Subway, Tram) [E]	0.133	0.0026	0.0020	passenger-mile
Bus	0.058	0.0007	0.0004	passenger-mile
Air Travel - Short Haul (< 300 miles)	0.275	0.0091	0.0087	passenger-mile
Air Travel - Medium Haul (>= 300 miles, < 2300 miles)	0.162	0.0008	0.0052	passenger-mile
Air Travel - Long Haul (>= 2300 miles)	0.191	0.0008	0.0060	passenger-mile

Source:
CO_2, CH_4, and N_2O emissions data for highway vehicles are from Table 2-15 of the Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2012. Vehicle-miles and passenger-miles data for highway vehicles are from Table VM-1 of the Federal Highway Administration Highway Statistics 2012.
Fuel consumption data and passenger-miles data for rail are from Tables A.14 to A.16 and 9.10 to 9.12 of the Transportation Energy Data Book: Edition 32. Fuel consumption was converted to emissions by using fuel and electricity emission factors presented in the tables above.

Notes:
[A] Passenger car: includes passenger cars, minivans, SUVs, and small pickup trucks (vehicles with wheelbase less than 121 inches).
[B] Light-duty truck: includes full-size pickup trucks, full-size vans, and extended-length SUVs (vehicles with wheelbase greater than 121 inches).
[C] Intercity rail: long-distance rail between major cities, such as Amtrak
[D] Commuter rail: rail service between a central city and adjacent suburbs (also called regional rail or suburban rail)
[E] Transit rail: rail typically within an urban center, such as subways, elevated railways, metropolitan railways (metro), streetcars, trolley cars, and tramways.

Table 8 Product Transport Emission Factors

Vehicle Type	CO_2 Factor (kg / unit)	CH_4 Factor (g / unit)	N_2O Factor (g / unit)	Units
Medium- and Heavy-duty Truck	1.456	0.018	0.011	vehicle-mile
Passenger Car [A]	0.368	0.018	0.013	vehicle-mile
Light-duty Truck [B]	0.501	0.024	0.019	vehicle-mile
Medium- and Heavy-duty Truck	0.296	0.0036	0.0022	ton-mile
Rail	0.026	0.0020	0.0007	ton-mile
Waterborne Craft	0.042	0.0004	0.0027	ton-mile
Aircraft	1.301	0.0000	0.0400	ton-mile

Source:
CO_2, CH_4, and N_2O emissions data for highway vehicles are from Table 2-15 of the Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2012. Vehicle-miles and passenger-miles data for highway vehicles are from Table VM-1 of the Federal Highway Administration Highway Statistics 2012.
CO_2e emissions data for non-highway vehicles are based on Table A-116 of the U.S. Greenhouse Gas Emissions and Sinks: 1990–2012, which are distributed into CO_2, CH_4, and N_2O emissions based on fuel/vehicle emission factors.
Freight ton-mile data for non-highway vehicles are from Table 1-50 of the Bureau of Transportation Statistics, National Transportation Statistics for 2012.

Notes:
Vehicle-mile factors are appropriate to use when the entire vehicle is dedicated to transporting the reporting company's product. Ton-mile factors are appropriate when the vehicle is shared with products from other companies.
[A] Passenger car: includes passenger cars, minivans, SUVs, and small pickup trucks (vehicles with wheelbase less than 121 inches).
[B] Light-duty truck: includes full-size pickup trucks, full-size vans, and extended-length SUVs (vehicles with wheelbase greater than 121 inches).

Source:
100-year GWPs from IPCC Fourth Assessment Report (AR4), 2007. IPCC AR4 was published in 2007 and is among the most current and comprehensive peer-reviewed assessments of climate change. AR4 provides revised GWPs of several GHGs relative to the values provided in previous assessment reports, following advances in scientific knowledge on the radiative efficiencies and atmospheric lifetimes of these GHGs and of CO_2. Because the GWPs provided in AR4 reflect an improved scientific understanding of the radiative effects of these gases in the atmosphere, the values provided are more appropriate for supporting the overall goal of organizational GHG reporting than the Second Assessment Report (SAR) GWP values previously used in the Emission Factors Hub.
While EPA recognizes that Fifth Assessment Report (AR5) GWPs have been published, in an effort to ensure consistency and comparability of GHG data between EPA's voluntary and non-voluntary GHG reporting programs (e.g. GHG Reporting Program and National Inventory), EPA recommends the use of AR4 GWPs. The United States and other developed countries to the UNFCCC have agreed to submit annual inventories in 2015 and future years to the UNFCCC using GWP values from AR4, which will replace the current use of SAR GWP values. Utilizing AR4 GWPs improves EPA's ability to analyze corporate, national, and sub-national GHG data consistently, enhances communication of GHG information between programs, and gives outside stakeholders a consistent, predictable set of GWPs to avoid confusion and additional burden.

Questions and Answers

Frequently Asked Questions from Owners and Operators of Nonroad Engines, Vehicles, and Equipment Certified to EPA Standards

The U.S. Environmental Protection Agency (EPA) has adopted emission standards for nearly all types of nonroad engines, vehicles, and equipment. This page describes how EPA emission standards affect individual owners and operators of these products.

Why does EPA adopt emission standards for nonroad engines, vehicles, and equipment?

Nonroad engines contribute significantly to air pollution. The emission standards address emissions of oxides of nitrogen (NOx), hydrocarbons (HC), particulate matter (PM), and carbon monoxide (CO). These emissions help form smog and include toxic compounds such as benzene, so reducing them will benefit our health and environment. In the Clean Air Act, Congress requires us to set emission standards that address these problems.

Does my current nonroad engine, vehicle, or equipment need to meet these regulations?

Manufacturers must ensure that each new engine, vehicle, or equipment meets the latest emission standards. Once manufacturers sell you a certified product, no further effort is required to complete certification. If products were built before EPA emission standards started to apply, they are generally not affected by the standards or other regulatory requirements. See Table 1 for a listing of when EPA emission standards started to apply. We never require owners to retire their old engines, vehicles, or equipment.

United States Environmental Protection Agency

Office of Transportation and Air Quality
EPA-420-F-12-053
August 2012

What requirements apply to owners and operators of certified products?

One of the most important part of the regulations that applies to you is the tampering prohibition—you may not disable any emission controls installed on certified engines, vehicles, or equipment. This would apply for removing emission control devices, adding or modifying hardware or software that increases emissions (of any pollutant), reprogramming onboard computers, or operating engines without any needed supplies such as Diesel Exhaust Fluid. Manufacturers explain in their owner's manual what type of emission controls exist for each model; they may also specify some minor maintenance that must be done to keep emission controls working properly. For restrictions and recordkeeping requirements that apply for rebuilding engines and performing maintenance on certified products, see "How to Maintain or Rebuild Engines Certified to EPA Standards," EPA-420-F-12-052 (available at www.epa.gov/nonroad/).

Similarly, EPA regulations prohibit defeat devices—you may not make, sell, or install any part that bypasses, impairs, defeats, or disables the control of emissions of any regulated pollutant.

Since manufacturers have the primary responsibility to meet emission standards for their products, you generally have no requirements to achieve a certain level of emission control or to re-certify. However, you must meet additional requirements in two special circumstances:

- You may need to use certified kits or systems when remanufacturing locomotive engines or marine diesel engines.
- In the case of Marine SI engines (40 CFR part 1045), Recreational vehicles (40 CFR part 1051), and Small SI engines (40 CFR part 1054), you must re-certify if you upgrade your engine to operate on a different fuel. For fuel conversions with other types of nonroad engines, vehicles, or equipment, you may need to do testing to show that the conversion is not considered tampering, but you do not need to re-certify.

What kind of emission controls does EPA require?

We don't tell manufacturers what emission controls to use to comply with the regulations, but we rely on testing information from engines equipped with specific technologies to establish the emission standards. Manufacturers may use these anticipated technologies, or they may find better ways to meet emission standards.

Manufacturers of diesel engines have typically met the standards with more careful control of intake air and fuel injection, with some exhaust gas recirculation. Long-term standards for many of these engines will generally involve additional use of aftertreatment devices such as diesel particulate filters (DPF) and selective catalytic reduction (SCR).

Most Large SI engines and many Marine SI engines use automotive-type technologies, including closed-loop fuel injection and three-way catalytic converters. For other engines, manufacturers will optimize air-fuel mixtures and make other internal engine changes. We expect continued use of two-stroke engines in the following cases: (1) outboard and personal watercraft marine engines may use direct-injection two-stroke engine technology, which avoids the most problematic aspects of two-stroke combustion; (2) to maintain lightweight performance, Handheld

Small SI engines will typically continue to use two-stroke engines, though these engines will generally have catalysts to reduce the amount of unburned fuel from escaping through the exhaust as hydrocarbon emissions; and (3) some two-stroke snowmobile engines will likely continue to be available, depending on ongoing efforts to improve the performance characteristics of four-stroke snowmobile engines.

For gasoline-fueled products, we have also adopted requirements to control permeation emissions from fuel systems. We expect these requirements to lead to the use of improved materials to prevent fuel from escaping through fuel tanks and hoses into the atmosphere. This should noticeably reduce the smell of gasoline around these vehicles and equipment.

How will these controls affect performance and safety?

As part of the rulemaking process, we evaluate potential safety issues related to new standards to make sure not to adopt emission standards that would cause manufacturers to use emission controls that add new risks to operating vehicles or equipment. As always, it is important to take proper precautions when using engine-powered vehicles or equipment.

Meeting emission standards adds to the engine designer's challenge. This might lead to some trade-offs with respect to power or efficiency; however, there are many examples of design engineers coming up with ways to add emission controls in a way that significantly improves engine power and efficiency while reducing emissions. Over time, engineers will work to improve designs to reduce or eliminate any remaining trade-offs.

Do EPA regulations affect where I can use my nonroad vehicle or equipment?

No. These regulations do not include any specific restrictions about where you can use your nonroad vehicle or equipment. They address only the permissible emission rates from new, certified products.

State and local governments have limited authority to set emission standards for new products; however, they may adopt regulations that restrict the use and operation of most products that are no longer new. EPA generally has no involvement with such restrictions.

Do EPA regulations apply in California?

California has adopted its own emission standards for certain types of new nonroad engines, vehicles, or equipment. In those cases, manufacturers must certify their products with the California Air Resources Board; these products are also certified with EPA even though no additional requirements apply.

EPA's prohibitions against tampering and defeat devices apply to certified products throughout the United States, including products that are certified to meet emission standards that apply uniquely in California.

For More Information

You can access documents related to emission standards for nonroad engines, vehicles, and equipment on EPA's Office of Transportation and Air Quality (OTAQ) web site at:

www.epa.gov/nonroad

Table 1
Schedule for Application of New Emission Standards for Certifying Engines and Vehicles

Engine category	Engine subcategory	Manufacturing date after which emission standards start to apply
A. Heavy-duty highway engines	—	Model year 1970
B. Locomotives or locomotive engines	—	January 1, 1973
C. Marine compression-ignition engines at or above 37 kW	**Commercial:** displacement < 0.9 L/cyl	Model year 2005
	Commercial: 0.9 ≤ displacement < 2.5 L/cyl	Model year 2004
	Commercial: displacement ≥ 2.5 L/cyl	Model year 2007
	Recreational: displacement < 0.9 L/cyl	Model year 2007
	Recreational: 0.9 ≤ displacement < 2.5 L/cyl	Model year 2006
	Recreational: 2.5 ≤ displacement < 5.0 L/cyl	Model year 2009
D. Other nonroad compression-ignition engines.	**Marine compression-ignition engines:** Power < 19 kW	January 1, 2000
	Marine compression-ignition engines: 19 kW ≤ Power < 37	January 1, 1999
	Nonroad engines: Power < 19 kW	January 1, 2000
	Nonroad engines: 19 kW ≤ Power < 37	January 1, 1999
	Nonroad engines: 37 kW ≤ Power < 75	January 1, 1998
	Nonroad engines: 75 kW ≤ Power < 130	January 1, 1997
	Nonroad engines: 130 kW ≤ Power ≤ 560	January 1, 1996
	Nonroad engines: Power > 560 kW	January 1, 2000
E. Marine spark-ignition engines.	Outboard	Model year 1998
	Personal watercraft	Model year 1999
	Sterndrive/inboard	Model Year 2010
F. Recreational spark-ignition engines and vehicles	—	Model year 2006
G. Other nonroad spark-ignition engines at or below 19 kW	—	Model year 1997
H. Other nonroad spark-ignition engines above 19 kW	—	Model year 2004

Best Practices for Clean Diesel Construction

Successful Implementation of Equipment Specifications to Minimize Diesel Pollution

by Northeast Diesel Collaborative

Northeast Diesel Collaborative
www.northeastdiesel.org

Best Practices for Clean Diesel Construction

Successful Implementation of Equipment Specifications to Minimize Diesel Pollution

Overview

Specifications for operating cleaner diesel equipment have become more prevalent as states, local governments, public agencies, and private entities have begun to require that clean diesel construction technologies and strategies be used on their sites. This document provides recommendations for successful implementation of specifications to minimize diesel pollution and exposure during construction. Such specifications are often referred to as Clean Diesel Equipment, Clean Diesel Construction or Clean Construction. In this document you will find steps to ensure effective communication and engagement by all parties associated with the construction project, links to resources, and checklists for the project owner/sponsor, construction manager and contractor.

Background

Diesel exhaust is a complex mixture of pollutants including particulate matter (soot), nitrogen oxides and volatile organic compounds which contribute to smog, acid rain, climate change, premature death and a range of health problems. Construction workers may have an increased risk of health related issues from occupational exposure to diesel exhaust. Additionally, diesel emissions may negatively impact communities around the construction site. Information about the health effects of diesel exhaust can be found at: http://www.mass.gov/dep/air/diesel/healthenv.htm

Equipment rolling off production lines today emits dramatically less pollution than 10 years ago due to EPA regulations restricting the emissions from new engines. However, construction equipment often lasts more than 30 years. It is estimated that 2 million pieces of diesel equipment currently in use do not meet newer standards. Fortunately, in addition to the option to buy or rent new equipment that meets current standards, actions can be taken to reduce emissions from existing equipment. These actions include but are not limited to:

- Replacement of older equipment with equipment meeting the latest emission standards
- Repowering equipment (i.e. replacing older engines with newer, cleaner engines and leaving the body of the equipment intact)
- Retrofitting engines and equipment with exhaust control technologies
- Proper equipment maintenance
- Application of idle reduction strategies
- Utilizing cleaner fuels

Elements of Success

In order to successfully develop and implement Clean Diesel Equipment specifications, several elements should be considered:

- Well Written Specifications in the Bid Package
  - Objective, clear, and concise
  - Reporting systems are clearly delineated
  - Model contract specifications developed by the Northeast Diesel Collaborative can be found at: *http://northeastdiesel.org/pdf/NEDC-Construction-Contract-Spec.pdf*

- Organizational Support Across all Involved Entities
  - Visible and consistent support throughout all levels of management and workers at each level
  - Inclusion of clean diesel implementation metrics in performance reviews for personnel involved in clean construction to help ensure accountability

- Effective Communication
  - Creation and implementation of a communication plan to support effective clean diesel activities
  - Align strategy, process and personnel to meet the Clean Diesel Equipment requirements
  - Assurance that specifications are feasible and technology is reliable, such that:
    - Required Diesel Particulate Filters (DPF) or other technologies are available either through purchasing or renting new equipment or retrofitting existing vehicles/equipment
    - Required DPF or other technologies is verified by the US Environmental Protection Agency (USEPA) or the California Air Resources Board (CARB):
      USEPA: http://epa.gov/cleandiesel/verification/verif-list.htm
      CARB: http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm
    - Resources are available to help determine the best retrofit technology available for cleaning up existing diesel equipment
      - Clean Diesel Clearinghouse http://www.cleandieselclearinghouse.org/
      - Diesel Engine Retrofits in the Construction Industry: A How To Guide www.mass.gov/dep/air/diesel/conretro.pdf
      - Construction Fleet Inventory Guide http://www.epa.gov/cleandiesel/documents/420b10025.pdf
      - Diesel Emissions Reduction Program (DERA): Technologies, Fleets and Projects Information http://www.epa.gov/cleandiesel/documents/420p11001.pdf

- An Action Plan for Effective Implementation that Includes:
  - Creating a "Clean Diesel Team" with representatives from the Project Owner/Sponsor organization to coordinate from the pre-bid phase through to completion of the project
  - Implementing a timeline with action items for designated personnel
    - Pre-bid phase
    - Post-award phase
  - Leveraging opportunities and co-benefits to promote success, such as:
    - Regulations
    - Occupational exposure issues
    - Community health considerations
    - Positive image for company
    - Addressing community concerns including Environmental Justice issues

  - Cost savings for idle reduction etc.
- Identifying and addressing possible barriers to success, such as:
  - Cost
  - Lack of knowledge (don't know the health risks)
  - Fear of new technology
  - Misinformation
  - Past practice/habit – disinclination to embrace change
- Delineating the roles of key personnel with Clean Diesel Responsibilities (see below)

The Process

All parties need to fully understand the Clean Diesel Equipment specifications and maintain ongoing communications from the development of the bid to the completion of the project. Early and consistent dialogue with key project personnel throughout the construction project increases the likelihood of successful implementation. It may also be helpful to acknowledge that Clean Diesel Equipment requirements typically represent a change from business as usual, and with the prospect of change often comes resistance. Implementing the best practices outlined in this document can help overcome that resistance.

<u>Phase I: Pre-Award Phase</u>

Together, the Project Owner/Sponsor and Construction Manager need to communicate the Clean Diesel Equipment requirements to potential contractors before the award. Prior to formally issuing a contract specification, the Project Sponsor/Owner may want to reach out to contracting associations to inform them of their commitment to Clean Diesel Equipment requirements.

The Project Owner/Sponsor and Construction Manager may also invite potential contractors to a pre-bid meeting to review the scope of work and project-specific requirements including Clean Diesel Equipment. The Project Owner/Sponsor can delineate the expectations for Clean Diesel Equipment to bidders at this time.

Project Owner/Sponsors can also ask for and obtain acceptance from the Contractor for the specification. All bids will then be submitted by Contractors with signed letters confirming that they have read and understand the clean diesel construction requirements.

Once a short list of potential contractors is determined, the Construction Manager can perform a scope review with the potential contractors to ensure they understand the Clean Diesel Equipment contract requirements. This process is similar to the pre-bid meeting; however, it consists of a more detailed review and would be done with each potential contractor separately. If possible, Clean Diesel Equipment should warrant a separate scope review meeting.

<u>Phase II: Post-Award Phase</u>

Once a qualified contractor is selected, he or she can hold a Clean Diesel Equipment kick-off meeting with the construction crew to review the clean construction requirements and go over the expectations of the Project Owner/Sponsor. The Contractor will want to include laborers, equipment operators and supervisors in this meeting.

After the kick-off meeting, the Construction Manager can work with the Contractor to ensure that all available information regarding emission control equipment vendors has been gathered, including the most current lead times necessary to obtain and install the required emission control equipment. This information will help ensure that the Contractor, Construction Manager and Project Owner/Sponsor are all on the same page and allow everyone to determine a realistic timeline to meet the Clean Diesel Equipment requirements. Resources such as those listed in the previous section are available to help determine the best retrofit technology available for reducing emissions from existing diesel equipment.

Developing a tracking system to ensure all equipment on site meets the specifications is also important. Creating scannable barcodes for each piece of equipment can prove to be very effective for large projects.

Roles of Key Personnel[1]

- **Project Owner/Sponsor organization** *(See appendix A for sample Project Owner Checklist)*
  - Develops the Clean Diesel Equipment requirements
  - Includes Clean Diesel Equipment specifications in the bid package
  - Develops an action plan for effective implementation of Clean Diesel Equipment requirements
  - Hires/appoints a Construction Manager to monitor/enforce the Clean Diesel Equipment requirements
  - Conveys expectations to Construction Manager regarding Clean Diesel Equipment requirements
  - Works with the Construction Manager to develop a communication plan to ensure that the Construction Manager communicates effectively with the Contractor
  - Works with the Construction Manager to determine circumstances that can be leveraged to support implementation and barriers that need to be overcome
  - Responds to and resolves concerns raised during the project
  - Designates staff member(s) from the Project Owner/Sponsor organization to walk the site once a week with the Construction Manager and Contractor to ensure compliance. The representatives from the Project Owner/Sponsor organization may ask about any Clean Diesel Equipment construction or safety concerns that may have been raised on the site
  - Holds a meeting with the Construction Manager once a week to review tracking system and discuss the compliance status of Clean Diesel Equipment requirements
  - Requires Contractor to certify that staff and workers are properly trained in Clean Diesel Equipment requirements
  - The Project Owner/Sponsor organization can require a detailed tracking plan to demonstrate that the specifications are being met

- **Construction Manager** *(See Appendix B for sample Construction Manager Checklist)*
  - Demonstrates complete understanding of the Project Owner/Sponsor's requirements and expectations
  - Presents Clean Diesel Equipment requirements to potential contractor
  - Performs a scope review with potential Contractors to ensure they understand Clean Diesel Equipment contract requirements
  - Understands and responds to all of the comments and questions raised by the Contractor
  - Works with the Project Owner/Sponsor to determine circumstances that can be leveraged to support implementation and barriers that need to overcome

---

[1] Please note that this document should be used as a general guide, as the roles and responsibilities of the key personnel can vary based on the specific configuration of the involved parties.

- ➢ Oversees and enforces Clean Diesel Equipment requirements on site
- ➢ Participates in an internal meeting with his or her supervisors once a week to discuss the compliance status of Clean Diesel Equipment construction requirements
- ➢ Holds a meeting with the Contractor once a week to ensure compliance with the Clean Diesel Equipment requirements and to address any related issues that may have occurred on site
- ➢ Conducts daily site inspections

- **Contractor** *(See Appendix C for sample Contractor Checklist)*
  - ➢ Reviews the Clean Diesel Equipment requirements thoroughly
  - ➢ Procures the necessary equipment to minimize diesel emissions for each covered piece of construction equipment
  - ➢ Requests clarification on any unclear specifications
  - ➢ Consistently reinforces to the crew the importance of the Clean Diesel Equipment site policy
  - ➢ Conducts training for all staff and workers as required in the contract documents
  - ➢ Includes Clean Diesel Equipment practices in daily 'tool box' talks
  - ➢ Includes Clean Diesel Equipment practices in means and methods
  - ➢ Submits reports on the Clean Diesel Equipment requirements and equipment inventories as listed in the specifications

For further information, please visit: http://northeastdiesel.org/construction.html

Appendix A: Sample Project Owner/Sponsor Checklist

Pre-Award Phase Tasks	
Has support been secured from management for Clean Diesel Equipment specifications?	
Has a set of Clean Diesel Equipment requirements been agreed upon by management and staff?	
Have the Clean Diesel Equipment requirements been determined to be achievable? (i.e., equipment, technology and/or vendor availability)	
Have all state or local regulatory requirements for Clean Diesel Equipment been identified?	
Has a clear, concise Clean Diesel Equipment specification been written and included in the bid package?	
Have circumstances been leveraged to support implementation and barriers to be overcome been identified?	
Has a Construction Manager with Clean Diesel Equipment compliance responsibilities been chosen?	
Does the Construction Manager have adequate knowledge and experience with Clean Diesel Equipment requirements?	
Has a pre-bid meeting been held to communicate requirements to potential contractors?	
Have all potential contractors submitted signed letters confirming that they have read and understand the Clean Diesel Equipment construction requirements?	
Post-Award Phase Tasks	
Has a kick-off meeting been held to review the Clean Diesel Equipment requirements?	
Has a team of representatives been assembled to perform weekly site visits and hold weekly meetings with the Construction Manager?	
Has a tracking system been developed and is it being properly implemented?	
Has Clean Diesel Equipment training been conducted for all staff and workers?	
Are all issues on site regarding Clean Diesel Equipment requirements being adequately addressed by the construction manager?	
Is the construction manager collecting reports on Clean Diesel Equipment requirements from the Contractor?	

Appendix B: Sample Construction Manager Checklist

Pre-Award Phase Tasks	
Has the Project Owner/Sponsor clearly defined the Clean Diesel Equipment requirements and expectations for this project?	
Can the Clean Diesel Equipment requirements be presented to contractors in a clear and concise manner?	
Have local vendors for Clean Diesel Equipment and technology been identified?	
Have local vendors indicated any issues or extended lead times for obtaining and installing emission control technologies?	
Has a pre-bid meeting been held to communicate requirements to potential contractors?	
Have all of the potential contractors' questions or concerns regarding the Clean Diesel Equipment requirements been addressed?	
Has a scope review been performed on the potential contractors to ensure understanding of the Clean Diesel Equipment requirements?	
Post-Award Phase Tasks	
Has a kick-off meeting been held to review the Clean Diesel Equipment requirements?	
Have all of the potential contractors' questions or concerns regarding the Clean Diesel Equipment requirements been addressed?	
Has a tracking system been developed and is it being properly implemented?	
Are site inspections being conducted daily?	
Are weekly meetings being held with supervisors to discuss the status of the Clean Diesel Equipment requirements?	
Are weekly meetings being held with the Contractor to discuss the status of the Clean Diesel Equipment requirements?	
Are all issues on site regarding Clean Diesel Equipment requirements being adequately addressed?	
Is the Contractor submitting reports on Clean Diesel Equipment requirements and equipment inventories as listed in the specifications?	
Is the data in the Contractor's reports accurate and consistent with what is present on site?	

Appendix C: Sample Contractor Checklist

Pre-Award Phase Tasks	
Have the Clean Diesel Equipment requirements and expectations for this project been read thoroughly?	
Has a pre-bid meeting been attended?	
Have all questions or concerns regarding the Clean Diesel Equipment requirements been addressed?	
Have local vendors for Clean Diesel Equipment and technology been identified?	
Have local vendors indicated any issues or extended lead times for obtaining and installing emission control technologies?	
Has a signed letter confirming that the Clean Diesel Equipment requirements have been read and understood been submitted?	
Post-Award Phase Tasks	
Has a kick-off meeting been attended to review the Clean Diesel Equipment requirements?	
Have all questions or concerns regarding the Clean Diesel Equipment requirements been addressed?	
Is the tracking system being properly implemented?	
Has Clean Diesel Equipment training for all staff and workers been conducted?	
Are Clean Diesel Equipment practices being included in daily 'tool box' talks?	
Are weekly meetings being held with the Construction Manager to discuss the status of the Clean Diesel Equipment requirements?	
Are all issues on site regarding Clean Diesel Equipment requirements being adequately addressed?	
Is all data on Clean Diesel Equipment requirements and equipment inventories as listed in the specifications being collected?	
Has the data collected been compiled into reports to be submitted to the Construction Manager?	

EXHIBIT 27

Construction

NEDC Clean Construction Workgroup

The NEDC Construction Workgroup brings together government, industry and other stakeholders involved in construction related activities to share information and implement innovative, cost-effective strategies to improve air quality and reduce diesel emissions from construction projects in the northeast states and Caribbean territories. Conference calls are held on the 4th Thursday of every month. *For more information about the workgroup or how to join contact Gary Rennie at rennie.gary@epa.gov.*

- The construction industry uses more diesel engines than any other sector. Of the 2 million diesel engines currently used in construction equipment across the nation, 31 percent were manufactured before the introduction of emissions regulations.
- These backhoes, cranes, and bulldozers account for 32 percent of all nitrogen oxide and 37 percent of fine particle emissions from mobile sources, and their reputation for remaining in service for decades creates a pollution problem for years to come.

Reducing Diesel Emissions from Construction

In the Northeast, public agencies and industry have partnered on pioneering emission control technologies and strategies for these workhorses of the economy. Among the successes are:

- LEED Clean Construction Pilot Credit Available. To minimize the health and climate impacts to local communities from diesel engine emissions associated with construction activities, the US Green Building Council announces that a Clean Construction Pilot Credit can be used toward Leadership in Energy and Environmental Design (LEED) certification.
- The 7 World Trade Center reconstruction in New York City included the first retrofit of a large tower crane, demonstrating the effectiveness of combining after-treatment devices and ultra-low sulfur diesel fuel in construction equipment. Several public agencies — Connecticut Department of Transportation, Massachusetts Highway Department, New York Transit Authority, and Massachusetts Bay Transportation Authority — now require retrofits on construction projects.
- Boston's Central Artery (Big Dig) was the country's first major construction retrofit project; 200 engines were retrofitted with oxidation catalysts or PM filters, resulting in a reduction of 8 tons of PM and hydrocarbons annually.
- Through the I-95 Q-Bridge reconstruction project in Connecticut, the state's Department of Transportation has retrofitted 105 vehicles to date.

The Collaborative is working to expand retrofit requirements for construction contracts to other municipalities, counties, government agencies, and major institutions. NEDC partners are also working with state and local agencies to lead by example by retrofitting their construction vehicles and equipment and participating in demonstrations of new technology.

» View EPA and CARB Verified Nonroad Retrofit Technologies

Top of Page

Federal Regulations

EPA's Nonroad Diesel Rule sets more stringent emissions standards for diesel construction vehicles and equipment beginning with those manufactured in 2008. The rules require clean diesel fuel with a sulfur content capped at 15 parts per million and the use of advanced emission control technology. New engines will be more than 90 percent cleaner than construction equipment in use today. However, these standards will affect only newly manufactured construction vehicles and equipment and will not reduce emissions from current vehicles and equipment.

Top of Page

State and Local Regulations

- New York City's Local Law 77, signed into law December 22, 2003, requires "that any diesel-powered nonroad vehicle, fifty horsepower and greater, that is owned by, operated by or on behalf of, or leased by a City agency be powered by ultra low sulfur diesel fuel and utilize the best available technology for reducing the emission of pollutants. Additionally, this legislation requires that any solicitation for a public works contract and any contract entered into as a result of such solicitation include specifications that all contractors in the performance of such contract use ultra low sulfur diesel fuel and the best available technology for reducing the emission of pollutants for diesel-powered nonroad vehicles."

Top of Page

State Contract Requirements

To encourage cleaner air around local construction sites, many agencies, organizations, businesses and institutions have initiated construction retrofit programs and are using contract specifications to call for emission control technologies. For specific language used by state agencies, see below:

- The Connecticut Department of Transportation
- The Massachusetts Highway Department
- New York State Department of Transportation

Top of Page

Model Contract Language & Best Practices

NEDC Model Construction Contract Specification
The NEDC Steering Committee in coordination with representatives from state air agencies, US EPA, emission control manufacturers, environmental organizations, and the construction industry have developed NEDC's newly revised model contract specification. The model contract specification offers guidance to private institutions and public entities interested in addressing pollution from construction sources through future construction contracts. The goal of this document is to encourage institutions and agencies to adopt contract specifications and to promote the widespread use of emission controls in the construction sector.

NEDC Best Practices for Clean Diesel Construction
"Best Practices for Clean Diesel Construction--Successful Implementation of Equipment Specifications to Minimize Diesel Pollution". The document provides recommendations for states, local governments, public agencies, and private entities to successfully implement clean diesel specifications on construction sites.

EXHIBIT 28

White Paper: An Industry Perspective on the California Air Resources Board Proposed Off-Road Diesel Regulations

Overview & History

The California Air Resources Board (CARB) is currently considering regulations to reduce Particulate Matter (PM) and NOx emissions from off-road diesel equipment operated by the construction and many other industries in the state.

The Board first announced its intention to promulgate these regulations in 2000. The Board's original plan called for an 18-year timeline to meet the state's goals of reducing particulate matter emissions only. Now, after seven years of delays in developing these rules, that timeline has been reduced to 13 years. In addition, the regulation of NOx emissions has been added to the rule – which significantly alters the technology needed for companies to be in compliance.

Throughout this process, the construction industry voluntarily has begun to retrofit and replace older, high-polluting equipment with new, cleaner burning engines. In addition, the industry has demonstrated a willingness to work with CARB to develop a fair regulation that achieves the state's air quality goals while providing contractors adequate time to meet the standards. Despite these efforts, the rules before the Board in their current form are not viable from an economic or technological perspective and cut off access to critical funding for retrofitting older equipment under the Carl Moyer Program. In addition, they threaten to seriously reduce the buying power of the $43 billion in bonds to build roads, schools, housing and improve the state's flood control system approved by voters in November.

The industry maintains its commitment to working with CARB, environmental organizations, the Legislature and other stakeholders to find a feasible solution that achieves the state's air quality goals while allowing contractors to meet the standards in a reasonable timeframe. By maintaining the original 18-year timeline for implementation of these rules, we have the opportunity to ensure California's economy, workforce, businesses, infrastructure and environment all win.

Moving Toward The Goal

The Construction Industry Air Quality Coalition (CIAQC) has been keenly aware of the concern over PM, NOx and visible emissions from construction equipment for many years. The public has also expressed a desire for cleaner burning, heavy duty, off-road construction equipment working in their neighborhoods.

The industry shares this concern and has taken action to proactively replace or retrofit older, higher-polluting off-road diesel equipment with cleaner models. A critical part of the industry's efforts is funding available through the state's Carl Moyer program for re-powering older construction engines.

The equipment most suitable for re-power includes scrapers, haul trucks, bulldozers, loaders, water pulls, water trucks, excavators, motor graders and trucks that transport cranes. Replacement engines for smaller equipment such as skid steers, backhoes and a host of other lower horsepower units are simply not available.

Since these funds became available, CIAQC has been encouraging construction companies to pursue an aggressive engine re-powering program. Over the past six years, twenty construction companies in the South Coast and San Diego Districts have re-powered 1,020 machines at a cost of $89 million. Carl Moyer Program provided $71.0 million with the remaining $18 million being provided by the machine owners themselves.

This single industry effort is the largest voluntary emission reduction program in the history of California and represents about 30 percent of the total funding statewide and about 10 percent of the total engines modified. It has resulted in a reduction of 3,797 tons per year of NOx and 126 tons per year of PM emissions. This accounts for 25 percent of the PM and 20 percent of the NOx program emissions reduced statewide.

The Legislature has recently committed $140 million a year, for the next five years, to continue the Carl Moyer Program. Under CARB's proposed rule, however the industry would loose access to these funds almost immediately. While these funds will not make a significant dent (the 1,020 engines re-powered in Southern California accounted for just one-half of one percent of all the engines in the state construction fleet) in meeting the fleet emission targets under the proposed rules, they are nonetheless an important and essential tool in improving air quality.

Construction-Related Off-Road Diesel Emissions

Before discussing the specifics of these regulations, it is important to note both the air quality goals CARB has set for the state and the level of construction related off-road diesel emissions.

These proposed regulations are part of CARB's strategy to reach its overall goal of reducing PM from all diesel fueled engines in California by 75 percent by year 2010, and by 85 percent by year 2020.

Construction-related of-road diesel emissions in California represent 24 percent of the total PM emissions from mobile sources across the state. They represent less than one percent of total man-made PM emissions from all sources.

NOx emissions from construction engines represent about 19 percent of all emissions from off-road sources. They are about 9 percent of all man-made NOx emissions statewide.

Fleet Technology & Size

Estimating the exact number of off-road diesel construction vehicles in operation in California today is difficult because this type of equipment is built to last for decades and there is no vehicle registration program for this machinery. CARB estimates that there are approximately 165,000 pieces of heavy-duty off-road construction equipment in California. CIAQC believes the number may actually exceed 200,000. Whatever the exact number, it is likely that the total fleet will expand over the next decade as the state begins to issue contracts for the transportation, school, housing, and flood protection bonds approved by voters in November.

There are four levels of diesel engines in operation in California today, from the oldest and highest polluting Tier 0 engines to the newer and cleaner Tier 3 models. Cleaner burning Tier 4 engines – which will be the only engines that meet both NOx and PM requirements under CARB's proposed rules - are not expected to come online in significant numbers until 2014. Based on a sampling of a cross-section of construction firms, CIAQC believes that 55 to 65 percent of the statewide fleet are Tier 0 engines (which are responsible for up to 70 percent of all PM emissions), 35 to 40 percent are Tier 1, approximately 7 percent are Tier 2 and less than 1 percent are Tier 3.

The Economics of Retrofitting, Re-Powering & Replacing

Currently there are five possible ways to modify the emission level of engines to achieve CARB's goals by 2020:

- Institute updated engine standards for newly manufactured equipment
- Require the use of cleaner burning diesel fuel
- Retrofit existing engines with emission control devices
- Re-power older machines with new lower-emitting engines
- Retire old equipment and reduce fleet size and workforce

The first two of these options are already in effect in California, the technology is in development for the third and the fourth is possible for certain categories of equipment.

New engine standards for newly manufactured equipment and new fuel standards have already been adopted and agreed to by the engine manufacturers (Tier 4 engines represent the cleanest version of these). Ultra-low sulfur fuel was mandated for use in California beginning in June 2006. Research and development is underway to build particulate filters and catalysts called Verified Diesel Emission Control Systems (VDECS), which can be used to retrofit existing engines, but only one model is certified for use today. Finally, for long lasting heavy-duty off-road equipment the option of re-powering with new engines rather than rebuilding an old engine can be economically feasible.

In order to achieve the emission reduction goals established by CARB, 77 percent of all Tier 0 equipment (approximately 75,000 engines) would have to be re-powered to Tier 3 by 2010 and 90 percent by 2020. The cost of re-powering a single engine averages about $300 per horsepower. This means a duel engine, 1000-hp scraper will cost $300,000 to re-power with Tier 3 engines. In addition, nearly all of this equipment will also require after-treatment (retrofitting) with VDECS in order to meet the 2020 goal. The cost for retrofitting with a certified VDECS device is approximately $100 per horsepower, or more than $50,000 for a 500-hp engine, not including the cost of expensive ongoing maintenance costs and ash disposal.

It also appears unlikely that most existing equipment can be re-powered with Tier 3 engines due to the sophistication of the technology and challenges with integrating the transmission and hydraulic systems with the engine. If a Tier 2 re-power is used instead of a Tier 3, level 3 VDECS must also be used in order to meet the year 2020 standard. This would require an additional expenditure of $25,000 to $50,000 per engine.

Replacing the equipment altogether is also very expensive, with a new scraper costing in excess of $1,000,000. In addition, Tier 4 engines are the clear choice for contractors replacing their equipment, but they will not be available in significant numbers until 2014.

CIAQC believes the full cost to achieve the targets under the current timeframe set by CARB through replacing, re-powering and retrofitting would be at least $9 billion.

In addition, this equipment is the primary asset-base of most construction companies, and is often used as collateral in financing the start-up of construction contracts. Therefore, regulations requiring early retirement of the equipment by a date certain, or a prohibition on resale, can reduce the value of the equipment and severely impact company finances and borrowing ability. As companies struggle to replace their primary assets, many will be forced to downsize or cease to operate altogether, which means the significant loss of high-wage construction jobs.

THE LIMITS OF TECHNOLOGY

In addition to the enormous financial burden the Board's proposed regulations will place on contractors, there are also several significant technological barriers to meeting the standards. First, there are currently no devices on the market to reduce both PM and NOx emissions that meet CARB's standards. This means construction companies will have to invest in and "touch" many pieces of equipment twice with costly retrofits to comply with the rule.

The annual emission goals established by CARB in would also require the use of level 3 VDECS to retrofit virtually every piece of equipment. Most manufacturers have not developed a device to reduce emissions to that level. In fact, there is currently only one level 3 VDECS available for retrofitting heavy-duty off-road construction equipment and no certainty that it will ever be work reliably for many engine families. This system is also "active," requiring a burner to achieve the proper exhaust temperature and special handling to dispose of the ash material created by the PM filter. And, its cost exceeds the assumption used by CARB in evaluating the economic impact of their proposed rule.

In addition, the Board's process for VDECS certification is lengthy and costly. Some engine families may simply not be large enough to warrant the investment in producing an effective VDECS. Those engines would be unable to meet the new standards even if they are the newest available models.

Another challenge is the availability of a sufficient number of engines to re-power or replace the state's existing fleet and meet the goal. Not only are not enough engines or equipment in existence, the capacity to produce them does not exist. To compound the situation, most new engines are used in the production of new equipment. The equipment manufacturers have been clear that they are interested in selling new equipment, not new engines – which will seriously diminish the opportunities for contractors to re-power their machines.

Given these facts, CIAQC has proposed several alternatives for consideration by CARB. First, by implementing this rule based on an 18-year timeline, as it originally said it would, CARB would allow technology and manufacturing to meet the demands for cleaner engine production.

Second, building on the success of the Carl Moyer program, CIAQC has offered a "fleet averaging" formula that would provide an incentive to every contractor to achieve emission reductions as quickly as possible. A fleet average would allow contractors to operate older specialty equipment by reducing emissions from other equipment ahead of schedule. A project based fleet average calculation would also accommodate the needs of smaller contractors who may be unable to meet vigorous compliance schedules.

Since most contractors know the size of their year 2000 fleets, each would be able to calculate their own baseline for purposes of establishing an 85 percent emission reduction target. It would offer each contractor maximum flexibility in re-powering, retrofitting or replacing equipment to meet the goal.

A critical part of making this alternative work also involves allowing contractors to use actual emission levels in determining compliance. Under the proposed rules, CARB requires the use of "certified" levels set by the Board which can be two to three times higher than actual levels.

THE CRITICAL ISSUES

Put simply, the rules CARB has put forward are not viable or achievable. There are five primary reasons for this – unattainable annual limits, inadequate clean engine supply, limited clean engine technology, prohibitive cost and the fact that construction is a low-margin business.

Unattainable Annual Limits
Given the available resources and technology, the annual emission limits in the draft proposal released by CARB cannot be achieved by the contractors in the State of California. Even the most progressive firms, who have been re-powering and updating their fleets in anticipation of the regulation, cannot meet the annual goals set forward in the draft rule.

Inadequate Clean Engine Supply
There is an inadequate supply of engines or new equipment to meet the demand these regulations would place on the market. These rules require the purchase of more than 165,000 new pieces of equipment by 2020. Virtually all Tier 0 and Tier 1engines will need to be replaced with Tier 2, 3 and 4 engines in 13 years. The Board consumed valuable and necessary time when they waited seven years to develop these rules and now the market is not able to meet the equipment demands. To put this into perspective, currently 10,000 new pieces of equipment are sold in California every year. Under these regulations, that number would have to grow to 15,000 each year for the next 13 years.

Limited Clean Engine Technology
The addition of NOx reductions to the proposed rule will force companies to re-power more engines (a very costly alternative), and make PM reductions a low priority. First, no retrofit device is available to achieve the NOx emission reduction requirements. This means companies will be forced to re-power or replace equipment – which significantly increased costs. The NOx requirement also makes it impossible for contractors to qualify for the Carl Moyer funding that has propelled the significant voluntary emissions reductions already achieved by the construction industry.

Prohibitive Cost
CARB has significantly underestimated cost of these rules. By assuming an unrealistic "natural" turnover for construction fleets and a lower number of machines covered under this rule, CARB's economic analysis of its proposal does not accurately reflect the real

burden of this proposal. In effect, CARB has inaccurately assumed that the construction industry will spend billions on repowering, replacing and retrofitting equipment in the next 13 years without any new regulation. CARB estimates that the cost of the draft rule is only $3 billion dollars. CIAQC estimates the total real cost to the industry to be at least $9 billion. These costs are likely to be passed on to consumers, including the state as it contracts to build the roads, schools, housing and flood control systems voters authorized $43 billion in bonds to construct.

Construction Is A Low-Margin Business
Contractors do not have the financial resources to fund the program. Construction is a fiercely competitive business and contracts can be won or lost by only a few thousand dollars. Most contractors hope to achieve a profit of 2.5 percent to 7 percent and can on average, do so in three out of five years. After labor, materials, insurance, fuel and overhead, a very small portion of the $60 billion spent on construction every year in California is available for fleet upgrades. To meet these requirements, many businesses will need to downsize, which means construction workers will be laid off and capacity to build projects will decrease.

WORKING TOGETHER TO IMPROVE AIR QUALITY

The industry is committed to working with CARB to develop a solution to this to ensure the state's air quality standards are achieved through the implementation of a viable and achievable rule. By making critical changes related to time, turnover, tender and technology, the Board can make it possible for the construction industry to meet its emissions reduction targets.

TIME: Restoring CARB'S Original Implementation Timeline
CARB's original plan called for an 18-year timeline to meet the 85 percent PM reductions. Delays by the Board in developing a rule have reduced that schedule to 13 years. By adopting a strategy that virtually eliminates Tier 0 and Tier 1 equipment from the fleet, and relies heavily on a Tier 4 inventory, that will not become available from the manufacturers until 2014 for the higher horsepower equipment, there is simply not enough time or Tier 4 equipment before 2020, to replace the existing fleet.

TURNOVER: Lower CARB's Turnover Estimate to Realistic Levels
CIAQC estimates the statewide fleet natural turnover at between 2 and 3 percent, significantly below CARB's estimate. To achieve the CARB 2020 fleet makeup, approximately 140,000 pieces of equipment have to be repowered, retrofitted or replaced. That's means more than 1,000 pieces of equipment, every month, for the next 13 years, that will need to be repowered, retrofitted or replaced. There is not enough manufacturing capacity for that much new equipment or engines for the California market. The major supplier of construction equipment, Caterpillar, ships less than 2,000 pieces of new construction equipment to California each year. Without that new equipment and engines it will be impossible to meet the NOx reductions required by this proposal.

TENDER: Help Alleviate the Cost Burden to Construction Companies
This proposal not only will inflict a $9 billion cost on the construction industry, but it will also end the availability of Carl Moyer funding for re-powering existing equipment. These funds have been an extremely important tool for accelerating the turnover of this equipment and without it many contractors will simply be unable to afford to retrofit or replace their equipment. These tremendous costs will lead many companies to downsize or go out of business completely which means the significant loss of high wage jobs for construction workers and increased costs for all construction projects, including to state and local government for building infrastructure.

TECHNOLOGY: Re-evaluate the Conflict Between NOx and PM Reduction
There is no retrofit device that will reduce both NOx and PM. As a consequence, the strategies proposed by CARB inherently conflict with any rational decisions that would be made by a construction company. Since most of the current fleet will have to be eliminated, no one wants to invest more money in equipment that they will have to dispose of before its useful life is completed. Having to repower one year, and retrofit two years later, and then replace completely five years after that simply makes no economic sense. As a result, it is likely that many small companies will disappear, many large companies will shrink their fleets and the overall ability of the construction industry to meet construction demand will diminish. That means higher prices, longer construction periods and fewer companies to keep prices competitive.

CIAQC believes it is possible to resolve these issues in a way that satisfies CARB's air quality improvement strategy while keeping the industry economically viable, ensuring construction jobs are not lost and making certain the state's historic $40 billion in infrastructure improvement builds as many roads, schools, houses and levees as possible. We look forward to working together to protect our environment and to build a better future for the people of California.

TIPS & NEWS FOR EQUIPMENT OWNERS AND OPERATORS

Tier 4 – How it will affect your equipment, your business and your environment.

Wayne Clark
Emissions Business Manager
Milton CAT

First, we need to clarify what "Tier 4" is – and what it is not.

"Tier" regulations are federal standards exclusively focused on manufacturers. They place the responsibility for designing and producing engines that comply with increasingly stricter emission regulations on the engine manufacturers' shoulders, not on equipment owners. "Tier" regulations have been introduced gradually, giving manufacturers a chance to design and produce the new engines in stages, generally depending on engine horsepower.

The first federal standards (Tier 1) for new off-road diesel engines over 50 hp were adopted in 1994. In 1996, a Statement of Principles (SOP) was signed between the EPA, California Air Resources Bureau (CARB) and engine makers (including Caterpillar, Cummins, Deere, Detroit Diesel, Deutz, Isuzu, Komatsu, Kubota, Mitsubishi, Navistar, New Holland, Wis-Con, and Yanmar) and in August 1998, the EPA signed the final rule reflecting the provisions of the SOP.

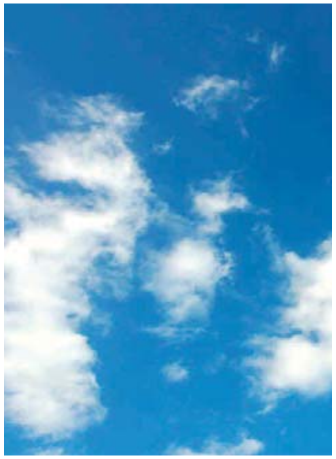
The 1998 regulation introduced Tier 1 standards for equipment under 50 hp as well as increasingly more stringent Tier 2 and Tier 3 standards for all equipment, with phase-in schedules from 2000 to 2008. The Tier 1 to 3 standards are met primarily through improvements in the combustion process with no, or only limited use of exhaust aftertreatment (oxidation catalysts).

In 2004, the EPA signed the final rule introducing Tier 4 emission standards, to be phased-in over the period of 2008 to 2015. Tier 4 standards require that emissions of Particulate Matter (PM) and Nitrogen Oxide (NOx), the prime targets of the Tier regulations, be further reduced by about 90%. From the point of view of engine manufacturers, Tier 4 standards are not easy to meet – actually, this is the stage that will achieve the least drastic reduction levels but is the toughest to reach in terms of engine and machine design. Manufacturers are currently undergoing "Tier 4 interim", a ramp-up period that allows them to focus their resources on producing the larger compliant engines.

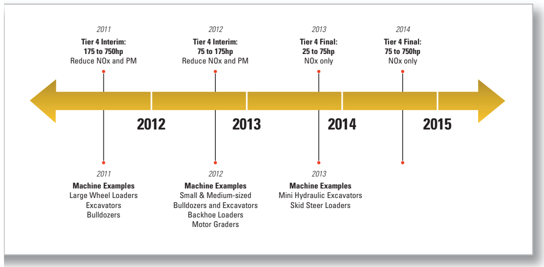
How are manufacturers going to meet Tier 4 regulations?

As of January 1st, 2011, all new machines between 175 and 750 horsepower will have to be Tier 4-compliant. These machines will have engines with advanced emission-control technologies similar to those used to meet the 2007-2010 standard for on-highway trucks and buses.

While the specific approach taken by each engine manufacturer may vary, many Tier 4 interim engines will include a Diesel Oxidation Catalyst (DOC) and/or a Diesel Particulate Filter (DPF) as part of the design. Those types of components were added to some Tier 1 and 2 machines as retrofits, to make them in-line with Tier 3 machines in terms of Particulate Matter, Hydrocarbon and Carbon Monoxide reductions. With Tier 4, however, those components will come as part of the machine, when it leaves the factory. In addition, Tier 4 engines will also include an Open Crankcase Ventilation or OCV filter that captures and controls crankcase emissions.



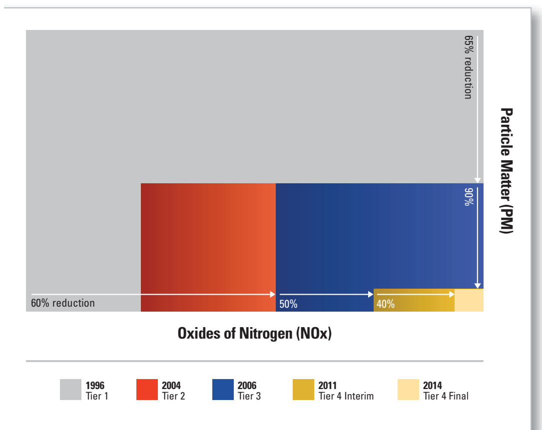
Tier 4 Interim and Tier 4 Final Timeline



Emissions Reduction

Tier 1 (1996) – Tier 4 Final (2014)

Engines rated 130 – 560 bkW (175-750 bhp)



How will this change the equipment itself?

New Tier 4 engines require a new engine oil formulation to operate properly. CJ-4 engine oil is required for proper engine operation, and has been formulated with oil additives necessary to reduce ash deposit.

As you can imagine, these new components being built into the engine, along with a bigger cooling package, will require a larger engine compartment, which translates into a larger machine. To insure good operator visibility, in some cases manufacturers have opted to modify cab and seat design.

With new Tier 4 components and technologies come some new maintenance practices. The Open Crankcase Ventilation filter will need to be replaced every 2,000 hours, and the Diesel Particulate Filter will need to be cleaned every 5,000 hours by your equipment dealer. Belts, hoses, radiators and alternators may also require more frequent inspection due to higher temperatures and operating pressures. In addition, the EPA requires that Ultra Low Sulfur Diesel (ULSD) be used in Tier 4 machines as well as a new engine oil, CJ-4, which has been formulated to reduce ash deposit. Many other maintenance requirements and service intervals will remain unchanged.

In addition, regardless of the manufacturer, you can expect higher purchase costs (8% +/-) for Tier 4 machines. Keep in mind though that by incorporating new reduction technologies in the right way, engine manufacturers have been able to claim up to 5% improved fuel efficiency, as well as boosted power and performance across applications.

How else will owning and operating change with Tier 4 compliant equipment?

To ensure the best performance and longevity, there are important considerations when it comes to Tier 4 machines. They include:

- The operators familiarizing themselves with the technologies, monitoring systems, dashboard symbols and alarms.
- Optimal operating ranges may change for some machines, so be sure to consult with your equipment dealer.

Who will be affected first and most by Tier 4 standards?

If your work involves public sector jobs and/or jobs for universities and other large organizations that have adopted Tier 4 standards, or if you are working in a non-compliance zone which is an area that the EPA has determined has poor air quality, you should expect that

the machines that you plan on using for that job will have to consist exclusively of Tier 4-compliant machines.

If you currently don't work on those type of projects, then for the most part you can avoid being affected by Tier 4 for the near future. In the longer term, of course, Tier 4 will affect every company that owns off-road equipment. Why is that? There will be no new machines available for sale in the United States other than Tier 4-compliant, and unlike with previous Tiers, it is not possible to retrofit a Tier 3 machine to Tier 4 standards with currently available technologies.

How can your equipment dealer help you?

As in most cases, it's a good idea to take as much control as possible; to ask questions and to be ready to demand straight answers.

Inside the DPF, particulate matter, sometimes referred to as "soot" is trapped until it is burned off through regeneration.

The DOC does not require maintenance because it is a "flow-through" device and the pollutants do not get trapped in the component.

For the Trenches

THE CAT CLEAN EMISSIONS MODULE (CEM)

The CEM is a flexible, Caterpillar designed module system that can include the following components: DOC, DPF, CAT Regeneration System, muffler and air cleaner. The CEM protects the components, minimizes the aftertreatment footprint and simplifies maintenance.

• Ask your equipment dealer which technology the manufacturers they represent will be using. Then, learn as much as possible about it.

• Understand what your dealer has done to ready themselves to service Tier 4 fleets, including salesperson and technician training, specialized tooling and inventoried parts.

• Consider having your equipment dealer conduct a fleet audit of your equipment. This is a process that matches your machines and business mix with current and upcoming emissions standards, to make sure that you'll be able to continue working on current projects – and to make sure you are in a position to take advantage of future opportunities.

• Make sure that your dealer has a large inventory of Tier 4-compliant machines, whether for purchase or for rental. You need to know whether you have access to the right equipment, before you win a "Tier 4 job."

• Be active in associations – more voices count and you will have access to resources not available to those who aren't involved.

"It's our turn."

I recently attended an association meeting where the speaker ended his presentations by reminding us that this is not a plot directed to undermine companies doing off-road work; every vehicle running on our roads and highways has had to comply with, and be built to, increasingly stricter emission regulations. Yes, it's our turn now. And let's finish by looking at the big picture – or the big numbers, in this case:

The EPA states that "by 2030, controlling these emissions would annually prevent 12,000 premature deaths, 8,900 hospitalizations, and one million workdays lost, so continued reduction and enforcement measures only make sense."

No. 183 September 20, 2013

Part IV

Environmental Protection Agency

California State Nonroad Engine Pollution Control Standards; Off-Road Compression Ignition Engines—In-Use Fleets; Notice of Decision; Notice

ENVIRONMENTAL PROTECTION AGENCY

[EPA–HQ–OAR–2008–0691; FRL–9901–18–OAR]

California State Nonroad Engine Pollution Control Standards; Off-Road Compression Ignition Engines—In-Use Fleets; Notice of Decision

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of decision.

SUMMARY: The Environmental Protection Agency (EPA) is granting the California Air Resources Board's (CARB's) request for authorization of California regulations applicable to in-use fleets that operate off-road (nonroad or NR), diesel-fueled (compression-ignition or CI) vehicles with engines 25 horsepower and greater. The regulations require such fleets to meet fleet average emissions standards for oxides of nitrogen (NO_X) and particulate matter (PM), or, alternatively, to comply with best available control technology (BACT) requirements for the vehicles in those fleets. This decision is issued under the authority of the Clean Air Act (CAA or Act).

DATES: Petitions for review must be filed by November 19, 2013.

ADDRESSES: EPA has established a docket for this action under Docket ID EPA–HQ–OAR–2008–0691. All documents relied upon in making this decision, including those submitted to EPA by CARB, are contained in the public docket. Publicly available docket materials are available either electronically through *www.regulations.gov* or in hard copy at the Air and Radiation Docket in the EPA Headquarters Library, EPA West Building, Room 3334, located at 1301 Constitution Avenue NW., Washington, DC. The Public Reading Room is open to the public on all federal government working days from 8:30 a.m. to 4:30 p.m.; generally, it is open Monday through Friday, excluding holidays. The telephone number for the Reading Room is (202) 566–1744. The Air and Radiation Docket and Information Center's Web site is *http://www.epa.gov/oar/docket.html*. The electronic mail (email) address for the Air and Radiation Docket is: *a-and-r-Docket@epa.gov*, the telephone number is (202) 566–1742, and the fax number is (202) 566–9744. An electronic version of the public docket is available through the federal government's electronic public docket and comment system. You may access EPA dockets at *http://www.regulations.gov*. After opening the *www.regulations.gov* Web site, enter EPA–HQ–OAR–2008–0691 in the "Enter Keyword or ID" fill-in box to view documents in the record. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute.

EPA's Office of Transportation and Air Quality (OTAQ) maintains a Web page that contains general information on its review of California waiver requests. Included on that page are links to prior waiver **Federal Register** notices, some of which are cited in today's notice; the page can be accessed at *http://www.epa.gov/otaq/cafr.htm*.

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Executive Summary

Today, the Environmental Protection Agency (EPA) is granting a California Air Resources Board (CARB) request for authorization of regulations designed to reduce PM and NO_X emissions from in-use nonroad diesel engines. The California In-Use Off-Road Diesel-Fueled Fleets Regulation (Fleet Requirements) applies to fleets with NR CI vehicles or equipment greater than 25 horsepower. The regulation takes effect beginning as early as 2014, depending on fleet size. It requires fleet operators to meet a progressively more stringent combined PM and NO_X standard, or to reduce emissions through technology upgrades such as retrofit or replacement. Today's decision pertains to CARB's request of March 1, 2012, for authorization of the Fleet Requirements as amended in 2010.

The legal framework for this decision stems from the provisions first adopted by Congress in 1967, and later modified in 1977, with respect to state emission requirements for motor vehicles and motor vehicle engines; and from similar language adopted by Congress in 1990 with respect to preemption of state emission requirements for certain nonroad vehicles and eqnipment. Section 209(e)(2) of the Act, 42 U.S.C. 7543(e)(2), specifies that EPA must authorize California to adopt and enforce covered nonroad standards if California determines that its standards are, in the aggregate, at least as protective of the public health and welfare as applicable Federal standards, *unless* EPA makes one of three findings specified under the Clean Air Act: (1) That California's protectiveness finding is arbitrary and capricious; (2) that California does not need such California standards to meet compelling and extraordinary conditions; or (3) that California standards and accompanying enforcement procedures are not consistent with this section. As explained below, EPA interprets the statutory language "consistent with this section" to mean consistent with section 209 (e.g. section 209(a), section 209(e)(1), and section 209(b)(1)(C)) of the Act. EPA's role npon receiving an authorization request is to determine whether it is appropriate to make any of these three specified findings. Opponents of authorization bear the bnrden of proving that at least one of the three bases for denial of authorization has been satisfied. If the Agency cannot make at least one of the three findings, then it must grant the requested authorization. EPA has evaluated CARB's request with regard to each of these three authorization criteria, in light of the evidence in the public record, and is granting CARB its authorization request as required under the Clean Air Act.

This Notice of Decision provides a full discussion of EPA's evaluation of each of the three criteria, including EPA's evaluation of the record and its determination that those opposing the authorization have not met their burden of proof with regard to any of the three criteria in section 209(e)(2)(A).

II. Background

A. California's Nonroad CI In-Use Fleet Requirements

CARB initially approved the Fleet Requirements on July 26, 2007. CARB subsequently amended the regulation after the Board conducted hearings in December 2008, January 2009, July 2009, and most recently in December 2010. As explained below, the December 2010 amendments significantly modified the regulation's compliance dates and in-use performance requirements.

The Fleet Requirements establish statewide in-use performance standards applicable to any person, business, or government agency that owns and operates in-use nonroad diesel vehicles in California with a maximum power of 25 horsepower (hp) or greater. The regulation applies to engines that are used to provide motive power, and in some cases auxiliary power, to nonroad vehicles, which are defined as vehicles that (1) cannot be registered and driven safely on-road, and (2) are not implements of husbandry or recreational off-highway vehicles.

The Fleet Requirements phase in according to fleet size as defined by total fleet horsepower. Requirements begin for large fleets (greater than 5,000 hp) in 2014; for medium fleets (2,500–5,000 hp) in 2017; and for small fleets, 2,500 hp or less, in 2019. The regulation establishes two general compliance pathways. Fleets may either (1) meet fleet average emission targets (based on the combined horsepower of the vehicles in the fleet) that become increasingly stringent over a ten-year period, or (2) satisfy best available control technology (BACT) requirements within a given compliance year. The BACT pathway requires fleets to retire, repower, designate for low use, and/or retrofit a certain percentage of the fleet's total horsepower each year. Fleets demonstrate compliance for a given year by taking a sufficient number of such actions in the prior year or by utilizing previously earned BACT credits associated with these actions. For large fleets, the annual BACT rates (demonstrated either through utilization of credits or through action taken during the previous calendar year) start out at 4.8 percent of the fleet's total horsepower in 2014 and increase to 8 percent for each year from 2015 through 2017, and to 10 percent for each year from 2018 through 2023. For medium fleets, the annual BACT rate is 8 percent in 2017, increasing to 10 percent for each year from 2018 through 2023. Small fleets have an annual BACT rate of 10 percent for each year from 2019 through 2028. After the final compliance year, all fleets must continue to either (1) meet the fleet average emission target rate for the final target year, or (2) satisfy the applicable final annual BACT compliance rate (e.g. 10 percent) each year until the fleet comes into compliance with the fleet average emission target. The Fleet Requirements also restrict fleets from adding older dirtier vehicles to their vehicle inventories.

The regulation EPA is authorizing in this decision reflects amendments that CARB adopted in 2010. Compared to the original Fleet Requirements, the 2010 amendments delay the original compliance schedule by four years. The 2010 amendments also simplified the annual requirements so that in each compliance year a fleet must only meet a single emissions target—a combined NO_X plus PM standard—rather than separate targets for each of these two pollutants. The amendments reduced the annual BACT requirements from a 28 percent turnover and retrofit requirement in the prior version of the regulation, to a combined 4.8 percent to 10 percent requirement (as outlined above). Finally, the amendments removed mandatory retrofitting requirements so that retrofit is now a compliance option under the BACT pathway rather than a mandate. Additional information about the original and amended Fleet Requirements is provided below in the section discussing the consistency of the Fleet Reqnirements with section 202(a) of the Act.

B. Clean Air Act Nonroad Engine and Vehicle Authorizations

Section 209(e)(1) of the Act permanently preempts any state, or political subdivision thereof, from adopting or attempting to enforce any standard or other requirement relating to the control of emissions for certain *new* nonroad engines or vehicles.[1] For all other nonroad engines (including "non-new" engines), states generally are preempted from adopting and enforcing standards and other requirements relating to the control of emissions, except that section 209(e)(2)(A) of the Act requires EPA, after notice and opportunity for public hearing, to authorize California to adopt and enforce such regulations unless EPA makes one of three enumerated findings. Specifically, EPA must deuy authorization if the Administrator finds that (1) California's protectiveness determination (that California standards will be, in the aggregate, as protective of public health and welfare as applicable federal standards) is arbitrary and capricious, (2) California does not need such standards to meet compelling and extraordinary conditions, or (3) the California standards and accompanying enforcement procedures are not consistent with section 209 of the Act. Other states with state air quality implementation plans may also adopt and enforce such regulations if the standards are identical to California's standards.

On July 20, 1994, EPA promulgated a rule interpreting the three criteria set forth in section 209(e)(2)(A) that EPA must consider before granting any California authorization request for nonroad engine or vehicle emission standards.[2] EPA revised these regulations in 1997.[3] As stated in the preamble to the 1994 rule, EPA historically has interpreted the consistency inquiry under the third criterion outlined above (set forth in section 209(e)(2)(A)(iii)) to require, at minimum, that California standards and enforcement procedures be consistent

[1] States are expressly preempted from adopting or attempting to enforce any standard or other requirement relating to the control of emissions from new nonroad engines which are used in construction equipment or vehicles or used in farm equipment or vehicles and which are smaller than 175 horsepower. Such express preemption under section 209(e)(1) of the Act also applies to new locomotives or new engines used in locomotives.

[2] 59 FR 36969 (July 20, 1994).

[3] *See* 62 FR 57733 (December 30, 1997). The applicable regulations are now found in 40 CFR part 1074, subpart B, § 1074.105.

with section 209(a), section 209(e)(1), and section 209(b)(1)(C) (as EPA has interpreted that subsection in the context of section 209(b) motor vehicle waivers) of the Act.[4]

In order to he consistent with section 209(a), California's nonroad standards and enforcement procedures mnst not apply to new motor vehicles or new motor vehicle engines. To be consistent with section 209(e)(1), California's nonroad staudards and enforcement procedures mnst not attempt to regulate engine categories that are permanently preempted from state regulation. To determine consistency with section 209(b)(1)(C), EPA typically reviews nonroad authorization requests under the same "consistency" criteria that are applied to motor vehicle waiver requests under section 209(b)(1)(C). That provision provides that the Administrator shall not grant California a motor vehicle waiver if she finds that California "standards and accompanying enforcement procedures are not consistent with section 202(a)" of the Act. Previous decisions granting waivers and authorizations have noted that state standards and enforcement procednres will be found to be inconsistent with section 202(a) if: (1) There is inadequate lead time to permit the development of the necessary technology, giving appropriate consideration to the cost of compliance within that time, or (2) the federal and state testing procedures impose inconsistent certification requirements.

In light of the similar language of sections 209(b) and 209(e)(2)(A), EPA has analyzed requests for California authorization of standards for nonroad vehicles or engines under section 209(e)(2)(A) using the same principles that it has historically applied in analyzing requests for waivers of preemption for new motor vehicle or new motor vehicle engine standards under section 209(b).[5] These principles include, among other things, that EPA should limit its inquiry to the three specific authorization criteria identified in section 209(e)(2)(A),[6] aud that EPA will give substantial deference to the policy judgments California has made in adopting its regulations. In previous waiver decisions, EPA has stated that Congress intended EPA's review of California's decision-making be narrow. EPA has rejected arguments that are not specified in the statnte as grounds for denying a waiver:

> The law makes clear that the waiver requests cannot he denied unless the specific findings designated in the statute can properly be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its costs or is otherwise an arguahly unwise exercise of regulatory power is not legally pertinent to my decision under section 209, as long as the California requirement is consistent with section 202(a) and is more stringent than applicable Federal requirements in the sense that it may result in some further reduction in air pollution in California.[7]

This principle of narrow EPA review has been upheld by the U.S. Court of Appeals for the District of Columbia Circuit.[8] Thus, EPA's consideration of all the evidence submitted concerning an anthorization decision is circumscribed by its relevance to those questions that may be considered under section 209(e)(2)(A).

C. Deference to California

In previous waiver decisions, EPA has recognized that the intent of Congress in creating a limited review based on the section 209(b)(1) criteria was to ensure that the federal government did not second-guess state policy choices. As the agency explained in one prior waiver decision:

> It is worth noting * * * I would feel constrained to approve a California approach to the prohlem which I might also feel unable to adopt at the federal level in my own capacity as a regulator. The whole approach of the Clean Air Act is to force the development of new types of emission control technology where that is needed by compelling the industry to "catch up" to some degree with newly promulgated standards. Such an approach * * * may be attended with costs, in the shape of reduced product offering, or price or fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential henefits from reduced emissions is a central policy decision for any regulatory agency under the statutory scheme outlined above, I believe I am reqnired to give very substantial deference to California's judgments on this score.[9]

Similarly, EPA has stated that the text, structnre, and history of the California waiver provision clearly indicate hoth a congressional intent and appropriate EPA practice of leaving the decision on "ambiguous and controversial matters of public policy" to California's judgment.[10] This interpretation is supported by relevant discussion in the House Committee Report for the 1977 amendments to the Clean Air Act.[11] Congress had the opportunity throngh the 1977 amendments to restrict the preexisting waiver provision, but elected iustead to expand California's flexibility to adopt a complete program of motor vehicle emission controls. The report explains that the amendment is intended to ratify and strengthen the preexisting California waiver provision and to affirm the underlying intent of that provision, that is, to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.[12]

D. Burden and Standard of Proof

As the U.S. Conrt of Appeals for the D.C. Circuit has made clear in *MEMA I,* opponents of a waiver request by California bear the burden of showing that the statutory criteria for a denial of the request have been met:

> [T]he language of the statute and its legislative history indicate that California's regulations, and California's determinations that they must comply with the statute, when presented to the Administrator are presumed to satisfy the waiver requirements and that the burden of proving otherwise is on whoever attacks them. California must present its regulations and findings at the hearing and thereafter the parties opposing the waiver request bear the burden of persuading the Administrator that the waiver request should be denied.[13]

The Administrator's burden, on the other hand, is to make a reasonable evaluation of the information in the record in coming to the waiver decision. As the court in *MEMA I* stated: "here, too, if the Administrator ignores evidence demonstrating that the waiver should not be granted, or if he seeks to overcome that evidence with unsupported assnmptions of his own, he runs the risk of having his waiver decision set aside as 'arbitrary and

[4] *See* 59 FR 36969 (July 20, 1994).

[5] *See Engine Manufacturers Association* v. *EPA,* 88 F.3d 1075 (D.C. Cir. 1996). ". . . EPA was within the bounds of permissible construction in analogizing § 209(e) on nonroad sources to § 209(a) on motor vehicles."

[6] *See* EPA's Final 209(e) rulemaking at 59 FR 36969, 36983 (July 20, 1994).

[7] 36 FR 17458 (Aug. 31, 1971). Note that the more stringent standard expressed here, in 1971, was superseded by the 1977 amendments to section 209, which established that California must determine that its standards are, in the aggregate, at least as protective of public health and welfare as applicable Federal standards. In the 1990 amendments to section 209, Congress established section 209(e) and similar language in section 209(e)(1)(i) pertaining to California's nonroad emission standards which California must determine to be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards.

[11] *MEMA I,* 627 F.2d at 1110 (*citing* H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–302 (1977)).

[12] *Id.*

[13] *Id.*

capricious.'" [14] Therefore, the Administrator's burden is to act "reasonably." [15]

With regard to the standard of proof, the court in *MEMA I* explained that the Administrator's role in a section 209 proceeding is to:

> consider all evidence that passes the threshold test of materiality and * * * thereafter assess such material evidence against a standard of proof to determine whether the parties favoring a denial of the waiver have shown that the factual circumstances exist in which Congress intended a denial of the waiver. [16]

In that decision, the court considered the standards of proof under section 209 for the two findings related to granting a waiver for an "accompanying enforcement procedure." Those findings involve: (1) Whether the enforcement procedures impact California's prior protectiveness determination for the associated standards, and (2) whether the procedures are consistent with section 202(a). The principles set forth by the court, however, are similarly applicable to an EPA review of a request for a waiver of preemption for a standard. The court instructed that "the standard of proof must take account of the nature of the risk of error involved in any given decision, and it therefore varies with the finding involved. We need not decide how this standard operates in every waiver decision." [17]

With regard to the protectiveness finding, the court upheld the Administrator's position that, to deny a waiver, there must be "clear and compelling evidence" to show that proposed enforcement procedures undermine the protectiveness of California's standards. [18] The court noted that this standard of proof also accords with the congressional intent to provide California with the broadest possible discretion in setting regulations it finds protective of the public health and welfare. [19]

With respect to the consistency finding, the court did not articulate a standard of proof applicable to all proceedings, but found that the opponents of the waiver were unable to meet their burden of proof even if the standard were a mere preponderance of the evidence. Although *MEMA I* did not explicitly consider the standards of proof under section 209 concerning a waiver request for "standards," as compared to a waiver request for accompanying enforcement procedures, there is nothing in the opinion to suggest that the court's analysis would not apply with equal force to such determinations. EPA's past waiver decisions have consistently made clear that: "[E]ven in the two areas concededly reserved for Federal judgment by this legislation—the existence of 'compelling and extraordinary' conditions and whether the standards are technologically feasible—Congress intended that the standards of EPA review of the State decision to be a narrow one." [20]

E. EPA's Administrative Process in Consideration of California's Nonroad CI In-Use Fleet Requirements

EPA has conducted three separate public notice and comment periods associated with three successive versions of CARB's NR CI in-use Fleet Requirements.

On August 8, 2008, CARB requested that EPA authorize California to enforce its original In-Use Off-Road Diesel-Fueled Fleets regulation adopted at its July 26, 2007 public hearing. [21] CARB's original regulations required fleets that operate nonroad, diesel fueled equipment with engines 25 hp and greater to meet separate fleet average emission standards for NO_X and PM, respectively. Alternatively, the regulations required the vehicles in those fleets to comply with BACT requirements. Based on this request, EPA noticed and conducted a public hearing on October 27, 2008, and provided an opportunity to submit written comment through December 19, 2008. [22] CARB amended the regulations between December 2008 and mid-2009. On February 11, 2010 CARB requested that EPA grant California authorization to enforce its In-Use Off- Road Diesel-Fueled Fleets regulation as amended. [23] Based on CARB's February 11, 2010 request, EPA noticed and conducted a public hearing on April 14, 2010, and provided an opportnnity to snbmit written comment through May 18, 2010. [24]

CARB again amended its regnlations in December 2010 and these amendments were formally adopted in California on December 14, 2011—resulting in the current version of the Fleet Requirements which are the subject of this authorization decision. On March 1, 2012, CARB submitted a reqnest that EPA grant California authorization to enforce its Fleet Requirements as most recently amended (Authorization Request). [25] Based on CARB's Authorization Request, on August 21, 2012 EPA invited comment on whether (a) CARB's determination that its standards, in the aggregate, are at least as protective of public health and welfare as applicable federal standards is arbitrary and capricious, (b) California needs separate standards to meet compelling and extraordinary conditions, and (c) California's standards and accompanying enforcement procedures are consistent with section 209 of the Act. [26] The Federal Register notice stated that EPA would only consider testimony and comment submitted in response to the current request for comment because the CARB regulations were substantially amended in December 2010. [27] EPA conducted a hearing on the Authorization Request on September 20, 2012, in Washington, DC. [28] The written

[16] *Id.* at 1122.

[17] *Id.*

[18] *Id.*

[19] *Id.*

[20] *See, e.g.*, 40 FR 21102–22103 (May 28, 1975).

[21] *See* CARB Resolution 07–19) and subsequently modified after supplemental public comment by CARB's Executive Officer by the In-Use Regulation in Executive Order R–08–002 on April 4, 2008 (these regulations are codified at Title 13, California Code of Regulations sections 2449 through 2449.3).

[22] *See* 73 FR 58585 (October 7, 2008) and 73 FR 67509 (November 14, 2008).

[23] CARB's amendments included those of December 2008 (and formally adopted in California on October 19, 2009); January 2009 (and formally adopted in California on December 31, 2009); and, a certain subset of amendments adopted by the Board in July 2009 in response to California Assembly Bill 8 2X (and formally adopted on December 3, 2009). In CARB's February 11, 2010 request letter to EPA it also noted additional amendments adopted in July 2009 and not yet formally adopted by California's Office of Administrative Law. Once this last subset of amendments was formally adopted CARB planned to submit them to EPA for subsequent consideration.

[24] *See* 75 FR 11880 (March 12, 2010).

[25] *See* EPA–HQ–OAR–2008–0691–0270.

[26] 77 FR 50500 (August 21, 2012).

[27] "Therefore, EPA will not be considering oral testimony or written comments based on the prior **Federal Register** notices, since CARB's December 2010 amendments are likely to affect many of these prior comments. To the extent any entity believes that its prior comments remain pertinent then EPA is requiring such comments be resubmitted or incorporated into new comments." *Id.* at 50502. EPA did not receive any adverse comment or suggestions that it is inappropriate to exclude comments submitted prior to the August 12, 2012 **Federal Register** notice. As noted by AGC, "While the Clean Air Act has not changed, and the questions that EPA must address are one and the same, the rule that CARB now seeks the authority to enforce is very different from the rule that CARB originally submitted to EPA." *See* EPA's Hearing transcript at 84 (EPA–HQ–OAR–2008–0691–0298). CARB reincorporated by reference all of its prior submissions regarding the Fleet Requirements.

[28] The written transcript of this hearing is at EPA–HQ–OAR–2008–0691–0298 (Hearing Transcript). EPA received testimony from CARB, the Pacific Legal Foundation (PLF), the American Road and Transportation Builders Association (ARTBA), the Manufacturers of Emission Controls Association (MECA), the Associated General Contractors of America (AGC), the Construction Industry Air Quality Association (CIAQC), and the California Construction Trucking Association (CCTA).

comment period closed on October 22, 2012. [29] In addition, to provide further opportnnity to submit direct verbal comment for affected parties who could not participate in the public hearing, EPA conducted an informal teleconference on October 19, 2012. [30]

III. Discussion

A. California's Protectiveness Determination

Section 209(e)(2)(A)(i) of the Act sets forth the first of the three criteria governing a request for authorization of relevant standards—providing that EPA cannot grant the reqnest if the agency finds that California was arbitrary and capricious in its determination that California standards will be, in the aggregate, at least as protective of public health and welfare as applicable federal standards. [31]

EPA maintains that the phrase "California standards" means California's entire group of standards (i.e. the overall program) that is applicable to nonroad engine emissions. As explained below, while evaluating California's protectiveness determination, EPA compares California's standards to applicable federal standards. That comparison is undertaken within the broader context of the California program applicable to nonroad vehicles and engines, for which EPA previously has granted authorization and which relies upon protectiveness determinations that EPA in its authorization decisions found not to be arbitrary and capricious. [32]

As noted above, EPA is guided in its interpretation of the section 209(e)(2) authorization criteria by the similar language in section 209(b) pertaining to waivers of preemption for new motor vehicle standards. Therefore, the evaluation of the protectiveness of CARB's nonroad standards under section 209(e)(2)(A)(i) follows the instruction of section 209(b)(2), which states: "If each State standard is at least as stringent as the comparable applicable Federal standard, such State standard shall be deemed to be at least as protective of health and welfare as such Federal standards for pnrposes of [209(b)(1)]." EPA evaluates the stringency of California's standards relative to comparable EPA emission standards. To review California's protectiveness determination under section 209(e)(2)(A)(i), EPA conducts its own analysis comparing the newly adopted California standards to comparable applicable Federal standards. EPA traditionally makes a quantitative comparison of relevant numeric emission standards to determine whether the California standards are more or less protective than the Federal standards. [33]

As explained above in the section on burden and standard of proof, any finding that California's determination was arbitrary and capricious under section 209(b)(1)(A) must be based upon "'clear and compelling evidence' to show that proposed [standards] undermine the protectiveness of California's standards." [34] Accordingly, even if EPA's own analysis of comparable protectiveness, or one submitted by a commenter, might diverge from California's analysis, that alone would not provide a sufficient basis for EPA to make a section 209(b)(1)(A) finding that California's protectiveness finding is arbitrary and capricious.

1. Based on EPA's Traditional Analysis, is California's Protectiveness Determination Arbitrary and Capricious?

In adopting the initial version of the Fleet Requirements, CARB approved Resolution 07–19, in which it declared:

> Be it further resolved that the Board hereby determines, in accordance with CAA section 209(e)(2), that to the extent the regulations approved herein affect nonroad vehicles or nonroad engines as defined in CAA section 216(10) and (11), the emission standards and other requirements related to the control of emissions in the regulations approved herein are, in the aggregate, at least as protective of public health and welfare as applicable federal standards, California needs its nonroad emission standards to meet compelling and extraordinary conditions, and the standards and accompanying enforcement procedures approved herein are consistent with CAA section 209. [35]

With the most recent Fleet Requirements amendments in 2010, the Board reaffirmed its protectiveness finding in Resolution 10–47. [36] CARB maintains that there is no basis for EPA to find the Board's determination (which applies solely to standards for *in-use* nonroad engines) is arbitrary and capricious since EPA's authority, under the CAA, is limited to *new* engines, vehicles, and equipment. As a result, EPA has not adopted any federal standards or requirements for in-use nonroad engines. CARB notes that there is no question that its Fleet Requirements are at least as protective of public health and welfare as

[29] EPA received written comment from: Airlines for America (A4A)—EPA–HQ–OAR–2008–0691–0297; Manufacturers of Emission Controls Association (MECA) (Copy of oral testimony)—EPA–HQ–OAR–2008–0691–0300; Steve Milloy (Copy of oral testimony)—EPA–HQ–OAR–2008–0691–0301; Pacific Legal Foundation (PLF) (copy of oral testimony)—EPA–HQ–OAR–2008–0691–0302; Associated General Contractors of America (AGC) (Copy of oral testimony)—EPA–HQ–OAR–2008–0691–0303; PLF—EPA–HQ–OAR–2008–0691–0304; Altfillisch Contractors (ACI)—EPA–HQ–OAR–2008–0691–0305; Savala Equipment Company—EPA–HQ–OAR–2008–0691–0306; Dr. Matthew Malkan—EPA–HQ–OAR–2008–0691–0307; Dr. James Enstrom—EPA–HQ–OAR–2008–0691–0308; Dr. Phalen—EPA–HQ–OAR–2008–0691–0313; California Construction Trucking Association (CCTA)—EPA–HQ–OAR–2008–0691–0309; American Road & Transportation Builders Association (ARTBA)—EPA–HQ–OAR–2008–0691–0310; Bay Cities Paving and Grading (Bay Cities)—EPA–HQ–OAR–2008–0691–0311; Nick Silicz—EPA–HQ–OAR–2008–0691–0313; Granite Rock—EPA–HQ–OAR–2008–0691–0314; Delta Construction—EPA–HQ–OAR–2008–0691–0315; United Contractors—EPA–HQ–OAR–2008–0691–0316; Construction Industry Air Quality Coalition (CIAQC)—EPA–HQ–OAR–2008–0891–0317; California Air Resources Board—EPA–HQ–OAR–2008–0691–0318 (CARB Written Comments) and EPA–HQ–OAR–2008–0691–0319 (CARB Supplemental Comments); PLF Request to Reopen Comment Period, etc—EPA–HQ–OAR–2008–0691–0320.

[30] EPA–HQ–OAR–2008–0691–0321. As discussed below, EPA believes that interested parties have adequate opportunity to present their views through both the public hearing and by submitting written comment.

[31] As explained above, EPA's authorization analysis is guided by precedent related to both section 209(e)(2) and to section 209(b), which contains similar, and in some cases identical, language. *See Engine Manufacturers Ass'n* v. *EPA (EMA)*, 88 F.3d 1075, 1085–87 (D.C. Cir. 1996).

[32] In situations where there are no Federal standards directly comparable to the specific California standards under review, the analysis then occurs against the backdrop of previous waivers which determined that the California program was at least as protective of the federal program. In a prior EPA waiver pertaining to California's zero-emission vehicle program (ZEV) for which there are no comparable Federal standards, EPA also took into consideration California's existing low-emission vehicle program (LEV II) and greenhouse gas emission standards (GHG) applicable to light-duty vehicles. ((LEV II + ZEV) + GHG). *See* 71 FR 78190 (December 28, 2006), Decision Document for Waiver of Federal Preemption for California Zero Emission Vehicle (ZEV) Standards (December 21, 2006).

[33] In situations where there are no Federal standards directly comparable to the specific California standards under review, the analysis then occurs against the backdrop of previous waivers which determined that the California program was at least as protective of the federal program ((LEV II + ZEV) + GHG). See 71 FR 78190 (December 28, 2006), Decision Document for Waiver of Federal Preemption for California Zero Emission Vehicle (ZEV) Standards (December 21, 2006).

[34] *MEMA I*, 627 F.2d at 1122.

[35] CARB Authorization Request at 17.

[36] "BE IT FURTHER RESOLVED that the Board hereby determines, in accordance with CAA section 209(e)(2), that the proposed amendments as they affect nonroad vehicles or nonroad engines as defined in CAA section 216 (10) and (11), do not undermine the Board's previous determination that the regulation's emission standards, other emissions related requirements, and associated enforcement procedures are, in the aggregate, at least as protective of public health and welfare as applicable federal standards, are necessary as part of ARB's off-road emission program to meet compelling and extraordinary conditions existing in the state, and are consistent with CAA section 209." CARB Resolution 10–47EPA–HQ–OAR–2008–0691–0283.

applicable federal standards, given the lack of any comparable EPA standards.[37]

As described above, EPA's traditional analysis has been to evaluate California's protectiveness determination by comparing the newly adopted California standards to applicable EPA emission standards for the same pollutants from the industry sector. CARB is correct that EPA's authority to adopt emission standards and other requirements related to the control of nonroad emissions is limited to new engines, vehicles, and equipment,[38] and that as a result EPA has not adopted any standards or requirements for in-nse nonroad engines.

EPA already has determined that California was not arbitrary and capricious in its determination that California standards applicable to *new* nonroad CI engines are at least as protective as comparable Federal standards.[39] The in-use Fleet Requirements will achieve emission reductions in addition to those achieved by the previously authorized new nonroad engine standards, for which CARB made a protectiveness finding that EPA found not to be arbitrary and capricious. According to CARB, the Fleet Requirements are expected to result in a reduction of 0.5 tons/day of NO_X in the South Coast and 0.3 tons/days in San Joaquin Valley in 2014, along with 3.2 tons/day and 1.9 tons/day in these respective areas in 2023.[40] As such, the Fleet Requirements achieve additional emission rednctions beyond those attained under CARB emission standards applicable to new nonroad CI engines, which EPA has already determined to be as protective, in the aggregate, as applicable federal standards. Accordingly, there is no basis for determining that CARB's protectiveness finding with regard to the in-use Fleet Requirements is arbitrary and capricions.

Further, as noted above, EPA is guided in its interpretation of 209(e)(2)(A)(i) by section 209(b)(2). Section 209(b)(2) states: "If each State standard is at least as stringent as the comparable applicable Federal standard, such State standard shall be deemed to be at least as protective of public health and welfare as such Federal standards for purposes of paragraph (1)." In this instance there is no comparable applicable Federal standard for in-use nonroad CI engines and thus there is no basis for determining the CARB's protectiveness finding is arbitrary and capricious through the application of section 209(b)(2).

Finally, EPA received no comments or evidence suggesting that CARB's protectiveness determination, under EPA's traditional analysis, is arbitrary and capricious. In particular, no commenter disputes that California standards, whether looking at the particular California standards being authorized in this proceeding or the entire suite of California standards for nonroad engines, are at least as stringent, in the aggregate, as applicable federal standards.

In light of the foregoing, EPA finds that CARB's Fleet Requirements achieve additional emission reductions beyond CARB's requirements applicable to new nonroad CI engines, and further finds that the opponents of authorization have not presented evidence to show that CARB's protectiveness determination is arbitrary and capricious. Accordingly, applying the traditional comparative analysis, we cannot find that CARB's protectiveness determination is arbitrary and capricious.

2. Is CARB's Protectiveness Determination Arbitrary and Capricious Based on Other Effects of California's Fleet Requirements?

Having addressed the protectiveness inquiry under EPA's traditional analysis, we turn now to the question whether we should use a different analytical approach and, if so, whether a different approach would yield a different outcome. EPA received one comment suggesting that EPA's analysis under section 209(e)(2)(A)(i) should be based on a broader inquiry into the effects of CARB's Fleet Requirements.[41] Relatedly, EPA received one other comment specifically questioning whether CARB's Fleet Requirements are as protective of applicable Federal requirements in light of the Fleet Requirements' alleged adverse impacts on needed transportation and infrastructure development across the country as well as in California.[42] The latter commenter suggested, for example, that CARB's rule "could" severely impact efforts at improving the nation's infrastructure because transportation projects by necessity involve moving construction equipment across state lines. The commenter stated that equipment associated with such national projects would necessarily have to meet CARB's Fleet Requirements, increasing costs, unless fleet operators were able to differentiate such equipment that would only be nsed for California projects.[43] The commenter argues that increased costs as a result of the Fleet Requirements could in turn prevent or delay needed construction of infrastructure such as roads, schools, housing and levees, and that such delay or prevention could adversely affect public health and safety impacts in California and in other states.[44] EPA received further comment suggesting that CARB is prioritizing one public health issue (air quality) over another (safe roads and infrastructure improvements) and thus California's protectiveness determination is "arbitrary and capricious."[45]

EPA also received a series of comments from general contracting companies and others that highlighted what they believe to be the adverse economic impacts of the Fleet Requirements. For example, several commenters stated that the regulation wonld have some combination of the following impacts: Significant layoffs, increased unemployment, and disadvantage to family-owned and other small businesses. Such impacts, the commenters argue, would have negative rather than the intended positive effects on public health.[46] One commenter asserted that the correlation between poor health and poverty or lack of employment is much stronger than the correlation between poor health and air pollution. The commenter claims that because of such economic and social impacts, regulations such as the Fleet Requirements will be harmful to California's citizens and that the health benefits from CARB's regulation are dubious if not counterproductive.[47] These comments, by and large, do not refer specifically to CARB's protectiveness determination or section 209(e)(2)(A)(i) and it is not clear whether commenters are referring to EPA's analysis under that section.

Finally, EPA received comment that does refer to CARB's protectiveness determination, suggesting it was arbitrary and capricious, but basing this claim on a variety of concerns that do not directly relate to CARB's actual protectiveness determination (e.g.

alleged flaws in CARB's emission modeling—including CARB's estimates of economic recovery scenarios—as well as concerns with the alleged impact of the Fleet Requirements on fleet operator assets leading to more unemployment and associated poor health, and concerns related to the health effects of $PM_{2.5}$).[48]

CARB's written comments note that the Board has repeatedly determined that its in-use off-road regulations are, in the aggregate, at least as protective of public health and welfare as applicable federal standards. In addition to the fact that EPA only has authority to adopt standards related to the control of emissions for *new* nonroad engines, CARB notes that EPA has previously stated that the phrase "state standards" as used in the protectiveness determination means the entire California set of standards (i.e. program) applicable to the relevant category of vehicles or engines. Further, CARB asserts that EPA has previously granted authorization to California's emission standards for new nonroad engines, and the in-use Fleet Requirements will yield emission reductions in addition to the new nonroad engine standards that were the subject of prior protectiveness findings, thus ensuring that the Fleet Requirements are of necessity more stringent than those covered by federal new engine emission standards alone.[49]

CARB responds to criticisms that it prioritized air quality health benefits and did not consider dis-benefits (e.g. increased costs for, and possible delay of, needed highway safety projects and improvements or other infrastructure) by stating that the latter set of concerns falls outside the scope of a section 209 protectiveness determination. CARB maintains that the plain language and intent of section 209(e)(2)(A)(i) is that review of California's protectiveness determination should be based exclusively on whether its "standards will be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards." Since this language is almost identical to the protectiveness criterion language in section 209(b)(1), CARB maintains that EPA should thus follow the directive of Congress in section 209(b)(2) that:

> If each State standard is at least as stringent as the comparable applicable Federal standard, such State standard shall be deemed to be at least as protective of bealth and welfare as such Federal standards for purpose of paragraph (1).

CARB points to EPA's 2009 waiver of California's light-dnty greenhouse gas standards (EPA's 2009 GHG Waiver) where EPA concluded that, in considering whether California's protectiveness determination is arbitrary and capricious under section 209(b)(1)(A), the agency "has always interpreted 'applicable Federal Standards' as limiting EPA's inquiry to motor vehicle emission standards established by EPA under the Clean Air Act that apply to the same cars and the same air pollutants or group of pollutants as considered by California's aggregate protectiveness finding."[50] CARB argues that same analysis should apply to nonroad authorizations. CARB maintains that if EPA were to require the Board to consider factors other than aggregate emission standards in making the Board's protectiveness determination, this would undermine the broad discretion that Congress intended to provide California in making policy decisions on how best to address California's severe air pollution.[51]

CARB also disagrees with opponents' argnments that the Fleet Requirements will delay highway safety improvements. CARB notes that, even before the 2010 amendments, the regulations' expected maximum costs were projected to be so small (less than one percent) compared to overall construction spending, that they would not be expected to decrease or delay constructions projects. With the 2010 amendments, CARB expects compliance costs to be significantly lower and even less likely to delay construction projects, including highway safety projects.[52]

EPA agrees that the phrase "California standards" means the entire California nonroad emissions program (i.e. the set of all nonroad standards), or at the very least all of California's standards for nonroad CI engines, which is the category of engines being regulated hy California in the Fleet Requirements. Therefore, as explained above, when evaluating California's protectiveness determination, EPA compares the California requirements to federal standards applicable to the relevant category of engines. Again, that comparison is undertaken within the broader context of the previously authorized California standards for the relevant category of engines, which rely upon protectiveness determinations that EPA previously has found were not arbitrary and capricious. Finally, as discussed above, no commenter disputes that California standards, whether looking at the particular standards being authorized in this proceeding or the entire suite of standards for nonroad engines, are more stringent than federal standards.

The only issue in dispute is whether other information provided by commenters, outlined at the beginning of this section, provides clear and compelling evidence that California was arbitrary and capricious in finding its standards are in the aggregate at least as protective of public health and welfare as applicable federal standards.

EPA previously has considered whether its traditional analysis is sufficient to properly review CARB's protectiveness determination with regard to the "in-use effects" of CARB's regulations. Analysis of such in-use effects remained focused on the actual emission reductions/benefits expected from CARB's regulation.[53] In EPA's 2009 GHG Waiver Decision granting a waiver of preemption for CARB's greenhouse gas (GHG) standards for light duty vehicles, we noted that, given the legislative history and text of section 209(b)(2), EPA would need a concrete factual basis to examine the in-use effect of California's GHG standards on its broader LEV II program as compared to the Federal Tier II program. EPA did not take a position as to the validity of the suggestion that the type of analysis discussed in EPA's traditional protectiveness analysis is insufficient. Rather, EPA reached the conclusion that commenters who opposed the GHG waiver did not meet their burden of proof in presenting clear and compelling factual evidence (in the context of the regulatory effect on real-world in-use emissions) that CARB's protectiveness determination was arbitrary and capricions.

We recount this history to contrast it with the comments received opposing the Fleet Requirements authorization on the basis of various safety, economic, and health arguments. In the instant proceeding, EPA received no comments indicating why EPA's review of CARB's protectiveness determination with regard to the Fleet Requirements should be broader than past reviews, and/or should be based on anything other than an examination of the stringency of comparable applicable federal standards.

Further, the opponents of the Authorization Request provide no analysis of the statutory language or history of section 209(e)(2)(A)(i) to support their view that the review of the "protectiveness" finding should be broader than EPA's traditional review. Nor do they provide any significant analysis or calculus as to how EPA should or would weigh these competing interests (i.e. those that go beyond the comparative stringency of applicable state and federal emission standards) in making its determination. While EPA recognizes that commenters have expressed significant concerns regarding the potential bnsiness impacts of the Fleet Requirements on individual contractors aud on employment, a review of CARB's protectiveness determination based upon such factors would be inconsistent with the broad discretion that Congress intended to provide California in making policy decisions on how best to address California's severe air pollution.[54] As EPA has previously concluded:

> [Congressional] sponsors of the (waiver) language eventually adopted referred repeatedly to their intent to make sure that no "Federal bureaucrat" would be able to tell the people of California what auto emission standards were good for them as long as they were stricter than the Federal standards.[55]

In our view, the statutory language of section 209(e)(2)(A)(i)—both on its face and as read together with 209(b)(2)—reflects Congress's intention that EPA evaluate only the comparative stringency of the relevant California and EPA emission standards. As discussed above, the text, structure, and history of the California waiver provision clearly indicate a congressional intent that EPA leave the decision on "ambiguous and controversial matters of public policy" to California's judgment. That has been EPA's consistent practice under section 209. As the court stated in *MEMA I*, Congress's intent in amending the protectiveness determination language in 1977 was to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens. EPA therefore considers it inappropriate, in the context of reviewing CARB's protectiveness determination, to second-guess CARB's policy choices or to weigh competing health and welfare interests that are best left to California.

As explained below under the third authorization criterion—consistency with section 209 (including consistency with 202(a))—EPA interprets the "cost of compliance" in section 202(a) to refer to the direct economic costs of CARB's standards and the timiug of a particular emission control regulation rather than to its social implications.[56] Similarly, EPA believes it appropriate to limit our examination for purposes of the protectiveness comparison to the specific effects the California and EPA emission standards have on emissions rather thau performing an analysis of social impacts or other secondary implications. Policy decisions with regard to how various potential non-emissions impacts of an emission regulation can or should be weighed against one another is inherently and properly within the sphere of the state regulatory authority promulgating the regulation. Such decisions should uot be made or reviewed by EPA, which Congress has given the limited role of reviewing the regulations based on the three specified and relatively narrow statutory criteria, consistent with Congress's intent to uphold California's broad regulatory discretion in this sphere.

For all these reasons, EPA declines to depart from its traditional analysis of the protectiveness criterion under section 209(e)(2)(A)(i), as discussed above. Even if there were a valid basis for considering the types of non-air quality impacts alleged by the opponents of the Authorization Request, the opponents did not meet their burden to provide clear and convincing evidence that CARB's analysis of the effects of the Fleet Requirements is unreasonable. For EPA to make a section 209(e)(2)(A)(i) finding that California's protectiveness determination is arbitrary and capricious, it is not enough for authorization opponents to provide competing analysis or alternative policy considerations and arguments. To support a denial of authorization under this criterion, commenters must show that California's analysis, or the assumptions on which California relied to support its protectiveness determination, were *arbitrary and capricious*. In this instance, the opponents of the authorization have suggested that CARB's Fleet Requirements *could* make construction projects more expensive and this could lead to delays. But they have not introduced any actual evidence that such projects will be suspended due to the costs associated with the Fleet Requirements, and certaiuly not that the projected increase in costs, as estimated by CARB after the 2010 amendments, will be significant enough to delay or prevent such projects. Similarly, the opponents of the waiver have not introduced substantial evidence that the Fleet Requirements themselves—as opposed to a host of other factors, including the economic downturn, that have affected the economy over the last several years—will result in a loss in the number of employees or actual business. In the absence of any such evidence, EPA could not find California's protectiveness determiuation to be arbitrary and capricious even if these alleged impacts were an appropriate subject for analysis under section 209(e)(2)(A)(i).

Regarding the comment that CARB's regulation could adversely affect health and welfare in other states, EPA does not find the comment to be a basis for judging California's protectiveness determination to be arbitrary and capricious for two reasons. First, a change in emissions outside of California would not lead to a different conclusion regarding the relative protectiveness of the Fleet Requirements to federal requirements within California. Second, the commenters do not provide any substantive or factual evidence to show significant emissions impacts in other states. We would also note that other states may decide iudependently to adopt California's regulations.

In response to the comment that California's *regulations* are arbitrary and capricious, we note that EPA's sole review under section 209(e)(2)(A)(i) is whether California's *protectiveness determination* was arbitrary and capricious. Congress did not give EPA wide-ranging authority to examine the overall reasonableness of California's regulations. As discussed above, the policy decisions made by CARB in enacting its regulations are not reviewed generally by EPA, and, as Congress intended, EPA leaves such policy decisions to California.

3. Section 209(e)(2)(A)(i) Conclusion

In light of the foregoing, based on the record before us, EPA finds that opponents of the authorization have not shown that California was arbitrary and capricious in its determination that its standards are, in the aggregate, at least as protective of public health and welfare as applicable federal standards.

[54] *See MEMA I*, 627 F.2d at 1122 ["(C)ongressional intent to provide California with the broadest possible discretion in setting regulations it finds protective of the public health and welfare."]; *see also* 40 FR 23102, 23104 (May 28, 1975).

B. Does California need its standards to meet compelling and extraordinary conditions?

Section 209(e)(2)(A)(ii) instructs that EPA cannot grant an authorization if the Agency finds that California "does not need such California standards to meet compelling and extraordinary conditions . . . ." EPA's inquiry under this second criterion (found both in paragraphs 209(b)(1)(B) and 209(e)(2)(A)(ii)) has been to determine whether California needs its own mobile source pollution program (i.e. set of standards) for the relevant class or category of vehicles or engines to meet compelling and extraordinary conditions, and not whether the specific standards that are the subject of the authorization or waiver request are necessary to meet such conditions.[57] In a 2009 waiver action, for example, EPA examined the language of section 209(b)(1)(B) and reiterated its longstanding traditional interpretation that the better approach for analyzing the *need* for "snch State standards" to meet "compelling and extraordinary conditions" is to review California's need for its program (i.e. set of standards) as a whole, for the class or category of vehicles being regulated, as opposed to its need for the individual standards that are the subject of a waiver or authorization request.[58]

As noted above, CARB first adopted its Fleet Requirements in 2007. CARB designed the 2007 regulation to address its determination that legacy fleets—and particularly nonroad CI vehicles—were responsible for significant PM and NO_X emissions. CARB's Initial Statement of Reasons (ISOR) states, in part:

> Off-road vehicles are a significant source of diesel particulate matter, as well as NO_X emissions that lead to ozone and ambient PM. Statewide, they are responsible for nearly a quarter of the total PM emissions from mobile diesel sources and nearly a fifth of the total NO_X emissions from mobile diesel sources. Although increasingly stringent new engine standards are reducing emissions from off-road diesel vehicles over time, because of their durability, most vehicles operate for several decades before being retired. Thus, in-use off-road diesel vehicles would continue to pose significant health risk for many years if this proposed regulation is not adopted. . . . without reductions from this large source category, the South Coast and San Joaquin Valley would be unable to attain the federal ambient air quality standards.
>
> . . . [E]missions would trend naturally down as the fleet gradually turned over to newer, cleaner engines. However, these reductions are not sufficient for many areas of the state to meet clean air standards. Because of this, the proposed regulation accelerates this anticipated reduction in emissions.[59]

The 2010 amendments affirmed CARB's longstanding position that California continues to need its own nonroad engine and vehicle program to address serious air pollution problems the state still confronts.[60] CARB's Authorization Request notes that California and particularly the South Coast and San Joaquin Valley air basins continue to experience some of the worst air quality in the nation and continue to be in non-attainment with national ambient air quality standards (NAAQS) for fine particulate matter ($PM_{2.5}$) and ozone.[61] "The nnique geographical and climatic conditions, and the tremendous growth in California's on- and off-road vehicle population, which moved Congress to authorize the State to establish on-road motor vehicle standards in 1970 and off-road engine standards in 1990, still exist today. . . . Nothing in these conditions has changed to warrant a change in this determination. Accordingly, there can be no doubt of the continuing existence of compelling and extraordinary conditions justifying California's need for its own mobile source emissions control program."[62]

CARB's Authorization Request also notes the continuing importance and need to address the NAAQS for pollutants considered to be harmful to public health, including $PM_{2.5}$ and ozone.[63] For areas in California that exceed the NAAQS, CARB is responsible under CAA section 110 for developing a State Implementation Plan (SIP) that describes how the state will attain the standards by certain deadlines. The South Coast Air Basin and the San Joaquin Valley Air Basin are in nonattainment for both $PM_{2.5}$ and the 8-honr ozone standard. Significant rednctions in NO_X emissions are needed to attain the standards because NO_X leads to formation in the atmosphere of both ozone and $PM_{2.5}$. Diesel PM emissions reductions are also needed because diesel PM contributes to ambient concentrations of $PM_{2.5}$. The South Coast and San Joaquin Valley air basins are both required to be in attainment with the $PM_{2.5}$ standard by 2014. The San Joaquin Valley and South Coast air basins are required to be in

[57] *See* 74 FR 32744, 32761 (July 8, 2009); 49 FR 18887, 18889–18890 (May 3, 1984).

[58] *See* EPA's 2009 GHG Waiver Decision wherein EPA rejected the suggested interpretation of section 209(b)(1)(B) as requiring a review of the specific need for California's new motor vehicle greenhouse gas emission standards as opposed to the traditional interpretation (need for the program as a whole) applied to local or regional air pollution problems.

[59] *See* STAFF REPORT: INITIAL STATEMENT OF REASONS FOR PROPOSED RULEMAKING (ISOR) at EPA–HQ–OAR–2008–0691–0002, attachment A at 7–10. EPA notes that while CARB has incorporated by reference its earlier submissions to EPA docket EPA–HQ–OAR–2008–0691 we recognize that CARB has modified its emission inventory modeling. Nevertheless, the NR CI legacy fleet in California continues to present California with serious air quality issues according to CARB.

[60] *See* CARB Resolution 10–47 at EPA–HQ–OAR–2008–0691–0283. Specifically, the Board stated, in part:

WHEREAS, in-use off-road diesel vehicles operating in the state, as a class, continue to be a significant source of air pollution emissions in California that contribute to continuing violations of the national ambient air quality standards (NAAQS) for both particulate matter (PM) less than 2.5 microns ($PM_{2.5}$) and ozone, and to continuing localized health risk, including premature death, associated with exposure to $PM_{2.5}$;

WHEREAS, Staff Report 2007 further discussed the results of ARB staff's evaluations of the non-cancer health effects of exposure to primary and secondary PM emissions from the vehicles subject to the initially proposed Off-Road regulation, and these evaluations indicated that exposure to these emissions can be associated with premature deaths and other non-cancer health impacts;

WHEREAS, the United States Environmental Protection Agency (U.S. EPA) in a recently published review of the PM-related health science literature, which is the first part of an ongoing review of the national ambient air quality standards for PM, concluded that long-term exposure to $PM_{2.5}$ is causally associated with premature mortality, and that premature deaths caused by $PM_{2.5}$ occur at levels as low as 5.8 micrograms per cubic meter, which is considerably lower than the current national standard of 15 micrograms per cubic meter;

WHEREAS, the U.S. EPA risk assessment methodology is the basis for ARB's estimate that 9,200 (7,300 to 11,000, 95 percent confidence interval) premature deaths occur annually in California and that reducing emissions to meet the Federal standard would result in 2,700 fewer premature deaths annually;

WHEREAS, the Board further finds based on its independent judgment and analysis of the entire record before it that:

In-use off-road diesel vehicles and engines that operate in the State—whether based in California or not—continue to be significant contributors of diesel PM and NO_X emissions, which California must reduce to attain the ozone and $PM_{2.5}$ NAAQS and to reduce the health risks associated with such pollutants;

Even with the amendments and economic relief proposed, the proposed amended regulation would significantly reduce diesel PM and NO_X emissions and associated cancer, premature mortality, and other adverse health effects statewide, such that emission reductions from the proposed amended regulation are expected to prevent 470 premature deaths from 2014 to 2029.

[61] CARB Authorization Request at 18, *citing* 7 FR 4052, 4054 (July 11, 2011).

[62] CARB Authorization Request at 18, *citing* 74 FR 32744, 32762 (July 8, 2009); 76 FR 77515, 77518 (December 13, 2011).

[63] CARB notes: Ambient $PM_{2.5}$ is associated with premature mortality, aggravation of respiratory and cardiovascular disease, asthma exacerbation, chronic and acute bronchitis and reductions in lung function. Ozone is a powerful oxidant. Exposure to ozone can resnlt in reduced lung function, increased respiratory symptoms, increased airway hyper-reactivity, and increased airway inflammation. Exposure to ozone is also associated with premature death, hospitalization for cardiopulmonary causes, and emergency room visits for asthma.

attainment of the 8-hour ozone standard hy 2023.[64]

The SIP for the South Coast and San Joaquin air basins demoustrates attainment of the $PM_{2.5}$ standard by 2014, but only based on projected achievement of $PM_{2.5}$ emission reductions of nearly 15 percent in the South Coast Air Basin and 25 percent in the San Joaquin Valley Air Basin. CARB's Authorization Request states that NO_X emissions must be reduced by approximately 50 percent to meet the $PM_{2.5}$ standard in the South Coast and the San Joaquin Valley air basins. Even greater NO_X reductions, on the order of 75 to 88 percent, will be needed to achieve the 8-hour ozone standard by 2023. California's 2007 SIP included the initial version of the Fleet Requirements as a control measnre. CARB's legal commitment to achieve the emission reductions specified in the SIP relies upon the emission reductions from the Fleet Reqnirements regulation in the South Coast and the San Joaquin Valley.[65] In its ISOR, CARB notes "Despite the major economic recession and revisions to the off-road regulation inventory, the in-use off-road diesel vehicle category remains an important source of emissions. In 2010, staff estimates the off-road vehicles subject to the off-road regulation are the fourth largest source of diesel PM in California (7 percent of total) and the sixth largest source of NO_X from all sources (4 percent of total)."[66]

1. Should EPA Review this Criterion Based on the Need for California's Nonroad Program or the Need for the Fleet Requirements?

In addressing whether California needs "such State standards to meet compelling and extraordinary conditions," we must first address the question whether it is appropriate for EPA to evaluate this criterion based on California's need for its nonroad emission program as a whole, or whether we instead should evaluate only the particular standards being addressed in this authorization proceeding.

As noted above, CARB maintains that the relevant inquiry is whether California needs its own emission control program as opposed to the need for any given standard as necessary to meet compelling and extraordinary conditions. CARB notes that in prior decisions the Administrator has determined that:

> "[C]ompelling and extraordinary conditions" does not refer to levels of pollution directly, but primarily to the factors that tend to produce them: Geographical and climatic conditions that, when combined with large numbers and high concentrations of automobiles create serious air pollution problems.[67]

EPA has also consistently held that the phrase "the need for California emission standards" refers to the need for California's program (i.e. set of standards) applicable to the relevant category of vehicles or engines, and not the need for the particular standards that are the subject of an authorization request. In the instaut proceeding, EPA received comments disputing this approach, which we discuss below.

a. Comment From Pacific Legal Foundation

EPA received comment from the Pacific Legal Foundation (PLF) challenging both California's and EPA's interpretation of the "compelling and extraordinary conditions" criterion in section 209(e)(2)(A)(ii). PLF asserts that based on both the plain language of the provision and its legislative history, the word "standards" should be read to refer only to particular standards, and not to the entire California program for the relevant category of engines or vehicles.[68]

PLF contends that California must apply for a waiver or authorization on a case-by-case basis[69] and that the Clean Air Act requires EPA not grant California any waiver or authorization unless California makes a showing that it has "compelling and extraordinary conditions" necessitating the particular standards for which a waiver or authorization is sought. PLF argues that CARB has put little evidence in the record about the need for the Fleet Requirements. Further, PLF asserts that "Congress intended the word 'standard' in section 209 to mean quantitative level of emissions"[70] and that there is no indication in the text or legislative history that by using the term "standard" Congress really meant "program" or anything other than "standard." PLF states that Congress could have used the term "program" rather than the term "standards" in the statute and delegated to EPA the responsibility to make case by case decisions on whether a particular standard was required or needed.

In addition, PLF cites the legislative history of section 209 to support its position that standards need to be justified on an individual basis. Specifically, PLF cites the Senate Committee report for the 1967 legislation, which in discussing section 208 (the predecessor to what is now section 209) refers to California's "compelling and extraordinary circumstances" that are "sufficiently different from the nation as a whole to justify standards . . . [that] may, *from time to time*, need to be more stringent than national standards."[71] PLF argues that this language indicates that Congress intended California to justify *specific* standards "from time to time," and that it intended EPA to deny a waiver if California does not require or need particular standards. PLF claims that if Congress wanted to apply a need tests based on California's need for a program as a whole then it could have stated so.

PLF further contends that in 1977, when Congress amended section 209(b)—Congress continued to focus on "standards" but with two important additions. First, Congress amended the language relating to the protectiveness determination to clarify that California's standards need only be at least as protective as federal standards "in the aggregate"—making clear that California did not need to determine that each individual standard would be more protective or stringent than applicable federal standards. PLF asserts that this clarification, however, applied only to the protectiveness determination. Second, Congress tightened section 209(b)(1)(B) to provide that "*no* such waiver shall be granted if EPA finds that California . . . does not *need* such *standards* to meet compelling and extraordinary conditions . . .." (emphasis added). PLF asserts that the preexisting 1967 language had provided that EPA "shall" grant a waiver unless it finds California did "not require" the underlying standards, whereas the 1977 amendments expressly *prohibited* EPA from granting a waiver where California did not "need" a particular emissions standard. Based on the foregoing, PLF argues that the 1977 amendments created two separate tests for "standards." The "protectiveness" test (under the first waiver criterion), which

[64] CARB Authorization Request at 3–4.

[65] *Id.*

[66] EPA–HQ–OAR–2008–0691–0002 Attachment A, at 13.

[67] CARB Authorization Request at 18.

[68] As explained below, EPA believes it important to examine the language of section 209(e)(2)(A)(ii) precisely as Congress set it forth. Therefore, to be clear, the phrase "the need for California emission standards" does not appear in this section. Rather, the language is "No such authorization shall be granted if the Administrator determines that—(ii) California does not need such California standards to meet compelling and extraordinary conditions." EPA's interpretation of this section includes an examination of the significance of the word "such" before "California standards."

[69] PLF at 1.

[70] PLF cites *MEMA I* at 1112–1113.

[71] S Rep No 90–403 at 33 (1967) (emphasis added).

applies to the protectiveness of California's aggregate set of standards, and the "needs" test (under the second waiver criterion), which is based on a need for the particular standards for which a waiver is sought and focuses on whether there are compelling conditions in the state necessitating that particular standard.

PLF also maintains that EPA's traditional interpretation is contrary to plain meaning of the CAA. PLF asserts that the term "program" is not used in section 209 and that the phrase "such California standards" in 209(e)(2)(A)(ii) does not refer to the entire California mobile source emissions program. PLF states that the phrase "in the aggregate" appears only ouce in section 209 and only under the first waiver prong added in the 1977 amendments. "In the aggregate" is set off by commas, PLF argues, providing evidence that it pertains only to protectiveness under the first waiver criterion, and does not apply to the "needs" inquiry under the second waiver criterion. PLF maintains that the outcome of the protectiveness test depeuds on California making a determination, whereas the outcome of the needs tests depends on EPA making a finding. Further, PLF argues that the protectiveness test affirmatively mandates that EPA approve the waiver application if California makes the protectiveness determination, while the "needs test" expressly prohibits EPA from granting a waiver if EPA makes the requisite finding. Thus, PLF argues, the first prong is written to broaden the likelihood of issuing a waiver, whereas the second prong is written to narrow it.

PLF maintains that the two waiver prongs were intended to address entirely different issues. Congress gave EPA greater authority to approve waivers under the first prong, PLF asserts, but lesser authority to approve waivers under the independent needs test. PLF highlights that the sentence regarding "protectiveness" applies to both "standards and other requirements," whereas the sentence establishing the needs test refers only to standards. This makes sense, according to PLF, because Congress intended EPA to look holistically at protectiveness and not at whether an individual standard was as protective. To ensure CARB did not abuse the privilege, PLF argues, Congress provided under the "needs" criterion that California could not adopt any standard that it did not need or that was not specifically designed to address California's "peculiar" conditions.

Finally, PLF maintains that EPA's traditioual interpretation leads to absurd resnlts. PLF states that EPA itself has acknowledged that conditions in California may improve, thereby eliminating the need for the authority to waive preemption of California standards.[72] Under EPA's traditional interpretation, PLF argues, EPA would be forced to deny a waiver request based on a finding that there is no longer a need for the California program. PLF argues that such a finding would put in jeopardy past waivers, as the positive (program-wide) "needs" finding underpinning those past waivers would no longer be valid. PLF further comments that a broad negative finding with regard to "needs" would eliminate CARB's ability to maintain its own mobile source emission standards program, separate from the federal program. In such circumstances, PLF argues, EPA would be substituting its policy jndgment for that of Congress. If one interpretation leads to absurd results and another does not, PLF argues, then the former must be rejected.

b. EPA Response

EPA examined these same issues at length in the Agency's 2009 decision granting California's request for a waiver of preemption of its GHG standards for light duty vehicles.[73] Consistent with that examination, EPA continues to believe that the traditional approach to the compelling and extraordinary conditions criterion is appropriate. That is, EPA believes it is proper to review California's need for its emission program (i.e. set of standards) applicable to the relevant category of vehicles or engines as a whole, rather than to follow an intarpretation that applies this criterion to specific standards that are the subject of an authorization request.

EPA's traditional interpretation is the most straightforward reading of the text and legislative history of section 209(b) and section 209(e). First, EPA disagrees with PLF's assertions regarding the original language of the preemption provision promulgated in 1967. The critical language in section 208(b) of the 1967 legislation required that EPA's predecessor department grant California a waiver of section 208(a) preemption unless it found that California "does not require standards more stringent than applicable Federal standards to meet compelling and extraordinary conditions . . .." This language did not suggest a searching review of every California standard. Rather, it required a waiver of preemption unless the agency determined that California did not require more stringent "standards"—a term that is both general and plural—to meet compelling and extraordinary conditions. This langnage is fully consistent with a review of California's general need for more stringent standards and thus for its own program (i.e. its own set of standards).

PLF's emphasis on the word "standards," as opposed to "program" in this section is inapposite. EPA's use of the word "program" in this context is simply meant to describe the *group of standards* applicable to the engines and vehicles in question under California's regulatory program, compared to those under the federal program. The "program" in this context is merely the standards being considered together. It is fully consistent with the language of the statute to review the need for the program (i.e. the set of relevant standards) as a whole, rather than the need for individual standards. PLF's reference to legislative history is consistent with EPA's view that the relevant issue in determining whether a waiver is justified is California's "circumstances" being "sufficiently different", rather than the specific need for any particular standard.[74]

Beginning prior to the 1977 amendments, EPA has consistently interpreted the "compelling and extraordinary conditions" criterion to apply to the full California program (i.e. set of standards).[75] When Congress re-evaluated this provision in 1977, it could have revised the criterion to make clear that California must show each standard is necessary. Instead, as discussed below, Congress went out of its way to indicate that California is to be given even more flexibility in designing its own motor vehicle program.[76]

PLF, moreover, does not take proper account of the critical statutory change Congress made in 1977, which allowed California to promulgate individual standards that are not as stringent as comparable federal standards, as long as the standards are "in the aggregate, at least as protective of public health and welfare as applicable federal standards." This decision by Congress requires EPA to waive preemption of individual California standards that, in and of themselves, might not be considered needed to meet compelling and extraordinary circumstances, but are part of California's overall approach to reducing vehicle emissions to address air pollution problems.

Although PLF is correct that the 1977 amendments formally separated the "protectiveness" criterion from the "need" criterion, the latter continues to

[72] *See* 74 FR 32744, 32762 (July 8, 2009).

[76] *MEMA I*, 627 F.2d at 1110.

refer back to the language regarding protectiveness, by using the term "*such* state standards." In addition, contrary to PLF's comments, the creation of the "in the aggregate" test for protectiveness is supportive of the argument that EPA is not to look at the need for each individual standard. If EPA were required to look independently at the need for each individual standard, any individual standard that was less stringent than a federal standard might be considered unnecessary. This would obviate the rationale for looking at the protectiveness of California's standards "in the aggregate" under the first criterion—effectively requiring EPA to give back in the second criterion what Congress explicitly gave California in its revision to the first criterion. Finally, it bears emphasis that the 1977 amendments continued to require that EPA grant a waiver of preemption unless it makes one of the findings in section 209(b)(1), thus continuing to put the burden of proof on those opposing the waiver.[77]

Congress, in 1990, added language in section 209(e)(2)(A) creating criteria for EPA authorization of California nonroad engine standards that are essentially identical to the criteria for EPA waiver of preemption of California's standards for new motor vehicles in section 209(b). In particular, Congress provided California with the discretion to create a broad emissions program (i.e. "California standards") that needs only to be as stringent as applicable EPA standards, in the aggregate. Further, section 209(e)(2)(A)(ii) refers to whether "*such* California standards" are needed to meet compelling and extraordinary conditions, referring back to the general and plural term "California standards" in the protectiveness finding.

The language of section 209(e)(2)(A) regarding the "protectiveness" determination by California refers only to "California standards," not to each California standard individually. Moreover, the use of the term "in the aggregate" makes clear that the set of standards to be reviewed is the aggregate set of standards applicable to the engines and vehicles being regulated. EPA is to determine whether California's determination is arbitrary and capricious under section 209(e)(2)(A)(i), and is to determine whether California does not need "such California standards" to meet compelling and extraordinary conditions. The natural reading of these provisions leads EPA, in addressing the "needs" criterion, to consider the same group of standards that California considered in making its protectiveness determination. While the words "in the aggregate" are not specifically applicable to section 209(e)(2)(A)(ii), this criterion does refer to the need for "such California standards," rather than "each California standard" or otherwise indicate a standard-by-standard analysis. The text thus indicates that the proper analysis is to review the aggregate set of standards (i.e. the program) applicable to the regulated vehicles and engines.[78]

PLF's discussion of case law interpreting the term "standard" is inapposite. For example, although PLF points to both *MEMA I* and *EMA*, those decisions address an entirely different issue relevant to section 209—i.e., whether the regulation set by California is, in fact, a "standard," as opposed to another type of provision, like an enforcement provision. These cases do not illuminate the issue of whether EPA reviews each standard individually under sections 209(b)(1)(B) and 209(e)(2)(A)(ii), or whether it reviews California's standards as a group (i.e. California's program for such engines) under those provisions.

EPA's 2009 decision waiving preemption of California's GHG standards for light duty vehicles considered the plain language and legislative history of section 209(b)(1)(B) and determined that for all pollutants, it was appropriate to review section 209(b)(1)(B) by reviewing the need for California's motor vehicle program, rather than individual standards. We incorporate that discussion into this decision by reference because, as explained above, the language of section 209(e)(2)(A)(ii) is substantively the same as that in section 209(b)(1)(B) on this issue.

The 2009 GHG waiver decision included the following discussion, which in particular addressed a 1984 decision waiving preemption for earlier California PM standards:

> [I]n the legislative history of section 209, the phrase "compelling and extraordinary circumstances" refers to "certain general circumstances, unique to California, primarily responsible for causing its air pollution problem," like the numerous thermal inversions caused by its local geography and wind patterns. The Administrator also noted that Congress recognized "the presence and growth of California's vehicle population, whose emissions were thought to be responsible for ninety percent of the air pollution in certain parts of California." EPA reasoned that the term compelling and extraordinary conditions "do not refer to the levels of pollution directly." Instead, the term refers primarily to the factors that tend to produce higher levels of pollution—"geographical and climatic conditions (like thermal inversions) that, when combined with large numbers and high concentrations of automobiles, create serious air pollution problems."
>
> The Administrator summarized that under this interpretation the question to be addressed in the second criterion is whether these "fundamental conditions" (i.e. the geographical and climate conditions and large motor vehicle population) that cause air pollution continued to exist, not whether the air pollution levels for PM were compelling and extraordinary, or the extent to which these specific PM standards will address the PM air pollution problem.[79]

The structure of section 209, as adopted in 1967 and as amended in 1977 and 1990, is notable in its focus on limiting the ability of EPA to deny a waiver or authorization. This limitation preserves discretion for California to construct its motor vehicle and nonroad programs as it deems appropriate to protect the health and welfare of its citizens. The legislative history indicates Congress quite intentionally restricted and limited EPA's review of California's standards, and that its express legislative intent was to "provide the broadest possible discretion [to California] in selecting the best means to protect the health of its citizens and the public welfare." [80] The D.C. Circuit recognized that "[t]he history of the congressional consideration of the California waiver provision, from its original enactment up through 1977, indicates that Congress intended the State to continue and expand its pioneering efforts at adopting and enforcing motor vehicle emission standards different from and in large measure more advanced than the corresponding federal program. In short to act as a kind of laboratory for innovation. * * * For a court [to limit

[77] *Id.*

[78] To the extent the provision is ambiguous, EPA's interpretation is, at minimum, one that is reasonable and entitled to deference under *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837 (1984). It certainly is not "unambiguously precluded" by the language of the statute. See *Entergy Corp. v. Riverkeeper, Inc.*, 129 S.Ct. 1498 (2009) ("That view governs if it is a reasonable interpretation of the statute—not necessarily the only possible interpretation, nor even the interpretation deemed most reasonable by the courts. *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 843–844 (1984).") ("It seems to us, therefore, that the phrase "best available," even with the added specification "for minimizing adverse environmental impact," does not unambiguously preclude cost-benefit analysis."). *Carrow v. Merit Systems Protection Board*, 564 F.3d 1359 (Fed. Cir. 2009) ("[W]e are obligated to give controlling effect to [agency's] interpretation if it is reasonable and is not contrary to the unambiguously expressed intent of Congress", citing *Entergy Corp.*).

[79] 74 FR 32744, 32759 (July 8, 2009) (citations omitted).

[80] 105 H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–302 (1977). *See MEMA*, 627 F.2d at 1110–11.

California's authority] despite the absence of such an indication would only frustrate the congressional intent." [81]

In this context, it is fully consistent with the expressed intention of Congress to interpret section 209(e)(2)(A)(ii) in a manner that allows California the policy discretion to set its emission program as it sees fit, subject to the limitation that its standards remain, in the aggregate, as protective of public health and welfare as applicable federal standards and that California continue to experience compelling and extraordinary conditions. Congress intended to provide California the broadest possible discretion to develop its nonroad emissions program. Neither the text nor the legislative history of section 209(b) or 209(e) indicates that Congress intended to limit this broad discretion by requiring EPA to determine, on a case-by-case basis, whether each specific standard is necessary or appropriate for California. EPA's longstanding interpretation, accordingly, is directly in line with the purpose of Congress.

This approach does not make section 209(b)(1)(B) or section 209(e)(2)(A)(ii) a nullity. EPA must still determine whether opponents of authorization have met their burden to establish that California does not need its nonroad program to meet the compelling and extraordinary conditions. As discussed below, EPA does not believe that burden has been met in this instance. We acknowledge, however, that conditions in California may one day improve such that it no longer has the need for a separate nonroad program to address certain air quality problems. The statute contemplates that such improvement is possible. PLF is incorrect in concluding that EPA's approach would lead to an absurd outcome. EPA would not deny an authorization request under section 209(e)(2)(A)(ii) unless it determined that the regulatory program was not needed because compelling and extraordinary conditions no longer exist in California. Furthermore, the basis for previously waived or authorized standards would remain valid unless EPA determined that the compelling and extraordinary conditions would not exist even without those standards in place. This is consistent with the intent of Congress to permit California to maintain separate emission standards when compelling and extraordinary conditions exist. Thus, there would be no absurd results regarding such standards.

Congress has directed EPA to exercise its technical judgment with regard to all three authorization criteria, but has not authorized EPA to substitute its policy judgment for California's judgment with regard to which of its specific standards are or are not needed to meet its compelling and extraordinary conditions. Those who oppose California regulations for reasons other than the three criteria that Congress specified in the statute have the ability to raise their legal, policy, and other concerns in the state administrative process, or through judicial review of the regulations themselves.

For these reasons, EPA believes that the better approach for analyzing the need for "such State standards" to meet "compelling and extraordinary conditions" is to review California's need for its program, as a whole, for the class or category of vehicles being regulated, as opposed to its need for the individual standards that are the subject of an authorization request.

2. Does California Need its Nonroad Program to Meet Compelling and Extraordinary Conditions?

Applying the traditional approach to application of the compelling and extraordinary circumstances criterion under section 209(e)(2)(A)(ii), EPA cannot deny the authorization of the Fleet Requirements on this basis.

CARB has repeatedly demonstrated the need for its nonroad program to address compelling and extraordinary conditions in California. As noted above, in its Authorization Request, CARB stated that the unique geographical and climatic conditions and the tremendous growth in California's onroad and nonroad vehicle population, giving rise to serious air quality problems and NAAQS nonattainment in California, still exist today and that nothing in these conditions has changed to warrant a change in this determination. As such CARB notes that there can be no doubt of the continuing existence of compelling and extraordinary conditions justifying California's need for its own mobile source emissions control program.

EPA received some comment from those that otherwise oppose the authorization but implicitly recognize the underlying compelling and extraordinary conditions in California. For example, the American Road and Transportation Builders Association (ARTBA) notes that it is "very supportive of both EPA and ARB's goal of reducing PM and NO_X emissions," but "does not believe ARB has considered fully some of the air quality improvements already occurring in California and the nation. These improvements in air quality undercut the need for a measure as severe as the ARB proposal." [82] ARTBA notes that the air quality is significantly improving without the Fleet Requirements.[83] However, EPA received no evidence to suggest that California's air quality is improving to the point that it will attain the NAAQS for PM and ozone without the Fleet Requirements or that California continues to experience serious air quality concerns based on continuing compelling and extraordinary conditions, as EPA and CARB have outlined in this and previous actions. Based on the record, EPA is unable to identify any change in circumstances or any evidence to suggest that the conditions that Congress identified as giving rise to serious air quality problems in California no longer exist. As noted by CARB, there continue to be underlying compelling conditions in California giving rise to a significant number of California air basins that continue to be in nonattainment with NAAQS for $PM_{2.5}$ and ozone.

To the degree that commenters question the stringency of the Fleet Requirements or whether the emission reductions projected from this rule are needed, EPA received no comment that addressed the fundamental question of whether California continues to experience compelling and extraordinary conditions giving rise to the need of a nonroad emissions program. The design, or stringency of such an emission program, is irrelevant to EPA's review of section 209(e)(2)(A)(ii). Such review would be inconsistent with the express indication from Congress to provide California with the "broadest possible discretion" in selecting the best means to protect the health of its citizens and the public welfare. Accordingly, applying the traditional approach of reviewing the need for a separate California nonroad program to meet compelling and extraordinary conditions, EPA cannot deny the authorization based on this criterion.

3. In the alternative, does California need its nonroad Fleet Requirements to meet compelling and extraordinary conditions?

As discussed above, EPA is maintaining its interpretation of section 209(e)(2)(A)(ii) as requiring a review of whether compelling and extraordinary conditions give rise to a need for a California nonroad emission program. Nevertheless, because EPA received

[81] *MEMA*, 627 F. 2d at 1111.

[82] ARTBA at 2.

[83] *Id.*

comment urging an alternative interpretation (based on a review of whether the Fleet Requirements are per se needed to meet compelling and extraordinary conditions) and because we received other comments concerning the specific need for or benefits of the Fleet Requirements, EPA has also evaluated this criterion in the alternative by reviewing the Fleet Requirements separately.

Although EPA received a wide variety of comments questioning the "need" for CARB's Fleet Reqnirements, we did not receive any comments or explanation as to how an evaluation of "need" shonld be performed by EPA. As discussed below, in light of the lack of criteria by which to judge such need (including how to weigh or balance evidence and provide CARB with the requisite policy deference described above), the lack of any explanation of the relevant facts that EPA must or could consider, and the failnre of commenters to satisfy their burden of proof to overcome CARB's stated need for its Fleet Requirements, even if EPA were to apply the alternative interpretation proposed by commenters, the agency would be unable to make an affirmative finding under section 209(e)(2)(A)(ii). Therefore, EPA is unable to deny CARB's reqnest on this basis.

a. California's Air Quality Today and Moving Forward

The Agency received a number of comments suggesting that California's air quality is improving on its own. ARTBA notes that levels of $PM_{2.5}$ and NO_X have declined significantly since 1980 and since 2001, while nnmerous economic indicators have increased. The Associated General Contractors of America (AGC) note the significant decline in emissions from off-road diesel equipment due to a decline in activity and other factors. The Construction Industry Air Quality Coalition (CIAQC) claims that emissions from the existing fleet are naturally declining and that additional regulation is not needed to reach the emission levels CARB attribntes to implementation of the Fleet Requirements. The California Construction Trucking Association (CCTA) and CIAQC state that CARB's emission modeling was overstated and continues to be inaccurate because it presumes too optimistic a scenario of economic recovery and therefore more activity and emissions from nonroad fleets than there actually has been. We also received comments that the cost of CARB's regulation compared to the benefits supports a finding that such standards are not needed, and that the health benefits are either overstated or non-existent. In related comments, commenters stated that the Fleet Requirements are likely to do harm to the public health of Californians and that the economic impacts of the regulation are likely to lead to significant adverse health effects.[84] We also received comment from Altfillisch Contractors (ACI) suggesting that the California Environmental Quality Act (CEQA) renders the Fleet Requirements unnecessary.

CARB explains in its comments that for areas that exceed the NAAQS, California is responsible under the CAA section 110 for developing a state implementation plan (SIP) that describes how the state will attain the standards by certain deadlines.

CARB notes that its Fleet Requirements are part of an integral strategy to attain the NAAQS in both the San Joaquin Valley Air Basin and Sonth Coast Air Basin. CARB notes there is no question that areas of California continue to be in nonattainment for $PM_{2.5}$, as well as for ozone, and that the Fleet Requirements and other regulations and incentives are needed to achieve attainment.[85] Additionally, CARB states that despite the economic recession and downward revisions to the in-use off-road emissions inventory, off-road diesel vehicles remain a significant source of emissions.[86] Thus, CARB states, there continues to be a strong need for further regulation of all emission source categories, including off-road vehicles. "As EPA has long-confirmed, questions of what sources to regulate and how to regulate them are policy questions that Congress has determined is best left to the State."[87]

CARB also notes, and the EPA agrees, that the CEQA does not render the Fleet Reqnirements nnnecessary. The purposes of the CEQA and the Fleet Requirements are different. The CEQA, which is applied in only a few air districts, is essentially designed to identify when projects will result in significant harm and to mitigate that harm (to make sure air quality does not worsen), whereas the Fleet Requirements are proactive measures applicable statewide as part of coordinated strategy designed to improve air qnality thronghout the state.

EPA believes that CARB's initial filings and additional snbmissions to the record, responding to arguments that the Fleet Requirements are not needed because of the economic downturn and because of CARB's overestimation of inventory and emissions, are reasonable. Mere assertions by commenters that CARB's most recent emission modeling is inaccurate do not meet the burden of proof to demonstrate otherwise. As noted above, CARB has submitted npdated estimates of projected emission reductions expected from the Fleet Requirements, and there is no evidence in the record to demonstrate that CARB's projections are unreasonable. EPA further finds that the opponents have not met their burden of demonstrating that such considerations would render the Fleet Requirements unnecessary. In adopting the 2010 amendments, CARB acknowledged that past and future emissions from in-use nonroad CI vehicles were significantly lower than originally projected, and CARB states that the amendments for

[84] Those comments are addressed in the "protectiveness" or section 209(e)(2)(i) discussion above. As discussed in that section, the Agency believes it appropriate to limit our examination to the specific effects the California and EPA emission standards have on emissions rather than performing an analysis of social impacts or other secondary implications. The determination of how numerous possible impacts of emission regulation can or should be weighed in determining public policy is one inherently directed to the regulatory authority promulgating the regulation, not to an authority whose limited role is to review the regulations based on three narrow criteria and who has been directed by Congress to provide broad discretion in its review.

[85] CARB notes in its Authorization Request that two air basins in California—South Coast Air Basin and San Joaquin Valley Air Basin—are in nonattainment for both $PM_{2.5}$ and the 8-hour ozone standard. This nonattainment is based on the 2006 NAAQS for PM (71 FR 61144, October 17, 2006) and which EPA has subsequently made more stringent in 2012 (78 FR 3086, January 15, 2013). The nonattainment for ozone is based on EPA's 2008 NAAQS 8-hour ozone standard (73 FR 16436, March 27, 2008). CARB notes that significant emission reductions of NO_X are needed because it leads to formation in the atmosphere of ozone and $PM_{2.5}$, and that diesel PM emission reductions are also needed because diesel PM contributes to ambient concentrations of $PM_{2.5}$.

California submitted a revision to its SIP (State Strategy) in 2007 for the South Coast and San Joaquin Valley Air Basins that demonstrates attainment of the $PM_{2.5}$ standard by 2014 (needed by 2015), but only after achieving significant reductions of $PM_{2.5}$ (and NO_X). In addition, additional reductions of NO_X emissions are needed to achieve the 8-hour ozone standard by 2023. EPA approved the Stated Strategy for both $PM_{2.5}$ and NO_X for the South Coast and San Joaquin Air Basins on November 9, 2011 and March 1, 2012, respectively. CARB projects that the Fleet Regulations will achieve a 17 percent reduction in NO_X emissions and a 21 percent reduction in $PM_{2.5}$ emissions in 2023 that would not occur without the regulation and that Fleet Requirements are an integral part of the SIP and are laid ont in EPA's proposed rulemaking to approve the State Strategy and that no "margin of safety" otherwise exists.

[86] CARB notes in its Written Comments at 10–11 that the Fleet Requirements are part of the approved SIP for the South Coast and San Joaquin valley, both extreme nonattainment areas for ozone and nonattainment for $PM_{2.5}$ and that specific emission benefits from the Fleet Requirements are laid out in EPA's proposed rulemaking to approve the State Strategy.

[87] CARB Written Comments at 12–13.

which authorization is requested provide economic relief to fleets while still achieving the emission reductions necessary to attain federal ambient air quality standards (NAAQS). CARB indicates that despite the smaller inventory contribution from in-use nonroad CI engines than CARB projected in the initial rulemaking, emissions from these engines still represent a significant portion of the overall emissions inventory. The opponents provide no evidence to refute CARB's assertion that despite the economic recession and revised inventory, the in-use nonroad CI fleet remains a significant source of emissions.

Moreover, as CARB notes, there continues to be a strong need for emission reductions from all emission categories, including the in-use nonroad CI fleet, to meet the $PM_{2.5}$ and ozone NAAQS. As CARB notes, it is not for EPA to decide which types of sources to regulate and in what manner to do so.[88] Congress intended to leave such policy questions in the hands of the state. As discussed below, EPA finds that CARB has promulgated the Fleet Requirements, in part, to satisfy its $PM_{2.5}$ and 8-hour ozone NAAQS requirements and no evidence exists in the record to explicitly demonstrate why the emission reductions projected hy CARB are not needed in order to meet California's NAAQS obligations.

Lastly, CARB restates its legal obligation to achieve PM emission reductions and the expected benefits associated with the Fleet Requirements:

> ARB adopted the Off-Road regulation, in part, to meet California's legal obligations under federal law to achieve attainment with the NAAQS for $PM_{2.5}$ by 2014. The emission reductions in the regulation are critical to attaining federally mandated air quality standards. Primary diesel PM emissions are a significant contributor to overall $PM_{2.5}$. In 2008, 20,600 tons of diesel PM were emitted in California. The present amendments to the Off-Road regulation have been adopted to accommodate the economic hardship of affected businesses while still meeting the legal requirements and protecting the public health of all Californians.[89]

In order to properly evaluate whether California has a need for its Fleet Requirements under the alternative approach to section 209(e)(2)(A)(ii) described above, EPA believes it would be necessary only to examine whether the identified "compelling and extraordinary conditions" in California are giving rise to an air quality problem that CARB seeks to address with the Fleet Requirements. EPA has received no comment suggesting that EPA's historically recognized "conditions" in California (e.g. geographic and climatic conditions, number of vehicles operating in California, etc.) do not continue to give rise to elevated concentrations of particulate matter and NO_X. In addition, EPA has received no comment rebutting CARB's statement that it is legally required to demonstrate compliance with the CAA's NAAQS requirements (for $PM_{2.5}$ and 8-hour ozone) and that CARB is currently committed to achieve such compliance in part through the promulgation of emission standards such as its Fleet Requirements. As noted by CARB, the Fleet Requirements were initially set in response to the NAAQS requirements for $PM_{2.5}$ and the 8-hour ozone set in 2006 and 2008, respectively. The state of California has a greater level of nonattainment under those NAAQS than other states. Since that time, EPA in 2012 has completed review of the PM NAAQS and has strengthened the primary annual standard for $PM_{2.5}$, and California continues to set regulations in response to snch requirements.[90] EPA believes that to the extent that a review of the need for the Fleet Requirements (as opposed to CARB's nonroad program) is required, that CARB has reasonably demonstrated such need due to its obligation to comply with federal law (including section 110 of the CAA); CARB needs its Fleet Reqnirements and a host of other regulatory measures in order to adequately meet its SIP obligations. Because EPA has received additional comment suggesting that the PM conditions in California are not a serious air quality issne the Agency addresses those comments below.

b. PM Health Effects

EPA received several comments that question the public health benefits associated with the Fleet Requirements. EPA received comment stating that $PM_{2.5}$, and specifically $PM_{2.5}$ from diesel combustion, does not present a public health risk in general,[91] and that there is no measurable or detectable relationship between $PM_{2.5}$ and mortality.[92] Separately EPA also received comment that $PM_{2.5}$ from diesel combustion located in California does not present a public health risk.

With regard to the suggestion that $PM_{2.5}$ from diesel combustion does not present a public health risk, EPA received comment stating that "the claimed toxic effects of diesel particulate matter are hundreds of times smaller than, for example, the increased risk of lung cancer caused by cigarette smoking. This commenter asserts that these possible effects are smaller than any previously discovered in medical history, the actual exposure levels are so difficult to estimate, and there are so many confounding health factors (smoking and lifestyle) that are impossible to control, that the entire scientific basis of the regulatory policy needs to be broadly re-assessed before allowing CARB any kind of waiver in $PM_{2.5}$ enforcement."[93]

EPA also received comment questioning whether $PM_{2.5}$ from diesel exhaust is causing cancer, premature death, or other health effects in

[88] Consistent with *MEMA I*, the Agency has evaluated costs in this authorization in the evaluation of the technological feasibility below. The Agency looks at the actnal cost of compliance in the time provided by the regulation, not the regulation's cost-effectiveness. The appropriate cost-effectiveness for a regulation is a policy decision of California that is considered and made when California adopts the regulations, and EPA, historically, has deferred to these policy decisions. EPA has stated in this regard, "the law makes it clear that the waiver request cannot be denied unless the specific findings designated in the statute can be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209. Therefore, EPA declines to review CARB's Fleet Requirements for their cost-effectiveness or the cost-benefits of the regulation in the context of any of the authorization criteria set forth in section 209(e)(2).

[89] *Id.*

[90] 78 FR 3086 (January 15, 2013).

[91] EPA received only one comment suggesting that NO_X and ozone do not pose a public health issue. This comment did not include any data or other evidence to support this assertion. *See* Milloy written testimony.

[92] *See* Milloy. EPA notes that Mr. Milloy, who submitted comment on behalf of the California Construction Trucking Association, separately brought litigation against EPA in which he signed a sworn declaration comparing exposure of human test subjects being voluntarily exposed to forms of particulate matter to Nazi death camp experimentation. Declaration of Steven J Milloy in Case 1:12–cv–01066–AJT–TCB pp. 2–3; *see also* the complaint in the same matter which states that such studies "ris[k] the lives and health of human study subjects" and that "Mr. Milloy is appalled by this inhumanity"(complaint para. 15). Those sworn statements are diametrically at odds with Mr. Milloy's presentation and testimony here that exposure to particulate matter does not pose a public health concern. Needless to say, when a commenter publically espouses positions that are at a 180 degree remove from each other, the credibility of the assertions is greatly diminished. This lawsuit was dismissed as lacking any legal basis. Dr. Eastrom states in his comment "There is now overwhelming epidemiologic evidence that $PM_{2.5}$ and diesel PM are not related to total mortality in California. This evidence has most recently been summarized in my thirteen-page September 28, 2012 paper, "Particulate Matter is Not Killing Californians. This paper was presented on August 1, 2012 at the American Statistical Association Joint Statistical Meeting in San Diego. It is currently posted online and will be published later this year in the 2012 JMS Proceedings (*http://www.scientificintegrityinstitute.org/ASAS092812.pdf*)."

[93] *See* Dr. Malkan.

California. For example, one commenter stated that "we don't know yet" and we "can't rule out" that exposure to diesel PM might statistically be related to zero premature deaths.[94] This commenter suggests that the toxic effects of diesel particulate matter are so small that the scientific basis for concerns about $PM_{2.5}$ impacts on health needs to be re-assessed before EPA authorizes California's regulation. This commenter maintains that science does not know yet if fine particulate matter is causing cancer and the premature death of a measurable number of Californians, and that other factors like smoking and lifestyle may confound any effects.[95] EPA also received comment suggesting that the scientific evidence on the health effects of particulate air pollution (specifically $PM_{2.5}$) in California does not support its further control or regulation at this time. This commenter maintains that "[o]ur $PM_{2.5}$ is different in composition and is less toxic than that in many Eastern regions of the U.S."[96] In addition, two commenters stated that strong epidemiologic evidence shows ambient $PM_{2.5}$ and diesel PM is not related to total mortality in California.[97] The commenters also note studies pnblished in 2005 and 2011 for support.[98] One commenter notes the 2011 study for California-specific evidence regarding $PM_{2.5}$ and diesel PM and mortality and claims it demonstrates no current relationship between $PM_{2.5}$ and mortality in California and may show no scientific or public health justification for this regulation.[99]

Separately, the commenter also takes issue with EPA's Regulatory Impact Analysis for its proposed PM NAAQS rule (which has since been finalized), claiming the Regulatory Impact Analysis is misleading and contains omissions.[100]

Lastly, we received comment from CCTA that references a paper titled "Mortality Among Members of a Truck Driver Trade Association" (Truck Driver study) suggesting that any research on exposure to diesel exhaust should necessarily include truck drivers. CCTA maintains that the study results indicate that those in closest proximity and duration of high levels of exposure to diesel exhaust don't seem to share the same deleterious effects to exposure claimed in other studies.

In response to claims that the Fleet Requirements are not needed because there is no causal connection existing between $PM_{2.5}$ exposure and premature mortality and other health effects, CARB states:

> Staff carefully reviewed all peer-reviewed studies that have been performed in the United States on the relationship between long-term $PM_{2.5}$ exposure and mortality, as has the U.S. EPA in its recent review of the National Ambient Air Quality Standard for particulate matter. U.S. EPA's 2009 science assessment states "Collectively, the evidence is sufficient to conclude that the relationship between long-term $PM_{2.5}$ exposures and mortality is causal." U.S. EPA and ARB have critically evaluated the methods used in each study so that we can place the most weight on the studies that have used the strongest methodologies . . .. ARB's conclusions about the relationship between long-term exposure to $PM_{2.5}$ and mortality are aligned with the findings of the U.S. EPA, the World Health Organization, Health Canada, and the British government. Those findings have been publicly peer reviewed by multiple independent bodies worldwide.[101]

With respect to the questions about the health effects associated with exposure to diesel exhaust PM, CARB notes:

> Staff agrees that ambient $PM_{2.5}$ arises from many different sources, including diesel exhaust, and there are no established methods for routinely measuring the concentration of $PM_{2.5}$ in ambient air from any specific source. Diesel PM is primarily less than 2.5 microns in diameter, and consequently falls into the $PM_{2.5}$ size category. As discussed above, exposure to PM in this size fraction is strongly associated with premature death. Also, the results of animal exposure studies suggest that diesel PM is at least as toxic as other species within this size range.[102]

Further, with respect to questions about the specific health effects of diesel exhaust PM in California, CARB cites, in its responsive comments during the waiver proceeding, the large body of peer-reviewed scientific studies evaluated by CARB and EPA that have identified a broad range of health effects associated with $PM_{2.5}$ exposures.[103] CARB states that "[t]he national studies reviewed by the U.S. EPA for the NAAQS assessment apply to California. In fact, as part of the federal standards review process, U.S. EPA estimated the premature deaths associated with $PM_{2.5}$ in two California cities—Los Angeles and Fresno."[104] CARB also cites EPA's Quantitative Health Risk Assessment, which estimates that, based on 2005 ambient mean levels of $PM_{2.5}$, approximately 63,000 to 80,000 premature deaths each year are related to $PM_{2.5}$ exposures in the United States. CARB also conducted its own California-focused study, which estimated that in California, exposure to $PM_{2.5}$ results in approximately 9,200 deaths each year.[105] In further comments, CARB states that the pre-2010 studies cited by Drs. Enstrom and Malkan in their comments were reviewed by CARB, as well as hy the EPA in the development of the PM Integrated Science Assessment (ISA).

Separately, CARB also reviewed the 2011 Jerrett et al. study, referenced by commenters.[106] [107] CARB notes that the

---

[94] *See* Dr. Malken. This commenter also suggests that the $PM_{2.5}$ from diesel exhaust in California might be inherently different than the PM studied in the eastern half of the United States.

[95] *Id.* at 2.

[96] *See* Dr. Phalen.

[97] *See* Delta and Dr. Enstrom. Delta also comments that the least healthy county in California has low diesel PM air concentrations, but high poverty and unemployment levels. Delta states that California is the fourth healthiest state as measured by premature death rates. EPA notes that Delta makes no attempt to connect these general views on health with the specific issue of whether emissions of $PM_{2.5}$ have any effect on health.

[98] *See* Dr. Enstrom and Dr. Malken. Dr. Malken claims that the CARB-funded Jerrett et al. (2011) study of the LA subset of ACS data was the only one which utilized data from particle monitors and "they found no significant correlation between $PM_{2.5}$ and 'premature deaths.'" This commentar also states that weighing all of the studies that CARB has considered is more a matter of subjective taste than a scientific process and that CARB has "cherry-picked" the few results that have supported their position.

[99] Dr. Enstrom. This commenter maintains that EPA's June 2012 "Regulatory Impact Analysis related to the Proposed Revisions to the National Ambient Air Quality Standards for Particulate Matter" erroneously conclnded that "most of the cohort studies conducted in California report central effect estimates similar to the (nation-wide) all-cause mortality risk estimate" but EPA's Table 5 B–10 was inaccurate or misleading, including the hazard ratio used from his 2005 paper. EPA notes that the proper place to contest the methodology and findings of the Agency in its NAAQS review process is in that federal context. This commenter also claims that "[a] glaring omission was the detailed evidence from the October 28, 2011 CARB-funded Report, "Spatiotemporal Analysis of Air Pollution and Mortality in California Based on the American Cancer Society Cohort: Final Report," by Drs. Michael Jerrett, Richard T. Burnett, C. Arden Pope III, Daniel Krewski, Michael Thun, and nine others *http://www.scientificintegrityinstitute.org/JerrettCriticism102811.pdf*)." This commenter also claims that his September 28, 2012 paper summarizes the epidemiologic evidence that $PM_{2.5}$ and diesel PM are not related to total mortality in California.

[106] CARB Sapplemental Comments.

[107] The Jerrett et al., 2011 report was not included in EPA's PM ISA because it was completed after the ISA was published. It was also not included in the Provisional Science Assessment because it was not a peer-reviewed publication at the time. However, the work conducted by Jerrett et al. was recently published and can now be found in the peer-reviewed literature [*http://www.atsjournals.org/doi/pdf/10.1164/rccm.201303-0609OC*]. EPA will

Continued

study fouud that "[c]ardiovascular disease (CVD) deaths, particularly those from ischemic heart disease (IHD), are consistently and robustly associated with fine particulate and traffic-related air pollution. The effects on CVD and IHD in California are virtually identical to those of the national . . . study." The study also found that "[a]ll-cause mortality is significantly associated with $PM_{2.5}$ exposure, but the resnlts are sensitive to statistical model specification and to the exposure model used to generate the estimates."[108]

CARB also included a copy of the 2011 Jerrett et al. study in its comments and indicated the stndy reached the following conclusion:

> Taken together, the results from this investigation indicate consistent and robust effects of $PM_{2.5}$—and other pollutants commonly found in the combustion-source mixture with $PM_{2.5}$—on deaths from CVD and IHD. We also found significant associations between $PM_{2.5}$ and all causes of death, although these findings were sensitive to model specification. In Los Angeles, where the monitoring network is capable of detecting intra urban variations in $PM_{2.5}$, we observed large effects on death from all causes, CVD, IHD, and respiratory disease. These results were consistent with past ACS [American Cancer Society cohort] analyses and with findings from other national or international studies reviewed in this report. Our strongest results were from a land use regression estimate of NO_2, which is generally thought to represent traffic sources, where significant elevated effects were found on deaths from all causes, CVD, IHD, and lung cancer. We therefore concluded that combustion-source air pollution as significantly associated with premature death in this large cohort of Californians.[109]

EPA will address in turn: (1) Suggestions that $PM_{2.5}$ does not present a public health risk in general; (2) snggestions that $PM_{2.5}$ from diesel combustion does not present a public health risk; and (3) suggestions that $PM_{2.5}$ from diesel combnstion located in California does not present a public health risk.

EPA disagrees with the commenters regarding the evidence associated with PM exposure in the context of all three suggestions noted above.

Regarding the claim that there is no link between health effects, including mortality, and exposure to $PM_{2.5}$, EPA disagrees with this comment and notes the large body of scientific literature that was thoroughly evaluated during the NAAQS review process is discussed in detail in EPA's Integrated Science Assessment (ISA) for Particulate Matter.[110] The ISA characterizes the weight of evidence for different health effects and makes causal determinations for both short-term (i.e., hours to days) and long-term (i.e., months to years) exposures to $PM_{2.5}$, $PM_{10-2.5}$, and ultrafine particles. Specifically in the ISA, the EPA carefully evaluated and integrated the scientific evidence from across epidemiological, toxicological and controlled human exposure stndies to make inferences about causality. The PM ISA considered and assessed an extensive body of scientific information, all of which had nndergone peer-review prior to being pnblished.[111]

Overall, the PM ISA provides a concise evaluation and integration of the policy-relevant science. This inclndes key science judgments npon which EPA based its Quantitative Health Risk Assessment for Particulate Matter (PM RA, U.S. EPA, 2010), and the Policy Assessment for the Review of Particulate Matter National Amhient Air Quality Standards (PM PA, U.S. EPA, 2011).[112] These docnments informed EPA's 2012 rule completing review of the PM NAAQS.[113]

After a thorough evaluation and integration of the evidence across scientific disciplines, the PM ISA made causal determinations for the health effects associated with both short- and long-term exposures to $PM_{2.5}$.[114] For short-term exposures, the PM ISA concludes that cardiovascular effects (e.g., emergency department (ED) visits and hospital admissions for ischemic heart disease (IHD) and congestive heart failure (CHF), changes in cardiovascular function, and myocardial ischemia), and premature mortality are causally associated with short-term exposure to $PM_{2.5}$. It also concludes that respiratory effects (e.g., ED visits and hospital admissions for chronic obstrnctive pnlmonary disease (COPD), respiratory infections, and asthma; and exacerbation of respiratory symptoms in asthmatic children) are likely to be causally associated with short-term exposure to $PM_{2.5}$. For long-term exposures, the PM ISA concludes that there are causal associations between long-term exposure to $PM_{2.5}$ and cardiovascular effects, such as the development/progression of cardiovascular disease (CVD), and premature mortality, particularly from cardiovascular causes. It also concludes that long-term exposure to $PM_{2.5}$ is likely to be causally associated with respiratory effects, such as reduced lung function growth, increased respiratory symptoms, and asthma development. The ISA characterizes the evidence as suggestive of a causal relationship for associations between long-term $PM_{2.5}$ exposure and reproductive and developmental outcomes, such as low birth weight and infant mortality. It also characterizes the evidence as suggestive of a causal relationship between $PM_{2.5}$ and cancer incidence, mutagenicity, and genotoxicity.[115] EPA's evaluation of the

---

consider this study in the next round of NAAQS reviews that include PM. We note, however, that the inclusion or exclusion of one report such as Jerrett would not materially change the large hody of scientific evidence indicating an effect of $PM_{2.5}$ exposure on human health.

[113] EPA incorporates by reference onr 2012 PM NAAQS review and associated rulemaking documents. EPA also notes that the reasoning and conclusions reached in the PM NAAQS review are not being revisited in the context of this authorization decision but are cited for the purposes of demonstrating the vast body of pear reviewed evidence and findings that is not contravened by the few studies submitted by commenters to the authorization docket. EPA also states that to the extent the comments take issue with the determinations made in the context of the PM NAAQS rulemaking, the proper place to bring challenges to those decisions would be in the context of that rule.

[114] *Id.* EPA also noted in this Response to Significant Comments document that "The EPA's evaluation of the scientific evidence and its application of the causal framework used in the current PM NAAQS review was the subject of exhaustive and detailed review by CASAC and the public. Prior to finalizing the ISA, two drafts were released for CASAC and public review to evaluate the scientific integrity of the documents. Evidence related to the substantive issues raised by CASAC and public commenters with regard to the content of the first and second draft ISAs were discussed at length during these public CASAC meetings and considered in developing the final ISA. CASAC supported the development of the EPA's causality framework and its use in the current PM NAAQS review and concluded: The five-level classification of strength of evidence for causal inference has been systematically applied; this approach has provided transparency and a clear statement of the level of confidence with regard to causation, and we recommend its continued use in future Integrated Science Assessments (Samet 2009f, p. 1)." (At II–9).

[115] U.S. EPA. (2009). Integrated Science Assessment for Particulate Matter (Final Report) (ISA). U.S. Environmental Protection Agency, Washington, DC, EPA/600/R–08/139F. Section 2.3.5 and Table 2–6. EPA also notes that the ISA assessed

studies presented in the ISA, as well as the causal framework and determinations upon which the Assessment is based, have undergone extensive critical review by the EPA, CASAC, and the public during its development. The rigor of the review makes the ISA the most reliable source of scientific information on the subject of PM and health and welfare effects.

Additionally, new health studies published since the completion of the ISA were discussed in EPA's Provisional Science Assessment (U.S. EPA, 2012), which was used to ensure the Administrator was fully aware of the "new" science that developed since 2009 before making final decisions on whether to retain or revise the ambient PM standards. Overall, the new health studies were found not to materially change the conclusions of the 2009 ISA. As in prior NAAQS reviews, the EPA based its final decisions on the studies and related information included in the ISA, RA, and PA which had undergone CASAC and public review. To the extent that the commenters attempt to introduce new arguments or new studies that have not been peer-reviewed, including the 2011 Jerrett study, EPA believes the new science published after the ISA does not materially change the conclusions found within the ISA.[116] As noted above, EPA has recently concluded its PM NAAQS review. No comments submitted in the context of this authorization proceeding lead the Agency to reassess (for pnrposes of this authorization) the findings related to PM exposure and health effects. EPA notes that the study referenced by Mr. Milloy in his comments was never provided to EPA nor has EPA found it in the peer-reviewed literature. Therefore EPA has no basis to review the technical methods used or the summary results.[117]

With regard to suggestions that $PM_{2.5}$ from diesel combustion does not present a public health risk or assertions that $PM_{2.5}$ composition is determinative to risk, EPA believes that the available scientific evidence liuking mortality and morbidity effects with long-and short-term exposures to fine particles continue to be largely indexed by $PM_{2.5}$ mass. In the PM NAAQS review completed in 2012, EPA concluded that it was appropriate to retain $PM_{2.5}$ as the indicator for fine particles due to the inability to differentiate those components or sources that are more closely related to specific health outcomes nor to exclude any component or group of components from the mix of fine particles included in the $PM_{2.5}$ indicator. As EPA previously stated in the ISA "overall, the results indicate that many constituents of PM can be linked with differing health effects and the evidence is not yet sufficient to allow differentiation of those constituents or sources that are more closely related to specific health outcomes." [118]

With regard to suggestions that EPA did not properly consider prior reports (including the 2005 Dr. Enstrom study), EPA notes the Enstrom study was included in summary figures depicting the totality of the evidence for long-term $PM_{2.5}$ exposure and mortality.[119] It is important to note that Dr. Enstrom based his comments solely on statistical significance. Another commenter also asserts that studies looking at associations between PM and premature mortality do not have statistically significant results.[120] EPA responded in the NAAQS rulemaking to the issue of relying on statistical significance and why it is not appropriate to only focus on it when evaluating a body of evidence.[121] Specifically, EPA stated:

Statistical significance is an indicator of the precision of a study's results, which is influenced by a variety of factors including, but not limited to, the size of the study, exposure and measurement error, and statistical model specifications. Statistical significance is just one of the means of evaluating the validity of the relationships determined with epidemiological studies. The EPA can reasonably look to other indicia of reliability such as the consistency and coherence of a body of studies as well as other confirming data to justify reliance on the results of a body of epidemiological studies, even if individual studies may lack statistical significance. *American Trucking Association* v. *EPA*, 283 F. 3d 355, 371 (D.C. Cir. 2002). As a result, in developing an integrated assessment of the health effects evidence for PM, the EPA has emphasized the importance of examining the pattern of results across various studies and their coherence and consistency, and has not focused solely on statistical significance as a criterion of study reliability.

It has been clearly articulated throughout the epidemiological and causal inference literature that it is important not to focus on results of statistical tests to the exclusion of other information. For example, Rothman (1998) stated: "Many data analysts appear to remain oblivious to the qualitative nature of significance testing [and that] . . . statistical significance is itself only a dichotomous indicator. As it has only two values, significant or not significant." As a result, Rothman recommended that P-values be omitted as long as point and interval estimates are available.

The concepts underlying the EPA's approach to evaluating statistical associations reported for the health effects on $PM_{2.5}$ have been discussed in numerous publications, including a report by the U.S. Surgeon General on the health consequences of smoking (Centers for Disease Control and Prevention, 2004). This report cautions against overreliance on statistical significance in evaluating the overall evidence for an exposure-response relationship: Hill made a point of commenting on the value, or lack thereof, of statistical testing in the determination of cause: "No formal tests of significance can answer those [causal] questions. Such tests can, and should, remind us of the effects the play of chance can create, and they will instruct us in the likely magnitude of those effects. Beyond that, they contribute nothing to the 'proof' of our hypothesis" (Hill 1965, p. 299). Hill's warning was in some ways prescient, as the reliance on statistically significaut testing as a substitute for judgment in a causal inference remains today (Savitz et al., 1994; Holman et al., 2001; Poole 2001). To understand the basis for this warning, it is critical to recognize the difference between inductive inferences about the truth of underlying hypotheses, and deductive statistical calculations that are relevant to those inferences, but that are not inductive statements themselves. The latter include p values, confidence intervals, and hypothesis tests (Greenland 1998; Goodman 1999). The dominant approach to statistical inference today, which employs those

the body of scientific evidence regarding particles available through mid-2009, which included over two thousand new studies. The ISA received two rigorous rounds of peer review by the independent Clean Air Scientific Advisory Committee (CASAC) and two draft PM ISAs were made available for public review and comment.

[116] *Id.* EPA is only reviewing the comments submitted to the EPA–HQ–OAR–008–0091 public docket for CARB's authorization reqnest and EPA the responses to such comments are not intended to imply that EPA is engaged in a reexamination of the issues thoroughly examined in the recent PM NAAQS review.

[117] EPA is only reviewing the comments submitted to the EPA–HQ–OAR–2008–0091 public docket for CARB's authorization request and EPA's responses to such comments are not intended to imply that EPA is engaged in a reexamination of the issues thoroughly examined in the recent PM NAAQS review.

[118] *See* ISA at 2–26.

[119] EPA noted that an association was reported for long-term $PM_{2.5}$ exposure with all-cause deaths from 1973–1982. However, no significant associations were reported with deaths in later time periods when $PM_{2.5}$ levels had decreased in the most pollnted counties (1983–2002). The $PM_{2.5}$ data were obtained from the EPA's Inhalation Particle Network (collected 1979–1983), and the locations represented a subset of data used in the 50-city ACS study (Pope et al., 1995, 045159). However, the use of average values for California counties as exposure surrogates likely leads to significant exposure error, as many California counties are large and quite topographically variable. ISA, at 7–85.

[120] *See* Dr.Malkan.

[121] *See* "Responses to Significant Comments on the 2012 Proposed Rule on the National Ambient Air Quality Standards for Particulate Matter (June 29, 2012; 77 FR 38890). *http://www.epa.gov/ttn/naaqs/standards/pm/data/20121214rtc.pdf* at II–9 to II–12 for discussion of EPA's application of its framework for causal determinations and recognition of the distinction between evaluating the relative scientific quality of individual study results and the evaluation of the pattern of results within the broader body of scientific evidence.

statistical measures, obscures this important distinction between deductive and inductive inferences (Royall 1997), and has produced the mistaken view that inferences flow directly and inevitably from data. There is no mathematical formula that can transform data into a probabilistic statement about the truth of an association without introducing some formal quantification of external knowledge, such as in Bayesian approaches to inference (Goodman 1993; Howson and Urbach, 1993). Significance testing and the complementary estimation of confidence intervals remain useful for characterizing the role of chance in producing the association in hand (CDC, 2003, pp. 23 to 24).

Accordingly, the statistical significance of findings from an individual study has played an important role in the EPA's evaluation of the study's results and overall the EPA has placed greater emphasis on studies reporting statistically significant results in making determinations as to the elements of the standard. In particular, as noted in section III.E.4.b.i of the preamble to the final rule, the EPA identified long- and short-term exposure studies considered "key" multi-city studies for consideration for informing the decisions on the appropriate standard levels and included those studies observing effects for which the evidence supported a causal or likely causal association. Figure 4 in the preamble to the final rule (also Figure 4 in the proposal, 77 FR 38933) represents the subset of multi-city studies included in Figures 1 through 3 of the preamble to the final rule (also Figures 1 through 3 in the proposal, 77 FR 38929 to 38931) that provided evidence of positive and generally statistically significant effects associated in whole, or in part, with more recent air quality data, generally representing health effects associated with lower $PM_{2.5}$ concentrations than had previously heen considered in the last review.

The EPA notes that many of these studies evaluated multiple health endpoints, and not all of the effects evaluated provided evidence of positive and statistically significant effects. For purposes of informing the Administrator's decision on the appropriate standard levels, the Agency considers the full body of scientific evidence and focuses on those aspects of the key studies that provided evidence of positive and generally statistically significant effects. However, in the broader evaluation of the evidence from many epidemiological studies, and subsequently during the process of forming causality determinations, the EPA has emphasized the pattern of results across epidemiological studies for drawing conclusions on the relationship between $PM_{2.5}$ and health outcomes, and whether the effects observed are coherent across the scientific disciplines. Thus, in making causality determinations, the EPA did not limit its focus or consideration to just studies that reported positive associations or where the results were statistically significant.[122]

In addition, EPA has previously addressed the issue of what one commenter calls "confounding health factors." In the case of short-term exposure studies, a confounder would need to vary on a day-to-day basis with both air pollution and with the specific health outcome being evaluated (e.g., mortality or hospital admissions or emergency department visits). The confounders that fit these criteria for short-term exposure studies are related to weather (e.g., temperature, dew point, relative humidity). The short-term exposure studies, specifically time-series studies, evaluated in the ISA all included weather covariates in their models to account for their potential confounding effects (U.S. EPA, 2009a, Chapter 6).

With regard to long-term exposure studies, a number of multilevel cohort studies (Naess et al. 2007; Jerrett et al. 2003; Jerrett et al. 2005) have evaluated individual-level and contextual, or ecologic-level variables as potential confounders. As reported in Jerrett et al. (2005), "Contextual effects occur when individual differences in health outcomes are associated with the grouped variables that represent the social, economic, and environmental settings where the individuals live, work, or spend time (e.g., poverty or crime rate in a neighborhood). These contextual effects often operate independently from (or interactively with) the individual-level variahles such as smoking." These studies found that the inclusion of contextual variables tended to attenuate the risk estimates for the association between long-term exposure to $PM_{2.5}$ and mortality, but that an independent effect of $PM_{2.5}$ on mortality remains. For example, Jerrett et al. (2005) found that for $PM_{2.5}$ (controlling for age, sex, and race), the relative risk was 1.24 (95% CI 1.11, 1.37) for a 10 µg/m3 exposure contrast. In a parsimonious model that controlled for 44 different individual covariates and ecological confounder variables that both reduced the pollution coefficient and had associations with mortality, the relative risk was 1.11 (95% CI 0.99, 1.25) for the same exposure contrast. The EPA believes that the results of these studies provide confidence that more recent reports with updated datasets are showing independent effects of $PM_{2.5}$.[123]

One commenter's assertion that the risk from PM is hundreds of times smaller than the increased risk of lung cancer caused by cigarette smoking, and difficult to estimate, has been previously addressed during the PM NAAQS review. The "Responses to Significant Comments on the 2012 Proposed Rule on the National Ambient Air Quality Standards for Particulate Matter" stated:

The comparison of smoking and ambient PM-related effect estimates was not considered relevant for the PM NAAQS review, and thus, was not considered in the ISA. This issue was not raised during the CASAC and public review of the drafts of the ISA. In order to address the comments submitted, the EPA conducted a provisional review of the "new" literature published since the close of the ISA including studies cited by commenters, and identified several relevant studies that compared and evaluated effect estimates determined for relationships between specific health outcomes and ambient particulate matter and active smoking (Pope et al. 2009; Pope et al. 2011). These authors analyzed data from the American Cancer Society cohort in order to evaluate the shape of the exposure-response relationship for $PM_{2.5}$ and both lung cancer mortality (Pope et al. 2011) and cardiovascular disease (CVD) mortality (Pope et al. 2009; Pope et al. 2011). In these studies, the authors evaluated three sources of exposure to $PM_{2.5}$: active smoking, passive smoking, and ambient air pollution.

For lung cancer mortality, the authors observed "a monotonic, nearly linear exposure response relationship with fairly constant marginal increases in RR [relative risk] with increasing exposure" across the full range of observed exposures (Pope et al. 2011). When the authors evaluated CVD mortality, they observed "an exposure-response relationship that is substantially non-linear, that is, much steeper at the very low levels of exposure compared with higher levels of exposure" (Pope et al. 2011). In fact, the study authors noted that "For lung cancer mortality, the RRs steadily increase to nearly 40 at the highest increment of cigarette smoking (>42 cigarettes per day), whereas for CVD mortality, the RRs level off at approximately 2.0–2.5."

Because of the much steeper exposure-response relationship for long-term exposure to $PM_{2.5}$ and CVD mortality at low $PM_{2.5}$ concentrations, which flattens out at higher $PM_{2.5}$ concentrations (i.e., those associated with passive and active cigarette smoking), it is biologically plausible that the risk estimates for CVD mortality due to exposure to ambient concentrations of $PM_{2.5}$ would be similar to risk estimates for CVD mortality due to active cigarette smoking. These results are consistent with the results observed in epidemiological studies of long-term exposure to $PM_{2.5}$ and mortality, and with the conclusions drawn in the ISA. For example, Dockery et al. (1993) found essentially the same risk estimates for CVD mortality associated with both ambient $PM_{2.5}$ concentrations and active cigarette smoking in an area with relatively high levels of ambient $PM_{2.5}$concentration.

Additionally, there could be non-traditional confounders have not been accounted for in epidemiological studies of short- and long-term exposure to air pollution. These confounders include physical and psychological population stress factors. The EPA disagrees with these commenters because: (1) There is very limited evidence of stress affecting the air pollution-health effect relationship upon which to base the commenters assertion; (2) in order for stress to be a true confounder it would need to vary temporally (for short-term exposure studies) and spatially (for long-term exposure studies) with both air pollution concentrations and the health effect of interest, which has not been demonstrated;

[122] *Id.*

[123] *Id.*

and (3) rather than stress acting as a true confounder, more than likely stress is on the causal pathway to the health effects that have been observed to be associated with air pollution. The EPA acknowledges that stress may contribute bias to epidemiological studies; however, stress more than likely would influence the magnitude of individual effect estimates in a single-city or multi-city study and not the trends of positive associations observed across studies conducted in multiple locations."[124]

With regard to the third set of $PM_{2.5}$ health effect comments noted above (suggestions that $PM_{2.5}$ from diesel combustion located in California does not present a public health risk), we note that the isolated studies noted by the commenters are either consistent with past peer-reviewed studies supportive of $PM_{2.5}$-related health effects, or have been considered previously by EPA and were considered as part of the weight of evidence used to make conclusions in the ISA.

Some of the commenters asserted that the composition of PM in California is less toxic than the PM in other areas of the country. One commenter asserted that "[t]he scientific evidence on the health effect of particulate matter air pollution in CA does not support its further control or regulation at this time. Our $PM_{2.5}$ is different in composition and is less toxic than that in many Eastern regions of the U.S."[125] Another commenter states that "[t]he composition of what CARB defines as $PM_{2.5}$ has changed over time, and is not the same as what has been studied in the Eastern half of the United States."[126] EPA responded to questions about heterogeneity in risk estimates in the PM NAAQS Review and that response is included here. EPA finds that no new evidence has been submitted in the context of the authorization proceeding to change this conclusion.

EPA responded in the PM NAAQS review that with respect to understanding the nature and magnitude of $PM_{2.5}$-related risks:

> [T]he EPA agrees that epidemiological studies evaluating health effects associated with long- and short-term $PM_{2.5}$ exposures have reported heterogeneity in responses between cities and effect estimates across geographic regions of the U.S. (U.S. EPA, 2009a, sections 6.2.12.1, 6.3.8.1, 6.5.2, and 7.6.1; U.S. EPA, 2011a, p. 2–25). For example, when focusing on short-term $PM_{2.5}$ exposure, the ISA found that multi-city studies that examined associations with mortality and cardiovascular and respiratory hospital admissions and emergency department visits demonstrated greater cardiovascular effects in the eastern versus the western U.S. (Dominici, et al., 2006a; Bell et al., 2008; Franklin et al. (2007, 2008)). However, the rationale that heterogeneity in risk estimates presents a potential bias as posed by the commenters is simplistic and does not account for a number of factors that have been shown to influence city-specific risk estimates in epidemiologic studies. As discussed in the ISA, the EPA recognizes that there are compositional differences in $PM_{2.5}$ across the country and that the county-level air quality data used in epidemiological studies may result in exposure error, which could in part account for variability in city-specific risk estimates (U.S. EPA, 2009a, section 2.3.2).
>
> There are a limited number of studies that evaluated regional heterogeneity in the association between long-term exposure to $PM_{2.5}$ and mortality. Krewski et al. (2009a) conducted subset analyses of the ACS cohort in Los Angeles, CA and New York City, NY, and observed a relative risk in Los Angeles that was greater in magnitude than what was observed in the full ACS cohort, while the relative risk in New York City was less than what was observed in the full ACS cohort. These observations are likely due to the greater spatial heterogeneity in $PM_{2.5}$ concentrations observed in Los Angeles, and the overall spatial homogeneity of $PM_{2.5}$ concentrations in New York City.
>
> In another retrospective cohort, Zeger et al. (2008) observed associations between long term exposure to $PM_{2.5}$ and mortality for the eastern and central ZIP codes that were similar to those reported in the ACS and Harvard Six Cities studies, though no association was observed in the western region. The lack of the association in the western region is "largely because the Los Angeles basin counties (California) have higher PM levels than other West Coast urban centers, but not higher adjusted mortality rates" (Zeger et al. 2008). The ISA also evaluated studies that provided some evidence for seasonal differences in $PM_{2.5}$ risk estimates, specifically in the northeast. The ISA found evidence indicating that individuals may be at greater risk of dying from higher exposures to $PM_{2.5}$ in the warmer months, and at greater risk of $PM_{2.5}$ associated hospitalization for cardiovascular and respiratory diseases during colder months of the year. The limited influence of seasonality on PM risk estimates in other regions of the U.S. may be due to a number of factors including varying PM composition by season, exposure misclassification due to regional tendencies to spend more or less time outdoors and air conditioning usage, and the prevalence of infectious diseases during the winter months (U.S. EPA, 2009a, p. 3–182).
>
> Overall, the EPA recognizes that uncertainties still remain regarding various factors that contribute to heterogeneity observed in epidemiological studies (77 FR 38909/3). Nonetheless, the EPA recognizes that this heterogeneity could be attributed, at least in part, to differences in $PM_{2.5}$ composition across the U.S., as well as to exposure differences that vary regionally such as personal activity patterns, microenvironmental characteristics, and the spatial variability of $PM_{2.5}$ concentrations in urban areas (U.S. EPA, 2009a, section 2.3.2; 77 FR 38910).
>
> As recognized in the PA, the current epidemiological evidence and the limited amount of city-specific speciated $PM_{2.5}$ data does not allow conclusions to be drawn that specifically differentiate effects of PM in different locations (U.S. EPA, 2011a, p. 2–25). Furthermore, as discussed in section III.E.1 of the preamble to the final rule, the ISA concluded, "that many constituents of $PM_{2.5}$ can be linked with multiple health effects, and the evidence is not yet sufficient to allow differentiation of those constituents or sources that are more closely related to specific health outcomes" (U.S. EPA, 2009a, p. 2–17). CASAC thoroughly reviewed the EPA's presentation of the scientific evidence indicating heterogeneity in $PM_{2.5}$ effect estimates in epidemiological studies and concurred with the overall conclusions presented in the ISA (Pages 6–179–180, Figure 6–25, Figure 6–26).[127]

In the PM ISA EPA has also stated:

> Additionally it is important to point out that there are a few CA-specific time-series studies conducted by Ostro et al. that did find associations with $PM_{2.5}$. These are discussed in the ISA $PM_{2.5}$-Mortality Associations on a Regional Scale: California. Ostro et al. (2006, 087991) examined associations between $PM_{2.5}$ and daily mortality in nine heavily populated California counties (Contra Costa, Fresno, Kern, Los Angeles, Orange, Riverside, Sacramento, San Diego, and Santa Clara) using data from 1999 through 2002. The authors used a two-stage model to examine all-cause, respiratory, cardiovascular, ischemic heart disease, and diabetes mortality individually and by potential effect modifier (i.e., age, gender, race, ethnicity, and education level). The a priori exposure periods examined included the average of 0- and 1-day lags (lag 0–1) and the 2-day lag (lag 2). The authors selected these non-overlapping lags (i.e., rather than selecting lag 1 as the single-day lag) because previous studies have reported stronger associations at lags of 1 or 2 days or with cumulative exposure over three days. It is unclear why the investigators chose these non-overlapping lags (i.e., single-day lag of 2 instead of 1) even though they state they based the selection of their lag days on results presented in previous studies, which found the strongest association for PM lagged 1 or 2 days. Using the average of 0- and 1-day lags Ostro et al. (2006, 087991) reported combined estimates of: 0.6% (95% CI: 0.2–1.0), 0.6% (95% CI: 0.0–1.1), 0.3% (95% CI: −0.5 to 1.0), 2.2% (95% CI: 0.6–3.9), and 2.4% (95% CI: 0.6–4.2) for all-cause, cardiovascular, ischemic heart disease, respiratory, and diabetes deaths, respectively, per 10 µg/m^3.

[125] *See* Dr. Phalen comment.

[126] *See* Dr. Malkan comment.

[127] *See* "Responses to Significant Comments on the 2012 Proposed Rule on the National Ambient Air Quality Standards for Particulate Matter (June 29, 2012; 77 FR 38890). *http://www.epa.gov/ttn/naaqs/standards/pm/data/20121214rtc.pdf* at II–37–II–38.

> . . . Five of the nine counties examined in the Ostro et al. (2006, 087991) analysis contain cities that are among the 2 cities examined in the Franklin et al. (2007, 091257) analysis for the same period, 1999–2002. While the lags used were different between these two studies, both presented $PM_{2.5}$ risk estimates in individual cities or counties (graphically in the Franklin et al. study (2007, 091257); in a table in the Ostro et al. study (2006, 087991)), which allowed for a cursory evaluation of consistency between the two analyses. In Franklin et al. (2007, 091257), $PM_{2.5}$ risk estimates at lag 1 day for the cities Los Angeles and Riverside were slightly negative, whereas Fresno, Sacramento, and San Diego showed positive values above 1% per 10 µg/m3 increase in $PM_{2.5}$. The 2-day lag result presented in Ostro et al. (2006, 087991) is qualitatively consistent, with Los Angeles and Riverside, both of which show slightly negative estimates, while the other 3 locations all show positive, but somewhat smaller estimates, than those reported by Franklin et al. (2007, 091257). The estimates for the average of 0- and 1-day lags for these five counties in Ostro et al. (2006, 087991), which contain cities examined in Franklin et al. (2007, 091257), were all positive. Thus, these two $PM_{2.5}$ studies showed some consistencies in risk estimates even though they used different lag periods and a different definition for the study areas of interest (i.e., counties vs. cities).[128]

Thus, as noted in EPA's PM NAAQS review and the Response to Comments document referenced above, EPA has stated it agrees that epidemiological studies evaluating health effects associated with long- and short-term $PM_{2.5}$ exposures have reported heterogeneity in responses between cities and effect estimates across geographic regions of the United States. However, EPA believes it critical to understand the issue in context and EPA's overall approach in concluding as it did in the ISA, "that many constituents of $PM_{2.5}$ can be linked with multiple health effects, and the evidence is not yet sufficient to allow differentiation of those constituents or sources that are more closely related to specific health outcomes." EPA finds that no new evidence has been submitted in the context of the authorization proceeding to change this conclusion.

With regard to the claims made by Dr. Phalen in comments on this authorization proceeding, Dr. Phalen does not provide any evidence or studies to support the proposition that $PM_{2.5}$ is not only different in composition in California but as a result is less toxic, or present evidence as to the level of reduced toxicity. With regard to Dr. Enstrom's comments regarding differences in PM health risk in California compared to other locations, as discussed above, EPA has previously reviewed Dr. Enstrom's studies and has responded to his comments, as well as others, on this issue. As explained above, EPA has examined the issue of whether $PM_{2.5}$ composition is determinative and found that the scientific evidence is not yet sufficient to allow differentiation of those components or sources that are more closely related to specific health outcomes nor to exclude any component or group of components from the mix of fine particles included in the $PM_{2.5}$ indicator. EPA similarly concluded that current evidence does not allow conclusions to be drawn that differentiate effects of PM in different locations.

With regard to the claims of omissions in EPA's Regulatory Impact Analysis (RIA) for its proposed PM air quality standards, it is necessary to understand that only the peer-reviewed studies cited in the PM ISA (2009) or PM Provisional Science Assessment (2012) were listed in the RIA table. Furthermore, the inclusion or exclusion of a study published after the Provisional Science Assessment would not materially change the large body of scientific evidence indicating an effect of $PM_{2.5}$ exposure on human health.

With regard to the claims based on the Trucker Study noted above, the study does not attempt to examine air pollution-related health effects or provide any measure of air pollution exposure in the cohort examined. The study looked only at mortality rates for certain deaths within the population studied. EPA notes that the Truck Driver study contains a research abstract that plainly states "[t]he absence of disease mortality deserves careful interpretation, and may be due to both a strong healthy worker effect and a short monitoring period."[129] We note that this study did not include an actual close study of air quality and PM exposure levels and otherwise is not of scientific significance. This type of study as well as the other few studies submitted in isolation does not overcome the significant evidence and scientific evidence that has been peer reviewed and found PM to be associated with health effects.

The comments provided do not provide sufficient evidence to meet the authorization opponents' burden of showing that PM emissions in California do not create any risk to public health, particularly given the substantial body of evidence suggesting such a risk. Therefore, even if EPA were to apply the alternative interpretation of section 209(e)(2)((A)(ii) and examine whether CARB has a specific need for its Fleet Requirements, the opponents of the authorization have not met their burden of proof to demonstrate that California no longer continues to have serious air quality issues related to PM and NO_X, that are created by California's underlying compelling and extraordinary conditions. The evidence submitted to the record, in addition to EPA's own PM NAAQS review and the multitude of studies reviewed therein and conclusions of EPA that were peer reviewed by CASAC, continue to demonstrate requisite health effects due to PM exposure and therefore the authorization cannot be denied on this basis.

Finally, EPA notes that CARB's Fleet Requirements are designed not only to reduce PM emissions and public health consequences, as discussed above, but also to address the harmful effects of ozone by reducing emissions of NO_X, as an ozone precursor, from the in-use fleet.[130] There is no evidence in the record to suggest that ozone pollution is not harmful to public health or that CARB's Fleet Requirements are not needed in that context.

In conclusion, even if EPA were to use the alternative approach outlined above—that of reviewing the need for the Fleet Requirements per se to meet compelling and extraordinary conditions in California—EPA finds that the opponents of the authorization have not met their burden of proof. Therefore, even if EPA were to use this alternative approach, we could not deny the authorization on this basis.

c. Additional PM Comments

EPA also received comment from the PLF focused on the recent decision issued by the United States Court of Appeals for the District of Columbia Circuit in *Natural Resources Defense Counsel* v. *EPA*, No 08–1250, January 4, 2013, (*NRDC* v. *EPA*) concerning implementation regulations applicable to the 1997 $PM_{2.5}$ NAAQS. PLF characterizes the court's decision as requiring EPA itself to adopt stringent

[128] *See* EPA–HQ–OAR–2008–0691–0318-attachment 3 and *http://yosemite.epa.gov/sab/sabproduct.nsf/368203f97a15308a852574ba005bbd01/8bee96ad3228eabe85257604 00702786!OpenDocument* at 6–179.

[129] CCTA; "Mortality Among Members of a Truck Driver Trade Associations" AAOHN Journal Vol. 58. No. 11, 2010 at 473.

[130] *See* CARB Authorization Request at 4 ("Even as amended to provide immediate short-term relief to fleets adversely impacted by the recession, the In-Use Off-Road Regulation is expected to achieve a 17 percent reduction in NO_X emissions and a 21 percent reduction in $PM_{2.5}$ emissions in 2023 from forecasted emissions that would exist without a regulation in place.").

federal implementation standards for $PM_{2.5}$ throughout the nation, including California. Becanse California asserted that it "needs" nonroad diesel PM standards that are more stringent than federal nonroad PM standards, and because (in PLF's view) EPA is now required to use the "stringent, action-forcing provisions" of section 188–188(b) of the Clean Air Act as a result of the Decision, PLF maintains that it is appropriate to complete EPA's administrative proceedings on remand (from the decision) for implementation regulations before EPA is able to determine the extent to which there is a "need" for California to have its own $PM_{2.5}$ nonroad diesel standard for engines and vehicles based on "compelling and extraordinary conditions" in California. In addition, PLF highlights EPA's most recent revision of the primary annual NAAQS for $PM_{2.5}$, which lowered the prior standard from 15.0 micrograms per cubic meter to 12.0 micrograms per cubic meter, and the concomitant revision to the Air Quality Index for $PM_{2.5}$. PLF asserts that these events provide additional reasons to question California's "need" for its own $PM_{2.5}$ nonroad diesel standard.

PLF's reliance on *NRDC* v. *EPA* is misplaced. That decision pertains only to EPA's regulations governing how states should address the statutory requirements for attainment plans. It does not require EPA "to move ahead in implementing strict federal $PM_{2.5}$ controls," through its own regulations as opposed to state regulation of $PM_{2.5}$ and $PM_{2.5}$ precursors. The Clean Air Act generally requires states to have state implementation plans (SIPs) that provide for attainment and maintenance of the NAAQS, and nothing in the Court's opinion obviates or supplants that statutory requirement. Further, the *NRDC* v. *EPA* decision will not result in EPA itself issuing new regulatory controls that impose any specific emission reductions requirements on mobile sources. To the extent that PLF is suggesting that EPA itself is now required to regulate any particular sources more stringently, through national standards, such suggestion is incorrect.

To the extent EPA imposes the "more stringent" NAAQS implementation requirements of sections 188 throngh 190 of the Act on the state (rather than the "less stringent" implementation requirements of sections 171 through 179B of the Act), then the state will still be required to adopt its own regulations (e.g. Fleet Requirements) to get necessary emission reductions to attain and maintain the applicable NAAQS.

While this may create somewhat lesser flexibility for states in developing attainment plan measures in the future, it by no means negates their SIP obligations today. The emission reductions from the Fleet Reqnirements take effect at the beginning of 2014, and California has shown that it needs these reductions as part of the suite of control measnres that are necessary for pnrposes of attaining and maintaining the $PM_{2.5}$ and ozone NAAQS expeditiously. Moreover, states still have a great deal of flexibility in designing their emission control program to achieve needed emission reductions, and nothing in the court's opinion in *NRDC* v. *EPA* indicates any attempt by the court to preclude California from using the specific flexibility provided by section 209(e)(2)(A) to reduce emissions throngh regulation of nonroad engines. Such emission reductions have been instrnmental in California's strategy to meet its NAAQS requirements.

With respect to the revisions to the primary annual $PM_{2.5}$ NAAQS issued in December of 2012, the revisions have increased the stringency of the standard. Thus, if anything, the new $PM_{2.5}$ standard will increase California's need to find reductions in emissions of $PM_{2.5}$ and $PM_{2.5}$ precursors from regulated sources, which should only increase the need for such regulations such as the Fleet Requirements.

For the reasons set forth above, EPA believes that nnder the alternative interpretation of the compelling need criterion discussed above, opponents of authorization have not meet their bnrden of demonstrating that California's Fleet Requirements do not have a rational relationship to contributing to amelioration of serious air quality problems in California, including its $PM_{2.5}$ and ozone. Accordingly, commenters' assertions to the contrary provide no basis for denying authorization.

4. Section 209(e)(2)(A)(ii) Conclusion

With respect to the need for California's standards to meet compelling and extraordinary conditions, after an examination of the text of section 209 and the legislative history, EPA again concludes that the best way to interpret this provision is to apply the traditional interpretation. Under this interpretation, EPA can deny authorization under section 209(e)(2)(A)(ii) only if it finds that opponents of authorization have demonstrated that California does not need a separate nonroad program to address compelling and extraordinary conditions. Under this traditional interpretation, EPA cannot find that opponents of the authorization have demonstrated that California does not need its state standards to meet compelling and extraordinary conditions. The opponents of the waiver have not adequately demonstrated that California no longer has a need for its nonroad emissions program.

Even if EPA were to apply the alternative interpretation advocated by commenters—that EPA is required to review, on a case by case basis, whether the specific standard submitted by CARB is needed to meet compelling and extraordinary conditions—EPA cannot find that the opponents of the waiver have demonstrated that California does not need its Fleet Requirements to meet compelling and extraordinary conditions.

Accordingly, EPA has determined that it cannot deny the authorization request under section 209(e)(2)(A)(ii).

C. Consistency with Section 209 of the Clean Air Act

Section 209(e)(2)(A)(iii) of the Act instructs that EPA cannot grant an authorization if California's standards and enforcement procedures are not consistent with "this section." As described above, EPA's section 209(e) rule states that the Administrator shall not grant authorization to California if she finds (among other tests) that the "California standards and accompanying enforcement procedures are not consistent with section 209." EPA has interpreted the requirement to mean that California standards and accompanying enforcement procedures must be consistent with at least section 209(a), section 209(e)(1), and section 209(b)(1)(C), as EPA has interpreted this last subsection in the context of motor vehicle waivers.[131] Thus, this can be viewed as a three-pronged test.

1. Consistency with Section 209(a)

Section 209(a) of the Clean Air Act prohibits states or any political subdivisions of states from setting emission standards for new motor vehicles or new motor vehicle engines. Section 209(a) is modified in turn by section 209(b) which allows California to set such standards if other statutory requirements are met. To find a standard to be inconsistent with section 209(a) for purposes of section 209(e)(2)(A)(iii), EPA must find that the standard in question actually regulates new motor vehicles or new motor vehicle engines.

In its authorization request, CARB stated that by definition, the section

[131] *See* 59 FR 36969 (July 20, 1994).

209(a) preemption does not apply to vehicles covered by the Fleet Reqnirements because the regulation only applies to non-new, in-use vehicles and engines aud not to new motor vehicles and engines. CARB also stated that with a few limited exceptions—workover rigs, two-engine cranes, and certain other two-engine vehicles—vehicles covered under the Fleets Requirements are not motor vehicles under the Clean Air Act definition of motor vehicles.[132] No commenter argued the contrary or otherwise asserted that the Fleet Requirements are not consistent with section 209(a).

Therefore, EPA cannot deny California's request on the basis that California's Fleet Requirements are not consistent with section 209(a).

2. Consistency with Section 209(e)(1)

To be consistent with section 209(e)(1) of the Cleau Air Act, California's standards or other requirements relating to the control of emissions must not relate to new engines which are used in farm or construction equipment or vehicles and which are smaller than 175 horsepower (hp), aud new locomotives or new engines used in locomotives.

In its Authorization Request, CARB stated that the Fleet Requiremeuts specifically "do not apply to locomotives and do not apply to new farm and construction vehicles and equipment less than 175 hp."[133] CARB notes that "implements of husbandry, regardless of engine size, are expressly excluded from coverage." While CARB acknowledged that nonroad construction vehicles and engines used in such vehicles are covered by the Fleets Requirements, CARB stated that the regulation does not apply to uew construction vehicles or engines.

CARB stated that the Fleet Requirements do not attempt to regulate new construction sources covered by the section 209(e)(1) preemption. New, as it applies to nonroad engines and equipment other than locomotives and engine used in locomotives, means engines and equipment whose legal title has not been transferred to an ultimate purchaser, or in certain cases, to engines or vehicles that have been placed into service.[134] The Fleet Requirements do not regulate engines and vehicles immediately after their titles are transferred or they enter service; instead, the regulation exempts any vehicle that is less than ten years old from the BACT requirements. CARB states that while a fleet owner may elect to comply with the fleet average or BACT requirements by purchasing or repowering a vehicle primarily used in construction with a new nonroad engine under 175 hp, that outcome also does not run afoul of the 209(e)(1) preemption. CARB notes that this new engine is only required to be certified to the existing federal nonroad emission standards.[135] Therefore, the Fleet Requirements do not establish standards for such new engines.

EPA received comment from ARTBA suggesting that CARB's regulations rum afoul of section 209(e)(1)'s preemption for "new engines which are used in construction equipment or vehicles or farm equipment or vehicles and which are smaller than 175 horsepower." ARTBA argues that section 209(e)(1)'s limitation on state standards or emission-related requirements for these engine/equipment categories lasts throughout the useful life of the equipment.[136] ARTBA stated in comment that under this interpretation, California's authorization request should be denied because the Fleet Requirements apply to all in-use off-road diesel construction equipment greater than 25 HP, including equipment in the permanently preempted power range. ARTBA did not provide any further explanation in its written comments or at the public hearing as to why this permanent preemption of certain types of "new" vehicles should be interpreted as extending throughout the useful life of the vehicles.

CARB, in response to comments made by ARTBA at EPA's public hearing, noted that the contention that the preemption under section 209(e)(1) extends throughout the useful life of the new engine is simply wrong. CARB noted that EPA considered and rejected this extended definition of "new" in section 209(e)(1) during the 209(e) rulemaking process.[137] CARB also noted in its Authorization Request that the Court of Appeals in *Engine Manufacturers Association* v. *EPA (EMA)*, affirmed EPA's definition of "new" as it is applied to off-road sources other than locomotives.[138] In *EMA*, the court discussed the issue of whether EPA's definition of new nonroad engines would effectively undermine the section 209(e)(1) preemption that states are prohihited from adopting emission standards for new farm and construction vehicles with less than 175 hp. CARB noted that the court concluded that EPA's definition of new did not undermine the preemption in 209(e)(1).[139]

CARB also notes the more recent history on this issue. In a 2002 petition to EPA, ARTBA requested that EPA revise its regulations such that nonroad engines in the categories covered under section 209(e)(1) are preempted for their useful lives. EPA denied ARTBA's reqnest,[140] and subsequently the United States Court of Appeals for the District of Columbia dismissed ARTBA's petition for review of that denial.[141]

At the outset, we note that no commenter disputes CARB's assertion that its regulations do not violate section 209(e)(1) as EPA's current regulations implement that provision. Rather, ARTBA's comments appear to go to the validity of EPA's longstanding regnlations, as opposed to the validity of California standards currently being reviewed under those regulations. As such, EPA believes ARTBA's comments are peripheral to this proceeding. EPA is not reviewing its authorization regulations in this proceeding, but is instead reviewing the validity of California's Fleet Requirements under those regulations.

In any event, EPA fully considered the scope of preemption issue (the definition of "new") during its 1994 rulemaking which implemented the provisions of section 209(e). The rationale contained in that rulemaking was affirmed by the Court of Appeals in *EMA*.[142] As CARB uotes, EPA fully reviewed its rationale regarding the definition of "new" in the context of ARTBA's earlier petition to reconsider its regulations and EPA denied the petition. No information or argument

[132] CARB Authorization Request. CARB noted that these limited exceptions are provided to afford fleet operators of such vehicles additional flexibility to address both the in-use on-highway requirements associated with the engines designed to propel the equipment and the nonroad engines on the vehicles designed to perform other functions. Since the regulation of such non-new (in use) on-highway vehicles (and the engines designed to propel such vehicles) is not preempted under section 209(a) CARB did not seek a waiver under section 209(b) and instead only sought an authorization under section 209(e) for the in use nonroad engines associated with such on-highway vehicles.

has been submitted to the record of this proceeding to rebut EPA's interpretation. ARTBA provides no new information or argument in the record of this proceeding to suggest that EPA should change its longstanding interpretation of "new" in section 209(e), [143] and as stated above, EPA is not in any case reviewing its regulations in the context of this proceeding. Moreover, ARTBA does not make any factual argument regarding the consistency with section 209(e)(1) of the particular regulations for which CARB is requesting authorization, even under ARTBA's own definition.

In light of the lack of information in the record, and giving due consideration to the burden of proof being on the opponents of the waiver, EPA cannot make a finding that CARB's Fleet Requirements are inconsistent with section 209(e)(1)(i). Therefore, EPA cannot deny CARB's authorization reqnest on this basis.

3. Consistency With Section 209(h)(1)(C)

The requirement that California's standards be consistent with section 209(b)(1)(C) of the Clean Air Act effectively requires consistency with section 202(a) of the Act. To determine this consistency, EPA has applied to California nonroad standards the same test it has used previously for California motor vehicle standards; namely, state standards are inconsistent with section 202(a) of the Act if there is inadequate lead-time to permit the development of technology necessary to meet those requirements, giving appropriate consideration to the cost of compliance within that timeframe. California's accompanying enforcement procedures would also be inconsistent with section 202(a) if federal and California test procedures conflicted. The scope of EPA's review of whether California's action is consistent with section 202(a) is narrow. The determination is limited to whether those opposed to the authorization or waiver have met their burden of establishing that California's standards are technologically infeasible, or that California's test procedures impose reqnirements inconsistent with the federal test procedures.[144]

EPA does not believe that there is any reason to review these criteria any differently for EPA's evaluation of California's Fleet Requirements. There is nothing inherently different about how the Fleet Requirement control technologies should be reviewed when making a determination about technological feasibility or consistency of text procedures.

a. Technological Feasibility

The legislative history of section 209 (including the "consistency with section 202(a) requirement in 209(b)((1)(C)) indicates that this provision is intended to relate to technological feasibility.[145] Section 202(a)(2) states, iu relevant part, that any regulation promulgated under its authority "shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." Section 202(a) thus requires the Administrator to first determine whether adequate technology already exists; or if it does not, whether there is adequate time to develop and apply the technology before the standards go into effect. The latter scenario also requires the Administrator to decide whether the cost of developing and applying the technology within that time is feasible. Previous EPA waivers are in accord with this position.[146] For example, EPA in a 1976 waiver decision considered California's standards and enforcement procedures to be consistent with section 202(a) because adequate technology existed as well as adequate lead-time to implement that technology.[147] The legislative history of the 1977 amendments to the Clean Air Act iudicates Congress' view that, generally, EPA's construction of the waiver provision had been consistent with congressional intent.[148]

EPA also evaluates CARB's request in light of congressional intent regarding the waiver program generally. This is consistent with the motivation behind section 209(b)—to foster California's role as a laboratory for motor vehicle emission control, in order "to continue the national benefits that might flow from allowing California to continue to act as a pioneer in this field." [149] For these reasons, EPA believes that California must be given substantial deference to adopt not only new motor vehicle emission standards, but to adopt new and in-use nonroad emission standards which may require new and/ or improved technology. This deference was discussed in an early waiver decision when EPA approved the waiver request for California's 1977 model year standards:

> Even on this issue of technological feasibility I would feel constrained to approve a California approach to the problem which I might feel unable to adopt at the Federal level in my own capacity as a regulator. The whole approach to the Clean Air Act is to force the development of new types of emission control technology where that is needed by compelling the industry to 'catch up' to some degree with newly promulgated standards. Such an approach to automotive emission control might be attended with costs, in the shape of reduced product offering, or price and fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential benefits from reduced emissions is a central policy decision for any regulatory agency, under the statutory scheme outlined above I believe I am required to give very substantial deference to California's judgment on that score.[150]

In *MEMA I,* the court addressed the cost of compliance relative to technological feasibility issue at some length in reviewing a waiver decision. According to the court:

> Section 202's cost of compliance concern, juxtaposed as it is with the requirement that the Administrator provide the requisite lead time to allow technological developments, refers to the economic costs of motor vehicle emission standards and accompanying enforcement procedures. *See* S. Rep. No. 192, 89th Cong., 1st Sass. 5–8 (1965); H.R. Rep. No. 728 90th Cong., 1st Sass. 23 (1967), *reprinted in* U.S. Code Cong. & Admin. News 1967, p. 1938. It relates to the timing of a particular emission control regulation rather than to its social implications. Congress wanted to avoid undue economic disruption in the automotive manufacturing industry and also sought to avoid *doubling or tripling* the cost of motor vehicles to purchasers. It, therefore, requires that the emission control regulations be technologically feasible within economic parameters. Therein lies the intent of the cost of compliance requirement (emphasis added).[151]

[143] ARTBA had previously, though not in this proceeding, provided a fuller explanation of its view regarding the interpretation of 209(e)(1) and we have previously responded that ARTBA's arguments were not persuasive. *See* 73 FR 59034, 59130 (October 8, 2008). The U.S. Court of Appeals for the District of Columbia subsequently dismissed ARTBA's petition for review of EPA's response. *ARTBA* v. *EPA* (2009 D.C. Cir. (588 F.3d 1109, rehearing en banc denied (March 5, 2010), certiorari denied 131 S.Ct. 388, 178 L.Ed2d 38. ARTBA has not made similar or other arguments in this proceeding beyond an unsupported statement regarding bow it interprets the length of the preemption, and we do not address that issue in depth here, except to say that ARTBA makes no attempt to support its assertion.

[150] *Id.* at 23103.

[151] *MEMA I* at 1118 (emphasis added). *See also id.* at 1114 n. 40 ([T]he 'cost of compliance' criterion relates to the timing of standards and procedures.

Previous waiver decisions are fully consistent with *MEMA I,* which indicates that the cost of compliance must reach a very high level before the EPA can deny a waiver. Therefore, past decisions indicate that the costs must be excessive to find that California's standards are inconsistent with section 202(a).[152] It should be noted that, as with other issues related to the determination of consistency with section 202(a), the hurden of proof regarding the cost issue falls upon the opponents of the grant of the waiver.

Consistent with *MEMA I,* the Agency has evaluated costs in the waiver and authorization context by looking at the actual cost of compliance in the time provided by the regulation, not the regulation's cost-effectiveness. The appropriate level of cost-effectiveness for any given California regulation is a policy decision that state regulators must consider in adopting the regnlation. EPA, historically, has deferred to these policy decisions. EPA has stated in this regard, "the law makes it clear that the waiver request cannot be denied unless the specific findings designated in the statute can be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209 * * *." [153] Thus, although EPA may evaluate whether compliance costs to manufacturers (or in this case, fleet operators) are so excessive as to implicate the regulation's technological feasibility, EPA does not look at cost-effectiveness when making a waiver decision.

In evaluating the Fleet Requirements' consistency with section 202(a), EPA finds that CARB provided a series of flexibilities in order to address concerns expressed by some about cost and cost-effectiveness. CARB, in its Authorization Request, notes that section 2449.1 of its 2010 amendments, requires all fleets to comply with annual fleet average emission targets or, alternatively, meet the annual BACT requirements for specified percentages of the fleet. The fleet average targets, CARB states, have been set to progressively become more stringent over the years to ensure that fleets modernize to achieve the necessary emission reductions for California to meet the federal NAAQS for NO_X and $PM_{2.5}$ and to meet its 2020 goal set forth in CARB's 2000 Diesel Risk Reduction Plan.[154]

CARB notes that to meet the fleet average targets or the alternative BACT requirements, a large or medium fleet may comply by using a variety of different strategies, including: replacing the engines in existing vehicles with cleaner engines, purchasing newer vehicles with cleaner engines to replace older, higher emitting vehicles, retiring vehicles from service, designating vehicles as permanent low use, or retrofitting engines with verified diesel emission control strategies (VDECS). Compliance with the amended regulation will require most large and medium fleets to phase-out use of Tier 0 and Tier 1 engines through replacement or repowering of vehicles, but CARB also notes that fleets will be able to meet the fleet average targets by replacing such vehicles and engines with a comhination of higher-tiered engines. Therefore, it is not until 2018 that the regulation actually requires large and medium fleets to replace vehicles and engines with only Tier 3 and 4 engines.

CARB states that by 2018, Tier 3 engines will have been available for at least ten years, Interim Tier 4 engines for at least seven years, and Tier 4 engines for at least three years. In addition, CARB notes that the Fleet Requirements provide relief to fleets if there is a delay in the availability of vehicles that would be required to use Tier 3, Tier 4 interim, or final Tier 4 emission standards. Therefore, CARB notes, it is anticipated that large and medium fleet owners with high natural turnover of vehicles will be able to meet the fleet average targets through normal replacement and repowering of vehicles. Fleets may also choose to meet the BACT fleet average requirements by either installing retrofits, or by modernizing the fleet by turning over older, dirtier engines and vehicles to newer (not necessarily new) and cleaner models; by retiring older vehicles or designating them as low use; or by using the other exemptions, compliance extensions, and credit provisions. Additionally, CARB explains that the 2010 amendments provide even further flexibility and relief for the smaller fleets, including, but not limited to, an additional five year delay iu the implementation date (2019) of the fleet average targets beyond that applicable to large fleets, a variety of exemptions from the BACT requirements including an exemption if the vehicle is less than ten years old, or if the vehicle has already heen retrofitted with a level 2 or 3 VDECS that was the highest level PM VDECS at the time of installation, etc. The 2010 amendments also included a new compliance path for small fleets whereby such fleets could comply by phasing out their Tier 0 and Tier 1 vehicles between 2019 and 2029—and if they meet such compliance targets for a specific year then no other compliance requirements would apply.

EPA received multiple comments regarding the cost of the CARB Fleet Requirements. The comments address both the cost to fleet operators and cost-effectiveness of the regulations. Almost all of the comments argue that authorization should be denied because of the high compliance costs for fleet operators. The comments claim that these costs are excessive for an industry characterized by small, independent companies, and they claim that many will be forced out of business by the cost of compliance with the Fleet Requirements. EPA also received comments on other aspects of technological feasibility including technology availability and safety issues. A detailed discussion of these comments is presented below.

EPA received comment from a variety of contractors and associations claiming that while the nation and California continue to experience a sluggish economic recovery, employment in the construction sector has continued to decline. As a result, these commenters argue, the market is less prepared to handle the Fleet Requirements than even before the 2010 amendments.

EPA also received a variety of comments stating that the Fleet Requirements require the use of new equipment that might not be available for purchase until 2014 or later. In this coutext, one commenter noted that, where technology is available, a sudden increase in demand could cause supplies to be exhausted and that contractors may he barred from their work if they are not able to make necessary purchases. As such, the commenter argues that CARB must allow technology to catch up to the point that compliant equipment is broadly available. The comment states that without a period for technology to catch up, contractors will be unable to meet the Fleet Requirements, triggering negative impacts on California's infrastructure rebuilding efforts, the health of the state's construction industry, and its overall economy.

[152] *See, e.g.* 47FR 7306, 7309 (Feb. 18, 1982), 43 FR 25735 (June 14, 1978), and 78 FR 2112, 2134 (Jan. 9, 2013).

[153] 36 FR 17158 (August 31, 1971). *See also* 40 FR 23102, 23104; 58 FR 4166 (January 7, 1993), LEV Waiver Decision Document at 20.

[154] CARB Authorization Request at 21. CARB notes that meeting the 2020 target would reduce diesel PM from all diesel sources by 85 percent from the 2000 baseline and would prevent thousands of premature deaths and medical infirmities.

Similarly, EPA received comment that the eventual elimination of Tier 0 and Tier 1 equipment has significantly diminished the resale value of such equipment and, combined with the recession in California, has forced the sale of this older eqnipment to out-of-state contractors. The commenter claims that this has caused a reduction in the size of the fleet and has probably eliminated up to 15,000 jobs in California and has also diminished the bonding capacity of contractors (equipment is used as collateral) and severely limited the size and number of constrnction projects which a contractor could undertake.

EPA also received a number of comments suggesting that the larger fleet companies may fare better than the smaller companies in terms of compliance with the Fleet Requirements. One commenter noted that larger companies have already begun the process of repowering or retrofitting their equipment: however the smaller companies (less than 10 employees) will be severely hampered by the costs of repowering or retrofitting equipment that, in some cases, is the sole asset of their family-owned businesses. Commenters asserted that many of these smaller companies do not have the resources or access to capital to repower or retrofit their engines and may he forced to park the equipment. Due to the annual emission reduction targets required by the Fleet Requirements, these commenters argue, many contractors will be required to first repower or retrofit an engine, only to have to turn around a few years later and replace the entire piece of equipment when the technology to do the job right finally hits the marketplace.

Another commenter maintains that the ongoing economic recession in conjunction with CARB's "draconian set of diesel regulations that denies normal industry replacement cycles" has placed many businesses in a "catch-22" situation.[155] Many businesses face having to replace and/or modify both on-road and off-road diesel powered equipment, yet the net effect of CARB's regulations has been to devalue their current equipment to the point they have lost eqnity necessary to secure finaucing. To the extent they may secure financing, the comment states, many could not secure enough work to satisfy a mortgage obligation.

EPA also received comment stating that regardless of whether EPA reconsiders its "case-by-case" implementation of section 209 waivers by revisiting what it means for California to need this regulation to meet its air quality goals,[156] the Fleet Requirements still suffer from gross inefficiencies, amortized over a smaller-than-expected market, for smaller-than-expected gains which should defeat the authorization as inconsistent with section 202(a), including technological feasibility, the cost of compliance, safety, aud lead time.

EPA received a variety of comments concerning the reliability and safety of diesel retrofits. One commenter noted that the California Occnpational Health and Safety Board has established safety standards for installation and operation of the retrofits.[157] Another commenter noted that attempts to meet emission levels by using filtering equipment have failed—to the extent that the 2010 amendinents eliminated the retrofit requirement altogether and made diesel particulate filters (DPFs) voluntary only, due to limitations in safety, reliability, and functionality.[158]

In addition to the concerns about retrofits noted ahove, EPA also received comment questioning whether EPA's regulation for replacement engines has eliminated fleets' ability to choose engine replacement or repower compliance strategies, which the commenter claimed to be the only cost effective means to achieve the fleet average emission standards. This commenter noted that one compliance option is to replace equipment with the uewest equipment available but that this is impractical for most contractors due to the cost of new equipment. For example, a new scraper or bulldozer can cost over $1,000,000. The second optiou is to repower an older machine with a new engine (replacing a Tier 0 engine with a Tier 3 engine with a cost of $150,000 or more). The commenter suggested this second option is far more practical as the equipment is designed to last for 30 years or more. The commenter contends that EPA's replacement engine regulation at 40 CFR 1068.240 prohibits the repowering of a machine unless the engine has "prematurely failed." This roadblock makes compliance impossible according to the commenter.[159]

EPA also received comment stating that attempts to repower or replace existing older engines with newer, cleaner technology have encountered the practical issue of compatibility. "The new engines either don't fit the old chassis, or require additional alterations or replacement of other systems (such as cooling units) in the old unit. Thus, cost-effectiveness of modifying such older units becomes problematical." [160] This commenter does not note the availability of retrofit, but instead noted that the alternative to repower is retirement and replacement.

Finally, EPA received a number of comments suggesting that the Fleet Requirements are generally not cost-effective, given the makeup of the current fleet.

EPA received comment in favor of CARB's Authorization Request from the Manufacturers of Emission Control Association (MECA), which supported CARB's original 2007 rule, and contiuues to support the current rnle while requesting that EPA grant this authorization. MECA contends that a number of advanced emission control technologies already exist with the capability to significantly reduce PM and NO_X emissions from the engines subject to CARB's regulation, and that over 250,000 systems (retrofits) have been installed on off-road engines worldwide. MECA also disputes safety concerns surrounding these systems, citing statistics that 35,000 diesel particulate filters have been installed in California, with fewer than 15 safety-related issues, all of which "were shown to be attributed to poor engine or device maiutenance, misapplication of devices, or the ignoring of warning alarms by the operator." MECA does not support the implementation delays built into the CARB's 2010 amendmeuts, but nonetheless asks EPA to grant the request.

In response to comments from opponents of the authorization, CARB states that the opponents have not met their burden of showing that the regulation is inconsistent with section 209(b)(1)(C). CARB continues to rely upon the information presented in its Authorization Request and earlier submissions and maintains that California has amply demonstrated that the performance standards of the regulation are technologically feasible in the lead time provided, giving appropriate consideration to costs. CARB states that its position that the feasibility of the performance standards of the regulation are amply demonstrated is consistent with past EPA authorizations for in-use vehicles

[155] California Construction Trucking Association (CCTA).

[156] To the extent that the "need" for the Fleet Requirements to meet California's air quality goals is relevant to EPA's consideration of CARB's authorization request we examine this under the second authorization criterion of section 209(e)(2)(ii) above.

[157] ARTBA and Allfishch Contractors.

[160] *See* United Contractors.

and equipment, in which EPA has stated:

> [S]ection 202(a) consistency calls for a limited review of technological feasibility, including analysis of the cost of new technology, if technology does not currently exist. Section 202(a) does not allow EPA to conduct a more searching review of whether the costs are outweighed by the overall benefits of the California regulations.

CARB notes that the costs of the regulation, which was amended for the express purpose of providing fleets with significant economic relief during the recovery from the nation's economic downturn, cannot be characterized as so prohibitive as to render the regnlation infeasible. In fact, CARB notes the 2010 amendments have significantly reduced the costs of compliance for all fleets by reducing the number of specific compliance actions that a fleet must undertake:

> By delaying initial implementation of the regulation, revising target and BACT compliance rates downward, and by providing fleets with greater compliance flexibility (vehicle exemptions, compliance extensions, and special credits), between 2010 and 2015, the costs for large fleets will he reduced by approximately 97 percent, from over $1 billion to approximately $33 million (2010 dollars). Total costs over the life of the off-road regulation would be reduced by approximately 72 percent, which represents a cost savings of over $1.5 billion (2010 dollars). Peak year costs would be postponed from 2013 to 2019 and reduced almost 73 percent, from $542 million to $146 million (2010 dollars).

With the amendments, CARB maintains fleets are in a better position today to effectively pass on the reduced amortized costs of the regnlation to their customers.

CARB references the testimony of AGC at EPA's puhlic hearing which characterized the regulation's cost as reasonable.[161]

CARB also notes, that to the extent that some companies may be more adversely impacted than others, CARB had previously stated in its authorization request:

> The costs to fleets for compliance varies dramatically, depending upon the size of the fleet, the type of vehicles and equipment used by the fleet, the age of the vehicles in the fleet, the fleet's normal fleet replacement practices, and the compliance pathway chosen. Regarding the last variable, fleets have wide discretion on how they choose to comply; which vehicles should be controlled first, should a [verified diesel emission control strategy] VDECS be installed, or should the vehicle or engine be turned over. If turnover is selected, does the fleet choose to rebuild a vehicle's existing engine, report the engine with a newer, cleaner engine, replace the older vehicle with a newer vehicle with a cleaner engine, etc; does the fleet elect to designate a vehicle as low use. Each of these decisions will determine the actual compliance costs for the fleet.

In the context of responding to fleet contractors who may have the financial inability to meet the compliance costs, CARB states that EPA has previously addressed this general issue in a separate proceeding:

> Regarding small businesses, the Owner-Operator Independent Drivers Association (OOIDA) commented that the transport refrigeration units (TRU) air toxic control measure (ATCM) places a "particularly onerous financial burden on small business truckers" with small fleets (20 or fewer trucks) making np 95% of the industry . . .. EPA believes that the CARB regulations are feasible with respect to cost objectively; i.e., all fleet operators face the same cost per unit to comply. While this cost may have different impacts on fleets of varying sizes, EPA recognizes that it is up to CARB to choose who it will regulate under its standards. Because these TRU engines do emit significant amount of pollution and the cost of compliance are not so large as to render the compliance options objectively out-of-reach, the fact that some operators may have difficnlties with the cost of the program does not make the Program infeasible.

CARB notes that EPA's previous statements regarding feasibility with regard to analyzing cost objectively and CARB's discretion to choose who and how it may regulate under its standards also holds true for its Fleet Requirements. CARB notes that in the context of the Fleet Requirements the technology itself is feasible and has not been questioned; and that the objective costs of the regulation—as conceded by some members of industry—are reasonable.

With regard to ARTBA and other commenters' contention that small companies will be severely affected by the Fleet Requirements becanse of the costs of repowering and retrofitting vehicles and that these companies do not have the resonrces to comply, CARB states that this overlooks the fact that the amended regulations have significantly reduced the costs of compliance and have extended the date of compliance along with a variety of compliance options. CARB notes that the total costs of compliance of the regulation have been reduced by approximately 72 percent. In addition, the compliance costs for smaller fleets are lower than the costs for larger fleets in that small fleets are exempted from having to turnover vehicles to meet the regulation's BACT reqnirements.[162]

CARB also addressed the issue of whether its new engine replacement provisions are inconsistent with EPA's regulations and therefore not a feasible compliance path for fleet operators in California. As CARB notes, and CIAQC's comments maintain, repowering nnder CARB's existing regulatory authority pertaining to new nonroad CI engine regnlations is, in many instances, technologically feasible at a significantly lower cost than replacing an older vehicle with a new one. CARB acknowledges that repowering is not possible in all circumstances but nevertheless is often a cost-effective option for older eqnipment and vehicles. CARB references comment from Altfillisch, as one example, that it has been able to repower at least 71 nonroad vehicles and equipment between 2001 and 2005, years before the Fleet Requirements went into effect.

With respect to whether EPA's replacement engine regulations are inconsistent with CARB's replacement engine regulations, CARB notes that EPA has previously anthorized the CARB nonroad CI emission standards applicable to new engines and eqnipment which inclnded CARB's replacement engine regulations.[163] Therefore California fleet operators are subject to CARB's replacement engine regulations which substitute for EPA's replacement engine provisions in California.[164]

In response to concerns that the Fleet Requirements are not technically feasible due to the unavailability of Tier 4 engines, CARB references its March 1, 2012 Authorization Request wherein it states:

[161] CARB Written Comments at 15, citing to the Hearing Transcript at p. 87. AGC noted that California's construction contractors invested enormous sums in the equipment in the reasonable expectation that they could lawfully operate and use it for the duration of its useful life. AGC also noted, anecdotally, that contractor defaults in 2012 will be higher than in any of the previous three years and thus EPA's review of CARB's most recent amendments is of interest and concern to AGC's members. AGC had requested EPA to delay prior proceedings on California's Fleet Requirements given ongoing announced plans by CARB to revisit at least portions of CARB's rule. AGC had been deeply concerned about the costs and other estimates CARB had made, about the technology that contractors would require to comply, and the lead time provided. AGC noted at EPA's authorization hearing that "reasonable people may disagree about whether the rule merits federal approval, but AGC is not prepared to dispute a resolution that goes either way." "At the time [of the 2010 amendments], from onr members in California [AGC members], . . ., the costs of the amended rule were considered reasonable. We would not have agreed to that package of amendments . . . if they were not considered to be reasonable."

[162] Title 13, CCR, section 2449.1(b)(3)(C).

[163] *See* 75 FR 8056, 8060 (February 23, 2010).

[164] *See* CARB Mail Out # MSC 13–07 (March 11, 2013), *see also* CARB Supplemental Comments.

It is not until 2018 that the regulation requires large and medium fleets to replace vehicles and engines with only Tier 3 and Tier 4 engines. By 2018, Tier 3 engines will have been available for at least ten years, Interim Tier 4 engines for at least 7 years, and Tier 4 engines for at least 3 years. Additionally, the regulation provides relief to fleets if there is a delay in availability of vehicles that would be required to use Tier 3 or Tier 4 Interim of final Tier 4 emission standards.

CARB noted that there is no basis to ARTBA's conjecture regarding Tier 4 engine unavailability during the applicable time frame.[165]

Finally, with respect to the compliance option of VDECS or retrofits, CARB's snpplemental comments clarify that the regulation never required unsafe retrofits to be installed, and retrofit safety is even less of a concern since the regulation, as amended, removes all mandatory installation of VDECS. CARB explains that the regulation, as initially adopted, only required retrofit of a specified percentage of vehicles if the fleet operator could not meet the PM fleet average targets. The amendments have since removed this reqnirement and, in addition, the California Occupational Health Standards Safety Board (OSHSB) has adopted amendments to its construction safety orders (after working with CARB) to ensure that any retrofit will not affect the capacity, structural integrity, or safe performance of the vehicle in which it is installed nor create a risk of fire or operator contact with the exhaust system or impair the vision of the operator. CARB's 2010 amendments to the Fleet Requirements continue to provide that no VDECS are required to be installed if in violation of the amended OSHSB safety order and, as noted above, there is no longer a mandate that a specified percentage of vehicles be retrofitted if the fleet average is not met.[166]

As explained below, EPA agrees with CARB's presentation of how technological feasibility should be evaluated, for purposes of authorization review by EPA, and that CARB has provided ample evidence of the feasibility of the Fleet Requirements overall, and the feasibility with respect to individual compliance options. CARB has presented appropriate evidence of the feasibility and availability of new nonroad CI engines along with appropriate replacement engines and retrofits.

CARB has also properly set forth the role of EPA in reviewing California in-use performance standards which require legacy fleets to achieve challenging emission reductions. EPA is not setting its own standards under section 202(a) of the Clean Air Act, rather EPA's role within its authorization review is more limited and takes place in the context of deference that Congress envisioned for California. This deference was discussed in an early waiver decision when EPA approved the waiver request for California's 1977 model year standards:

> Even on this issue of technological feasibility I would feel constrained to approve a California approach to the problem which I might also feel unable to adopt at the Federal level in my own capacity as a regulator. The whole approach to the Clean Air Act is to force the development of new types of emission control technology where that is needed by compelling the industry to 'catch up' to some degree with newly promulgated standards. Such an approach to automotive emission control might be attended with costs, in the shape of a reduced product offering, or price or fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential benefits from reduced emissions is a central policy decision for any regulatory agency, under the statutory scheme outlined above I believe I am required to give very substantial deference to California's judgement on that score.[167]

CARB has set forth a series of compliance options to address emissions from its legacy fleet of NR CI engines. Fleet operators may choose from these compliance options. As explained below, EPA does not believe those opposing these regulations have met their burden of showing that the regnlations are not technologically feasible.

Further, while EPA acknowledges the comments it has received that claim that the Fleet Requirements may have significant adverse economic affect on individual fleet operators, the Agency finds no factual basis for determining that the Fleet Requirements are objectively cost prohibitive. To the extent that a balancing of risks attendant with adverse effect on some fleet operators against the benefits of addressing the emission inventory associated with the legacy fleet in California, EPA gives that the same substantial deference (as with past waivers) to California's judgment regarding the balancing of the risks and costs of regulation against the potential benefits from reduced emissions. CARB has gone through several significant rounds of amendments to address in part the economic cost associated with the Fleet Requirements and has afforded the fleet operators a significant number of compliance options and delays in initial compliance in order to objectively address the risks associated with costs.

At the outset, EPA believes it important to note that we agree with CARB's assessment that the Fleet Requirements will be feasible given the technology available today along with the technologies that CARB projects to be available in the lead time provided.

First, several commenters noted their concern that one of the more cost effective compliance options, the replacement of engines or repowering, is precluded as it conflicts with EPA's engine replacement policy at 40 CFR 1068.240. EPA has previously authorized CARB's emission standards applicable to new NR CI engines and the regulations in that authorization included CARB's replacement engine provisions. Therefore, CARB's replacement engine provisions, not EPA's provisions, are the applicable provisions for the purposes of these Fleet Reqnirements. In addition, EPA has recently published a direct final rule and accompanying notice of proposed rulemaking that adopts modifications to the Agency's replacement engine provisions to allow, on a limited basis, the practice of replacing engines with engines that are cleaner, bnt not certified to the most stringent standards, even where the original engines have not failed prematnrely.[168] Therefore, EPA's replacement engine provisions do not prevent use of repowering as a method of complying with CARB's regulations.

Second, with respect to fleet operators choosing to replace their eqnipment with new cleaner vehicles and commenters questioning the availability of snch vehicles (e.g., Tier 3, interim Tier 4, and Tier 4), EPA notes that these standards have already been reviewed by EPA in the context of its own rulemakings, and EPA has found these standards to be feasihle in a timeframe allowing even less lead time than that provided by California. EPA annually certifies new NR CI engines and the certification data to date strongly suggest that engine manufacturers are certifying to meet the newest applicable standards, and tbat these standards are

[165] CARB Written Comments at 17.

[166] *Id.* at 17–18.

[167] 40 FR 23102, 23103 (May 28, 1975); *see also* 78 FR 2112 (January 9, 2013).

[168] *See http://www.epa.gov/otaq/climate/documents/420f13001.pdf*, and *http://www.gpo.gov/fdsys/pkg/FR-2013-06-17/pdf/2013-11980.pdf*. The EPA received adverse comment on a portion of the Direct Final Rule, but no commenter objected to the provision allowing repowering using engines that are not certified to the most stringent standards.

feasible.[169] EPA believes CARB is reasonable in its depiction of cnrrently available emission control technology and with its projection of sufficient lead time being available to ensure that a sufficient supply of newer emission control technologies (meeting newer Tier 3, and interim and final Tier 4 emission standards) is in place to meet the demands of fleet operators. As CARB notes, the comments contending otherwise have not provided any evidence that in 2018 large and medinm-sized fleet operators will not be able to replace vehicles and engines with Tier 3 and Tier 4 engines. In addition, to the extent a fleet operator replaces such vehicles and engines, CARB's Fleet Reqnirements also provide relief to fleets if there is a delay in availability of vehicles that would be reqnired to use Tier 3 or Tier 4 interim or final Tier 4 emission standards. Finally, there is no evidence in the record indicating a shortage of certified engines during the time frame for which they will be needed for this rule, given the flexibilities provided by the amendments. The opponents of the waiver have not met their hurden of proof to demonstrate the lack of commercial availability of appropriate engines to the extent that the regulations would be infeasible.

Third, with respect to the technical feasibility of exhaust retrofits (VDECS) and the safety-related and compatibility concerns expressed by commenters, EPA believes that CARB's 2010 amendments add both the needed flexibility, with respect to not mandating retrofits, and sufficiently clarify when a NR CI vehicle is exempted due to expressed safety concerns. The Fleet Requirements never required unsafe retrofits be installed, and retrofit safety is even less of a concern now that the regulation has been amended to remove all mandatory installation of VDECS, even if fleet average targets are not met.[170] EPA believes that CARB has also appropriately addressed expressed concerns regarding retrofit safety, including referencing the amendments adopted by OSHSB. These amendments, adopted in March 2012, state that a safety order will be provided in order to ensure that a retrofitted VDECS shall not affect the capacity, structural integrity, and safe performance of the vehicle in which it is installed nor create a fire or safety risk or impair the operators' vision.[171] EPA also notes that the CARB staff reviewed retrofit field experience since 2002. Of the 35,000 diesel particulate filters (DPFs) deployed in the state, less than 15 safety-related issues were identified and all of these were shown to be attributed to poor engine or device maintenance, misapplication of devices, or the ignoring of warning alarms by the operator.[172] With regard to the availability of VDECS in general, there is no evidence in the record to refute CARB's view that the Fleet Requirements are likely to continue to increase the demand for retrofits and that CARB's anticipation that an increase in supply will occur as compliance deadlines approach is reasonable. CARB has identified a number of verified Level 3 VDECS and the commenters have not shown that this option does not provide a feasible alternative in many cases to meeting the Fleet Requirements.[173]

EPA also believes it important to note that CARB's fleet average targets have been set so that they progressively become more stringent over the years in order that CARB's emission reductions goals are met while affording fleet operators with necessary flexibility and compliance options. In addition, CARB's four-year delay in compliance (from 2010 to 2014) helps ensure the feasibility of the regulation along with built-in provisions that ensure against noncompliance with the Fleet Requirements due to the unavailability of the highest tiered engines or VDECS. In addition, CARB's BACT credits compliance path includes a number of accommodations (e.g. accrual of credits earned prior to March 1, 2010 may in certain circumstances be applied toward a large fleets' January 1, 2014 compliance deadline; double credits for early installation of VDECS; credit for reduced horsepower of the fleet, etc). There are also a number of exemptions under the BACT requirements applicable to large and medium fleets, and separately for small fleets. For example, vehicles in any size fleet are exempt from the BACT credit requirement calculation if on any given annual compliance date the vehicle is less than ten years old from the date of manufacture, and specialty vehicles are exempt if the fleet has applied BACT to all other vehicles in the fleet and no engine is available to repower the specialty vehicle and instead has the highest level VDECS available installed. In addition, for large and medium fleets, a vehicle is exempt if it had a Level 2 or 3 p.m. VDECS installed within the last six years and for small fleets the vehicle is exempt if has already been retrofitted with a Level 2 or 3 VDECS that was the highest level PM VDECS available at the time of installation. Regarding the claim that the regulations reqnire an initial repower or retrofit and then a replacement of an entire piece of eqnipment shortly thereafter, CARB's 2010 amendments also provide an exemption for vehicles that have had a level 2 or 3 p.m. VDECS installed within the last six years and an exemption for original equipment manufacturer diesel PM equipped vehicles and, with certain limitations, to vehicles that installed highest level VDECS prior to 2013. These further accommodations help assure the feasibility of the Fleet Requirements.

Although certain fleet operators contend that their business will either be severely or irreparably harmed (as reviewed further below), the commenters opposing the authorization have not provided any factual evidence in the record to demonstrate that a mix of available compliance options and flexibilities is not feasible.

EPA believes that CARB has afforded a variety of compliance options (and initial delays of the phase-in periods for compliance) that individual fleet operators can employ in a variety of ways depending on the nature of their business and the composition of their fleets. Accordingly, with regard to the consideration of cost of the Fleet Requirements (inclnding comments that the regulation will diminish the net value of certain fleet operators which will further impair their ability to finance the upgrades necessary to comply with the regulation or to obtain construction bonds), we note at the outset that many factors affect the ability of certain fleet operators to meet the Fleet Requirements. While it is possible that some diminishment in value of certain fleet operator equipment will occur as a result of the Fleet Requirements (while recognizing that CARB has significantly delayed the requirement that such engines be replaced), there is no evidence or data in the record to demonstrate that the loss in value to the fleet operator is the proximate cause of such operations going out of business or that such

[170] CARB Supplemental Comments at 17–18.

[171] *Id.*

[172] MECA at 4. "Regarding the safe installation of retrofit devices, retrofit manufacturers have shown that off-road retrofits can be installed to comply with the Cal/OSHA retrofit visibility/safety requirements finalized last year. Retrofit manufacturers are using the best engineering judgment and installation practices to ensure the safe installation of devices. In general, retrofit installations in California have had an excellent safety record.

[173] Authorization Request at 24. *See also* EPA's list of currently verified technologies at: *http://www.epa.gov/cleandiesel/verification/verif-list.htm*, and generally: *http://www.epa.gov/cleandiesel/technologies/*.

economic results render the Fleet Requirements infeasible for the broader regulated community. EPA believes that CARB has reasonably responded to concerns expressed about the costs of the Fleet Requirements, including the availability of engine replacements and retrofits. EPA notes that even some commenters otherwise opposed to the authorization have recognized the feasibility of early engine replacement. In addition, there is no evidence in the record to reflect a widespread or significant economic disruption to regulated fleet operators that is proximately caused by the Fleet Requirements.[174]

More importantly, EPA believes that the CARB regulations are feasible with respect to cost objectively; i.e., although fleets are likely to be comprised differently, all fleet operators are nevertheless facing the same cost per unit to comply. While this cost may have different impacts on fleets of varying sizes, EPA recognizes that it is up to CARB to choose who it will regulate under its standards.[175] The fact that some operators may have difficulties with the cost of the program does not make the program infeasible.[176]

In addition, nnder the guidelines of *MEMA I*, EPA believes that it should evaluate costs in authorization requests by looking at the actual costs of compliance in terms of the lead time provided by the regulations, and not at the regulation's cost-effectiveness. It is CARB's responsibility to determine the best way to reduce emissions in its state, and EPA does not reevaluate California's policy decisions in deciding whether to grant authorization, as long as, pursuant to section 209(e), the regulations can be met without making the costs prohibitive. The comments received regarding cost-effectiveness do not show that the costs for fleet operators generally will be prohibitive. California's estimates of the costs of the regulation are reasonable and CARB has rebutted the argument that small fleet operators in general will not be able to meet the requirements.[177] EPA also agrees with CARB's statement that EPA has long deferred to California's policy judgments associated with cost-effectiveness "EPA will not look into the question of cost-effectiveness—that is, whether the overall benefits of the regulation are outweighed by the regulation's costs of compliance." [178] Consequently, based on the record, EPA is unable to make the finding that the Fleet Requiremeuts are not technologically feasible with the available lead time giving consideration to the cost of compliance.

b. Consistency of Certification Procedures

California's standards and accompanying enforcement procedures would also be inconsistent with section 202(a) if the California test procedures were to impose certification requirements inconsistent with the federal certification requirements. Such inconsistency would mean that manufacturers would be unable to meet both the California and federal testing requirements using the same test vehicle or engine.[179] CARB presents that the Fleet Requirements raise no issue regarding incompatibility of California and federal test procedures. "There is no requirement on engine manufacturers or fleet owners to certify engines beyond existing federal and state certification testing for new engines. Additionally, there are no conflicts between federal and California test procedures for verification testing for diesel emission control strategies in that there is no comparable mandatory federal program." [180] EPA received no comments suggesting that CARB's Fleet Requirements pose any test procedure consistency problem. Therefore, based on the record, EPA canuot find that CARB's testing procedures are inconsistent with section 202(a) and cannot deny CARB's request based on this criterion.

D. Additional Issues Raised in Comment

EPA received a series of comments on grounds other than those specified in section 209(e)(2)(A) of the Act. These comments include several administrative concerns including the lack of a public hearing in California and a request to reopen the pnblic comment period (and to stay the issuance of a final EPA decision). We also received a number of comments objecting to the authorization based on other federal law or constitutional claims. As set forth below, EPA has complied with all relevant administrative process reqnirements for this proceeding and none of the comments described above provide any basis for denying CARB's Authorization Request.

1. Request for a Public Hearing in California

EPA received comment during the course of the public comment period associated with EPA's August 12, 2012 **Federal Register** notice requesting that EPA conduct a public hearing or hearings in California in order for those affected by CARB's regulation, the fleet operators, to be directly heard and for those nnable to travel to Washington, DC be afforded the opportunity to express their concerns to EPA.

Section 209(e)(2)(A) states in part that ". . . the Administrator shall, after notice and opportunity for pnblic hearing, authorize California to adopt and enforce standards and other requirements relating to the control of emissions from such nonroad vehicles or engines . . . ." EPA's process for providing an opportunity for public comment on the CARB Fleet Requirements was consistent with the normal process EPA applies in response to this language. EPA has consistently anuounced in the **Federal Register** the opportunity for a public hearing for any authorization request received from CARB. As a general matter EPA has also offered an opportunity for written comment which has opened on the date of the **Federal Register** notice and closed on a date after the public hearing. As part of EPA's public hearings, the presiding officer has consistently stated that the hearing was being conducted in accordance with section 209(e) of the Clean Air Act and that any interested parties have the opportunity to present both oral testimony and written comments. While EPA occasionally has held hearings in California, the vast

[174] Regarding comments that these regulations would stop valuable work to be performed by this industry in California, there is no evidence that this rule has led to the widespread cancelation of projects.

[175] CARB notes that the increased costs, due to the Fleet Requirements, to small fleet operators is on the magnitude of $38,000 for the youngest fleets to $173,000 for the oldest fleets (cite) and such costs have not been countered by opponents of the authorization.

[176] EPA has previously stated that it is up to CARB to choose who it will regulate under its standards, even though such costs may have differing impacts for different fleets. *See* 74 FR 3030 (January 16, 2009), TRU Decision Document at 63.

[177] CARB's Authorization Request at 25. CARB notes that small fleets are expected to be able to fully comply with the regulation if it routinely turns over its vehicles and equipment and meet the emission target rates and have little or no compliance costs associated with the regulation. To the extent normal turnover is insufficient, CARB notes small fleets are expected to comply through installation of VDECS (If a small fleet cannot be retrofitted with a VDECS that vehicle is exempt from the BACT requirements, including turnover), by exercising the special option for fleets with less than 500 total horsepower, designating vehicles as low-use, and by exercising the small fleet vehicle exemptions along various other exemptions, credits, etc.

[178] *Id., citing* 58 FR 4166 (January 7, 1993), Decision Document at 20 ("Since a balancing of these . . . costs against the potential benefits from reduced emissions is a central policy decision [of CARB is adopting the regulation] I believe I am required to give very substantial deference to California's judgments on this score.").

[179] *See, e.g.*, 43 FR 32182 (July 25, 1978).

[180] CARB Authorization Request at 28.

majority of hearings on section 209 proceedings have occurred in Washington, DC. EPA has been conducting its section 209(b) waiver proceedings and section 209(e) authorization proceedings in this manner for decades, and although Congress has amended provisions in section 209 on two separate occasions, Congress has not chosen to alter EPA's administrative requirements.

EPA is guided by the principles of fair public notice and opportuuity for comment. In this instance, EPA published notice of CARB's authorization request in the **Federal Register**, including the Clean Air Act prescribed authorization criteria EPA would review in consideration of CARB's request, and provided more than 30 days of notice before conducting a public hearing. EPA conducted a properly noticed public hearing in Washington, DC which was attended by several trade associations representing numerous members and fleet operators within California.[181] EPA has placed the transcript of the public hearing into the public docket. After the public hearing EPA provided an additional 30 days for interested parties to submit written comment addressing all relevant issues pertaining to California's authorization request. The affected parties have had in their possession the necessary information to adequately comment on whether the Fleet Requirements are technologically feasible as well as CARB's protectiveness determination. Opponents have had access to the necessary information to formulate comments in regard to the second waiver criterion at section 209(e)(2)(A)(ii). All written comments have been placed in the public docket. EPA was responsive to the desire expressed by some commenters to speak directly with representatives to EPA, including the desire to explain the economic impacts the Fleet Requirements may have on their businesses. In response, EPA conducted and made available an informal teleconference phone call for interested parties in California with representatives from EPA.[182] This **Federal Register** notice provides EPA's reasoned response to all oral testimony, written comment, and viewpoints expressed to EPA. All commenters, including opponents of the waiver, have had ample opportunity to comment and meet their applicable burdens of proof. Opponents of CARB's Fleet Requirements and of its authorization request have had ample opportuuity to present their viewpoints duriug the course of CARB's rulemaking and EPA's authorization proceeding. Lastly, as noted above, CARB has engaged in several proceedings and has adopted a series of amendments in response to concerns raised by the regulated parties, including fleet operators.

2. Request for EPA To Reopen the Comment Period

EPA received comment from PLF characterized as a "Notice of New Development and Supplemental Comment" requesting that EPA reopen the comment period associated with the Fleet Requirements authorization request and to hold in abeyance any decision regarding California's authorization request. PLF points to the recent decision issned by the United States Court of Appeals for the District of Colnmbia Circuit in *Natural Resources Defense Counsel* v. *EPA*, No. 08–1250, January 4, 2013, (Decision) for the proposition that the court's decision and CARB's authorization application are inextricably linked. PLF characterizes the Decision as requiring EPA itself to adopt stringent federal implementation standards for $PM_{2.5}$ throughout the nation, including California. Because California asserted that it "needs" $PM_{2.5}$ nonroad diesel standards that are more stringent than federal $PM_{2.5}$ standards, and because EPA is now required to use the "stringent, action-forcing provisions" of section 188–188(b) of the Clean Air Act as a result of the Decision, PLF maintains that it is appropriate to complete EPA's administrative proceedings on remand (from the Decision) before EPA is able to determine the extent to which there is a "need" for California to have its own $PM_{2.5}$ standard based on "compelling and extraordinary conditions" in California. In addition, PLF asserts that EPA's most recent revision of the NAAQS $PM_{2.5}$ primary standard, which lowers the existing level to 12.0 micrograms per cubic meter, and the concomitant revision to the Air Quality Index for $PM_{2.5}$, provides additional reason to question California's "need" for its own $PM_{2.5}$ nonroad diesel standard.[183] EPA responds to the substance of PLF's comments above in our discussion of the second criterion for authorization.

As discussed above, EPA does not agree that the recent decision of the Conrt of Appeals has any significant effect on the second criterion for granting authorization. Moreover, PLF has had a full opportunity to make its argument with regard to this new decision and its potential effect on this authorization determination, and EPA has responded in full to PLF's comments. We therefore believe there is no need for a further reopening of the comment period for this proceeding; nor is there any cause for any delay in issning onr decision with regard to the authorization. Therefore, we deny PLF's reqnest to reopen the authorization comment period and to delay issuing an authorization decision for the Fleet Requirements.

3. Claims Outside the Scope of the Clean Air Act

Airlines for America ("A4A") has provided comment opposing EPA authorization of California's Fleets Regulation. A4A claims that the Fleet Requirements, as they affect airport ground equipment, are preempted hy the Federal Aviation Act and the Airline Deregulation Act. These comments are outside the scope of EPA's scope of review of California authorization requests under section 209(e)(2). As EPA has stated on numerous occasions, EPA's review of California regulations under section 209 is not a broad review of the reasonableness of the regulations or its compatibility with all other laws. Sections 209(b) and 209(e) of the Clean Air Act limit EPA's authority to deny California requests for waivers and authorizations to the three criteria listed therein. As a result, EPA has consistently refrained from denying California's requests for waivers and authorizations based on any other criteria.[184] In instances where the U.S. Court of Appeals has reviewed EPA decisions declining to deny waiver requests based on criteria not found in section 209(b), the Court has upheld and agreed with EPA's determination.[185] A4A's comment raises issnes of federal preemption that are not included within the criteria listed under sections 209(e).[186] Therefore, in considering

[181] As explained in EPA's July 2009 GHG waiver decision, EPA is guided by the language in the Clean Air Act and not the hearing requirements set forth in the Administrative Procedure Act. EPA incorporates that reasoning into today's decision. *See* 74 FR 32744, 32780–32782 (July 8, 2009).

[182] EPA–HQ–OAR–2008–0691–0321.

[183] Although PLF expresses the NAAQS $PM_{2.5}$ primary standard in "micrometers," the correct unit of measure is micrograms.

[184] *See, e.g.*, 74 FR 32744, 32783 (July 8, 2009).

[185] *See Motor and Equipment Manufacturers Ass'n* v. *Nichols*, 142 F.3d 449, 462–63, 466–67 (D.C. Cir.1998), *Motor and Equipment Manufacturers Ass'n* v. *EPA*, 627 F.2d 1095, 1111, 1114–20 (D.C. Cir. 1979).

[186] A4A may raise these issues in a direct challenge to California's regulations in other forums, but these issues are not relevant to EPA's limited review under section 209.

whether to grant authorization for California's Fleet Requirements under section 209(e), EPA cannot deny California's request for authorization based on the issues raised by A4A.

EPA also received comment suggesting that EPA and California must certify CARB's Fleet Requirements as "not having a significant economic impact on a substantial number of small entities" under the Regulatory Flexibility Act (5 U.S.C. 601).[187] EPA notes that CARB's authorization request and EPA's subsequent action do not constitute a rule as defined in the Regulatory Flexibility Act, 5 U.S.C. 601(2), and therefore are not covered by the certification requirement in that statute. EPA's authorization proceedings and actions nnder section 209(e)(2)(A) are informal adjndications. In an authorization proceeding, EPA receives a request from one entity (CARB) that is presenting an existing regulation established as a matter of California law. The request is for an EPA anthorization for that party, so it may adopt and enforce the specific regulations. In deciding this request, EPA interprets and applies the three authorization criteria established by the Act, and under this provision is reqnired to grant the authorization unless EPA makes one of the tbree specified findings. EPA applies the pre-existing law, section 209(e)(2)(A), and EPA's regnlation promulgated therein, to a specific request covering a specific regulation, and applies the three statutory criteria to the facts of the specific request.

The decision to grant or deny the authorization request directly affects the legal rights of the party before EPA, California. If EPA grants the authorization, then CARB may enforce its state regulations. Other parties, for example, the fleet operators, may be indirectly affected because state regulation is no longer preempted. While there may be indirect consequences for various parties, the only decision taken by EPA in the authorization proceeding is the decision that permits the State of California to adopt and enforce its state regulations. As noted above, sections 209(b) and 209(e) of the Clean Air Act limit EPA's authority to deny California requests for waivers and authorizations to the three criteria listed therein. As a result, EPA has consistently refrained from denying California's requests for waivers and authorizations based on any other criteria.[188] Review of California regulations under the Regulatory Flexibility Act is not included within the criteria listed under sections 209(e). Indeed, Congress intended EPA to provide California with substantial deference in making its own decisions regarding the effects of its regulations. Therefore, in considering whether to grant authorization for California's Fleet Requirements under section 209(e), EPA is not required to undertake a review under the Regulatory Flexibility Act and could not deny California's request for authorization based on any such review.

4. Constitutional Claims

EPA received a number of comments suggesting that EPA should deny authorization of the Fleet Requirements because of their potential to impose negative economic impacts on fleets. These comments stated that the regulations would cause emissions control equipment that fleet operators purchased before CARB's regulations took effect to lose its asset value, even though tbe equipment still has a long useful life. The comments suggest that CARB's regulation amounts to a "taking" as defined under the Fifth Amendment to the U.S. Constitution and "appropriate sections of California Constitution and Law." EPA's response to these comments is gnided first by the language in section 209(e)(2)(A) that clearly sets forth the limited criteria or basis by which we may deny an authorization request from CARB. EPA's limited ability to deny an authorization request to the criteria found in section 209(e)(2)(A) of the Act is consistent with case law.[189] Therefore, in considering whether to grant authorization for California's Fleet Requirements under section 209(e), EPA cannot deny California's request for authorization based on constitntional arguments outside the scope of the Clean Air Act. Moreover, such arguments are best directed against California directly in a conrt of law, not to a separate government agency with only a limited authority to review California's regulations.

E. Authorization Determination for California's Fleet Requirements

After a review of the information submitted by CARB and other commenters, EPA finds that those opposing California's request have not met the burden of demonstrating that authorization for California's Fleet Requirements sbould be denied based on any of the statutory criteria of section 209(e)(2)(A). For this reason, EPA finds that an authorization for California's Fleet Requirements should be granted.

IV. Decision

The Administrator has delegated the authority to grant California section 209(e) authorizations to the Assistant Administrator for Air and Radiation. After evaluating California's Fleet Requirements, CARB's submissions, and the public comments received, EPA is granting an autborization to California for its Fleet Requirements.

My decision will indirectly affect not only persons in California, but also entities outside the state who must comply with California's requirements. For this reason, I determine and find that this is a final action of national applicability for purposes of section 307(b)(1) of the Act. Pnrsuant to section 307(b)(1) of the Act, judicial review of this final action may be sought only in the United States Court of Appeals for the District of Columbia Circnit. Petitions for review must be filed by November 19, 2013. Judicial review of this final action may not be obtained in subsequent enforcement proceedings, pursuant to section 307(b)(2) of the Act.

V. Statutory and Executive Order Reviews

As with past authorization and waiver decisions, this action is not a rnle as defined by Executive Order 12866. Therefore, it is exempt from review by the Office of Management and Budget as required for rules and regulations by Executive Order 12866.

In addition, this action is not a rule as defined in the Regulatory Flexibility Act, 5 U.S.C. 601(2). Therefore, EPA has not prepared a supporting regulatory flexibility analysis addressing the impact of this action on small business entities.

Further, the Congressional Review Act, 5 U.S.C. 801, *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, does not apply because this action is not a rule for purposes of 5 U.S.C. 804(3).

Dated: September 13, 2013.

Janet G. McCabe,

Acting Assistant Administrator, Office of Air and Radiation.

Re: **Noise Impacts** - Comments regarding on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 22, 2015, letter report authored by acoustical engineer Frank Hubach (attached as Exhibit 1).

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to Noise Impacts.

A fundamental defect in the DSEIR's analysis of noise impacts is its use of thresholds of significance that do not actually measure the impacts that matter. This is readily demonstrated by comparing the two impacts that relate to the consistency of the Project with governing noise standards or plans (i.e., Impacts NO-2 (construction) and NO-4 (operations)) with the two impacts that relate to how noise affects people (i.e., Impacts NO-1 (construction) and NO-5 (operations)). Even in its discussion of the impacts that affect people, the DSEIR uses thresholds of significance that conflate compliance with non-CEQA regulatory programs with less-than-significant impacts under CEQA. This is error.

The DSEIR uses several general thresholds of significance for noise impacts:

- Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

(DSEIR, p. 5.3-16.)

Impact NO-1 is described as "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR 5.3-20.) For construction impacts, the DSEIR uses several more specific thresholds of significance, including:

- Non-impact equipment. The impact is considered less than significant as long as construction noise from non-impact equipment is less than 80dba at 100 feet from the noise generating equipment.[1]

- Impact equipment. The impact is considered less than significant as long as the 1-hour Leq is less than 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses,

[1] DSEIR, p. 5.3-16 - 5.3-17 ["Proposed construction activities would be required to comply with the San Francisco Noise Ordinance and the Mission Bay Good Neighbor Construction Noise Policy. The San Francisco Noise Ordinance prohibits construction activities between 8:00 p.m. and 7:00 a.m. and limits noise from any individual piece of construction equipment, except impact tools approved by the Department of Public Works, to 80 dBA at 100 feet. The Mission Bay Good Neighbor Construction Noise Policy limits pile driving or other extreme noise generating activity (80 dBA at a distance of 100 feet) to 8:00 a.m. to 5:00 p.m., Monday through Friday. As long as project construction activities comply with the noise ordinance, construction noise impacts from non-impact equipment would be considered less than significant. If construction activities using non-impact equipment would exceed these standards and the restrictions of the Mission Bay Good Neighbor Policy, then the noise effects would be potentially significant and mitigation measures would be required."]

and 100 dBA for commercial and industrial uses.[2]

The DSEIR then rigidly adheres to the regulatory scheme of the San Francisco Noise Ordinance in assessing the significance of noise from non-impact equipment, erroneously assuming the noise ordinance's regulatory scheme provides an appropriate threshold for determining whether impacts are significant under CEQA. Subdivision (d) of section 2909 of the San Francisco Noise Ordinance establishes thresholds for determining significance of noise impacts on nearby residents of 45 dBA nighttime/55 dBA daytime noise, stating:

> Fixed Residential Interior Noise Limits. In order to prevent sleep disturbance, protect public health and prevent the acoustical environment from progressive deterioration due to the increasing use and influence of mechanical equipment, no fixed noise source may cause the noise level measured inside any sleeping or living room in any dwelling unit located on residential property to exceed 45 dBA between the hours of 10:00 p.m. to 7:00 a.m. or 55 dBA between the hours of 7:00 a.m. to 10:00p.m. with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

These standards (i.e., 45 dBA nighttime/55 dBA daytime noise) are based on the actual health and welfare of people. But the DSEIR does not use them for construction noise or operational traffic or crowd noise because this provision of the City's noise ordinance only applies to fixed noise sources. The DSEIR thus conflates compliance with the noise ordinance for less-than-significant impacts under CEQA.

The EIR's assumption in this regard violates CEQA, because compliance with regulatory standards cannot be used as a substitute for a fact-based analysis of whether an impact is significant. While San Francisco is free to adopt a noise ordinance that exempts specific noise sources from its regulatory effect, it is not free, under CEQA, to fail to disclose the significance of noise that exceeds these interior noise limits.[3]

[2] DSEIR, p. 5.3-17 ["The San Francisco Noise Ordinance does not identify any quantitative noise limit standard for impact equipment. To assess the potential impacts related to rapid impact compaction, this analysis employs the general construction noise assessment methodology and criteria suggested by the Federal Transit Administration (FTA). This guidance identifies a 1-hour Leq of 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses. Commercial and industrial land use exposure to construction noise of 100 dBA is suggested as an assessment criterion."]

[3] *See*, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not

Because the DSEIR did not use the thresholds stated in section 2909(d), the noise impact assessment does not present relevant information that is necessary for determining whether the impact is significant. Instead, we have an impact assessment that is constrained by a series of arbitrary distinctions (i.e., the source fixed or not, the equipment impact or non-impact, the receptors are located in residences or hospitals) that have nothing to do with whether the affected community will suffer significant noise impacts.

The DSEIR refers to the World Health Organization (WHO) as "perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency all but eliminated its noise investigation and control program in the 1970s." (DSEIR, p. 5.3-4.) The DSEIR also cites WHO's Guidelines for Community Noise and its thresholds for adverse effects of noise on people.

> In contrast to many other environmental problems, noise pollution continues to grow and it is accompanied by an increasing number of complaints from people exposed to the noise. The growth in noise pollution is unsustainable because it involves direct, as well as cumulative, adverse health effects.

(WHO, Guidelines for Community Noise, p. vii.)

Specific effects to be considered when setting community noise guidelines include:

---

and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 ["the fact that a particular environmental effect meets a particular threshold cannot be used as an automatic determinant that the effect is or is not significant ... a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant"]; *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

> interference with communication; noise-induced hearing loss; sleep disturbance effects; cardiovascular and psycho-physiological effects; performance reduction effects; annoyance responses; and effects on social behaviour.

(WHO, Guidelines for Community Noise, p. v.)

> The scope of WHO's effort to derive guidelines for community noise is to consolidate actual scientific knowledge on the health impacts of community noise and to provide guidance to environmental health authorities and professionals trying to protect people from the harmful effects of noise in non-industrial environments.

(WHO, Guidelines for Community Noise, p. iii.)

As discussed by Mr. Hubach:

> WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA.

(Exhibit 1, p. 3.) Yet, despite citing the WHO Guidelines, the DSEIR fails to use these standards as its thresholds of significance, and finds that "ambient plus project" noise levels much higher than the WHO's standards for harmful noise are less than significant.

Another human health and welfare based standard is provided by the State of California:

> State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are collectively known as the California Noise Insulation Standards and are found in Title 24 of the California Code of Regulations.
>
> The State of California updated its Building Code requirements with respect to sound transmission, effective January 2014. Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) 13 rating of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. The previous code requirements (before 2014) set an interior performance standard of 45 dBA from exterior noise sources. This requirement will be re-instated in July of 2015.

(DSEIR, p. 5.3-10.) DSEIR does not tell us what buildings in area comply with this code. (See DSEIR § 5.3.3.4 [Sensitive Receptors], and Table 5.3-4.) However, as Mr. Hubach observes:

> Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq).

(Exhibit 1, p. 4.) Since the Project's noise, when added to background or ambient noise, exceeds the above health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code.

For operational traffic noise, the DSEIR states:

> Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA18 and the Federal Interagency Committee on Noise (FICON)19 that thresholds should be more stringent for environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase.

(DSEIR, p. 5.3-19.)

> Operational noise from non-transportation sources such as egress of patrons from events or sound amplification equipment in common areas are assessed based on noise increases of 8 dBA (for noise generated by commercial uses) over existing ambient (L90) levels and any applicable restrictions of the City's noise ordinance and Police Code. Although these operational noise increases would be of limited duration, they would be expected to occur throughout the life of the project and are therefore considered permanent changes in noise conditions.

(DSEIR, p. 5.3-19.)

As described by Mr. Hubach, for operational noise impacts (Impact NO-5), the DSEIR uses

a series of "ambient plus increment" thresholds. As discussed by Mr. Hubach, using "ambient plus increment" thresholds where existing noise levels are already high:

> disregards the fact the Project will make severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

(Exhibit 1, p. 5.)

By ignoring the severity of existing noise levels and only looking to the "de minimis" nature of the Project's incremental effect, the DSEIR's noise impact determinations violate CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"].)[4] *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

With respect to vibration impacts, as Mr. Hubach states:

> The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration.

---

[4]*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].)

In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:

"As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA." (DSEIR, p. 5.3-25.)

The DSEIR cannot omit an analysis of potentially significant effects by the simple expedient of arbitrarily defining the receptors of such effects as non-sensitive.

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

Project: Warriors Event Center in Mission Bay
FHA # 648-02

Dear Mr. Lippe,

You requested that I review the analysis of this Project's noise impacts in the Draft Subsequent EIR dated 5 June 2015, Chapter 3.5. This letter report responds to your specific questions. My CV is attached.

1. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-1 and Impact NO-5.

Impact NO-1 is "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR, pp. 5.3-20 to 5.3-23.)

Impact NO-5 is "Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project vicinity. (Significant and Unavoidable with Mitigation)." (DSEIR, pp. 5.3-32 to 5.3-39.)

In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-1 or NO-5 is significant.

The DSEIR omits important information about the environmental setting.

For example, to judge the noise impact on residents of the Hearst Tower, it is important to know whether these residents typically open their window to get fresh air or, conversely, whether the building is subject to any requirements to keep windows closed. This is because closed windows provide significant sound transmission loss.

It also important to know what kind of windows nearby buildings have, because standard windows provide much less sound transmission loss than acoustically-rated windows.

Fax 510-528-1506
Email: info@fha-eng.com

California State Building Code Section 1207 requires an interior performance standard of 45 dBA DNL. Given that windows in the Hearst Tower, and adjacent residences, are operable and ostensibly used for ventilation, achieving 45 dBA interior may be in jeopardy. It is unknown if the Hearst Tower has mechanical ventilation to allow the windows to be closed for noise control. Even if they do already have mechanical ventilation, their windows may not have sufficient sound transmission loss for the predicted increased noise levels.

The Title 24 compliance for Hearst Towers may have permitted windows to be open and not have required mechanical ventilation systems. If that is the case, they would need to keep windows open for fresh air and then suffer the increased noise.

I tried to find out if there is a ventilation system mandated by code for Hearst Tower. This is Section 1207.11 of the California State Building Code, which says in noisy settings, windows must be closed to achieve the state's 45 dB interior standard, in which case a mechanical ventilation system must be installed. I searched for an acoustical report typically filed with Planning and/or Department of Building Inspection (DBI) to see what original design requirement were in place. I visited DBI and spoke with Dwayne Farrell who said they had no record of Hearst Tower at 1560 3rd St, and only a crane permit for the parking garage on the opposite corner. He suggested I visit the inspectors and planners in the building to see if they could find a permit number or block and lot information. I did, to no avail. However, it was suggested that perhaps since it is a State building, the State Architect might have all records. So I contacted Luke Molinar, DSA, who did a records search but came up empty on this topic (See Attachment 1 [email exchange with Luke Molinar].)

Nevertheless, I visited the Project site on 8 July 2015, to make visual and aural observations. I walked along 3rd St from South St to 16th St, and South St to Terry Francois Blvd. The predominant noise is due to traffic – largely Muni, trucks and the occasional motorcycle. It was noticeably quieter away from 3rd St approaching the waterfront to the east. I spent some time in the pedestrian mall along Gene Friend Way.

I observed many of the windows in Hearst Tower and adjacent Mission Bay Housing were open. (See Attachment 2 [a photograph I took on 8 July 2015, showing part of the Mission Bay Housing building on the left and part of the Hearst Tower on the right], and Attachment 3 [a photograph I took on 8 July 2015, showing part of the Hearst Tower on the right].)

Therefore, regardless of whether the buildings are required to keep windows closed. The residents are opening them, presumably for fresh air.

For Impact NO-1 and Impact NO-5, the DSEIR uses a threshold of significance of the "ambient plus increment" type. For Impact No-1, the "ambient plus increment" threshold of significance is whether the "the increase in noise levels over existing conditions would be less than 10 dBA." (DSEIR, p. 5.3-23.)

This type of threshold discounts the significance or severity of pre-existing noise levels and treats them as if they are irrelevant to whether the incremental change caused by the Project is "significant." The DSEIR finds that "Peak cumulative construction activities would occur during a 3-month period in 2015–2016 and during this time, the increase in noise levels over existing conditions would be less than 10 dBA (without mitigation). All other periods of construction would similarly be under 10 dBA. Therefore, this impact would be less than significant." (DSEIR, p. 5.3-23.)

This conclusion is based on Table 5.3-8, which shows that all three receptors chosen for analysis have pre-existing ambient noise levels that are very loud already (i.e., Madrone Residential Tower is at 70.1 dBA (hourly Leq), Hearst Residential Tower is at 71.2 dBA (hourly Leq), and UCSF Hospital is at 67 dBA (hourly Leq).

As a point of reference for these noise levels, the World Health Organization's (WHO) standards for harmful noise are much lower than these pre-existing noise levels. WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA.

Another point of reference for the pre-exiting noise levels a the three "sensitive receptor locations" selected by the DSEIR is the San Francisco Noise Ordinance. As the DSEIR describes it, section 2909(d) provides "maximum noise levels at any sleeping or living room in any dwelling unit located on residential property must not exceed 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m" where source of the noise is "fixed sources of noise, such as building mechanical equipment and industrial or commercial processing
machinery." (DSEIR, pp. 5.3-13, 14.)

The DSEIR does not use the WHO standards at all. With respect to the San Francisco Noise Ordinance, the DSEIR does not use the 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m standard for any aspect of the Project's noise except the fixed machinery (e.g. generators) because the noise ordinance does not use this standard to regulate the Project's noise from construction equipment or operational noise from increased traffic, crowds, concerts, etc.[1]

This approach may be useful to the City for Impacts NO-2 and NO-4, which assess the Project's consistency with other applicable plans and laws, but it does not makes sense for assessing the construction or operational impacts of the Project on actual people.

Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq). Since the Project's

The DSEIR's use of compliance with the San Francisco Noise Ordinance as a threshold for judging the significance of the Project's construction noise impacts (see DSEIR p. 5.3-17) appears to reflect a policy decision, because it is not based on science.

---

[1]The DSEIR states that: "The HUD regulations also include a goal (not a standard) that interior noise levels not exceed 45 dB DNL" (DSEIR, p. 5.3-9.) But HUD's goal of 45 DNL interior, is 10 dB greater than the 35 dB Leq level the DSEIR cites as a threshold for sleep disturbance (see DSEIR, 5.3-2), and 15 dB greater than the 30 dB Leq guideline given by WHO.
noise, when added to background or ambient noise, exceeds these health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code standard.

The same is true of the DSEIR's use, for operational noise impacts, of a threshold of 8 dBA or 8 dBC above ambient noise, based on the San Francisco Noise Ordinance. (DSEIR, p. 5.3-13). The same is true of the DSEIR's use, for mobile sources of operational noise impacts, of "ambient plus increment" thresholds of significance:

> "Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA18 and the Federal Interagency Committee on Noise (FICON)19 that thresholds should be more stringent for environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase."

(DSEIR, p. 5.3-17).

> "Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase."

(DSEIR, p 5.3-19)

Using these "ambient plus increment" thresholds where existing noise levels are already too high, as shown in Tables 5.3-9 and 5.3-10 (DSEIR, pp. 5.3-34, 36), disregards the fact that the Project will make already severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

Therefore, the operational impact assessment needs to be redone using valid, science-based thresholds that relate to actual human health and welfare effects of noise.

In my opinion, is the Project will cause a significant increase in Impact NO-1 and Impact NO-5 above levels existing without the project.

2. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-3?

Impact NO-3 is "Construction of the proposed project would not expose people and structures to or generate excessive groundborne vibration levels. (Less than Significant)." (DSEIR, pp. 5.3-24 to 5.3-26.)

In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-3 is significant.

The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration.

In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:

> "As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA."

(DSEIR, p. 5.3-25.)

Since UCSF is a "research hospital" is it safe to assume that scanning electron-beam microscopes are used by researchers and pathologists. These devices are extremely sensitive to low level vibration. It is common for them to have environmental criteria specifically for vibration. If the specified vibration levels are exceeded the image will blur rendering the instrument useless. Therefore, in my opinion, the DSEIR should include users of vibration-sensitive equipment in the category of sensitive receptors, and then assess the Project's impact on the users.

For "Human annoyance" from groundborne vibration, the DSEIR uses a threshold of significance of : "For adverse human reaction, this analysis applies the "strongly perceptible" threshold of 0.1 inches per second PPV." (DSEIR, p. 5.3-25.) In my opinion, this threshold should be "perceptible, not "strongly perceptible."

In applying its "strongly perceptible" threshold, the DSEIR says:

> "The closest residence would be the UCSF Mission Bay Housing (Hearst Tower), approximately 200 feet from the project site while the nearest hospital would be approximately 560 feet away. A recent study of vibration induced by rapid impact compaction indicated that at a distance of 30 meters (100 feet), cumulative vibration energy results in maximum vibration level of 2.3 millimeters per second (0.09 inches per second). Because sensitive land uses would be more than 100 feet away, worst-case cumulative vibration levels generated by rapid impact compaction would be below the strongly perceptible threshold."

(DSEIR, p. 5.3- 25.)

In my opinion, this conclusion is incorrect because the DSEIR's calculation of vibration does take into account the increased vibration on upper floors of this building. Soil attenuation varies with the type of soil and moisture content, and distance attenuation from 100 to 200 feet may only be a factor of 0.5, or less. Accordingly, actual PPV at the Hearst Tower is likely to be 0.045 ips, or considerably greater depending on site-specific parameters. In addition, the DSEIR's calculation does not take into account building resonance effects for above-grade floors which amplify vibration at certain frequencies. Recalculating to take this factor into account indicates vibration on upper floors would certainly be "perceptible" and likely "strongly perceptible."

Alternate Calculation:

rapid impact compaction - 0.09 ips PPV @100 feet
distance attenuation factor - x 0.5 from 100 to 200 feet
rapid impact compaction - 0.045 ips PPV @200 feet
soil attenuation variation - x 2 (6 dB) ground floor
result at Hearst Tower - 0.09 ips PPV @100 feet
resonant amplification - x 3 (10 dB)
result at Hearst Tower - 0.27 ips PPV upper floors
criterion for humans - 0.1 ips PPV "strongly perceptible"

In my opinion, the Project likely to cause a significant increase in Impact NO-3 above levels existing without the project, particularly when compaction is occurring during construction.

Very truly yours,

Frank J. Hubach
President

Subject: RE: Acoustical Report

Hello Frank,

I've done some digging, and the attached is all I have that deals with windows/hvac at the address you gave me.

I'm afraid we don't really have much documentation on noise control, as it does not fall within our remit.

We were not involved with any other projects that occurred at this address.

Hopefully the information I sent over helps.

Thank you,

Luke Molinar

Subject: Acoustical Report

Luke,

You asked me to email my document request.

Project: UCSF Hearst Towers 1560 3rd St, San Francisco, CA

Primary Documents: Acoustical Report for Title 24 & State Building Code Section 1207.11

Additional Documents: Window schedule, HVAC duct drawings, HVAC ventilation schematics, etc.

Purpose: Determine the need to close windows to control noise. If windows are closed, mechanical ventilation must be provided. I want to confirm that design and implementation.

Thank you for assisting me today.

Regards,

Frank Hubach

RESUME

FRANK J. HUBACH

Frank J. Hubach, President of FHA, has over twenty years experience in noise and vibration control for advanced technology, industrial and commercial projects. Design and testing of facilities where micro-vibration is of great concern for metrology and lithography has been his focus. Projects range from comprehensive campus master planning to remodeling in the private, public and institutional sectors. Structural dynamics and mechanical systems for cleanrooms and laboratories have been the specialty. His musical and audio engineering background also makes him well suited for acoustic design of critical listening rooms for recording, broadcast and performance.

Mr. Hubach has over thirty years experience in construction, electronics and audio engineering. He is considered a leading authority on noise and vibration control for microelectronics manufacturing. Mr. Hubach has published several papers and been a speaker at numerous conferences and seminars. He has given expert witness testimony in state and federal courts for acoustic forensics, noise control and construction.

EDUCATION

1971 Bachelor of Engineering Electrical Engineering	New York University Bronx, NY
1970 to 1972 Coursework Graduate Studies in Acoustics and Electronics	New York University Bronx, NY

Re: **Transportation Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 23, 2015, letter report authored by traffic engineer Dan Smith (attached as Exhibit 1), and the July 21, 2015, letter report authored by traffic engineer Larry Wymer (attached as Exhibit 2).

I. THE DSEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO TRANSPORTATION IMPACTS.

A. The DSEIR Fails to Assess the Project Traffic Impacts on the Entire Affected Environment.

The DSEIR studies Project-induced increases in congestion and delay, for both incremental and cumulative impacts, at twenty-two (22) intersections and six (6) freeway ramps, as shown in Table 1.

Table 1

Incremental Impact Assessment (With Implementation of the Special Events Transit Service Plan)	Incremental Impact Assessment (Without Implementation of the Special Events Transit Service Plan)	Cumulative Impact Assessment
Intersections at DSEIR, p. 5.2-18, Table 5.2-34 p. 5.2-121, Table 5.2-35 p. 5.2-123, Table 5.2-36 p. 5.2-172, Table 5.2-47 p. 5.2-174, Table 5.2-48	Intersections at DSEIR, p. 5.2-192, Table 5.2-53 p. 5.2-193, Table 5.2-54	Intersections at DSEIR, p. 5.2-214, Table 5.2-59 p. 5.2-217, Table 5.2-60.
Freeway ramps at DSEIR, p. 5.2-133, Table 5.2-37 p. 5.2-133, Table 5.2-38 p. 5.2-134, Table 5.2-39 p. 5.2-181, Table 5.2-49 p. 5.2-181, Table 5.2-50	Freeway ramps at DSEIR, p. 5.2-198, Table 5.2-55 p. 5.2-198, Table 5.2-66	Freeway ramps at DSEIR, p. 5.2-221, Table 5.2-61 p. 5.2-221, Table 5.2-62

Remarkably, the DSEIR fails to disclose the criteria the City used to select these intersections and freeway ramps. More importantly, the DSEIR fails to disclose the criteria the City used to *exclude* other intersections and freeway ramps. The omission of this fundamentally important information renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

Also, as shown in the attached report from traffic engineers Larry Wymer and Dan Smith, the DSEIR omitted from its area of study numerous intersections and freeway ramps that will also suffer potentially substantial increases in traffic congestion and delay. The omission of these intersections and freeway ramps from the DSEIR's analysis of the Project's effect on traffic also renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

How did this happen? The DSEIR simply states: "The traffic impact assessment for the proposed project was conducted for 23 study intersections and six freeway ramp locations in the vicinity of the project site" (DSEIR, p. 5.2-72),[1] with no further explanation. The same is true for

[1]The DSEIR actually studies 22 intersections, not 23, in the tables listed in footnote 1.

the six freeway ramps. (DSEIR, p. 5.2-74.)

The DSEIR does inform the reader that:

> The impacts of the proposed project on the surrounding transportation network were analyzed using the Transportation Impact Analysis Guidelines issued by the Planning Department in 2002 (SF Guidelines 2002), which provides direction for analyzing transportation conditions and in identifying the transportation impacts of a proposed project.

(DSEIR, p. 5.2-69.) These Guidelines provide:

> 2. Project Setting
> The setting information shall be presented immediately following the Project Description as a discrete chapter or report section. The goal is to provide a brief but complete description of existing transportation infrastructure and conditions in the vicinity of the project. Normally, the described vicinity is a radius between two blocks and 0.25 mile, however, a larger area may be determined in the scoping process. *The specific perimeters of the study area, for both setting and project impact analysis, are to be confirmed as part of the approval for the scope of work.*

(Transportation Impact Analysis Guidelines (October 2002), pp.6-7 (italics added).) Based on this text, the reader would expect to find the criteria and rationale for delimiting "the specific perimeters of the study area" in the Scope of Work which the City approved pursuant to these Guidelines as a prerequisite to preparation of the DSEIR. Unfortunately, this expectation is disappointed, because the City-approved Scope of Work is also silent on the topic. (DSEIR, Appendix TR, pp. TR-8 to TR 14.)

Consequently, the City must revise the DSEIR to include an analysis of the Project's congestion and delay impacts on the excluded intersections and freeway ramps and then recirculate the Revised DSEIR for at least 45 days for public review and comment.

B. The DSEIR Fails to Disclose the Severity of the Project's Impacts on Intersections and Freeway Ramps which the Project Will Cause to Deteriorate to Level of Service (LOS) F.

As explained by Dan Smith in his attached report, the DSEIR fails to disclose the severity of the Project's congestion and delay impacts on intersections and freeway ramps which the Project will cause to deteriorate to Level of Service (LOS) F.

The DSEIR discloses the Project will cause significant congestion and delay impacts at numerous intersections and freeway ramps in the "study area," where Project-induced increases in congestion and delay will cause deterioration in Level of Service (LOS) to LOS E or F. (See intersections and freeway ramps listed in footnote 1.) For the intersections and freeway ramps in the "study area" where Project-induced increases in congestion and delay will cause deterioration to LOS E, the DSEIR provides a measurement of the degree of severity of the significant impact (i.e., average delay for intersections or average density for freeway ramps).

However, for the intersections and freeway ramps in the study area where Project-induced increases in congestion and delay will cause deterioration to LOS F, the DSEIR fails to provide a full measurement of the degree of severity of the significant impact. Instead, for intersections pushed to LOS F, instead of presenting a measure of average delay, the DSEIR provides a "greater than" measurement of "80 seconds per vehicle." (See 5.2-74 and Tables cited above.) For freeway ramps pushed to LOS F, instead of providing the average density, the DSEIR provides no measurement of "existing plus project" density. Instead, the severity of the Project's impacts at intersections and freeway ramps pushed to LOS F has no upper limit, and remains undisclosed, other than to note that "demand exceeds capacity." (See 5.2-75, Table 5.2-19 and Tables cited above.)

Thus, the DSEIR fails to comply with CEQA because, beyond making the binary determination that the Project's impacts on these intersections and freeway ramps are significant, the DSEIR fails to disclose the severity of these significant impacts. (See *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].) Consequently, the City must revise the DSEIR to include this missing information, then recirculate the Revised DSEIR for at least 45 days for public review and comment.

C. The DSEIR Fails to Identify the Significance and Severity of the Project's Impacts on Intersections Where the Project Will Use Parking Control Officers.

In its impact assessment tables for "Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday PM and Saturday Evening Peak Hour" (DSEIR, p. 5.2-172, Table 5.2-47) and "Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday Evening and Late Evening Peak Hour" p. 5.2-174, Table 5.2-48), the DSEIR measures the significance of impacts by the use of Level of Service (LOS) and delay measurements.

But for two intersections, King and Third streets, and King and Fourth streets, the DSEIR provides no LOS or delay measurements, and therefore, no information on whether the Project's congestion and delay impacts on these intersections are significant, and if so, the severity of these significant impacts.

Instead, the DSEIR indicates that the Project calls for posting Parking Control Officers (PCOs) at these intersections at the times indicated. But the adoption of a mitigation measure cannot substitute for disclosing whether the Project's impacts on these intersections are significant or their severity.[2]

D. The DSEIR's Analysis of the Project's Construction-Related Traffic Congestion and Delay Impacts Is Legally Flawed.

The DSEIR's analysis of the Project's construction related traffic congestion and delay impacts is legally flawed because it is based on invalid criteria, it fails to lawfully assess the Project's cumulative construction period impacts, and it improperly defers the development of mitigation measures to reduce the Project's construction-related traffic impacts to less than significant.

The DSEIR states "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR, p. 5.2-46.) This statement is placed in the section describing the DSEIR's thresholds of significance. Therefore, it appears this conclusion reflects a policy decision rather than a fact-based assessment.

In the impacts analysis section, the DSEIR states: "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR p 5.2-111). Elsewhere the DSEIR quantifies the construction period's "temporary and limited duration" as 26 months. (DSEIR, p. 5.2-112.) However, the notion that the DSEIR can determine the Project's construction related traffic impacts to be "less than significant" based primarily on their temporary duration is legally and logically flawed because from a cumulative standpoint, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco.

Indeed, the DSEIR's discussion of the Project's cumulative construction period impacts recognizes there are numerous other construction projects planned in Mission Bay and that the construction related traffic impacts of these projects will combine with this Project's construction related impacts. (DSEIR, p. 5.2-210 (Impact C-TR-1.)

However, the DSEIR's discussion of the Project's cumulative construction period impacts

---

[2]CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56' *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123*; Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

is flawed because it is constrained by several artificial limits.

First, as discussed in section I.A above, the impact assessment is limited to impacts and intersections and freeway ramps within the artificially restricted geographic "study area."

Second, the impact assessment considers only construction projects within the Mission Bay neighborhood without regard to whether other "past, present, or reasonably foreseeable future projects" may be "closely related" because their impacts may combine with the Project's impacts.

Third, the DSEIR's analysis of cumulative traffic impacts for *construction* of the project only references a handful of foreseeable projects located very close to the Project, and the DSEIR's discussion of these projects is solely in terms of whether their construction periods overlap with construction of this Project, as if the operational impacts of other "past, present, and reasonably foreseeable future projects" are not "closely related." (See DSEIR, p. 5.2-10 and 11.)[3] This is incorrect because "closely related" simply means the other projects' impacts may combine with the Project's impacts.

Table 3 in the attached report by Larry Wymer shows that it is possible to include a broader range of projects - across both time and area - in the assessment of the Project's cumulative construction period traffic impacts, and that when this is done, there are many Projects that will be under construction or operational in the period before, during, and after construction of the Project whose effects will combine with those of the Warriors Arena construction. Therefore, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco and the DSEIR errs by basing its determination of significance on the "limited duration" of the construction period. (DSEIR, p. 5.2-212.)

The second basis for the DSEIR's less-than-significant determination is the DSEIR's statement that "construction activities would be ... required to be conducted in accordance with City

[3]These projects are:
• 1.13 million gsf of UCSF LRDP projects under construction at the Mission Bay Campus, including, the UCSF East Campus project on Blocks 33/34,
• Construction of Bayfront Park,
• realignment of Terry A. Francois Boulevard,
• construction of a neighborhood park on the north side of Mariposa Street east of Owens Street,
• the Exchange project on Mission Bay Block 40,
• the Family House project on Mission Bay Block 7 East,
• the Residential and Hotel project on Mission Bay Block 1,
• the 360 Berry Street project on Mission Bay Block N4/P3, and
• Caltrain's Peninsula Corridor Electrification Project.

requirements." (DSEIR, p. 5.2-212.) This vague assurance is meaningless because the DSEIR does not specify what these " City requirements" are, does not specify a performance standard that these City requirements would either impose or achieve, and presents no evidence that these unspecified "City requirements" are likely to avoid significant cumulative construction related traffic effects. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*CBE*); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

The third and final basis for the DSEIR's less-than-significant determination is "Improvement Measure I-TR-1: Construction Management Plan and Public Updates." The DSEIR suggests this Plan would help avoid significant cumulative construction related traffic effects. (DSEIR, p. 5.2-212.) But it is improper for the DSEIR to rely on Improvement Measure I-TR-1 to help reduce impacts to less than significant because it is not identified as a mitigation measure necessary to substantially reduce significant Project impacts; therefore, it is not enforceable. (CEQA Guideline 15126.4(a)(4).)

Finally, the DSEIR fails to quantify the Projects' construction period impacts, presumably based on its qualitative conclusion that unspecified "City requirements" and "Improvement Measure I-TR-1" will avoid significant impacts. This puts the cart before the horse.[4]

E. The DSEIR's Analysis of the Project's Operational Traffic and Transit Congestion and Delay Impacts Is Legally Flawed.

1. The DSEIR understates traffic and transit volumes in the PM peak period of 4:00 to 6:00 PM by using "time of arrival" at the Arena as a proxy measurement for "time of travel."

In modeling traffic and transit impacts, the DSEIR assumes only 5% of basketball game attendees will be traveling in the "study area" in the PM peak period of 4:00 to 6:00 p.m. Table 5.2-21 states that 5% of arrivals are expected before 6:00 p.m. for 7:30 p.m. weekday basketball games; another 11% will arrive between 6:00 and 6:30 p.m. (DSEIR, p. 5.2-83.) This data is based on turnstile counts of people entering the arena.

As explained by Dan Smith in his attached report, this proxy measurement does not provide reliable data as to when game or event attendees are actually traveling through affected intersections or freeway ramps or using affected transit routes:

> These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented

[4]See footnote 2 above.

> in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands. Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually traveling on the transportation system instead of the time they enter the event venue.

(Exhibit 1, p. 3.)

In his analysis, Mr. Smith found:

> it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

(Exhibit 1, p. 3.)

Even just applying common sense to the DSEIR's data indicates that many or most of the 11% that the DSEIR says arrive at the turnstile between 6:00 and 6:30 p.m. would be traveling to the event in the PM peak period of 4:00 to 6:00 pm. This minimal adjustment alone changes the assumption on which the modeling is based from 5% to 16% traveling in the "study area" in the PM peak period of 4:00 to 6:00 pm. As shown by Mr. Smith, this minimal adjustment more than doubles the Project's contribution of traffic to affected intersections, and would change the DSEIR's determination from less-than-significant to significant at some intersections. (Exhibit 1, p. 4.)

This issue was flagged in public scoping comments on the DSEIR. (DSEIR, p. 2-15.) Yet, somehow, the DSEIR did not adjust its reliance on turnstile data to develop a reliable metric to use instead. Instead, the DSEIR offers a series of weak or irrelevant rationales for its methodology, including:

> because basketball games typically start at 7:30 p.m. a higher percentage of inbound event attendees would travel to the event center during the 6:00 to 8:00 p.m. period than during the 4:00 to 6:00 p.m. commute peak period.

(DSEIR p. 5.2-71); and

> the SF Guidelines do not include travel demand characteristics for the specialized uses (e.g., sports events, conventions, and other events) that would take place at the proposed event center. Similarly, standard trip generation resources, such as the Institute of Transportation Engineer's Trip Generation Manual, do not include sufficiently detailed trip generation data for such specialized uses. Therefore, the travel demand for the event center component of the proposed project was based on the estimated attendance, as well as information on current travel characteristics of Golden State Warriors basketball attendees at the Oracle arena in Oakland.

(DSEIR, p. 5.2-81); and

> The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR.

(DSEIR, p. 5.2-82.)[5]

---

[5] In the "Travel Demand Methodology and Results" section of Chapter 5.2, the DSEIR states:

> The Basketball Game scenario reflects the travel demand of the office, retail and restaurant uses, plus an evening basketball game. The transportation impact analysis of the Basketball Game scenario was conducted for four analysis hours (weekday p.m., weekday evening, weekday late evening, and Saturday evening), for conditions without and with an overlapping SF Giants evening game at AT&T Park.
>
> Table 5.2-21 presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR. Based on this information, it was assumed that approximately 5 percent of arrivals to a basketball game would occur during the p.m. peak hour (5:00 to 6:00 p.m.), and up to 66 percent of arrivals would occur during the evening peak hour (7:00 to 8:00 p.m.). Similarly, up to 70 percent of the departures would occur during the late evening peak hour (9:00 to 10:00 p.m.).

A discussion and summary of the data from other venues than Oracle is provided in DSEIR, Appendix TR, at pp. TR-21 to TR-25 and TR-37 [Appendix A, p. A-9]. The table at page TR-37 provides time of arrival data from, in addition to Oracle, six purportedly "comparable" venues, namely: Icon Venue Group, Houston, Phoenix, Sacramento, Brooklyn (2013-2014), and Brooklyn (2014-2015). An interesting fact about this table is that the data for 4:00 to 6:00 p.m. arrivals at four of these six venues (i.e., Icon Venue Group, Houston, Phoenix, Sacramento) is "included in" the data for later time periods. So, in fact, the only purportedly comparable venue for which the DSEIR presents supporting data is Brooklyn (2013-2014 and 2014-2015). The venue with the largest proportion of arrivals in the 4:00 to 6:00 p.m. period is Brooklyn (2014-2015), with 4.1%.

In short, the City and the Warriors failed to develop reliable accurate, reliable data on the key variable in the entire transportation analysis, i.e., the number of people traveling to events in the peak PM time period when traffic and transit crowding are at their worst. A lead agency "must use its best efforts to find out and disclose all that it reasonably can." (CEQA Guideline, § 15144.)

The above quoted rationales do not excuse this failure. The scoping comments flagging this issue were submitted to the City between November 19, 2014, and December 19, 2014, during the middle of the basketball season. (DSEIR, p. 2-8 and 2-9, 2-15.) The Warriors played fifty-seven (57) games between December 19, 2014, through the close of the regular season on April 15, 2015.[6] There are thirty (30) teams in the NBA.[7] That means there were approximately eight-hundred and fifty five (i.e., 15 x 57 = 855) regular season games played in the 2014-2015 regular season after December 19, 2014. In the playoffs following the regular season, sixteen teams played a total of seventy-nine games after April 15, 2015.[8]

Therefore, both the Warriors and the City had ample opportunity to conduct market research by interviews and exit polling of a sample of the hundreds of thousands of fans attending these games to discover how far in advance of arriving at the turnstile they traveled through the traffic and transit impacted area surrounding the venue. The City's and Warriors' decision to pass up this opportunity after being informed of the issue does not satisfy their duty to use best efforts to find out

---

> Event staff for basketball games would be expected to arrive between 4:30 and 5:00 p.m. and would be on post prior to the gate opening time; event staff would leave between 11:00 and 11:30 p.m.

(DSEIR, p. 5.2-82.)

[6]http://www.nba.com/warriors/schedule,

[7]http://www.nba.com/teams/?ls=iref:nba:gnav

[8]http://www.nba.com/playoffs/

and disclose all they reasonably can.

Indeed, the City was fully aware of the need to gather information more relevant to fans "time of travel" than turnstile counts and made some efforts to do so. But it failed to disclose that there are alternative metrics for "time of travel" or the results of its efforts in this regard. For example, an email exchange dated January 12, 2015, between the City's EIR consultant (ESA) and City Planning officials includes data on arrivals before 6:00 p.m. at the Arco Arena parking lot for a 7:00 p.m. Sacramento Kings game and arrivals before 6:00 p.m. in buildings for other NBA venues. Thus, the City was aware of other measurements (e.g., parking lot entry rather than turnstile counts) that could more accurately predict peak PM period travel to games.

Also, the arrival numbers cited in this email exchange show 14% arriving at the Arco Arena parking lot before 6 p.m. for one 7 p.m. game and 9% arriving before 6 p.m. in buildings for other NBA venues. These numbers indicate the DSEIR's assumption that 5% of fans will be traveling through the study area before 6 p.m. for 7:30 p.m. games is vastly understated. Yet the DSEIR fails to reference these numbers.

The DSEIR must be revised to provide accurate peak period traffic data and analysis

2. The DSEIR's Analysis of the Project's Cumulative Impacts Does Not Comply With CEQA.

a. The 5% threshold of significance for impacts at intersections and freeway ramps operating at LOS E or F violates CEQA.

For intersections operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F" (DSEIR, p. 5.2-73-74.) For freeway ramps operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes on the ramp." (DSEIR, p. 5.2-74.)[9]

No rationale for the 5% threshold is provided. Indeed, blind reliance on this number ignores the law governing the assessment of cumulative impacts, which requires a fact based assessment that takes into account the severity of preexisting impacts. A one-size-fits-all "ratio" violates CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*Communities*"); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d

---

[9]"The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project's contribution to the worsening of the average delay per vehicle." (DSEIR, p. 5.2-45.)

692, 720-21 (*Kings County*). *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm, and that focusing on the magnitude (i.e., "ratio") of the Project's incremental contribution to severe preexisting harm is inconsistent with the definition of cumulative impacts under CEQA.[10]

b. The year 2040 baseline for assessing the significance of the Project's cumulative impacts violates CEQA.

The DSEIR assesses the Project's incremental traffic and transit impacts and its cumulative traffic and transit impacts pegged to the year 2040, which is 25 years in the future.[11] While the Alliance supports such long range forecasting in general, as used in this DSEIR the year 2040 baseline for assessing the significance of the Project's cumulative impacts is misleading, for two reasons.

First, this approach overlooks the Project's cumulative traffic and transit impacts pegged to its first 1 to 10 years of operations. This time period is of immediate interest to the citizens of San Francisco because the traffic mess predicted by the DSEIR will be upon them then. And who among them know whether they will even be in the City by the year 2040. Thus, while including a year 2040 baseline is not in itself objectionable, the omission of a baseline 5 to 10 years in the future

---

[10](*Communities,* 103 Cal.App.4th at p. 120 ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"]; *Kings County,* 221 Cal.App.3d at pp. 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].)

[11]"Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions." (DSEIR, p. 5.2-110.)

renders the DSEIR informationally defective.

Second, by using a baseline projected to the year 2040, the DSEIR inflates the denominator in the 5% "ratio" it uses to determine the significance of Project cumulative impacts at LOS E and F intersections, thereby masking actual significant effects. (See Exhibit 2 (D. Smith), p. 25.)

c. The DSEIR's use of a "projection" based approach to the Project's cumulative impacts is misleading.

The DSEIR states that:

> Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. .... The 2040 cumulative traffic volumes take into account cumulative development projects in the project vicinity, such as the build-out of the Mission Bay Area, completion of the UCSF Research Campus and the UCSF Medical Center, the Mission Rock Project at Seawall Lot 337, Pier 70, etc., as well as the additional vehicle trips generated by the proposed project.

(DSEIR, p. 5.2-110.)[12]

The DSEIR presents no evidence supporting the DSEIR's assumption that the year 2040 projection is reliable for predicting future traffic and transit demand, other than the vague assertion that the "SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions ... has been validated to represent future

---

[12]In the section titled "Approach to Cumulative Impact Analysis" (DSEIR 5.1-6, § 5.1.5), the DSEIR asserts that the CEQA Guidelines provide "two approaches to a cumulative impact analysis ... (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area." (DSEIR, p. 5.1-7.) The DSEIR asserts that "The analyses in this SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed ... the Transportation and Circulation analysis relies on a citywide growth projection model that also encompasses many individual projects anticipated in and surrounding the project site vicinity, which is the typical methodology the San Francisco Planning Department applies to analysis of transportation impacts." (DSEIR, p. 5.1-7.)

transportation conditions in San Francisco." (DSEIR, p. 5.2-110.) But, as explained by Mr Smith, the SF-CHAMP model's margin of error is greater than the 5% threshold used to determine the significance of Project cumulative impacts at LOS E and F intersections. (See Exhibit 2 (D. Smith), p. 25.) Therefore, SF-CHAMP is the wrong tool for the task.

Further, given the sheer number of developments in this area of the City (see table 3 of Mr. Wymer's report) and the breakneck pace of their approval and implementation, the projection approach is misleading, not informative. Therefore, the DSEIR's cumulative impact assessment must use a list based approach to forecast reasonably foreseeable travel demand, and do so in a meaningful time frame.

F. The DSEIR's Methodology for Analyzing Project Impacts on the Transit System Is Legally Flawed.

The DSEIR summarizes its methodology for analyzing Project Impacts on the transit system, as follows:

> The impact of additional transit ridership generated by the proposed project on local and regional transit providers was assessed by comparing the projected ridership to the available transit capacity at the maximum load point. Transit "capacity utilization" refers to transit riders as a percentage of the capacity of the transit line, or group of lines combined and analyzed as screenlines across which transit lines travel. The transit analyses were conducted for the peak direction of travel for each of the analysis time periods.

(DSEIR, p. 5.2-75.)

This methodology contains two flaws. First, it suffers from the same unwarranted and unsupported assumptions about basketball fans' time of travel to the arena for games described above. Second, the DSEIR's use of transit screenline and route capacities is also misleading and unsupported.

1. The DSEIR's use of transit screenline and route capacities is misleading and unsupported.

For its Project specific (or incremental) transit impact analysis, the DSEIR uses the following thresholds of significance:

> The proposed project was determined to have a significant transit impact if project-generated transit trips would cause downtown or regional screenlines, and, where applicable, directly affected routes, operating at less than its capacity

> utilization standard under existing conditions, to operate at more than capacity utilization standard. For Muni, the capacity utilization standard is 85 percent for conditions without an event at the project site, and 100 percent for conditions with an event at the project site. For regional operators, the capacity utilization standard is 100 percent for conditions without and with an event at the project site.

(DSEIR, p. 5.2-76, 77.)

For its cumulative transit impact analysis, the DSEIR uses the following thresholds of significance:

> Under 2040 cumulative conditions, the proposed project was determined to have a significant cumulative impact if its implementation would cause the capacity utilization at the Muni and regional screenlines and/or corridors within the screenlines to exceed the capacity utilization standard noted above for conditions without and with an event at the project site, or if its implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route). In addition, if it was determined that the proposed project would have a significant project-specific transit impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

(DSEIR, p. 5.2-76, 77.)

For both Project specific (incremental) and cumulative impacts, the DSEIR uses "capacity utilization standards" as baselines against which to measure the Project's impacts. Capacity utilization standards are specific percentages of the theoretical maximum capacity of a transit screenline or transit line.

For Project specific (or incremental) thresholds of significance for Muni, the DSEIR uses two different capacity utilization standards against which to measure the Project's impacts. For conditions without an event at the Project site, the capacity utilization standard is 85 percent of maximum theoretical capacity of the transit screenline or line. For conditions with an event at the Project site, the capacity utilization standard is 100 percent of maximum theoretical capacity.

If the question to be answered by the transit impact analysis is whether the Project will inflict significant suffering on people riding Muni, why does the DSEIR use two different baselines for its impact assessment. If exceeding 85% inflicts suffering without an event, then exceeding 85% will inflict suffering with an event.

The DSEIR does not examine this use of inconsistent baselines. However, the June 21, 2013, Planning Department Memorandum "Transit Data for Transportation Impact Studies" (at Appendix-TR, p. TR-624) states:

> The SFMTA Board has adopted an "85 percent" capacity utilization standard for transit vehicle loads. In other words, transit lines should operate at or below 85 percent capacity utilization. The SFMTA Board has determined that this threshold more accurately reflects actual operations and the likelihood of "pass-ups" (i.e., vehicles not stopping to pick up more passengers). The Planning Department, in preparing and reviewing transportation impact studies, has similarly utilized the 85 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to the SFMTA lines.

(DSEIR, Appendix-TR, p. TR-624.) Thus, the 85 percent capacity utilization threshold apparently has nothing to do with the suffering of Muni's passengers; it simply reflects the reality of Muni's operations. And even if 85% of capacity is the break point at which Muni drivers tend to refuse to pick up more passengers due to overcrowding, then using 100% of capacity as a threshold of significance is entirely unsupportable.

For its cumulative impact analysis, the DSEIR uses the same baselines and thresholds of significance discussed above plus one more if the Project "would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route)."

The 5% threshold for determining a Project's contribution to be "considerable" is stated at Appendix-TR, p. TR-625. No rationale for this number is provided. A Project contributing 1% more capacity utilization to a screenline that usually operates at 84%, resulting in a total capacity utilization of 85%, may not contribute considerably to a significant impacts, while a Project contributing 1% more capacity utilization to a screenline that usually operates at 94%, resulting in a total capacity utilization of 95%, may well contribute considerably to a significant impact. A one-size-fits-all "ratio" violates CEQA. (See *Communities, supra; Kings County, supra*.)

G. The DSEIR Unlawfully Defers the Development of Mitigation Measures.

The DSEIR sketches out a number of concepts for mitigating the Project's significant transportation effects where it defers the development of specific mitigation measure until a future date. The DSEIR's deferral all of the mitigation measures listed below in this section does not meet CEQA requirements to identify specific mitigation measures in the Draft EIR so the public may meaningfully review and comment on them. These measures violate CEQA's requirements for deferred mitigation because the DSEIR does not specify binding performance standards by which

the measures' success can be judged, there is no evidence it is impracticable to develop and include the specific measures in the DSEIR, there is no evidence the measures will be effective, there is no evidence the measures are feasible, there is no evidence the measures will be implemented because the Project Sponsor may deem them infeasible, and the measures are not enforceable. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*CBE*); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

The listed measures are qualified by language such as "if feasible" or "could include" (e.g., Measure M-TR-2b). Such qualifications render the measures illusory, unenforceable, and ineffective for purposes of the DSEIR's claim of substantial reductions in impact or reductions in impact to less-than-significant levels. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope..."].)

Even the listed measures that include performance standards (e.g., Measure M-TR-18) do not require they be achieved. For example, Measure M-TR-18 only requires that the Project Sponsor "work to achieve" the performance standards. CEQA requires that deferred mitigation measures include binding performance standards.

- Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts. (DSEIR, p. 1-15.)

- Mission Bay FSEIR Mitigation Measure E.47: Transportation System Management Plan. (DSEIR, p. 1-17.)

- Mitigation Measure M-TR-5a: Additional Caltrain Service. (DSEIR, p. 1-18.)

- Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service. (DSEIR, p. 1-19.)

- Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction. (DSEIR, p. 1-20.)

- Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan. (DSEIR, p. 1-21.)

- Mitigation Measure M-TR-11b: Participation in the Ballpark/Mission Bay Transportation Coordinating Committee. (DSEIR, p. 1-22.)

- Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events. (DSEIR, p. 1-23.)

- Mitigation Measure M-TR-13: Additional Muni Transit Service during Overlapping Events.

(DSEIR, p. 1-24.)

- Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events. (DSEIR, p. 1-24.)

- Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring. (DSEIR, p. 1-25.)

H. The DSEIR's Discussion of Transportation Impacts Is Incomplete.

The DSEIR analyzes transportation impacts in two broad scenarios: with and without implementation of the Special Events Transit Service Plan.

In the scenario "With Implementation of the Special Events Transit Service Plan" the DSEIR analyzes two narrower scenarios: with and without a Giants game. In each Giants game scenario, the DSEIR analyzes three narrower scenarios: no event, convention event, and basketball game. The result is six scenarios applied to ten different transportation resources, as shown in Table 2.

Table 2

With Implementation of the Special Events Transit Service Plan					
Without Giants game			With Giants game		
No event	Convention event	Basketball game	No event	Convention event	Basketball game
TR-1 Construction - Traffic LS TR-2 Traffic - Intersections SUM TR-3 Traffic - Freeway Ramps SUM TR-4 Transit - Muni LS TR-5 Transit - Regional - Caltrain SUM TR-6 Pedestrian LSM TR-7 Bicycle LS TR-8 Loading LS TR-9a Construction Helipad LSM TR-9b Const. Lights Helipad LS TR-9c Operation Helipad LS TR-9b Operation Lights Helipad LSM TR-10 Emergency Vehicle Access LS			TR-1 Construction - Traffic LS TR-11 Traffic - Intersections SUM TR-12 Traffic - Freeway Ramps SUM TR-13 Transit - Muni LSM TR-14 Transit - Regional -All SUM TR-15 Pedestrian LSM TR-16 Bicycle LS TR-17 Emergency Vehicle Access LS		

In the scenario "Without Implementation of the Special Events Transit Service Plan"

the DSEIR analyzes only one narrower scenario: without a Giants game and with a basketball game. The result is one scenario applied to ten different transportation resources, but the omission of the other five scenarios, as shown in Table 3.

Table 3

Without Implementation of the Special Events Transit Service Plan	
Without Giants game	
Basketball Game	
TR-1 Construction - Traffic	LS
TR-18 Traffic - Intersections	SUM
TR-19 Traffic - Freeway Ramps	SUM
TR-20 Transit - Muni	SUM
TR-21 Transit - Regional	SUM
TR-22 Pedestrian	LSM
TR-23 Bicycle	LS
TR-24 Loading	LS
TR-25Emergency Vehicle Access	LS

Since the scenario "Without Implementation of the Special Events Transit Service Plan" is likely enough to justify including it in the DSEIR, the DSEIR should include the other five omitted scenarios.

In addition, the DSEIR's cumulative impact analysis does not even inform the reader if it is performed for the "with" or "without" scenario for "Implementation of the Special Events Transit Service Plan." The cumulative impact analysis should include both scenarios, and should inform the reader which is which.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

EXHIBIT 1

SMITH ENGINEERING & MANAGEMENT

July 26, 2015

Mr. Tom Lippe
Law Offices of Thomas N. Lippe, APC
201 Mission Street, 12th Floor
San Francisco, CA 94105

Subject: Draft Subsequent Environmental Impact Report for Event Center and Mixed Use Development at Mission Bay Blocks 29-32. SCN:2014112045

P15003

Dear Mr. Lippe:

Per your request, I have reviewed the Draft Subsequent Environmental Impact Report (hereinafter "the DSEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). The focus of my review is in regard to matters involving transportation and circulation. My qualifications to perform this review include registration as both a Civil and Traffic Engineer in California and 47 years professional consulting practice in these fields. I have prepared, reviewed, and commented on the traffic and circulation components of numerous environmental impact documents under the California Environmental Quality Act (hereinafter "CEQA"), working for Lead Agencies, Responsible Agencies and private citizens and organizations. I am familiar with the Project vicinity, having lived and worked in the Bay Area since 1967 and having been involved in numerous significant projects affecting the San Francisco Waterfront including a decade of planning studies for the Mission Bay development. My professional resume is attached. My comments follow.

The DSEIR's Transportation Impact Analysis Understates and Fails To Disclose and Mitigate Arena Event Impacts on PM Commute Peak Hour Travel Because It Fails to Consider the Time and Duration of Attendees Travel In Advance of Passing Through Venue Entry Turnstiles

The DSEIR considers turnstile data on time of arrival at the Golden State Warriors current venue site (Oracle Arena) and other basketball venues to

estimate how many attendees traveling to a game with a 7:30 PM start time would be traveling on the area transportation system in the 4 to 6 PM peak commute period versus in the 6 to 8 PM early evening peak shoulder period. However, it uses an overly simplistic relationship between turnstile arrival data and whether the attendee traveled in the 4 to 6 peak or in the 6 to 8 shoulder: If the attendee arrives at the turnstiles more than 1.5 hours before the 7:30 event start, they are assumed to have traveled in the 4 to 6 peak; if they hit the turnstiles less than 1.5 hours in advance of the event start, they are presumed to have traveled in the 6 to 8 shoulder. The problem with this is it fails to take into account the duration of each attendee's travel (which varies by where each person is coming from, the mode or modes they choose and the travel time on that mode or modes). It also fails to consider the substantial portion of attendees who, rather than passing through the turnstiles immediately, choose to remain outside for a while (such as stopping at a nearby restaurant / bar for a meal or drinks, or just waiting outside, as in the circumstance where 2 or more people are going to sit together but are traveling independently from different points and one person has all the tickets). Turnstile data is only a weak surrogate measure for end-time of trip for travel to stadium and arena event venues. It is weak and non-representative of the actual times attendees may be traveling on the transportation system for the following reasons. Many attendees at weeknight Warriors games will be coming from places where they will have to travel more than 45 minutes or an hour to get there. Many attendees, when they reach the area of the Project will choose to patronize nearby bars or restaurants or need to wait outside to meet up with others. In reality, someone who has traveled an hour to get to the Project site and passes through the turnstile directly on arrival at 6:30, say, will have actually completed a substantial portion of their trip within the PM peak hour. Another person who has only traveled for, say, 45 minutes but spends a half-hour in a nearby bar before passing through the turnstiles at 6:45 will also have completed most of their trip in the PM peak hour. These offsets of actual time-of-travel on the transportation system from time of passage through the turnstiles are not adequately considered in the DSEIR.

The DSEIR States that 5 percent of arriving 7:30 PM basketball event attendees arrive between 5:00 and 6:00 PM (per Table 5.2-21) which would be 903 person trips for 18,064 maximum attendance. However, Table 5.2-22 shows a total of 1,803 person trips within the 4-6 PM peak hour. Presumably, this discrepancy accounts for roughly 900 trips of the assumed 1100 day-of-game workers (ushers, ticket-takers, vendors, event-level security personnel and other day-of-game functionaries who generally need to be in place when the turnstiles open). Some 95 percent of the attendees are assumed to arrive in the 6 – 8 PM early evening peak shoulder per Table 5.2-21 with the maximum arrival hour between 7 and 8 pm involving 11,742 trips (65 percent of attendees per Appendix TR Table 3).

But, considering the facts that:

- over 70 percent of the attendees will be coming from outside San Francisco (including 31.1 percent from the East Bay, 8.9 percent from the North Bay, 26.7 percent from the South Bay and 4 percent from completely outside the Bay Region)[1] meaning many of their trips to the Project site will take 45 minutes to an hour or more,
- many attendees will, after traveling to the vicinity of the Project site, stop in neighboring restaurants and bars for drinks or a meal, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles by 30 minutes to an hour or more. This would apply to attendees coming from points in San Francisco as well as those making longer trips.
- many of the attendees, after completing their trip to the site, may need to wait to meet with others before passing through the turnstiles, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles. While some waits to meet are of short duration, the arrivals may often be disparate by 30 minutes or more. This would apply to attendees coming from points in San Francisco as well as those making longer trips.

When all of these factors are considered, it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands.[2] Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually

[1] Per DSEIR Appendix TR Table 8 at page TR 25.
[2] This commenter has consulted regarding transportation issues related to many professional sports stadiums and arenas. In addition, by being an attendee at a very large number of professional sports events and concert events, this writer has observed with a professional eye the transportation and pre-event behavior of attendees at nearly 1200 major league stadium and arena events at various venues. The writer has held season tickets to the Giants at their current venue for 8 years, to the 49ers for 33 years, to the Oakland Raiders for 20 years and a quarter-share of season tickets to the San Jose Sharks.

traveling on the transportation system instead of the time they enter the event venue.

In order to illustrate how consequential is the DSEIR's failure to consider the time difference between the time when event attendees pass through the arena turnstiles and the time when they are actually travelling on the transportation system, we review a simplified scenario. Undisputedly, people who pass through the arena turnstiles in the half-hour between 6:00 AND 6:30 PM were traveling on the transportation system before 6 PM – that is, within the 5 to 6 PM peak period. DSEIR Table 5.2-21 at page 5.2-83 estimates that 11 percent of turnstile arrivals do so in the 6:00 to 6:30 PM half-hour, amounting to 1987 person trips at capacity basketball attendance of 18,064. When these trips are added to the 1803 trips the DSEIR already estimates are traveling in the 5 to 6 pm peak hour[3] , there would really be a total of 3790 Project basketball-related trips traveling in the pm peak hour. In other words, the Project's basketball-related trips in the PM peak hour would be more than doubled (actual factor 2.102).

The effects of a doubling of PM peak hour travel attributable to adding the Project with a 7:30 PM basketball game as compared to what the DSEIR estimates would be most evident at the intersection of Seventh Street with Mission Bay Drive where, instead of operating at LOS D as projected in table 5.2-24, it would operate at deficient LOS E, a significant impact. The effect on outbound MUNI lines T Third and 22 Filmore requires some special attention because Table 5.2-40 is obviously in error, showing the ridership on each of these lines as being *less* with a basketball game than without one. This is completely inconsistent with the text in the first bullet point on page 5.2-141 which states that a basketball game would add 681 new outbound transit trips to these lines in the PM peak hour. If we correct the table to be consistent with the text of the DSEIR analysis, the DSEIR's analysis of these two lines in the "with basketball" scenario should show a total outbound ridership of 3862 trips (or 81.3 percent of capacity).[4] If we add to that the riders who pass through the turnstiles in just the 6 to 6:30 PM period who, because of the offset between overall ride time and the 6-to 6:30 turnstile entry count, must have been riding on the transportation system in the 5 to 6 PM commute peak hour, the analysis would show an added ridership due to basketball of 1431, a net ridership in that situation of 4612, and a capacity utilization of 97.1, extremely close to crush capacity.[5]

[3] See DSEIR Table 5.2-24 at page 5.2-90.
[4] Regardless of whether the City agrees with our further analysis of the PM peak ridership with a basketball game, it must correct this table to make it consistent with the analysis findings in the text.
[5] Under the City's normal impact threshold, which is riders exceeding 85 percent of screenline capacity, this would be a significant impact on transit. However, because the City has improperly created a Project-specific impact threshold of 100 percent of screenline capacity for this Project, the ridership would fall just below the gerrymandered impact threshold. The impropriety of creating a specially relaxed threshold of impact for this one Project is discussed in a subsequent section.

The DSEIR Only Analyzes Impacts of Weeknight Basketball Games That Start at 7:30 PM, Not at Other Start Times Closer to the PM Peak.

The only scenarios analyzed involving weeknight basketball games assume a start time of 7:30 pm. But this is not the only times that weeknight basketball games start although it does account for a majority. In the three preceding full seasons to the time of the NOP, 6 percent of the weeknight home games started at 6 PM (average 2.5 games per season) and over the three seasons there were individual games starting at 5 PM and 7 PM. However, the recently completed season proves that earlier games than 7:30 PM start times are not likely to be just a rarity in future years. In the three regular seasons considered in the DSEIR, the Warriors team was mediocre to 'emerging'. However, after this year's excellent regular season, the team played 11 home playoff games, seven of which were weekday games that started at 6 PM. With an outstanding young team, the prospects are that the team could play similar numbers of home 6 PM weeknight playoff games (6 PM being the time nationally broadcast weeknight games normally start) for several seasons hence. Moreover, the national attention this team has attracted could result in several more national broadcasts of regular season home games (also normally starting at 6 PM). So there is a substantial likelihood that weeknight 6 PM games could become a frequent occurrence rather than a rarity. There might easily be 16 out of 54 or so combined regular season and playoff home games that start at 6 PM, or just under 30 percent of the total weeknight home games. Obviously, the 6 PM start puts more travel pressure on the 4 – 6 PM peak. The DSEIR should analyze this basketball start time as a separate scenario rather than dismissing it as an anomaly

The City's Process for Evaluating a Project's Impacts on Public Transit Evades Disclosure of Significant Impacts

The City's process for evaluating transit impacts for projects in the "greater downtown area" (the C-3, SOMA and Mission Bay districts) is to consider peak hour ridership on the routes that cross designated screen lines across portions of the City or, for regional routes, on its perimeters versus the aggregate capacity of the peak hour services crossing those screenlines. There are several problems with this procedure that result in failure to disclose impacts.

- Considering aggregate capacity across screen lines versus aggregate patronage does not reasonably disclose impacts. For the routes inside San Francisco served by the San Francisco Municipal Railway (MUNI), a standard has been established that there is significant impact when ridership crossing the screen line exceeds 85 percent of capacity on that screen line. But this standard of significance involves an underlying assumption that individual travelers could use any of the routes crossing a particular screen line to accomplish their trip. But in actual fact, an

individual traveler's particular trip is most often only well served by one route. When some routes crossing a screen line are heavily patronized while others are less patronized, the excess capacity on the less popular routes does not cancel out the overcrowding on the most popular routes. It is noted that the City Planning Department can request that transit impacts be analyzed on an individual line basis. When this is done, if the individual line ridership exceeds 85 percent of capacity *and the project's contribution exceeds 5 percent of the total ridership at its maximum load point (MLP)*, then the project would be found to have significant transit impact.
- MUNI's capacity standards per vehicle involve percentages of standees above seating capacity ranging from 30% to 80% of seating capacity (depending on vehicle type); therefore, the above addition of 5 percent ridership to the impact threshold in analysis of individual lines represents a substantial crush loading.
- The capacity as considered in the analysis is the theoretical capacity of the services as scheduled. However, rarely, if ever, does MUNI deliver all of its scheduled service. San Francisco Municipal Transportation Authority statistics show that MUNI typically delivers an average of between 95 and 98 percent of scheduled services although on some days the percentage of missed runs can be much worse. MUNI's goal is to only deliver 98.5 percent of scheduled service. Principal causes of missed runs include driver unavailability, insufficient vehicle availability and in-service breakdowns. On the light rail lines, the percentage of weekdays when enough light rail vehicles were operationally available to deliver scheduled service averaged only 61.7 percent in fiscal year 2014 and was well under 50 percent in the two preceding years.
- Difficulty maintaining schedule reliability (on-time performance) exacerbates capacity problems. Muni's on-time performance is normally less than 20 percent. As a result, there is difficulty maintaining planned headways between vehicles on a given route. Bunching occurs. When that happens, the lead vehicle in a bunch becomes overcrowded while the one or more closely following vehicles in the bunch are underutilized. Muni experiences bunching on about 4 percent of its trips overall; in excess of 5 percent on its "Rapid Network".

If the threshold of impact were measured at 85 percent of the capacity of *actual effective service delivered* instead of *theoretical schedule-based service capacity*, more of the individual lines and screen lines would be found to be closely approaching or above the 85 percent of capacity criterion. And as a consequences of these circumstances in the City's procedures and policy criteria, it is rare for a project to be found to have significant impact on MUNI transit services despite the fact that the public perception is that MUNI is overburdened and dysfunctional.

We also note that for scenarios involving arena events at this Project, the DSEIR alters the City's normal criterion for evaluating transit impacts, changing the threshold of significant impact from 85 percent of capacity to 100 percent of capacity. Its basis for making this alteration, which tends to shield the Project from disclosure of significant transit impacts, is that event-goers accept a higher level of crowding than normal riders. However, "accept" is too generous a word. Nobody wants to ride in 'crush load' conditions. Event attendees grudgingly tolerate 'crush loads' as the least undesirable of their other options of a)walking long distances, b)paying much more for taxis or shared ride services, c) paying even much more to drive and park or d) (only in the post-event exit) waiting until the crowding has dissipated. Moreover, this shift in acceptability criterion is impactful of itself in that it imposes the values and tolerances of event-attendees upon normal riders who use the involved lines at that particular time of day. Furthermore, the DSEIR is unclear whether the change in impact criterion is operative only for lines directly serving the Project site, or system-wide, which would have a far greater impact on normal riders. The City's action to alter its normal thresholds of impact in the case of one particular project to lessens the chance of findings of significant impact and is not consistent with the good faith effort to disclose impact that CEQA demands. The City should faithfully disclose impacts as measured by its normal criteria, and, if it still wants to approve the Project, make findings of overriding considerations.

With regard to regional transit services, considering capacity versus ridership at San Francisco perimeter screenlines (North Bay, East Bay, South Bay) as the sole criterion of impact on the regional systems results in the analysis failing to address other significant impacts that are unrelated to corridor screenline ridership to capacity relationships. For example, in the case of BART, while Transbay capacity (the screen line analyzed) is a concern, an equal concern is the peak period platform capacity at the Embarcadero and Montgomery Street stations. These stations each individually serve 22 percent of all BART travelers and in the peaks are simultaneously serving peak-direction travelers to/from both eastbound and westbound corridors as well as serving contra-peak direction travelers in both directions. The platform congestion at both these stations is a serious operational and safety concern, has been documented in public[6], is visibly worse in the pm peak hour when the Giants have weekday night games scheduled and would presumably be similarly affected by weekday evening Warriors games and other large events at the Project. BART is actively developing designs for adding outboard platforms at both of these stations – a mitigation measure that the Project (and others) could make fair share contributions toward if the Project's impacts at these locations were properly

[6] See *BART Sustainable Communities Operations Analysis*, June 2013

analyzed. But for the present, the DSEIR's is deficient because it completely fails to analyze, disclose and mitigate the Project's impacts on this situation.

The City's Selections of Intersections (and Freeway Ramps) Studied in the DSEIR Excludes Intersections it Knew or Should Have Known Would Potentially Be Significantly Impacted by the Project

Intersections selected for study in the DSEIR for the subject Project exclude a number of intersection that were to be subject to analysis in the DEIR for the prior proposal for essentially the same project but located on the Piers 30/32 site. Among the intersections slated for study in the prior edition of the project but not studied in the current work are the 9 major intersections along Embarcadero from and including that with Brannan all the way to that with Broadway, plus those at Main with Harrison, Main with Bryant, Beale with Mission, Beale with Bryant, Delancy and the 80 on ramp, Fremont with each of Mission, Harrison and Folsom/80 off, Third with Harrison, Third with Mission, Second and Bryant, Second and Brannan, Second and King, Second and Bryant, First with Harrison and the 80 on ramp, Fourth and Howard, Fourth and Harrison/80 on ramp, Fourth and Bryant/80 off ramp, Bryant with Sterling/80 on ramp. Virtually all of these excluded intersections are heavily congested in the pm peak.

Although the Project location is now shifted to a site approximately 6800 feet south, and the DSEIR has added study intersections in that direction, the excluded intersections are still on the likely paths of traffic coming from the Northbay, Eastbay and northern parts of San Francisco. . The project is fundamentally the same size and will generate fundamentally the same amount of traffic. The amount of traffic through the excluded intersections approaching from and departing to the Northbay, Eastbay and northern parts of San Francisco is essentially unchanged from the totals that would have occurred with the Piers 30/32 site. So there is no reasonable logic for excluding these intersections from the current DSEIR analysis.

That the excluded intersections are at risk to be impacted by the Project is demonstrated in the DSEIR's own analysis of Alternatives to the Project. One of the alternatives it analyzes is putting the Project back on the previously proposed Piers 30-32 /Seawall Lot 330 site. Appendix TR at page TR-783 analyzes the project on the alternate (or formerly proposed site) at the intersections formerly proposed for evaluation. It shows the Existing + Project with Basketball Event would have significant project-specific impacts at 8 intersections, 5 of which are intersections excluded from the current DSEIR analysis of the Project at its current site, and would make significant contributions to traffic at 4 intersections already at LOS E or F, 3 of which are among the intersections excluded from the analysis of the Project at its currently proposed site. We reiterate, it is clear that most of the traffic contributory to the impacted intersections with the Project on the formerly proposed site would still pass through these intersections with the Project located at the currently proposed site. So the DSEIR is deficient for excluding these intersections from the analysis of the Project.[7]

We also note that DSEIR Figures 5.2-14 E and 5.2-14 F indicate that approximately 31 percent of Warriors game weekday and Saturday attendees would approach and depart two and from the northwest via 7th Street at times when there are no overlapping Giants games. Although the DSEIR does not specifically present usage of this corridor by Warrior's attendee traffic at times of overlapping Giants home games, it would doubtless be considerably greater. In both cases, this suggests that the capacity-challenged intersections of Seventh and Townsend, Seventh and Brannan, Eighth and Brannan and Eighth and Bryant should have been analyzed in the DSEIR. Please do so.

There is a similar situation with the study of freeway ramps. The current DSEIR analyzes 6 ramps. The study for the prior site analyzed 12 ramps. Four of the six ramps studied in the current work are new (not considered in the analysis of the former proposed site). In other words, ten of the ramps to be studied in the analysis of the prior site, all problematic in peaks, are eliminated from consideration. There is no reasonable justification for their elimination.

The Transit Analysis Understates Impacts Because It Relies On Stale Transit Baseline Data

This DSEIR's Notice of Preparation was filed on November 19, 2014. The DSEIR's transit impact analysis relies upon transit ridership data published in a City Planning Department memo dated June 21, 2013 entitled *Transit Data for Transportation Impact Studies*[8]. However, the data published in that memo is from counts taken in the fall of 2010 and in 2011. Between 2010/11 and late 2014 when the NOP was filed there have been a large number of significant development projects that have been completed and occupied in the C-3, SOMA and Mission Bay and numerous others approved and placed under construction. These render the transit database collected in 2010/11 stale for evaluation of a Project whose NOP was filed in late 2014. Hence, the transit analysis is inadequate for relying on stale data.

Similarly, for the regional transit corridor screenlines, the cited *Transit Data for Transportation Impact Studies* memo relies on data from a SFMTA TEP Project

[7] Our colleague, Mr. Larry Wymer of Larry Wymer and Associates Traffic Engineering has provided a separate letter of comment on this DSEIR (dated July 21,2015) that concurs in the need for study of additional intersections and provides supporting data.
[8] *Transit Data For Transportation Impact Studies* is reproduced in DSEIR Appendix TR at pages TR-624 thru TR-632.

document produced in October, 2012. Obviously, the transit ridership data in that document reflects observations some time before October, 2012. Again, significant development has occurred in the C-3, SOMA and Mission Bay between whenever the data published in October 2012 was collected and the date of the NOP for the subject Project. This would result in significantly heavier loadings on the regional transit carriers in the peak periods at the time of the NOP than represented in the *Transit Data for Transportation Impact Studies* memo. For example, the data relied on in the DSEIR indicates BART's Transbay peak hour ridership is 19,716. *BART Sustainable Communities Operations Analysis* report[9] indicates peak hour Transbay ridership at 21,600 passengers in 2012 and projects 21,815 peak hour peak direction riders by 2015. BART's ridership values would respectively put BART at 98 percent of capacity in 2012 and at 98.9 percent currently. This leaves considerably less capacity for peak hour travelers to the Project to be accommodated without impact.

The DSEIR transit analysis should be redone based on updated estimates of baseline transit ridership, taking into account projections of transit use from the environmental documents for all projects known to the City to have been completed since the time of the actual transit ridership counts or known to be reasonably certain, at the time of this Project's NOP, of being completed by the estimated time of completion of this Project

The Traffic Analysis Underestimates Impacts Because It Relies on Stale Baseline Data

The traffic impact component of the DSEIR relies on a number of traffic counts taken in 2013 and others in June, 2014. It adjusts those counts to account for traffic from the UCSF Medical Center Phase 1 and the Public Safety Building that are located close to the Project site and were under construction when the counts were taken but were occupied about the time of the NOP. However, it seems likely that there was other development in C-3, SOMA and Mission Bay completed in the period between when the 2013 counts were taken and the date of the NOP that would logically affect baseline traffic at some of the intersections analyzed in the DSEIR and still more that is known to the City to be reasonably certain of completion by the time of completion of the subject project. Please list all such developments and adjust the baseline traffic used in the DSEIR analysis accordingly.[10]

[9] *BART Sustainable Communities Operations Analysis*, Bay Area Rapid Transit District, June, 2013.
[10] The aforementioned separate comment letter on this Project by Mr. Larry Wymer includes a spreadsheet reflecting, to the best of Mr. Wymer's ability based on culling the posting of environmental documents of development projects on the City Planning Department's web site, a listing of such projects and the traffic they would contribute to locations that were or should have been studied in this DSEIR's traffic analysis. However, responsibility for developing a comprehensive list of such projects and adjusting the baseline for their effects rests with the City Planning Department that is charged with generating and maintaining these

The DSEIR Fails to Evaluate Impacts at Intersections Under PCO Control

The DSEIR does not report LOS or delay at intersections that are under PCO control in certain situations, claiming that LOS cannot be calculated for intersections under PCO control. However, this interpretation evades the issue of why PCO control is employed in the first place. The reason is because it is assumed or known through experience that these locations would become gridlocked (deep LOS F conditions) if left to automated traffic control. In theory, the PCO or group of PCOs is/are smarter than an automated traffic signal in such circumstances. In particular, the human controllers can observe downstream blockages and give advantage to movements with unblocked downstreams and alter phase sequences to give green to movements as their downstreams become unblocked. But fundamentally, any intersection under PCO control should be regarded as being at LOS F. But this poses another issue. There is no determination of how much worse (more impacted) conditions are in the Existing + Giants game + Warriors game situation than in the Existing + Giants game alone scenario. This determination is an essential purpose of this DSEIR and it is not being evaluated.

The DSEIR Fails To Evaluate Quantitatively the Severity of the Project's Traffic Impacts at Locations That Are Already In LOS F Condition

The DSEIR tables reporting intersection delay and intersection LOS for the various locations and scenarios analyzed fail to report the actual delay at intersections experiencing delay at or above the threshold of LOS F. They merely report the delay as being greater than 80 seconds of delay per vehicle. This manner of reporting prevents the public from knowing the severity of the Project's traffic impacts when it affects intersections already in impacted condition.

Most commercially available intersection LOS/delay calculation programs do calculate the actual delay of intersections that are above the LOS F threshold. It is the analyst's option to display the actual value in the program output or to suppress reporting it and display the >80 symbol. Some analysts claim that once an intersection is in LOS F, the delay value is irrelevant. But that is nonsense. If an existing condition is, say, just at the 80 second delay LOS threshold and a project causes the delay value to increase to 81 seconds, in that instance the degradation caused by the project may be almost imperceptible. But if the computation shows that the project increases delay to, say, 120 seconds per vehicle, than the degradation caused by the project is clearly quite severe and seriously impactful. Since an essential objective of an EIR is to disclose how

records, not to an independent party attempting to do so from the outside.

adverse or severe a project's impacts are, the DSEIR is deficient in failing to disclose information relative to severity that it easily could have disclosed.

The same considerations apply to the freeway ramp analysis where, once a ramp has reached the average vehicle density threshold of LOS F operations[11], the DSEIR presents a special character symbol instead of the actual density compiled, thereby thwarting the ability of the public or professional reviewers to understand how severe and adverse the impacts of the project really are. We also note that DSEIR Table 5.2-2 contains an apparent error in the entry for the I-80 eastbound ramp at Sterling for the weekday evening (6-8 PM) period. It reports that vehicle density is 38 vehicles per vehicle lane-mile but a LOS of C. If the density really is 38, this ramp would be in the LOS E-F range; if the LOS really is C, the density would have to be less than 28. Please correct the error.

Complex Interrelated Issues Are Not Addressed In the DSEIR

At present, persons traveling between BART or the MUNI LRT lines and the Project site can make a simple in-station transfer to/from the K-T line from any of the downtown Market Street stations. Once the Central Subway is completed, the T-Third line will no longer be directly inter-routed with the K-Ingleside line in the Market Street subway. Instead, access from BART and the Market Street LRT lines to the T line that serves the proposed Project site will only be via the Powell Street station and only via a 1,000 foot tunnel in the wrong direction that connects Powell to the Union Square station where T LRT trains can be boarded – an unattractive and slower transfer than at present. Although other MUNI LRT lines from the Market Street subway will continue to connect to 4th and King via the Embarcadero, passengers on those lines or those from BART who transfer to them at the Market Street stations will be faced with another transfer to the T-Third at that point or an walk of .8 miles to the Project site. These are less attractive options than what is available at present. With the rise of ride-share services like Uber and Lyft that can be summoned via a cell phone application – a new phenomenon, the percentage of persons who take ride share services or conventional taxi instead of transit all the way to the site may be far more than for AT&T Park events (which will continue to be served by LRT lines that stop directly in all the Market Street BART stations). This is detrimental as each time people use ride-share or conventional taxi services to

[11] Vehicle density, the number of vehicles per lane mile, is the logical measure of either congestion or high quality service on freeways and ramps in merge and diverge areas. In free-flowing conditions, vehicles operate with substantial space between them so the number of vehicles per lane mile is low. At highly congested conditions, stop-and-go or crawl speed operations, vehicles are closely spaced and the number of vehicles per lane mile is high. Per *Highway Capacity Manual 2000* the threshold for LOS E and F operations is 35 passenger car equivalents per lane-mile per hour. With true scientific caution, *Highway Capacity Manual 2000* counsels against reporting vehicle densities in the LOS E-F range because flow rates, a principle factor in calculating vehicle density, vary radically in LOS E-F situations. Nevertheless, the computed vehicle densities are what they are, and constitute the only reasonable way to measure weather the Project's effects on an already unacceptable ramp situation are significantly deleterious or not.

access the Project, they cancel the environmental savings of direct transit access usage and double the number of motor vehicle trips to the area as compared to if they drove and parked in the area (because the ride-share or taxi vehicle drives away after dropping passengers off). The DEIR does not appear to address these considerations. Please do so.

The DSEIR Cumulative Analysis Fails To Consider and Analyze the Project in the Context of the City's Proposal to Remove the Northern Portion of I-280 As Far South As the Mariposa Street Interchange

Since at least as long ago as 2012, the City has been actively considering a proposal to demolish the northern portion of I-280 as far south as the Mariposa Interchange, eliminating the on- and off -ramp connections to King Street and to Sixth Street[12]. If carried out, the I-280 truncation would shift much of the traffic that now uses those ramps to surface streets in the immediate vicinity (including two of the frontage streets) of the subject Project. Moreover, development of the site freed up would add to demands on the traffic and transit system. In view of the City's continuing active consideration and refined development of this proposed major change in transportation infrastructure[13] both well before and after the NOP for the subject Project, this DSEIR should have, at a minimum, in addition to the cumulative scenarios studied, analyzed the proposed Project in the context of an alternative transportation network scenario that reflects the truncation of I-280 as far south as the Mariposa Interchange. However, the DSEIR's only mentions the I-280 truncation project in two places. One is a single short background paragraph about ongoing projects in the vicinity of the site in the Appendix TMP introductory section. The other is a lengthier two-paragraph description at DSEIR pages 5.2-109 and 5.2-110. That section concludes by stating that the information on the 280 truncation is provided for information purposes only and that because that project is not fully designed, has not received the approval of other responsible agencies and is not funded, it is speculative and is not considered in the DSEIR cumulative 2040 analysis. However, since the City has already spent in excess of $ 1.7 million in design and feasibility studies, has already approached other responsible agencies for funding involvement and approvals and since it has such a vast potential consequence for the transportation network in the immediate area of the subject

[12] Evidence of this is the unveiling by the Mayor's Transportation Policy Director, Gillian Gillett, at a San Francisco Planning and Urban Renewal Association (SPUR) forum on January 10, 2013, releasing a City study deceptively named Fourth and King Street Railyards, Final Summary Memo dated December, 2012 and a related request dated January 7, 2013 by the Office of the Mayor to Steve Hemminger. Executive Director of the Metropolitan Transportation Commission.

[13] The City's continuing interest in the I-280 truncation is demonstrated by the initiation of the San Francisco Planning Department's *Railyard Alternatives and I-280 Boulevard Feasibility Study*, which began in June, 2014 and in the May 11, 2015 *San Francisco Chronicle* column by Matier & Ross lead by the statement "San Francisco Mayor Ed Lee is quietly shopping plans to tear down Interstate 280 at Mission Bay and build an underground rail tunnel through the area – complete with a station between the proposed Warriors arena and AT&T Park.".

Project by the forecast year of the cumulative analysis, and since that forecast year, 2040, is 25 years hence, it is evasive, irresponsible, improper for the City to have failed to at least considered an *alternative cumulative scenario* that assumes the latest design concept from the *Railyard Alternatives and I-280 Boulevard Feasibility Study* in *addition to* the cumulative scenario that was analyzed. The DSEIR should be revised to include such a cumulative alternative and recirculated in draft status for the 45 day review period.

There Is No Evidence The DSEIR Considered the Disruptive Impacts of the At-Grade Rail Crossing of 16th Street on Intersection LOS at the Intersections of 16th and 3rd and 16th and 7th Streets.

The Caltrain rail mainline crosses Sixteenth Street in an at-grade crossing between the study intersections of Sixteenth with Third and with Seventh Streets. In the 5 to 6 PM peak hour, gate closure protection to allow train passage blocks Sixteenth Street traffic 10 times and another 10 times in the 6 to 7 PM early evening peak shoulder period. Increased rail traffic and increased train lengths will increase the blockage time. There is no evidence this blockage has been taken into account in the LOS calculations for the nearby intersections.
If it has, please explain how. If it hasn't, please adjust the calculations or explain why not.

The Project's Truck Loading and Truck Staging Provisions Appear Inadequate.

With regard to loading facilities, the Project Description narrative at DSEIR page 3-20 states: "*The loading and service areas, including 13 truck loading docks, would be located on the Lower Parking Level 1"*. After describing dimensions of those loading dock spaces, the narrative continues: *"In addition to the 13 on-site below grade loading area, 17 on-street commercial loading spaces would be provided on South Street (8 spaces), Terry A Francois Boulevard south of South Street (8 spaces) and 16th Street (1 space) …".*

This statement in the Project Description has multifold inaccuracies:

- The accompanying scale drawing of Lower Parking Level 1 actually shows 14 off street truck loading spaces but about half of them cannot be accessed or egressed if trucks, especially the 70± foot tractor trailer rigs, are occupying nearby spaces.
- Other docks, if not completely blocked by vehicles in other loading docks, involve extremely difficult backing maneuvers.
- Some docks involve "blind" right hand backing turns from the "hammerhead" area that are ordinarily avoided in truck loading area design.
- The Project does not *provide* 17 on-street commercial loading spaces. It does not *provide* any. It simply asserts claim to enough on-street parking

area to park 17 large trucks, taking use of area that otherwise would be available for public parking.

- In addition to the above, the Project does not appear to have sufficient area for staging of trucks that have already been unloaded. Headliner rock concerts and family shows are often supported by large numbers of trucks. For instance, concerts for U-2's current tour are supported by 26 tractor-trailer rigs. The Rolling Stones are supported by about the same number. A national political convention would involve many more. It is obvious that this many trucks cannot be staged within the proposed site plan, especially since the loading docks also need to be used for the truck loading that is routine for any event (such as delivery of food. drink and souvenir supplies for the concessions, removal of garbage and support for the other uses in the proposed Project. It appears that the Project will either stash those trucks, when not actively loading or unloading, by preempting public on-street parking areas in the Project vicinity or by obtaining a formal off-site staging area. Which of these is planned and if a formal staging area is planned, where is it and what is its capacity?

Construction Impacts on Transportation and Circulation Are Not Adequately Addressed

In its section describing thresholds of significance, the DSEIR's transportation and circulation analysis declares that "Construction related impacts generally would not be considered significant due to their temporary and limited duration". This assessment by fiat rather than by a reasonable effort to measure or estimate the Project's construction impacts on the transportation and circulation system is inconsistent with the good faith effort to disclose impact demanded by CEQA. It also flies in the face of common sense. For example:

- A project that is located on a heavily trafficked street, a street with high-volume transit service or a street with heavy pedestrian flows would tend to have much more construction impacts on transportation than a project on a minor street that has none of those characteristics.
- A project whose construction causes closures of traffic lanes or closures of continuous sidewalks or temporarily eliminates or relocates transit stops has more construction impact on transportation than one that does not. A project that does those things on busy streets has more construction impact on transportation than one on lesser-used streets.
- A project that is large tends to involve more workers commuting daily, more daily import of supplies and construction materials, more export of demolition and construction refuse and, as a consequence of its size, tends to be of longer duration, tends to have greater construction impacts on transportation than a smaller one.

These considerations that distinguish the severity of construction impacts on transportation can be defined or measured both qualitatively and quantitatively. The DSEIR is deficient in failing to do so.

Despite its "by fiat" finding that the Project's construction impacts on transportation and circulation are less than significant (LS in the Summary Of Impacts And Mitigation Measures), the DSEIR identifies "Improvement Measure I-TR-1: Construction Management Plan and Public Updates". This so called 'Improvement Measure' is a surrogate 'Mitigation Measure' and, by its very existence, is de facto admission that the Project does have construction impacts on transportation and circulation that should have been disclosed as such.

Unfortunately, the measure is in part, vague and yet to be defined (deferred mitigation that is improper under CEQA, and in other parts, defies common sense. We discuss these subjects in a subsequent section.

The DSEIR Concludes, Without Adequate Foundation, That the Project Would Not Have Adverse Impact on Emergency Access

The emergency entrance to the newly opened UCSF Benioff Children's Hospital is located on Fourth Street near its intersection with Mariposa, about 1050 feet (as the crow flies) from the nearest corner of the Project site. At two locations in the Transportation and Circulation section the DSEIR states that if a project were to result in inadequate emergency access, the project would be found to have a significant impact on the environment. Yet incredibly, it concludes that the subject Project would not result in inadequate emergency access when capacity events are taking place at the Project on weekday evenings, weekend afternoons or weekend evenings, regardless of whether or not the Giants or other events at AT&T park are taking place at overlapping times. The DSEIR offers no objective data to support its conclusion that emergency access would not be adversely impacted in event travel peaks – such as relative emergency vehicle travel time data with and without event traffic[14]. Instead, the DSEIR relies on its own rationalizations of why emergency vehicles might not be slowed during event travel peaks to justify concluding the Project would not have significant impact.

The DSEIR notes drivers' obligations to get out of the way of emergency vehicles under the vehicle code. However, it fails to note that in special event access/egress situations, when vehicles are queued bumper to bumper and pedestrians are swarming the crosswalks, drivers abilities to clear the way for emergency vehicles are impaired and the emergency vehicles will inevitably be delayed more than in a

[14] Emergency responders ordinarily log the time calls are received by dispatch, the time the subject is reached and the time the subject is delivered to an emergency care facility. So there is an objective data base that could have been examined to assess the consequences when special events currently take place in the area versus times when special events are not taking place.

normal traffic situation. The DSEIR notes that the presence of PCOs will help clear paths or emergency vehicles through event traffic. PCOs can help, but when event traffic is jammed up with scant maneuvering space and pedestrians are swarming about, PCOs can only do so much and the emergency vehicle(s) will inevitably be delayed compared to normal traffic. The DSEIR also claims emergency vehicles can utilize the proposed exclusive transit lane on 16th Street to bypass normal vehicles in event jams. This will be fine until an emergency vehicle overtakes a transit vehicle, at which time a more confusing than normal maneuvering will have to take place. And not all the emergency vehicles will be approaching from points from which 16th Street is the best route. Finally, not all vehicles traveling in emergencies are official emergency vehicles equipped with emergency lights and sirens. Quite often, parents, caregivers or friends attempt to rush a person requiring emergency care to the emergency room in private vehicles. Private vehicles on an emergency mission are often not recognized as such by other drivers, pedestrians, or PCOs and consequently, it event traffic, suffer even more delay than official emergency vehicles.

Because of these considerations, the DSEIR's conclusions about emergency access impacts are not only unsupported by objective data but incorrect and implausible.

Mitigation Measures Are Vague, Insubstantive, Unresponsive to the Impact Purportedly Addressed or Do Not Qualify as Mitigation Under CEQA

A number of the mitigation measures (and de facto mitigation measures identified as "improvement measures") identified in the DSEIR are vague, insubstantive, unresponsive to the impact purportedly addressed or offer no basis for the DSEIR's conclusion. Measure having these characteristics, which disqualify them as adequate mitigation under CEQA, are not limited to those cited as egregious examples highlighted below.

<u>De Facto Mitigation Measure: Improvement Measure I-TR-1: Construction Management Plan and Public Updates</u>

The first section of this measure states as follows:

> ***Construction Coordination*** – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit and vehicles at the project site, the project sponsor shall require that the contractor prepare a Construction Management Plan for the project construction period. The preparation of a Construction Management Plan could be a requirement included in the construction bid package. Prior to finalizing the Plan, the project sponsor/construction contractor(s) shall meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to include in the Construction Management Plan to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. This review should consider other ongoing construction in the project vicinity, such as construction of the nearby UCSF LRDP projects and construction on Blocks 26 and 27.

While expressing good intention, what will be done as the result of this measure is so vague and subject to future determination as to constitute deferred mitigation. To be an effective measure, it should commit to explicit features such as the following examples:

A continuous protected sidewalk will be maintained at all times on the Project's frontage on the east side of Third Street. Third Street will not be subject to lane closures at any time during the construction period. All access to the Project for workers, import of construction materials and equipment and export of demolition and construction debris shall be from the Sixteenth Street, South Street or Terry Francois Boulevard frontages. All connections to underground utilities shall be made from the Sixteenth Street, South Street or Terry Francois Boulevard frontages.

The second section of this measure states as follows:

> ***Carpool, Bicycle, Walk and Transit Access for Construction Workers*** – To minimize parking demand and vehicle trips associated with construction workers, the construction contractor could include as part of the Construction Management Plan methods to encourage carpooling, bicycle, walk and transit access to the project site by construction workers (such as providing transit subsidies to construction workers, providing secure bicycle parking spaces, participating in free-to-employee ride matching program from www.511.org, participating in emergency ride home program through the City of San Francisco (www.sferh.org), and providing transit information to construction workers.

This section contradicts common sense and common knowledge. It is common knowledge that few construction workers will use a bicycle, walk or use transit to travel to and from work - for compelling reasons. Many workers carry their personal tools and equipment with them each day; it is impractical to do this while walking, bicycling or riding transit. Construction work often involves strenuous physical labor. Consequently, even if not carrying tools and equipment, construction workers are normally disinclined to walk or bike to and from work. Because of the physical labor aspect, construction workers are frequently dirty and sweaty on the homebound commute. Because of this, construction workers are themselves uncomfortable and make other riders uncomfortable if they ride transit. Because these considerations are well known, it is ridiculous and cynical for the City to pad the DSEIR with useless statements such as that reproduced above.

<u>Mitigation Measure M-TR-2</u>

This sequence of mitigation measures purportedly reduces the effects of Impact TR-2 (that the proposed Project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park) even though the impacts are still classified Significant and Unavoidable with Mitigation (SUM). While many of the measures sound potentially useful, close consideration reveals they do not have quantifiable effects, they affect conditions that are not part of the original quantification of impact or they are ineffective in changing the behavior of the problem traveler population. We consider the mitigation measures for Impact TR-2 in sequence.

Mitigation Measure M-TR-2a: Additional PCOs during Events

This measure involves providing four more PCOs during events than the Project's proposed TMP and suggests 5 intersections where they may be deployed. The problem with this is that while PCOs can help prevent unnecessary degeneration of conditions (such as drivers 'blocking the box' or jaywalkers obstructing lanes on the green phase, they cannot cure fundamental LOS E or F conditions.

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts

This measure involves fourteen itemized strategies in four subgroups. The lead in states:

"The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies that could be implemented by the City or other public agency (e.g., Caltrans)."

Critical words here are "if feasible". CEQA requires that "feasible mitigation" be developed. If there is any doubt at this point about the feasibility of the mitigation proposals, they cannot be presented in the DSEIR as mitigation.

Strategies to Reduce Traffic Congestion

 The City to work with Caltrans to install changeable message signs upstream of key entry points onto the street network, such as on I-280 northbound.

Variable message signing only helps LOS if there are uncongested routes to which traffic can be directed. The variable message signs placed on the freeway approaches to Candlestick Park when the 49ers still played there were noteworthy in their uselessness because there were no uncongested routes to which traffic could be directed.

 The City to provide coordinated outreach efforts to surrounding neighborhoods to explore the need/desire for new on-street parking management strategies, which could include implementation of time limits and Residential Parking Permit program areas.

Neighborhood parking conditions and parking permit programs have nothing to do with the LOS E and F conditions at major intersections that are the object of mitigation in this item. The proposal is irrelevant.

 The project sponsor to offer for pre-purchase substantially all available on-site parking spaces not otherwise committed to office tenants, retail customers or season ticket holders, and to cooperate with neighboring private garage operators to presell parking spaces, as well as notify patrons in advance that nearby parking resources are limited and travel by non-auto modes is encouraged.

Preselling parking so that drivers have a fixed destination they can travel to directly instead of circling blocks looking for parking is a good idea. But it solves a problem not accounted for in the DSEIR's original measurement of impact. The DSEIR's underlying traffic assignments all assume drivers are destined for explicit destinations, not milling about looking for one. So this would not reduce the LOS impacts forecast.

 The project sponsor to create a smart phone application, or integrate into an existing smart phone application, transportation information that promotes transit first, allows for pre-purchase of parking and designates suggested paths of travel that best avoid congested areas or residential streets such as Bridgeview north of Mission Bay Boulevard and Fourth Street.

The problem with this entry is similar to some of the prior entries. At event times, there really are no uncongested paths to the Project vicinity, pre-purchase of parking helps solve a problem unaccounted for in the intersection LOS computations, keeping people out of residential streets is inconsistent with the supposed objective of reducing congestion at major intersections and people driving and using the app to find parking or avoid most congested routes are likely inured to transit first promotional messages.

 The City and the project sponsor to work to identify off-site parking lot(s) in the vicinity of the event center, if available, where livery and TNC vehicles could stage prior to the end of an event.

This is a worthwhile action. But it avoids an on-street clutter of pick-up activity that was not accounted for in the original intersection LOS impact estimates. Hence, it does not mitigate the impact disclosed.

 The City to include on-street parking spaces within Mission Bay in the expansion and permanent implementation of SF*park*, including installation of sensors, dynamic pricing, and smart phone application providing real-time parking availability and cost.

This is a worthwhile action. But again, it helps solve a problem that is not reflected in the DSEIR intersection LOS analysis – that of vehicles cruising the area searching for parking. The 'searching' traffic would be additive to the traffic that was considered in compiling the LOS impacts.

 The City shall work to include the publicly accessible off-street facilities into the permanent implementation of SF*park*, and incorporate data into a smart phone application and permanent dynamic message signs.

The problem with this is the same issue as above – the 'searching' traffic it may reduce was never considered in the DSEIR's analysis. Hence, it does not reduce the LOS impacts as disclosed.

 If necessary to support achievement of non-auto mode shares for the project, the project sponsor shall cooperate with future City efforts for active interventions to effectively manage and price the parking supply in the project vicinity to reduce travel by automobile, thus improving traffic conditions.

The problem with this proposed mitigation measure is twofold. First, the project sponsor does not control most of the parking event attendees may use in the Project vicinity. Hence, it cannot meaningfully "manage and price" the parking supply. Second, for the 2015-16 basketball season, Warriors individual game tickets at season ticketholder prices range from $30 to $60 in the upper deck and from $85 to $550 in the lower deck. Season ticketholder per game prices for the recent 2015 playoffs ranged from $100 to $165 (upper deck) and from $210 to $1050 (lower deck) in the first round to, in the final round, from $230 to $345 (upper deck) and $525 to $2000 (lower deck). At these ticket prices, very few of the attendees who haven't already chosen to ride transit for other reasons are going to be sensitive enough to parking pricing to change mode. So this strategy is unlikely to be effective.

 The project sponsor to seek partnerships with car-sharing services.

Given the above ticket pricing inference as to the economics of event goers, it is doubtful that car-sharing partnerships would have quantifiable effect on travel habits or the ultimate intersection LOS impacts. Hence, there is no mitigation.

Strategy to Enhance Non-auto Modes

 The project sponsor to provide a promotional incentive (e.g., show Clipper card or bike valet ticket for concession savings, chance to win merchandise or experience, etc.) for public transit use and/or bicycle valet use at the event center.

Given the above ticket pricing inference as to the economics of event goers, it is doubtful that the suggested incentives would have any effect on travel habits or the ultimate intersection LOS impacts. Hence, there is no mitigation.

Strategies to Enhance Transportation Conditions in Mission Bay and Nearby Neighborhoods

 The project sponsor to participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and to notify at least one month prior to the start of any non-GSW event with at least 12,500 expected attendees. If commercially reasonable circumstances prevent such advance notification, the GSW shall notify the MBBTCC within 72 hours of booking.

The notification provided herein is useful to set the ordinary event traffic management procedures in place for the scheduled date. However, there is no inference that this would change the intersection LOS impacts disclosed in the DSEIR. Hence, there is no mitigative effect.

 The City and the project sponsor to meet to discuss transportation and scheduling logistics following signing any marquee events (national tournaments or championships, political conventions, or tenants interested in additional season runs: NHL, NCAA, etc.).

Again, the notification provided herein is useful to set the ordinary event traffic management procedures in place for the scheduled date. However, there is no inference that this would change the intersection LOS impacts disclosed in the DSEIR. Hence, there is no mitigative effect.

Strategies to Increase Transit Access

 The City to coordinate with regional providers to encourage increased special event service, particularly longer BART and Caltrain trains, and increased ferry and bus service.

If the City really wanted to mitigate the significant impacts on intersection LOS, instead of just asking the regional service providers for more services, it should condition the Project to pay the regional providers for the incremental cost of such services over fare revenue generated. Otherwise, the measure as constituted is unenforceable and ineffective.

 The City to work in good faith with the Water Emergency Transportation Agency, the project sponsor, UCSF, and other interested parties to explore the possibility of construction of a ferry landing at the terminus of 16th Street, and provision of ferry service during events.

Discussing possibilities is not mitigation. If the City wants to have this measure as an effective mitigation, it must condition the Project to contribute a fair-share payment to the ferry landing, if developed, and to pay fair share incremental costs over fare revenues for ferry operations.

The next section of mitigation for Project Impact TR-2 counts on the Mission Bay FSEIR Mitigation Measure E.47: the Transportation System Management Plan.

However, the effects of those portions of that TSM Plan that have been implemented have been absorbed and are reflected in the existing baseline counts that underlie this DSEIR's disclosures of impact TR-2. To constitute effective mitigation for the subject Project, this DSEIR should identify the specific elements of the hypothetical Mission Bay FSEIR Mitigation Measure E.47 that have actually been implemented and what enhancements to it this Project needs to carry out. For instance, considering the elements of Mission Bay FSEIR Mitigation Measure E.47 the following observations can be made.

> *FSEIR Mitigation Measure E.47.a*: Shuttle Bus - Operate shuttle bus service between Mission Bay and regional transit stops in San Francisco (e.g., BART, Caltrain, Ferry Terminal, Transbay Transit Terminal), and specific gathering points in major San Francisco neighborhoods (e.g., Richmond and Mission Districts).

To be effective mitigation, the DSEIR must disclose what additions to shuttle routes and times of service would be needed to alter conditions reported in Impact TR-2 and commit the Project to implement them.

> *FSEIR Mitigation Measure E.47.b*: Transit Pass Sales - Sell transit passes in neighborhood retail stores and commercial buildings in the Project Area.

The effect of this measure is not quantifiable as mitigation. It is doubtful that anyone who might use transit to and from the Project site is deterred from doing so for want of a convenient location selling transit passes.

> *FSEIR Mitigation Measure E.47.c*: Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers.

While transit subsidies might alter the commute modes of some daytime employees at the Project, given the composition of uses proposed, it is unclear how many employers would be characterized as "major" and consequently, how many employees would be qualified for subsidies. Hence, the effect of this measure cannot be quantified.

> *FSEIR Mitigation Measure E.47.e*: Secure Bicycle Parking - Provide secure bicycle parking area in parking garages of residential buildings, office buildings, and research and development facilities. Provide secure bicycle parking areas by 1) constructing secure bicycle parking at a ratio of 1 bicycle parking space for each 20 automobile parking spaces, and 2) carry out an annual survey program during project development to establish trends in bicycle use and to estimate actual demand for secure bicycle parking and for sidewalk bicycle racks, increasing the number of secure bicycle parking spaces or racks either in new buildings or in existing automobile parking facilities to meet the estimated demand. Provide secure bicycle racks throughout Mission Bay for the use of visitors.

This measure might change the mode of choice of a few daytime employees or visitors to the site who would otherwise not use bicycle but it

is not likely to change the choices of event attendees, particularly in the evening or evening workers.

> *FSEIR Mitigation Measure E.47.f*: Appropriate Street Lighting - Ensure that streets and sidewalks in Mission Bay are sufficiently lit to provide pedestrians and bicyclists with a greater sense of safety, and thereby encourage Mission Bay employees, visitors and residents to walk and bicycle to and from Mission Bay.

Since adequate lighting is a prerequisite of any modern urban development, it is unlikely that this measure would change the mode splits the DSEIR already projects in disclosing impact TR-2. The measure has no. quantifiable mitigation effect.

> *FSEIR Mitigation Measure E.47.g*: Transit and Pedestrian and Bicycle Route Information - Provide maps of the local and citywide pedestrian and bicycle routes with transit maps and information on kiosks throughout the Project Area to promote multi-modal travel.

The amount of change in the mode choice pattern the DSEIR already projects that provision of this information would result in is not quantifiable. Hence, there is no clear mitigation of Impact TR-2.

> *FSEIR Mitigation Measure E.47.h*: Parking Management Strategies - Establish parking management guidelines for the private operators of parking facilities in the Project Area.

This measure is so vague that consequences of it are not quantifiable. Hence, there is no clear mitigation of Impact TR-2.

> *FSEIR Mitigation Measure E.47i*: Flexible Work Hours/Telecommuting - Where feasible, offer employees in the Project Area the opportunity to work on flexible schedules and/or telecommute so they could avoid peak hour traffic conditions.

This FSEIR mitigation measure does nothing to address the Project's special event transportation impacts in the PM peak and Early Evening hours.

> *FSEIR Mitigation Measure E.49*: Ferry Service - Make a good faith effort to assist the Port of San Francisco and others in ongoing studies of the feasibility of expanding regional ferry service. Make good faith efforts to assist in implementing feasible study recommendations.

As previously noted in the context of other mentions of ferry service, this item does not qualify as mitigation for the DSEIR subject project since the DSEIR has failed to determine that ferry service is feasible and since it does not condition the Project to take qualifying actions such as paying fair share contributions to development of a ferry landing serving the Project or paying a fair share of the incremental cost of ferry operations over revenue.

Impact and Mitigation Measure TR-5

The DSEIR finds that the Project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity and finds it significant and unavoidable with mitigation (SUM). However, many of the purported mitigations disclosed are fatally flawed as demonstrated below.

> **Mitigation Measure M-TR-5a: Additional Caltrain Service**
> As a mitigation measure to accommodate transit demand to and from the South Bay for weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

Coordination does not qualify as mitigation. Doing something substantial such as offering to pay for incremental cost of additional services over revenues is necessary to consider this as mitigation. And determining the need for special service should have been done in this DSEIR, not deferred to subsequent surveys.

> **Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service**
> As a mitigation measure to accommodate transit demand to the North Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Golden GateTransit and WETA to provide additional ferry and/or bus service from San Francisco following weekday and weekend evening events. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

The same comment as immediately above applies. M-TR -5b does not qualify as mitigation under CEQA.

In summary, as these examples demonstrate, the measures proposed in an attempt to mitigate the Project's significant impacts lack substance, and their feasibility is still undetermined. Hence, the attempt at disclosing feasible mitigation is inadequate under CEQA.

Excessively Distant Time Frame and Massive Development Assumptions Masks Significance of Project's Nearer Term Cumulative Impacts

The cumulative analysis of the Project's transportation and circulation impacts is done in the context of a Year 2040 (25 years hence) plan-based development scenario. That scenario assumes development in Downtown, the SOMA and

Mission Bay that would add 162,000 new PM peak hour trips over existing[15]. Per DSEIR Table 5.2-22, the Project, at its highest PM peak hour trip generation intensity (with an evening capacity basketball game scheduled) would generate some 4599 person trips. This is only 2.84 percent of the new downtown-SOMA-Mission Bay trips projected in the 2040 cumulative analysis. As previously noted, San Francisco transportation impact thresholds require a project to add 5 percent to critical movements at an intersection already at unacceptable LOS, 5 percent to vehicle density on freeway ramps already at unacceptable levels, and 5 percent to MUNI ridership on screen lines and specific routes already exceeding acceptable percentages of capacity. Because the Project comprises only 2.84 percent of the PM peak hour core area trip growth contemplated in the cumulative analysis, it is highly unlikely that this Project, or any project of similar size, or even nearly double its size, could ever be found to cause transportation impacts that are cumulatively significant, given the nature of the impact thresholds and the distant and bloated development scenario that is the context of the cumulative transportation impact analysis of the Project. A more reasonable cumulative analysis would consider a future analysis year of, say, 10 years forward, and consider other development projects and transportation infrastructure projects that are reasonably foreseeable in that time frame. The cumulative analysis should be redone in that or similar context.

While on this subject, it is worthwhile considering the transportation forecast model relied upon in the cumulative analysis – SF Champ. This is a model that, by its nature, is intended to provide information guiding major planning development policy decisions and major transportation investment decisions. It is not intended, or suitable, for providing microscale information at the level of transportation impact assessment of individual development projects on intersections, freeway ramps, individual transit lines and so on. This is evident in the validation statistics of the model. On traffic *screenlines* its validation accuracy is within 10 percent on only 80 percent of the screenlines tested[16]. Its accuracy on individual roadways and intersections would be significantly less. Since the criterion of significant cumulative impact at unsatisfactory intersections and ramps is a 5 percent contribution to the traffic at that location, the accuracy of the model is less than the impact threshold that the environmental analysis is attempting to measure. So using this forecast model for an EIR type micro-analysis is like using a sledge hammer or pile driver to drive a common pin. The lesson in this is that the City should be using a project-based build-up analysis over a shorter term future to develop the cumulative scenario.

Conclusion

---

[15] *San Francisco Transportation Plan 2040, Appendix C, Core Circulation Study*, SFMTA, 2013.
[16] See *San Francisco Transportation Forecasting Model Final Report, Executive Summary*, San Francisco County Transportation Authority by Cambridge Systematics, October 1, 2002.

Due to all of the foregoing, the DSEIR transportation and circulation section is inadequate. The document must be completely revised, a revision that will involve disclosure of significant new information. Hence, the document should be recirculated in draft status for a full 45 day review period.

Sincerely,

Smith Engineering & Management, 1993 to present. President.
DKS Associates, 1979 to 1993. Founder, Vice President, Principal Transportation Engineer.
De Leuw, Cather & Company, 1968 to 1979. Senior Transportation Planner.
Personal specialties and project experience include:

Litigation Consulting. Provides consultation, investigations and expert witness testimony in highway design, transit design and traffic engineering matters including condemnations involving transportation access issues; traffic accidents involving highway design or traffic engineering factors; land use and development matters involving access and transportation impacts; parking and other traffic and transportation matters.

Urban Corridor Studies/Alternatives Analysis. Principal-in-charge for State Route (SR) 102 Feasibility Study, a 35-mile freeway alignment study north of Sacramento. Consultant on I-280 Interstate Transfer Concept Program, San Francisco, an AA/EIS for completion of I-280, demolition of Embarcadero freeway, substitute light rail and commuter rail projects. Principal-in-charge, SR 238 corridor freeway/expressway design/environmental study, Hayward (Calif.) Project manager, Sacramento Northeast Area multi-modal transportation corridor study. Transportation planner for I-80N West Terminal Study, and Harbor Drive Traffic Study, Portland, Oregon. Project manager for design of surface segment of Woodward Corridor LRT, Detroit, Michigan. Directed staff on I-80 National Strategic Corridor Study (Sacramento-San Francisco), US 101-Sonoma freeway operations study, SR 92 freeway operations study, I-880 freeway operations study, SR 152 alignment studies, Sacramento RTD light rail systems study, Tasman Corridor LRT AA/EIS, Fremont-Warm Springs BART extension plan/EIR, SRs 70/99 freeway alternatives study, and Richmond Parkway (SR 93) design study.

Area Transportation Plans. Principal-in charge for transportation element of City of Los Angeles General Plan Framework, shaping nations largest city two decades into 21'st century. Project manager for the transportation element of 300-acre Mission Bay development in downtown San Francisco. Mission Bay involves 7 million gsf office/commercial space, 8,500 dwelling units, and community facilities. Transportation features include relocation of commuter rail station; extension of MUNI-Metro LRT; a multi-modal terminal for LRT, commuter rail and local bus; removal of a quarter mile elevated freeway; replacement by new ramps and a boulevard; an internal roadway network overcoming constraints imposed by an internal tidal basin; freeway structures and rail facilities; and concept plans for 20,000 structured parking spaces. Principal-in-charge for circulation plan to accommodate 9 million gsf of office/commercial growth in downtown Bellevue (Wash.). Principal-in-charge for 64 acre, 2 million gsf multi-use complex for FMC adjacent to San Jose International Airport. Project manager for transportation element of Sacramento Capitol Area Plan for the state governmental complex, and for Downtown Sacramento Redevelopment Plan. Project manager for Napa (Calif.) General Plan Circulation Element and Downtown Riverfront Redevelopment Plan, on parking program for downtown Walnut Creek, on downtown transportation plan for San Mateo and redevelopment plan for downtown Mountain View (Calif.), for traffic circulation and safety plans for California cities of Davis, Pleasant Hill and Hayward, and for Salem, Oregon.

Transportation Centers. Project manager for Daly City Intermodal Study which developed a $7 million surface bus terminal, traffic access, parking and pedestrian circulation improvements at the Daly City BART station plus development of functional plans for a new BART station at Colma. Project manager for design of multi-modal terminal (commuter rail, light rail, bus) at Mission Bay, San Francisco. In Santa Clarita Long Range Transit Development Program, responsible for plan to relocate system's existing timed-transfer hub and development of three satellite transfer hubs. Performed airport ground transportation system evaluations for San Francisco International, Oakland International, Sea-Tac International, Oakland International, Los Angeles International, and San Diego Lindberg.

Campus Transportation. Campus transportation planning assignments for UC Davis, UC Berkeley, UC Santa Cruz and UC San Francisco Medical Center campuses; San Francisco State University; University of San Francisco; and the University of Alaska and others. Also developed master plans for institutional campuses including medical centers, headquarters complexes and research & development facilities.

Special Event Facilities. Evaluations and design studies for football/baseball stadiums, indoor sports arenas, horse and motor racing facilities, theme parks, fairgrounds and convention centers, ski complexes and destination resorts throughout western United States.

Parking. Parking programs and facilities for large area plans and individual sites including downtowns, special event facilities, university and institutional campuses and other large site developments; numerous parking feasibility and operations studies for parking structures and surface facilities; also, resident preferential parking .

Transportation System Management & Traffic Restraint. Project manager on FHWA program to develop techniques and guidelines for neighborhood street traffic limitation. Project manager for Berkeley, (Calif.), Neighborhood Traffic Study, pioneered application of traffic restraint techniques in the U.S. Developed residential traffic plans for Menlo Park, Santa Monica, Santa Cruz, Mill Valley, Oakland, Palo Alto, Piedmont, San Mateo County, Pasadena, Santa Ana and others. Participated in development of photo/radar speed enforcement device and experimented with speed humps. Co-author of Institute of Transportation Engineers reference publication on neighborhood traffic control.

Bicycle Facilities. Project manager to develop an FHWA manual for bicycle facility design and planning, on bikeway plans for Del Mar, (Calif.), the UC Davis and the City of Davis. Consultant to bikeway plans for Eugene, Oregon, Washington, D.C., Buffalo, New York, and Skokie, Illinois. Consultant to U.S. Bureau of Reclamation for development of hydraulically efficient, bicycle safe drainage inlets. Consultant on FHWA research on effective retrofits of undercrossing and overcrossing structures for bicyclists, pedestrians, and handicapped.

RE: Draft Subsequent EIR Informational Sufficiency Review for Golden State Warriors Arena
aka - Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (SCN:2014112045)

Mr. Lippe,

This letter summarizes the professional opinions of Larry Wymer, licensed California Traffic Engineer (#1955), on the informational sufficiency of the Draft Subsequent Environmental Impact Report (DSEIR) for the proposed Golden State Warriors Arena. Henceforth, "DSEIR" will refer to the arena project's DSEIR

Per your request, I reviewed specific aspects of the DSEIR focusing on transportation and circulation. My Curriculum Vitae is attached outlining my 26 years of consulting experience in traffic engineering/transportation planning.

My opinions are outlined below.

OPINION 1 - The DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development

The defined study area for the DSEIR is taken to be a subsection of the study area identified for the "Mission Bay Final Subsequent Environmental Impact Report", from which the DSEIR was tiered. Since the Mission Bay FSEIR was completed in 1998, the assumptions included therein are presently 17 years old and require appropriate revisions, and possibly expansions beyond those assumed within that report, to provide a similar level of impact analysis as provided therein.

Numerous San Francisco regional planning documents conclude that auto trips within and adjacent to the DSEIR's study area will increase significantly up to the 2040 cumulative year horizon. Specifically, the "2040 San Francisco Transportation Plan" concludes that daily auto trips within the "SoMa/Mission Bay" (South of Market/Mission Bay) regions along roadways arena traffic would travel will grow by the following percentages between 2012 and 2040:[1]

- Overall SoMa/Mission Bay auto trips (2012-2040) = +82% (+125,000 vehicles)
- So/Ma between Downtown Core & I-80 (2012-2040) = +42%
- So/Ma (south of I-80) to Mission Bay = +174%

[1] San Francisco Transportation Plan 2040, Appendix K: SF Travel At a Glance

The DSEIR provides six figures showing "Project Vehicle Trip Patterns to Major Parking Facilities" serving the arena. **Table 1** summarizes the information within these figures establishing the trip percentages that travel to/from or through the SoMa and North Mission Bay areas.

Table 1
Project Vehicle Trip Patterns to Major Parking Facilities
North Mission Bay & South SoMa

Figure	Page	Figure Title	Trip Assignment Along Roadway: Seventh St s/o Townsend St	Fourth St s/o Townsed St	King St e/o Third St	from WB I-80 to Fifth St
5.2-14A	5.2-95	Project Vehicle Trip Patterns to Major Parking Facilities - Inbound Weekday PM Peak Hour - No Event and Convention Event	18% / 22%	7% / 7%	5% / 11%	8% / 7%
5.2-14B	5.2-96	Project Vehicle Trip Patterns to Major Parking Facilities- Outbound Weekday PM Peak Hour - No Event and Convention Event	19% / 19%	7% / 12%	5% / 5%	8% / 8%

Source: "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" DSEIR (June 5, 2015)

The table above establishes that the arterials within the northern portion of the study area will experience significant increases in traffic volumes ranging from 9% to 32%. At issue for much of this traffic is where the traffic will originate.

Table 5.2-23 (page 5.2-85), and corresponding text on pages 5.2-84 to 5.2-86, describes expected trip distribution patterns to the project site from attendees arriving from the downtown area, with increased numbers on weekdays due to attendees traveling to the study area directly from their jobs downtown:

> *The origin/destination distribution range for a weekday basketball game reflects an adjustment for event attendees who would travel to the event center directly from work rather than from their place of residence. The adjustment was based on a survey of Golden State Warriors season ticket holders (see Appendix TR). As shown in Table 5.2-23, the number of trips starting in San Francisco on a weekday is projected to be about 7.5 percentage points greater than on a weekend, with the corresponding reductions in trips arriving from the East Bay (2 percentage points), North Bay (4 percentage points), and South Bay (1.5 percentage points) areas. The majority of visitor trips to a convention event, retail, office, and restaurant uses would be from within San Francisco (70 to 81 percent), followed by South Bay (9 to 10 percent), and then East Bay (3 to 9 percent) origins/destinations.*

Because these attendees will be arriving largely from the high employment areas in and near downtown, significant numbers of attendees would be required to pass through the SoMa area and northern portion of the DSEIR's defined study area to arrive at either the stadium or one of the ancillary land uses (i.e. restaurants) in the vicinity of the proposed arena. And because these attendees will be travelling to the arena directly from work, it can be reasonably assumed many (if not most) would initiate their trip within the later part of the PM peak period (i.e. 5:00/5:30 to 6:00

pm). Thus it can be expected many intersections north of those studied within the DSEIR (i.e. from north of Market Street to south of King Street) will experience large increases in PM peak hour traffic volumes as a result of this Project.

When these project volumes are combined with the 42% to 174% increases within this same area (from north of Market Street to south of King Street), the potential impacts are compounded necessitating the need to widen the study area northward towards downtown. Thus the increases in both cumulative background and project traffic volumes, particularly during weekday PM peak hour periods, requires widening the study area beyond that included within the Mission Bay Blocks 29-32 DSEIR, and beyond the study area within the 1998 "Mission Bay Final Subsequent Environmental Impact Report" from which the more recent DSEIR was tiered.

A revised SEIR should expand the study area northward to at least Market Street, an area henceforth referred to as the "expanded study area". For planning purposes, the expanded study area into north Mission Bay and SoMa is assumed to be northward from the existing study area within an area bounded generally by 8th Street to the west, Market Street to the north between 8th Street and The Embarcadero, northward along The Embarcadero to Broadway, and the San Francisco Bay to the east. A few additional intersections are included in the neighborhood east of the I80/US-101 interchange.

Further justification for expanding the study area northward is provided in Opinion 2 below.

The following opinion will almost exclusively focus on weekday PM peak hour conditions since that is the time period my proposed expanded analysis is assumed will largely experience the most significant impacts.

OPINION 2 - The DSEIR's Transportation and Circulation analysis does not analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas, most notably those between Market Street and King Street

To assist in reviewing the adequacy of the DSEIRs study area limits, I reviewed the draft traffic study (in memorandum format) for the previous proposed arena site. That memorandum report was titled *"Travel and Parking Demand Estimates for the Proposed Event Center and Mixed Use Development at Piers 30-32 and Seawall Lot 330";* stamped "Draft-Subject to Revisions; dated August 9, 2013; submitted by Jose I. Farran of Adavant Consulting; and submitted to the San Francisco Planning Department (Brett Bollinger, Chris Kern and Viktoriya Wise), Orion Environmental (Joyce Hsiao), and Environmental Science Associates (Paul Mitchell). The traffic study for this earlier proposed arena will henceforth be referred to as the "2013 memorandum traffic study," or "2013 arena study" within tables.

Although the arena analyzed in the 2013 memorandum traffic study was also originally proposed to be located south of I-80 (same as the currently proposed arena), trip distribution patterns and intersections identified as critical intersections warranting study stretches significantly further northward into and through the entire SoMa area, with a few even included north of Market Street. Since both versions of the arena project are located south of I-80, traffic arriving at the respective arena sites would include traffic originating from the downtown areas as described in Opinion 1, traffic would travel southeastward along SoMa arterials and through SoMa intersections to both sites, and traffic would also pass through still more intersections within the first several blocks south of I-80. The original 2013 memorandum traffic study analyzed 12 intersections north of I-80 and 10 intersections between I-80 and King Street, whereas none of these 22 intersections were analyzed within the DSEIR. A review of trip distribution patterns for both versions of the project reveal that trip distribution and assignment patterns are not substantially different between the two, however the DSEIR fails to reflect this reality with a noticeable absence of much needed analysis of the critical intersections identified in the traffic study for the earlier site.

Table 2 provides a summary of 27 study intersections located within the SoMA area and blocks north and south of I-80 which were analyzed within the 2013 memorandum traffic study, and the PM peak hour levels of service which

were established therein for Existing (No Project), Existing Plus Project, and Existing Plus "No Event" Project conditions. The table also notes that 10 of these 27 intersections were analyzed within the1998 Mission Bay DSEIR, yet only 5 of those 10 intersections (and 5 of the 27) were analyzed within the DSEIR. And finally, the table shows that 13 of the 22 intersections neglected in the DSEIR would operate at deficient level of service (LOS) E or F operations for no project and/or plus project conditions.

NOTES:

Deficient LOS E or F within 2015 DSEIR LOS analysis.

[1] = Analyzed in Original 2013 Arena Study - "Event Center & Mixed-Use Development at Piers 30-32 & Seawall Lot 330" (GSW P30-32 LOS_Table 052815_FP.xlsx)(pg TR-783)

[2] = Analyzed in 1998 "Mission Bay Final Subsequent Envirorонmental Impact Report"

[3] = Analyzed in 2015 "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" (SCN:2014112045).
Table only considers study intersections north of the proposed project site, thus study intersections #6 through #22 of the DSEIR are neglected herein.

[4] = Incomplete data from memoranudm traffic study indicates deficient LOS E &/or F but no specifics regarding intersection #, delays, and which scenarios are projected to experience LOS E/F.

The information provided in the Table above supports Opinion 1 that the DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development, and that by extension the DSEIR's Transportation and Circulation analysis also does not adequately analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas.

Based on the deficient levels of service identified in the table above which the proposed project would potentially add significant traffic volumes, a revised SEIR should add (at a minimum) the following 13 study intersections from the expanded study area identified above.

1) Mission Street / The Embarcadero
2) Howard Street / The Embarcadero
3) Folsom Street / The Embarcadero
4) Harrison Street / The Embarcadero
5) Bryant Street / The Embarcadero
6) Townsend Street / The Embarcadero
7) King Street / Second Street
8) Harrison Street / Main Street
9) Bryant Street / Beale Street
10) Folsom Street / Freemont Street
11) Harrison Street / First Street
12) Bryant Street / Fourth Street
13) Bryant Street / Second Street

Further justification for adding these 13 intersections is provided below.

Table 3 (divided into 3 sections 3a, 3b and 3c) summarizes a review of all of the CEQA Documents and notices for non-SFPUC projects consisting of Environmental Impact Reports, Negative Declaration, NOPs, etc. which were listed on the City/County of San Francisco's Planning Department Website as of July 17, 2015.[2] Each of the projects were reviewed to establish the location of the project relative to the arena, and more importantly if traffic generated by the project would impact any intersections the arena might also impact.

If a cumulative project is located both well outside of the expanded study area, and it can be reasonably concluded the project would add little to no traffic to potential study intersections within the expanded study area, the project was eliminated from further consideration and not included in Table 3.

If the cumulative project was located near the expanded study area with the potential to add traffic volumes to potential study intersections within the expanded study area, the project was reviewed further to make a determination whether or not it should be added to Table 3.

If a cumulative project was located within the general boundaries of the expanded study area, it was included in Table 3 regardless of whether an EIR had been prepared or the project was at the initial NOP stage with study intersections yet to be determined.

For those projects which have an EIR and corresponding traffic impact study, I reviewed the traffic impact study with particular attention to trip distribution and study intersection graphics, and LOS intersection and freeway ramp operations analysis tables. I noted any study intersections located within the expanded study area described in Opinion 1 which were found to operate at a deficient level of service for weekday PM peak hour conditions for any scenario whether it be existing, cumulative, no project, plus project, etc. These intersections, along with corresponding deficient delays and LOS E and/or F operations, are noted in Table 3.

If the proposed project was located within the expanded study area itself, it is included in Table 3 whether it has completed an EIR with corresponding LOS tables, or simply an NOP with no traffic analysis yet. They were included because the project will obviously add some level of (yet to be determined) traffic to (yet to be determined) study intersections in the expanded study area, some of which might be newly added study intersections for the arena

[2] http://www.sf-planning.org/index.aspx?page=3562

project. Cumulative NOP projects without an EIR or traffic impact study are included for future planning purposes with the assumption an EIR and traffic impact study might be ready when a review is initiated to establish a revised scope and study area for a revised DSEIR. In the meantime, Table 3 includes an "NA" (not applicable) notation in place of a list of intersections operating at deficient levels of service.

Note that Table 3 is considered a planning level tool. Because a more detailed analysis will need to be performed at a later time to establish trip distribution and assignment patterns through the expanded study area, there is at present some uncertainty regarding the complete list of intersections within the expanded study area which will warrant study. Although an initial list of additional study intersections is provided below which in my opinion satisfies that criteria, it is not comprehensive and requires additional planning level analysis to expand to a full list. Thus without foresight regarding what intersections may or may not be included within that final list, and in the interest of providing an initial list of potential study intersections, Table 3 simply lists any and all study intersections identified as operating deficiently within the expanded study area within any EIR or traffic study.

Table 4 (divided into tables 4a and 4b due to length) combines and refines information provided within Tables 2 and 3 to provide a better planning level focus on the selection of study intersections within the expanded study area. It includes all of the intersections identified and included within Table 2 and/or Table 3. The table is organized with intersections separated into five different categories with those within the top most section being those which in my opinion absolutely satisfy the criteria of requiring analysis within a revised DSEIR, and those at the bottom of the list not requiring analysis unless a future screening analysis included them. A full and complete list of additional study intersections should be determined through a planning level analysis which considers trip distribution and assignment through the SoMa and northern Mission Bay areas north and south of I-80.

For clarity, intersections are organized within Table 4 with a specific order. For example, intersection "A"/"B" is such that street "A" consists of the northwest-southeast street (i.e. The Embarcadero, 1st St, 2nd St, ... , 7th St, 8th St, etc.) and street "B" consists of the southwest-northeast street (i.e. Market St, Mission St, ... , Harrison St, Bryant St, Brannan St, Bryan St, King St, Berry St, etc.). Additionally, lists of intersections are ordered beginning in the northeast (i.e. The Embarcadero/Broadway) and ending in the southwest (i.e. 8th St/Berry St).

The first five intersections (included within Table 4a) were already included within the DSEIR and are assumed would be included within the revised DSEIR. They are included simply to provide a full list of the intersections included in the 2013 memorandum traffic study.

The second set of intersections (also included within Table 4a) are comprised of the same thirteen intersections identified above as those which a revised SEIR should add (at a minimum) into the traffic analysis, all of which were also included within the 2013 memorandum traffic study.

The third set of intersections (also included within Table 4a) are comprised of the nine remaining intersections analyzed within the 2013 memorandum traffic study which may or may not be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment process.

The fourth set of intersections (also included within Table 4a) are comprised of the eleven remaining intersections analyzed within the 1998 Mission Bay FSEIR excluded from the 2015 DSEIR which may or may not be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment process.

The fifth and final set of intersections (comprising the entirety of Table 4b) are all of the remaining intersections included within Table 3, some of which may be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment screening process.

OPINION 3 –The DSEIR's Transportation and Circulation analysis understates and fails to disclose and mitigate arena event impacts on PM commute peak travel because it fails to consider the time and duration of attendees travel in advance of passing through venue entry turnstiles

I have reviewed Dan T. Smith Jr.'s opinion within his report dated July 15, 2015 regarding The DSEIR's failure to adequately consider PM peak hour impacts due to its failure to consider the time and duration of attendees travel in advance of their arrival at the turnstile. I agree particularly with his statement that:

"many attendees will, after traveling to the vicinity of the Project site, due to their this stop in neighboring restaurants and bars for drinks or a meal, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles by 30 minutes to an hour or more."

I can personally attest to this dynamic. I have personal experience with 'time of arrival' issues pertaining to the NBA arena where the Sacramento Kings play, presently called 'Sleep Train Arena', but historically called (and still commonly called) 'Arco Arena'. I lived in Sacramento for sixteen years (1996-2012), and during seven of those years (1996-2003) I literally lived within 100 ft of the I-80/Truxel Road interchange. The I-80/Truxel Road interchange is presently 1 of 3 main interchanges providing primary access to the arena, and during the time I lived near the interchange I witnessed the building of the interchange (about 1998, which at the time became the 2nd main interchange providing primary access to the arena). I also witnessed and experienced the development of nearly ALL of the ancillary commercial developments (including restaurants, bars, shopping, etc.) surrounding the arena following the completion of the Truxel interchange. Throughout those seven years I commuted to/from work along the highways and arterials surrounding the arena, and frequented the commercial developments surrounding the arena during and immediately after the PM peak hour period. Thus on each and every game day, whether I personally went to a game myself or not, I experienced first-hand the increased trip generation to ancillary land uses during the later part of the PM peak hour (i.e. 5:00-6:00), experienced increased traffic volumes on I-80 and connecting arterials near the arena, and experienced worsening levels of service and increased delays. In addition to living for a time in the immediate vicinity of the arena, I also attended over 200 NBA games at the arena (as well as dozens of other special events at the arena) throughout the sixteen years I lived in Sacramento. Although I moved to and lived in the Rocklin area between 2003 and 2012, I continued to visit the arena for games, concerts, etc. and would often arrive early to meet with friends and/or frequent one of the many restaurants in the area. Through this experience, I can personally attest to the fact that the ancillary commercial uses surrounding the arena most definitely experiences a significant uptick beginning about 5:00/5:30 pm on game days (and other special events), and that this uptick most definitely increases traffic volumes along I-80, on I-80 freeway ramps to the three interchanges providing primary access to the arena, and along the arterials (and surface streets) surrounding the arena. As part of my research to provide opinions of the sufficiency of review for the proposed Golden State Warriors Arena in Mission Bay, I contacted one of the traffic engineers in the City of Sacramento's Department of Transportation to discuss this 'early arrival' dynamic. He was in agreement that the area most definitely experiences an uptick in traffic and resulting worsening in levels of service during the end of the PM peak period.

Please feel free to give me a call if you have any questions.

Sincerely,

Larry Wymer & Associates Traffic Engineering

Larry Wymer, CA T.E. 1955

Larry Wymer & Associates Traffic Engineering provides traffic/transportation engineering and transportation planning consulting services for development projects, public agencies, and others requiring solutions to their transportation challenges.

Owner Larry Wymer is a licensed traffic engineer with over twenty years of diverse experience covering a full range of traffic and transportation issues, including completion of over 100 traffic impact studies ranging from small single-use developments to large multi-use developments having regional impact. His experience includes working with private clients, as well as public sector clients including Caltrans, numerous Cities and Counties throughout California, and California tribal governments. This experience with both the private and public sectors, and the establishment of successful, positive, working relationships with both private entities and public agency officials, helps to assure that fair and equitable traffic mitigation measures will be identified and/or negotiated when project induced traffic impacts are identified within our client's traffic impact studies. Mr. Wymer is known for his skillful report writing and strict attention to detail which assures that all traffic studies conform to CEQA, Caltrans, and local agency standards, and include well researched, thorough, and detailed analysis which meet the expectation of reviewing agencies.

In addition to his involvement in typical transportation engineering projects, Mr. Wymer brings three years of distinctive experience working with attorneys and expert witnesses to analyze impacts, design conceptual mitigated alternative site designs, and formulate opinions for use in depositions and expert witness testimony for over 100 properties undergoing eminent domain proceedings; as well as investigating, analyzing, reconstructing, and formulating opinions for over 100 accidents.

SERVICES PROVIDED

- Traffic/Transportation Engineering Consulting
- Transportation Planning Consulting
- Traffic Impact Studies (including CEQA level for EIR's)
- Circulation Elements
- Traffic Operations and Flow Analysis
- Project Access & Internal Circulation Analysis
- Traffic Signal Warrant Analysis
- Speed Studies
- Traffic Data Collection (including Peak Hour Intersection Turning Movement Counts)

LARRY C. WYMER
Curriculum Vitae

PROFESSIONAL REGISTRATION

- California T.E. (Traffic Engineer) #TR-1955, February, 1998
- Florida P.E. (Professional Engineer) #47692, February 1994
- Professional Traffic Operations Engineer (P.T.O.E.) #2187, June, 2007

PROFESSIONAL ORGANIZATIONS

- Institute of Transportation Engineers – Northern California Section
  - President (2007-08)
  - Section Administrator (2008-present)
  - Board Member (2004-Present) through positions as Treasurer (2004-05), Secretary (2005-06), Vice President (2006-07), President (2007-08), Past President (2008-09), Section Administrator (2008-present)
  - Various Chairs: Career/Student Guidance Chairperson (1997-2000), Technical Chairperson (1999-2000), Membership Chairperson (2004-present), Archivist (2007-08).
- Institute of Transportation Engineers – Western District (aka District 6 / Western United States)
  - Current Vice Chair for Student Initiatives (2008-present)
  - Current N. CA Section Representative of ITE District 6 Student Endowment Fund Grassroots Committee
  - Candidate for ITE International Director representing Western District (2009-12 term)
  - Candidate for ITE Western District Secretary-Treasurer (2008-09 term)

EDUCATION / HONORS

- University of Texas at Arlington. B.S. in Civil Engineering, 1989
  - President - American Society of Civil Engineers Student Chapter
  - Distinguished Senior Award - Civil Engineering Department
  - Chi Epsilon National Civil Engineering Honor Society
  - Omicron Delta Kappa National Leadership Honor Society
- Recipient of ITE District 6 (Western US District) Presidential Proclamation (2008)

PROFESSIONAL EXPERIENCE

Owner, *Larry Wymer & Associates Traffic Engineering*, El Dorado Hills, CA	Jan 2009 – Present
Manager, Traffic Engineering, *Gene E. Thorne and Associates*, Cameron Park, CA	Oct 2006 – Jan 2009
Senior Transportation Engineer, *Omni Means*, Roseville, CA	Feb 2004 – Sept 2006
Senior Transportation Engineer, *Analytical Environmental Services*, Sacramento, CA	July 2002 – Feb 2004
Manager, Traffic Engineering, *David Evans & Associates*, Roseville, CA	Aug 1999 – July 2002
Senior Transportation Engineer, *CCS Planning & Engineering*, Sacramento, CA	May 1996 – Aug 1999
Transportation Engineer, *Zook, Moore & Associate*, West Palm Beach, FL	Dec 1992 – Nov 1995
Transportation Analyst, *Kimley-Horn & Associates*, Orange, CA	Jan 1992 – Dec 1992
Associate Transportation Engineer, *DKS Associates*, Oakland & Santa Ana, CA	June 1989 – Nov 1991

College Internships

Transportation Technician, *Texas Transportation Institute*, Arlington, TX	Aug 1988 – May 1989
Environmental Technician, *Environmental Protection Agency*, Dallas, TX	Summer 1987

RELEVANT SKILLS / REPRESENTATIVE PROJECTS

OFFICE/BUSINESS MANAGEMENT SKILLS

- Owner of Larry Wymer & Associates Traffic Engineering (2009-present).
- Developed and managed Transportation Engineering Department at Gene E. Thorne & Associates in Cameron Park (2006-2009).
- Managed newly established Transportation Engineering Department of David Evans & Associates' Roseville office (2000-2002).
- Served as interim office manager of CCS Planning and Engineering's Sacramento office during the summer of 1997.
- Former licensed irrigator in Texas - Owner and operator of Forever Green Lawn Irrigation (June 1986 - June 1989) and Co-Operations Manager/Salesman at Sprinkler Engineering Corporation (Feb. 1982-June 1986).

TRANSPORTATION PLANNING

- Project manager/engineer on over 100 traffic impact studies ranging from small single-use developments requiring simple hand trip assignments and operations analysis to large regionally impacting multi-use developments requiring detailed computer analysis. (*NOTE: See attached list of selected traffic impact studies)*
- Project manager/engineer studying the feasibility of potential bypass alternatives for SR-49 traffic between I-80 and North Auburn, as well as traffic continuing to/from Nevada County. Analyzed existing travel patterns through use of video surveys and an associated DMV license plate check, oversaw the development and calibration of a MINUTP traffic model to simulate these patterns, tested ten alternative routes and various improvement strategies to alleviate congestion along the S.R. 49 corridor, and compared and contrasted the relative benefits and impacts associated with each of these alternatives, particularly in terms of how it eases congestion and improves operation of SR-49. Was an integral part of the SR-49 Bypass Study Technical Advisory Committee (TAC).
- Project manager/engineer of transportation/circulation studies for various design options associated with development of the Shingle Springs Rancheria in El Dorado County, a 160 acre site located adjacent to US-50 belonging to the Shingle Springs Band of the Miwok Indians. The latest proposed project includes a 238,500 sq. ft. casino and 250 room hotel with access via a new US-50 interchange. The various studies conformed to both CEQA/NEPA criteria and included: (1) Shingle Springs Hotel-Casino Environmental Assessment (EA), (2) Shingle Springs Medical Clinic-Residential EA, (3) Shingle Springs Interchange Project Study Report (PSR), and (4) Shingle Springs Interchange Project EIR/EA. Worked with El Dorado County traffic engineering personnel to establish analysis methodologies consistent with the El Dorado County General Plan, including helping the County to establish a matrix which outlines specific significant impact thresholds and criteria. The analysis investigated impacts to roadways and highways throughout all of El Dorado County through use of the El Dorado County MINUTP traffic model. The analysis also involved extensive research regarding recreational activity options within El Dorado County which resulted in an establishment of the likely distribution of recreation oriented trips to and from the hotel component of the project. Also an active member of the Project Development Team (PDT).
- Project engineer for Project Study Reports (PSR) for I-80/Elkhorn-Greenback interchange in Sacramento and SR-99/Hammer Lane and SR-99/Wilson Way interchanges in Stockton. Assisted with development of traffic forecasts, performed traffic operation analyses for various alternatives and helped establish final recommended geometrics.
- Project manager/engineer assisting the developer of the Pheasant Run development in the City of Dixon by providing justification to the City of Dixon to change the parcel's zoning from light industrial to residential. Prepared a traffic study using the City's MINUTP model. Presented findings to the city council showing the lessened impacts which would accompany the proposed change in zoning. The city council subsequently approved the project.
- Project engineer performing numerous screenline analyses of fatal impacts associated with the development of Indian gaming casinos at various locations to help casino developers and tribes with the selection or elimination of potential casino locations in and around the San Francisco Bay metropolitan area.
- Project engineer in responsible charge of preparing the first circulation element for the newly incorporated City of Diamond Bar, California. The project included development of a corresponding forecast transportation demand model using EMME/2. Also organized and oversaw a license plate survey which quantified the through traffic along all of the city's arterials. Also prepared circulation element updates for the cities of South Pasadena and Chino Hills.
- Project engineer performing analysis of added trips within various San Diego County sub-regions which would be

generated by new housing and commercial development associated with growth induced by development of the Jamul Indian gaming casino. Trips were established based on the number of jobs which would be established and the number of new homes which would be built to accommodate newly created jobs, with consideration for commutes occurring between and within each sub-region.

- Project engineer involved in the development and post-processing of the Riverside-San Bernardino Regional Transportation Model (RIVSAN) for the Riverside County Transportation Commission (RCTC) using TRANPLAN.
- Assistant project manager/project engineer for initial stages of preparation of the South San Diego County Impact Fee Study.

TRAFFIC ENGINEERING

- Extensive experience analyzing intersection and roadway operations using a variety of methodologies, software applications, and traffic impact study guidelines. Operations analysis includes detailed methodologies requiring use of TRAFFIX and HCM software; more simple critical movement analysis methodologies (i.e. Circular 212, CMA); and straight volume-to-capacity analysis. Experience includes detailed research and surveys for purposes of collecting and establishing existing, proposed and future year field conditions including traffic volumes, geometrics, and signal timings; supplemented as necessary by experienced engineering judgment to establish reasonable assumptions when data is not available.
- Owned and operated business performing traffic data collection services, including peak hour intersection turning movement counts. Organized and supervised data collection crews, summarized traffic data for clients.
- Project manager/engineer for Ridge Road speed study to analyze 85th percentile speeds and safety consideration for establishment of a speed zone in the vicinity of the Jackson Rancheria, including testimony to Amador County Board of Commissioners.
- Project manager/engineer for traffic control analysis of Lincoln Boulevard/Wyandotte Avenue intersection in the City of Oroville. Analyzed the feasibility of various traffic control measures to improve traffic operations at the intersection including signalization, all-way stop, and a round-about, along with opinions of costs for each alternative.
- Project manager/engineer for traffic operations and capacity analysis of design alternatives for a new roundabout intersection providing access to the new Grand Canyon Transit Center.
- Project engineer involved in the traffic engineering element of the Long Beach-Los Angeles Metro Blue Line Light Rail Transit Project. Field manager overseeing the bench and field testing and installation of modified local and central traffic signal control and surveillance software for all 27 traffic signals within the City of Los Angeles. Continued to provide system fine tuning, modifications, and on-call troubleshooting during actual operation of the system. Modified design specifications and prepared final as-built functional specifications and users manuals for the software. Also assisted in the development of the automated traffic signal testing programs created specifically for the project.
- Project engineer in responsible charge of overseeing data collection and analysis of traffic related data for the Contra Costa Transportation Authority's (CCTA) Traffic Service Objective (TSO) Monitoring Study. The study was the first detailed study performed to gauge the degree to which the County's traffic goals were met as compared to specific TSO's developed eight years earlier by CCTA, the five sub-County districts, Contra Costa County, Caltrans, BART and other local transit agencies, and the 20 incorporated cities within the County. Traffic Engineering analysis included level of service analysis for 120 intersection and numerous roadways, travel time studies and vehicle occupancy studies along freeways and dozens of major arterials, transit ridership, park and ride lot utilization, reduction of accidents, and reduction of through truck traffic.
- Project engineer assisting in the redesign of Tropicana Avenue in Las Vegas, Nevada to an 8-lane facility by analyzing intersection design alternatives, and assisting with preparation of final intersection, signal, and roadway designs.
- Principal project engineer for a corridor traffic improvement study for Spring Mountain Road in Las Vegas, Nevada.
- Experience and classroom training in use of TSIS/CORSIM (including TRAF-NETSIM, FRESIM), with ability to construct simulation models using ITRAF or write input code from scratch, and calibrate model with actual field conditions; applications include use in analyzing vehicle progression, signal coordination, and alternatives testing.

CALTRANS INITIAL STUDIES

- Project manager/engineer on seven Initial Studies analyzing impacts associated with roadway and intersection improvements along SR-16 associated with the expansion of the Cache Creek Casino in Yolo County. The first of

seven Initial Studies analyzed impacts associated with revised project access to the casino including a new signalized entrance, two new additional access driveways, and the widening and realigning of SR-16 adjacent to the casino. The other six Initial Studies analyzed impacts associated with improvements at six off-site intersections along SR-16 to accommodate increased traffic volumes associated with the expansion. Also active member of Project Development Team (PDT), and participated in public meeting in the affected community accepting comments on the first of the seven Initial Studies.

BICYCLE ROUTE STUDIES

- Completed the Safety and Transportation Analysis section of the City of Sacramento Bikeway Master Plan Update EIR which addressed safety and traffic related impacts which would be associated with adoption of the proposed plan amendments studied. Issues which were addressed included cyclist safety including shared use of roadways, potential conflicts with traffic, adequacy of roadways to accommodate proposed bikeways, and impacts associated with barriers such as freeways, freeway interchanges, rivers, railroad crossings, and major intersections. The analysis also addressed the consistency of the Bikeway Master Plan Amendment with local and regional transportation plans and programs.

CONSTRUCTION TRAFFIC HANDLING

- Project engineer responsible for evaluating traffic impacts and preparing preliminary traffic handling strategies for SRCSD pipeline construction projects along major arterials in Sacramento County including the 8 mile long Folsom 2 Interceptor and the 34 mile long Northwest Interceptor.
- Project engineer responsible for performing field inspections and assisting in the preparation of PS&E for traffic handling, construction area signing, and pavement delineation along the project corridor for the US-50 Storm Damage Repair Project in Caltrans District 3.

SPECIAL EVENT TRAFFIC MANAGEMENT

- Project engineer responsible for aspects of traffic and parking for the first annual Wings over Stockton Air Show with an attendance of over 100,000 people. Responsibilities included designing and overseeing creation and placement of signing designating routes into and through the City of Stockton to off-site shuttle lots and on-site parking; design of on-site parking including public parking, handicap, and various special pass lots; overseeing actual parking and traffic during the show including coordinating the activities of approximately 250 volunteers and troubleshooting.

EMINENT DOMAIN / SITE DEVELOPMENT & ANALYSIS

- Project engineer involved with analyzing the impacts to over 100 properties undergoing eminent domain proceedings for use in expert witness testimony. Analysis of impacts and design of mitigating cures requires investigation and analysis of numerous issues encompassing many disciplines of civil engineering in addition to traffic engineering, transportation planning, and roadway design. Civil and traffic engineering issues which are typically addressed include site access and circulation, parking, building setbacks and landscape buffers, site drainage, adjacent roadway design, conceptual site redesigns, and preparation of construction cost estimates. Transportation planning issues include concurrency reviews and conceptual traffic impact analysis for both vacant sites and fully developed sites with alternative land use concepts. Work with attorneys as well as marketing experts, appraisers, contractors, and engineers acting as expert witnesses to help formulate final opinions and courtroom defense tactics.

ACCIDENT STUDIES & ACCIDENT RECONSTRUCTION

- Project engineer involved with the investigation and reconstruction of over 100 accidents for use in expert witness testimony. Analyze accident dynamics through hand calculations, graphical analysis, and the utilization of accident reconstruction computer programs such as EDVAP. Investigate potential deficiencies in roadway designs and traffic control. Research accident histories and conduct cost-benefit analysis for potential improvements at high accident risk locations. Work with attorneys and engineer acting as expert witness to help formulate final opinions and courtroom defense tactics.

SELECTED TRAFFIC IMPACT STUDIES

Penobscot Ranch Subdivision TIS (El Dorado County) – 331.54 acre site with 33 single family residences.
Diamond Plaza TIS (El Dorado County) – 1.80 acre site with 10,389 sq. ft. retail, 5,603 sq. ft. office, 3,644 sq. ft. restaurant, and 7 single family residential lots.
Wild Chaparral Offices TIS (El Dorado County) – 2.00 acre site with 18,000 sq. ft. office.
Lakeside Avenue Sub-division TIS (City of Redding) – 25.9 acre site with 40 single family residences.
Willows Wal-Mart Expansion TIS (City of Willows) – Replacement of existing Wal-Mart store with 187,348 sq. ft. Wal-Mart Supercenter, plus 3,206 sq. ft. fast food restaurant with drive through, and gas station.
Sierra College Center TIS (City of Rocklin) – 9.83 acre site with 77,588 sq. ft. of retail/office development.
West Ridge MP TIS (City of Redding) - 400 acre site with 296 single family residences.
Chico Wal-Mart South TIS (City of Chico) – Expansion of existing 97,124 sq. ft. Wal-Mart store to a 223,013 sq. ft. Wal-Mart Superstore, plus a 5,000 sq. ft. fast food restaurant with drive through, and gas station.
Woodcreek Terraces TIS (City of Roseville) – 10 acre site with 30,420 sq. ft. of mixed retail, and 53 single family dwelling units.
Tierra Oaks TIS (City of Redding) – Expansion of subdivision to include an additional 57 single family residences.
Oroville Retail NW of SR-70 & Nelson TIS (City of Oroville) – 15.56 acres with 271,117 sq. ft. of retail/business.
Martin Ranch TIS (City of Oroville) – 70 acres with 238 single family residences.
Fiddler Green TIS (Placer County) - 18.5 acre site 116 single family residences.
Butte Woods 2 TIS (City of Oroville) - 55 acre site with 169 single family residences.
Bella Ceda TIS (City of Oroville) - 24.1 acre site with 22,000 sq. ft. medical-dental office, 7,000 sq. ft. restaurant, and 87 single family residences.
Javani Estates TIS (Sacramento County) - 7.67 acre site with 74,527 sq. ft. of grocery/retail.
Oroville Los Olivos & Ceraolo TIS (City of Oroville) - 35 acre site 132 single family residences.
Mercy San Juan Medical Center TIS (Sacramento County) – Expansion of existing hospital to include new 142,683 sq. ft. hospital tower, and a new 40,000 sq. ft. medical office building, as well as two new parking structures.
Auburn Fitness TIS (Placer County) – 3.5 acre site with 35,000 sq. ft fitness center.
West Tuolumne Rd Subdivision (City of Turlock) – 48 single family residences.
California Waste Recovery & Transfer Station (City of Galt) – 5 acre waste/recycling transfer facility.
Walnut Avenue Theater / Retail Project (City of Galt) – 15.5 acre site with 117,000 sq. ft. retail and 43,000 sq. ft. (11 screen / 1,800 seat) movie theatre.
Rocklin Pavilion (City of Rocklin) – 41.9 acre site with 415.1 sq. ft. of retail shopping center and 15,000 sq. ft. office.
Cache Creek Casino-Hotel (Yolo County) – 262,137 sq. ft. casino and 200 room hotel.
Enterprise Rancheria Casino-Hotel (Yuba County) – 40 acre site including a 207,760 sq. ft. casino and 170 room hotel.
Auburn Rancheria School (Placer County) – 2.84 acre site including 19,354 sq. ft. facility with school, administrative and tribal offices, health center, and assembly hall.
Guenoc Winery (Lake and Napa County) – Expansion of irrigated winery vineyard, pasture, and forage cropland from 1,819 acres to 6,847 acres.
Lincoln Gateway Development (City of Lincoln) – Analysis of three alternatives for 18 acre site: (1) Proposed Project: 52,500 sq. ft. retail, 5,000 sq. ft. restaurant, 12,500 sq. ft. fast food, 75,000 sq. ft. professional office, 25,000 sq. ft. medical office, and 150 affordable senior residences; (2) Reduced Commercial/Reduced Residential Alternative: 39,375 sq. ft. retail, 12,500 sq. ft. fast food, 56,250 sq. ft. professional office, 18,750 sq. ft. medical office, and 112 affordable senior residences; (3) Reduced Commercial/Increased Residential Alternative: 52,500 sq. ft. retail, 12,500 sq. ft. fast food, 5,000 sq. ft. restaurant, 44 single family residences, and 138 affordable senior residences.
Latrobe Self Storage (El Dorado County) – Rezone of 7.0 acre site from Research/Development to self-storage facility containing 104,880 sq. ft. of enclosed storage space (containing up to 693 storage units), 121 RV parking spaces, and a 4,052 sq. ft. manager office/residence.
Horizon Church (San Joaquin County) – 10, 880 sq. ft. church.
Timbisha Shoshone Casino-Hotel (City of Hesperia) – 58.1 acres including 182,500 sq. ft. casino and 300 room hotel.
Ione Casino-Hotel (City of Plymouth) – 120,000 sq. ft. casino and 250 room hotel.
Sacramento Mormon Temple (Sacramento County) – 47 acre site containing 17,500 sq. ft. the Church of Jesus Christ of Latter-Day Saints temple, a clothing and curriculum supply distribution center, and two caretakers' residences.

Evans Creek Storage (El Dorado County) – 122,000 sq. ft. of enclosed storage space consisting of up to 752 storage units.
Travis Crossing Apartments (Solano County) – 9.52 acres with 181 apartments.
All Outdoor Whitewater Rafting (El Dorado County) – Modification of existing 7.5 acre site to provide for commercial whitewater rafting put-ins and take-outs at the site.
Chapa De Indian Health Program Medical Center (City of Grass Valley) – 26,980 sq. ft. medical clinic.
Shingle Springs Casino-Hotel (El Dorado County) – 238,500 sq. ft. casino complex and 250 room hotel.
Shingle Springs Clinic and Residential Development (El Dorado County) – 14,335 sq. ft. health clinic and six single family residences.
Paskenta (Rolling Hills) Reservation Casino (Tehama County) – 50 acres including 60,000 sq. ft. casino.
Santa Rosa Rancheria Fire Station (King County) – Relocation of Kings County Fire Station #7 to Santa Rosa Rancheria adjacent to The Palace Casino.
Greenville Rancheria Casino (Tehama County) – Analysis of 2 alternatives: (1) 120,000 sq. ft. casino; (2) 122,250 sq. ft. commercial development.
Mechoopda/Chico Rancheria Casino (Butte County) – 7.58 acres with 41,600 sq. ft. casino.
Sienna Vista PCD Development (City of Phoenix, Arizona) – 260.6 acre mixed use development including 805 single family residences, elementary school, convenience market/gas station, and 13.5 acre park.
North Coast Business Park (Clatsop County, Oregon) – Master plan of 270 acre community with analysis of 2 alternatives: (1) 59.4 acres light industrial, 80 bed youth correctional facility and county animal shelter; (2) 59.4 acres light industrial, 326,700 sq. ft. shopping center, 170 county jail, 80 bed youth correctional facility county animal shelter, and 2,100 student junior college.
San Jose Continuation High School (City of San Jose)
Coachella-Augustine Rancheria Casino (Riverside County) – Two studies: (1) 162,500 sq. ft. Casino, 200,000 sq. ft. Retail, 400 room hotel, and an 18 hole golf course; (2) scaled down development with a 31,200 sq. ft. casino.
Sybil Women's Prison (Los Angeles County) – renovation of 900 bed Sybil Brand Institute and Correction Facility.
5-Star Storage (El Dorado County) – 3.34 acres with 295 storage units.
Cameron Park Storage (El Dorado County) – 5.9 acres with 90,790 sq. ft. of enclosed storage and 105 RV parking spaces.
Rios Labor Farm Camp (San Joaquin County) – existing 80 acre farm with 75 proposed housing units to accommodate approximately 400 employees/labor camp residents.
Delta Church (San Joaquin County) – 37,580 sq. ft. church including a 499 seat worship area, education, and administration facilities, as well as outdoor recreational facilities.
Central Valley Baptist Church (San Joaquin County) – 10,000 sq. ft. church and 2,400 sq. ft. multi-purpose building.
Granade Automotive (El Dorado County) – 4,000 sq. ft. automotive repair garage.
March Industrial Park (City of Roseville) – 5.25 acres of light industrial development.
Arbor View Development (City of Roseville) – 6.8 acres with 29, 909 sq. ft. retail, 7,477 sq. ft. office, and 4,500 sq. ft. restaurant.
Lincoln Terrace Apartments (City of Lincoln) – 5.1 acres with 80 apartments.
6th Street Extension (City of Lincoln) – Impacts associated with abandonment of proposed westward extension of 6th Street to accommodate 190 dwelling unit apartment complex.
Warmington Homes (City of Auburn) – 16.98 acre rezone from commercial to residential to accommodate 83 single family residences.
Forest Hill Retirement Community (Placer County) – 1700 unit active retiree community.
Peabody Green Residential Development (City of Fairfield) – 17.9 acres with 146 single family residences.
Pleasant Valley Executive Homes (City of Vacaville) – 629 acre single family residential development with planning level analysis of 500 units vs. 700 units vs. 900 units vs. 1,200 units.
Pheasant Run (City of Dixon) – 37 acre rezone from light industrial to 132 single family residences and 4.71 acres of highway commercial development.
Second Street Senior Apartments (City of Dixon) – 3.8 acres containing 81 affordable senior apartments.
Vineyard Springs Comprehensive Plan Update (Sacramento County) – 2,560 acre community with analysis of 2 alternatives: (1) 5,409 single family residences, 1,160 multi-family residences, 100,000 sq. ft. medical/dental office, 100,000 sq. ft. general office, 2 elementary schools, 18-hole golf course, 10 neighborhood parks; (2) 5,399 single family

residences, 1,170 multi-family residences, 14 acres shopping center, 5 acres limited commercial, 146,000 sq. ft. medical/dental office, 146,000 sq. ft. general office, 2 elementary schools, 18-hole golf course, 10 neighborhood parks.
Arcadian Village Community Plan Amendment Update (Sacramento County) – 268 acres including 883 single family residences, 300 multi-family residences, 22 acres commercial, 11 acres office, 1 elementary school, 3 neighborhood parks, 1 community park.
Riverwalk General Plan/Community Plan Amendment (Sacramento County) – 677 acres including 305 single family residences, 18-hole golf course, 35 acre equestrian center, swim/tennis club.
Deer Creek Hills Community Plan (Sacramento County) – 1,892 acre seniors community including 2,224 single family residences, 775 multi-family residences, 150 dwelling unit congregate care facility, 50 bed nursing home, 80,000 sq. ft. shopping center, 30,000 sq. ft. medical/dental office, 18-hole golf course.
Embassy Suites Waterfront Hotel (Downtown City of Sacramento) – 248 room hotel with meeting rooms, restaurant, bar, retail.
Capitol East End Office Development (Downtown City of Sacramento) – 1.45 million sq. ft. state office park immediately east of State Capitol.
Capitol Area Plan Update (Downtown City of Sacramento) – Master plan for downtown Sacramento including development of 2.8 million sq. ft. of new office, 4,211 new parking spaces, 90,000 sq. ft. of new commercial, and 725 new residential dwelling units.
Neighborhood Preservation Transportation Plan (NPTP) Alternative Analysis (Downtown City of Sacramento) – Recirculation of traffic following implementation of complex network of traffic calming measures.
Coral Business Park (City of Sacramento) – 18 acres including 360,000 sq. ft. office park, gas station/restaurant, 2 restaurants, 240 room hotel.
Farmer's Market IV (City of Sacramento) – 90,000 sq. ft. office.
Calvary Christian School (City of Sacramento) – 300 student elementary school/day care center.
Citgo 7-11 Convenience Store (City of Sacramento)
Taco Bell at Folsom/53rd (City of Sacramento)
South Sacramento Streams (City of Sacramento) – Area wide levee improvement project.
Arch Road Industrial Site (San Joaquin County) – 103 acres including 2,700,000 sq. ft. light industrial/warehouse.
Woodson Road Trucking Facility (San Joaquin County) – 15 acre agricultural trucking facility.
Morada Ranch (City of Stockton) – 265 acre rezone including 107 single family residences, 413,000 sq. ft. commercial.
University of the Pacific Campus Plan (City of Stockton) – Reconfiguration of campus roadways and circulation.
Sacramento Valley (Bill Graham Presents) Amphitheater (Yuba County) – 20,000 seat concert amphitheater.
City of Dixon Multi-Modal Station (City of Dixon) – Commuter Rail Station.
San Joaquin River Conservancy EIR (Fresno and Madera Counties) – Development of recreational facilities along 45 miles of San Joaquin River.
Pleasant Grove/Foothills Commercial Center - Woodcreek Plaza (City of Roseville) – 14 acres including 12,300 sq. ft. shopping center, 16,800 sq. ft. quality restaurant, 2,000 sq. ft. fast food restaurant, 8,400 sq. ft. medical office, 8,400 sq. ft. general office, 7,800 sq. ft. day care center.
Lifescan 2 Corporate Expansion (City of Milpitas) – 85,000 sq. ft. add on of administrative office to corporate park.
Peery-Arrilliga Business Park (City of Milpitas) – 144 acres including 1,945,000 sq. ft. of research and development center, 150,000 sq. ft. general office, 110,000 sq. ft. commercial.
Treefarm Condominium/Office Development (City of Los Altos) – Includes 90 multi-family residences, 72,000 sq. ft. office, 28,000 sq. ft. retail.
Phil Lewis Property (West Palm Beach, Florida) – 100,000 sq. ft. light industrial development.
Parkway Center (Downtown City of Las Vegas, Nevada) – 250 acres including 3 hotel/casinos (5,404,000 sq. ft.), 1,642,000 sq. ft. office, 1,690,000 sq. ft. County Administration Center, 773,000 sq. ft. commercial, 78,000 sq. ft. fast food, 65,000 sq. ft. quality restaurant, 65,000 sq. ft. high turnover restaurant.
The Orchards Development (City of Las Vegas, Nevada) – 432 acres including 1,750 single family residences, 1,250 multi-family residences, 11.3 acres commercial, 600 student elementary school, 15,400 sq. ft. church, 13 acre city park.
Meadow Valley Development – North & South (Clark County, Nevada) – 75 acres including 294 single family residences, 376 multi-family residences, 3,700 sq. ft. bank, and 58,000 sq. ft. commercial.
Greenway Gardens Development (City of Henderson, Nevada) – 89 single family residences.
Foothills North Development (City of Henderson, Nevada) – 43 acres including 205 single family residences.

Wilson Tower Development (City of San Gabriel) – 25,000 sq. ft. 3-story commercial/office building.
Huntington Plaza Development (City of South Pasadena) – 23,000 sq. ft. 2-story commercial/office building.
Guasti Community (City of Ontario/Ontario International Airport) – 74 acres including 2,038,000 sq. ft. of office, 422,000 sq. ft. of office/industrial, 3 hotels with 1,100 rooms and commercial uses.
Beach Blvd./La Mirada Blvd. Shopping Center (City of Buena Park) – 11 acres including 53,000 sq. ft. supermarket and 78,000 sq. ft. commercial.
Villages of Palm Springs (City of Palm Springs) – 348 single family residences.
Duoc Su Buddhist Temple (City of Garden Grove)
San Juan Meadows Development (City of San Juan Capistrano) – Residential development with 18-hole golf course and driving range.
Bixby Old Ranch Development (City of Seal Beach) – 231 acres including 168 single family residences, 125 multi-family residences, 15,000 sq. ft. restaurant, 180 room hotel.
Santa Monica College Satellite Campus - Madison School Site (City of Santa Monica) – Use of old elementary school to accommodate 8 college classrooms and a day care center for 24 children.
South Gate New Elementary and High Schools (City of South Gate) – 100 classroom (2,700 student) high school and 21 classroom (600 student) elementary school.

Subject: RE: GSW - Arrival distribution
Date: Monday, January 12, 2015 3:01:04 PM

Luba:

I just sent everyone in this email the Sacramento Kings RTC document via ESA DeliverIt. Also, Brian Boxer sent the information below regarding arrival/departure patterns for the Kings ESC EIR to Jose last Wednesday.

Paul Mitchell
ESA | Community Development
550 Kearny Street, Suite 800
San Francisco, CA 94108
415.896-5900 | 415.896-0332 fax
pmitchell@esassoc.com

The following is extracted from pages 4.10-43 and 4.10-44 of the Sacramento ESC EIR:

Arrival / Departure Patterns

Following is an evaluation of expected arrival/departure patterns for each event type (see Appendix D for technical data).

- **Weekday Evening Kings Game** – Table 4.10-8 displays the observed percentages of vehicles entering the Sleep Train Arena parking lot (via all four entrances) for a 7 pm weekday Kings game on April 5, 2012. As shown, 67.4 percent of all attendees arrived between 6 and 7 PM. This table also shows data provided by ICON Venue Group for a number of other NBA arenas. Although the data show that 53.8 percent entered the arena during the one-hour prior to the game start, it is likely that many of the 37 percent that arrived at or after tipoff initially arrived to the site during the one-hour prior (and were searching for parking or visiting an adjacent retail/restaurant. Therefore, to be reasonably conservative, 67.4 percent of evening Kings game attendees are assumed to enter the study area during the pre-event peak hour.

- **Morning Civic Event** – Based on data from previous studies and professional judgment, two-thirds (66.7 percent) of civic event attendees are expected to arrive during the AM peak hour. This is reasonably conservative when compared to other of conference centers that assume 50 percent or less of arrivals occur during the AM peak hour.

- **Afternoon Event** – Based on data from previous studies and professional judgment, three-quarters (75 percent) of special/family event attendees are assumed to depart during the PM peak hour. This input is substantiated by 2010 traffic counts collected at a Los Lobos concert at the Mondavi Performing Arts Center on the UC Davis campus. That study found that 74 percent of all concert attendees departed the event within the one-hour after the event ended.

TABLE 4.10-8
PRE-EVENT ATTENDEE ARRIVAL PATTERNS

Time	Percent Entering Sleep Train Arena Parking Lot for 7 pm Game [1]	Percent Entering Building for Other NBA Venues [2]
5-6 pm	14%	9.2%
6-6:30 pm	22.7%	21.5%
6:30-7 pm	44.7%	32.3%
7-8 pm	18.6%	37.0%

1. Fehr & Peers conducted counts from 5 to 8 pm at all entrances to a Kings home game (versus Clippers) at Sleep Train Arena on Friday, April 5, 2012. Game had attendance of 12,600.
2. Based on data provided by Icon Venue Group.

SOURCE: Fehr & Peers, 2013.

According to the Sacramento Kings, about 850 of the 1,200 ESC Kings game event employees would arrive two hours prior to the start of the event (i.e., prior to the pre-event peak hour) and remain on-site for some time after the event concludes.[1] For analysis purposes, 100 inbound employee trips are conservatively assumed during the pre-event peak hour.

During weekday evening Kings games, other event management, all-day, and cleaning staff would arrive/depart during various parts of the day. Data from the April 5, 2012 Kings game were reviewed and showed 190 outbound trips departing Sleep Train Arena from 6 to 7 PM. This may have included departing day employees, deliveries, and even some drop-offs. To account for these types of activities, 200 outbound employee trips are estimated for the pre-event peak hour.

Subject: GSW - Arrival distribution

Hi all

The numbers that GSW Warriors provided are the actual Oracle arena arrivals numbers, but Clarke was happy that they were higher than the other NBA aggregated venues that Kate had provided late on Friday (Although it is likely that the aggregated venues do not include lots of downtown arenas - plus SF is different anyway).
There is some question about what exactly was used in the Kings arena, and Clarke is following up with Brian with that. Also, Clarke will ask Brian on how the AECOM comment on the EIR was responded to.

Changing the distribution now would add more than a week to the schedule, depending.

I mentioned that one way or another we need to address this issue this Wednesday, and that we need direction from EP. We feel that it is appropriate that the percentage arriving during the 4 to 6 PM peak period at the SF site is greater than at the existing arena. What percentage, not sure.

Paul, can you get the Kings EIR RTC document to us? And maybe have someone find the AECOM comment?

Thanks,
Luba

SAN FRANCISCO TRANSPORTATION PLAN 2040

FINAL REPORT
DECEMBER 2013

FROM THE EXECUTIVE DIRECTOR

The countywide transportation plan is where all of the city's transportation modes, operators, and networks come together. Ten years ago we developed the first long-range transportation plan and investment blueprint for San Francisco. This investment strategy served as the basis for Prop K, the half-cent transportation sales tax reauthorized by over 75% of voters in late 2003. To date, we have allocated over $1 billion in Prop K expenditures, leveraging as we did so significant regional, state, and federal matching dollars. The Transportation Authority's Prop K and other allocations have funded critical improvements in every neighborhood such as traffic calming, safe pedestrian and bicycle networks, new transit vehicles, signal priority, and street resurfacing. With the help of public and private partners, all of the Plan's signature capital investments also have been implemented or are substantially underway, including the Presidio Parkway, Transbay Transit Center, Central Subway, and Van Ness Avenue Bus Rapid Transit. During this time, the city responded together with the region to a statewide call to action on climate change, approving a generation of land use plans with transit-oriented designs and sustainable policies. Together, we weathered an economic cycle whose impacts were mitigated by our ability to use local funds such as Prop K to keep projects moving forward and competitive for new funding opportunities when they eventually arose (such as federal stimulus funds). We also partnered with the City to maintain our transportation assets, though significant needs remain. Now, as economic activity returns, we must continue to invest to address pressing maintenance and safety needs. We should deploy and manage our scarce resources efficiently. And we will develop innovative solutions and deliver the next generation of infrastructure that is necessary to meet our goals for a healthy, vibrant, and equitable transportation system for all users.

Tilly Chang
EXECUTIVE DIRECTOR, SFCTA

SAN FRANCISCO TRANSPORTATION PLAN 2040

CONTENTS

Adopted by the Transportation Authority Board on December 17, 2013

Preparation of this report was made possible in part by the San Francisco County Transportation Authority through a grant of Proposition K local transportation sales tax funds and a grant from the U.S. Department of Transportation and the Federal Highway Administration. Content of this report does not necessarily reflect the official views or policy of the U.S. Department of Transportation.

FINAL REPORT • SAN FRANCISCO TRANSPORTATION PLAN
SAN FRANCISCO COUNTY TRANSPORTATION AUTHORITY • DECEMBER 2013

CHAPTER ONE

INTRODUCING THE SAN FRANCISCO TRANSPORTATION PLAN

THE SAN FRANCISCO TRANSPORTATION PLAN, OR SFTP, is the blueprint for San Francisco's transportation system development and investment over the next 30 years. The SFTP brings all transportation modes, operators, and networks together, with a view to improving travel choices for all users. Through detailed analysis, interagency collaboration, and listening to the public, we've evaluated ways to improve our system with existing and potential new revenues. The SFTP recommends a diverse investment plan that makes meaningful progress towards our important goals: livability, world-class infrastructure, economic competitiveness, and a healthy environment. The SFTP also recommends policy changes that depart from business as usual and will help us make the most of our investments.

INSIDE THE SFTP

The SFTP contains:

- The Investment Plan, to guide spending of existing and anticipated new transportation funds through 2040.
- The SF Investment Vision, to guide spending of additional new locally-controlled revenues.
- Policy recommendations and strategic initiatives to complement the Investment Plan and Vision.
- Next steps for implementing the SFTP recommendations and monitoring results.

Through 2040, we can expect about $75 billion in funding to support San Francisco's transportation system. Most of this is already committed to specific projects or purposes. This leaves $5 billion in existing and anticipated new revenues that we can decide how to spend. As shown in Figure 1, this $75 billion funds the Investment Plan. Because there is far more need than available revenues for transportation, the SF Investment Vision assumes an additional $7.5 billion in locally-controlled revenues. Figure 2 presents the highlights of the Investment Plan and Vision.

PHOTO: CENTRAL SUBWAY'S TUNNEL BORING MACHINE "MOM CHUNG" IS NOW MAKING ITS WAY BENEATH THE STREETS OF SAN FRANCISCO

The SFTP recommends a diverse investment plan that makes meaningful progress towards our important goals: safe and livable neighborhoods, well-maintained infrastructure, economic competitiveness, and environmental health.

FIGURE 1. SF INVESTMENT PLAN AND SF INVESTMENT VISION REVENUE
(BY USE)

FIGURE 2. HIGHLIGHTS OF THE SFTP INVESTMENT SCENARIOS

	INVESTMENT PLAN		SF INVESTMENT VISION	
Operations and Maintenance of Transit and Streets	$66.3B 88%	70% of highest priority transit maintenance needs met Maintains today's pavement condition	$69.7B 84%	100 % of highest priority transit maintenance needs met Pavement condition improves to "good" levels
Multimodal Street Safety, Enhancement, and Community Mobility	$1.2B 1%	About 40% of the City's Pedestrian Safety Strategy and 22% of the City's Bicycle Strategy funded Parking and peak period congestion pricing downtown help reduce auto trips by up to 10%	$2.5B 3%	100% of the Pedestrian Safety and Bicycle Strategies funded Further expansions of cost-effective employer, school, and community trip reduction programs help reduce auto trips by up to 14%
Efficiency and Expansion Projects	$7.6B 10%	15 miles of protected transit lanes Caltrain electrification and extension to a rebuilt Transbay Terminal	$10.4B 13%	Up to 33 miles of protected transit lanes, including increased BART capacity and reliability Freeway management and transit efficiency strategies, including increased BART capacity and reliability
TOTAL	**$75.1B**		**$82.6B**	

KEY FINDINGS AND POLICY RECOMMENDATIONS

- Prioritize revenues to fully fund timely vehicle replacement and rehabilitation
- Expand transit service while supporting steps to stabilize costs
- Achieve city goals for average pavement condition
- Build the pedestrian and bicycle strategies to establish safer neighborhood networks citywide
- Create more complete streets (at lower cost) through coordination with repaving
- Increase investment in employer, school, and community trip reduction programs
- Increase transparency and promote public involvement by sharing agency prioritization and development processes
- Continue to develop pricing approaches to congestion management
- Continue rapid transit network development, including bus rapid transit
- Continue to coordinate transit investment with land use development plans
- Set a vision for managing the city's freeway network
- Identify the next generation transit network priorities for BART, Caltrain, and Muni
- Consider all options for delivering projects

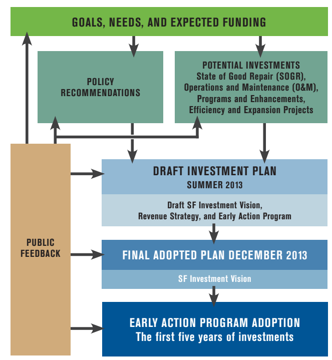

FIGURE 3. SFTP PROCESS FLOW CHART

SFTP GOALS

The SFTP positions San Francisco to meet our city's transportation system goals. We identified the four SFTP goal areas, shown in Figure 4, through Board, partner agency, and community input, and through consideration of city policies like the Transit First Policy in the City Charter and the City's Climate Action Plan. Appendix A (SFTP Plan Development Process) and Appendix B (Needs Analysis White Paper) describe how these goals and associated performance measures shaped our assessment of transportation system needs, the Investment Plans, and policy recommendations.

HOW WE DEVELOPED THE SFTP

As Congestion Management Agency (CMA) for San Francisco, the Transportation Authority is responsible for developing a long-range, countywide transportation plan. We developed the SFTP through extensive technical analysis, consultation with partner agencies, and community outreach over several years. Appendices A-J describe the technical analysis behind the plan.

Throughout the SFTP development process, we heard several consistent policy questions from our Board, partner agencies, and the public, and we responded with research and analysis. Figure 5 (next page) lists the policy research topics and associated products. The research findings led to the creation of the final policy recommendations contained in this document.

THE SIGNIFICANCE OF THE SFTP

The priorities established in the SFTP influence the regional transportation plan prepared by the Metropolitan Transportation Commission (MTC), known as Plan Bay Area, and position San Francisco for regional, state, and federal transportation funding. Transportation projects seeking this funding must be consistent with the SFTP and Plan Bay Area.

Additionally, the SFTP informs and guides other local and regional plans and policy priorities:

- It reflects and reinforces San Francisco's Transit First Policy, adopted in 1973.
- It informs local plans and investments including the General Plan Transportation Element, the SFMTA and City and County of San Francisco Capital Plans, and regional transit operator (e.g. BART and Caltrain) expansion plans.
- It informs San Francisco's efforts to manage congestion and coordinate transportation investment with land use, as described in the Congestion Management Program (CMP).
- It guides project selection for the Proposition K (Prop K) 5-year plans. Prop K is San Francisco's half-cent transportation sales tax, approved by over 75% of voters in 2003. Prop K leverages federal, state, and other funds to direct hundreds of millions of dollars toward SFTP implementation.

FIGURE 4. SFTP GOAL AREAS

SAN FRANCISCO TRANSPORTATION PLAN 2040

FIGURE 5. ANALYSIS AND POLICY STUDIES DEVELOPED DURING THE SFTP PROCESS

POLICY QUESTION/STRATEGIC INITIATIVE	RESEARCH PRODUCT
How can we...	
Meet our ambitious livability and environmental goals?	Needs Analysis White Paper (Appendix B)
Improve the social and geographic equity of our transportation system?	Transportation Equity Analysis (Appendix F)
Create complete streets that improve safety for all users?	Small Project Delivery White Paper (Appendix H)
Deliver transportation projects faster?	Small Project Delivery White Paper (Appendix H) Large Project Delivery White Paper (Appendix I)
Reduce conflicts between the local and regional transportation systems, and improve connections?	Core Circulation Study (Appendix C)
Collaborate more effectively with the private sector to manage travel demand?	Travel demand management strategic plan (expected spring 2014)
Reduce conflicts and provide for the needs generated by the fast-growing SoMa neighborhood?	Core Circulation Study (Appendix C)
Raise new revenue for transportation?	Revenue Options Analysis (available on request) Revenue White Paper (expected early 2014)
Meet the unique transportation needs of young students, visitors, and deliveries?	Needs Analysis White Paper (Appendix B)

Significant progress has been made on goals set in the 2004 Countywide Transportation Plan, projects that were made possible in part through San Francisco's Prop K transportation sales tax dollars, approved by over 75% of voters in 2003.

ACCOMPLISHMENTS SINCE THE LAST PLAN

The SFTP builds on the accomplishments of the 2004 Countywide Transportation Plan,[1] including:

- Major investments in new transit capacity and system maintenance projects are constructed or underway:
  - » T-Third Light Rail linking the Bayview and South of Market.
  - » Tunneling work for the new Central Subway linking the T-Third to SoMa, Union Square and Chinatown.
  - » Replacement of the old Central Freeway with Octavia Boulevard.
  - » Replacement of Doyle Drive with Presidio Parkway.
  - » A new Transbay Transit Center under construction.
- A citywide network of rapid buses is under development:
  - » Completion of environmental work for Van Ness Avenue Bus Rapid Transit (BRT).
  - » Environmental impact analyses are underway for Geary Boulevard BRT and the Transit Effectiveness Project.
- Neighborhoods are more livable, through bicycle, pedestrian, traffic calming, and streetscape improvements:
  - » Prop K provided the first and only stable source of funding for traffic calming.
  - » Examples such as Leland Avenue, Valencia Street, and Broadway Street re-designs demonstrate new ways of improving safety, livability, and creating open space.
  - » Majority of SF Bicycle Plan constructed.
- Parking management and road pricing are key concepts in discussions about managing San Francisco's transportation system:
  - » SFMTA piloted variable parking pricing and management (SFpark).
  - » The Transportation Authority Board adopted the Mobility Access and Pricing Study exploring various scenarios for possible congestion charge downtown.
  - » The Board of Supervisors unanimously adopted the innovative road and parking pricing program for Treasure Island.
- Multiple Neighborhood Transportation Plans adopted by the Authority Board have established a pipeline of community-supported neighborhood transportation projects, many of which have been implemented, including in the Outer Mission, Mission South of Chavez, Tenderloin/Little Saigon, Bayview, Western South of Market, and Balboa Park.
- Numerous state of good repair investments to improve the reliability of the transportation network:
  - » Construction of the Muni Metro East Maintenance Facility, the first major expansion to the SFMTA's Light Rail Vehicle maintenance facilities since the 1970s.
  - » Acquisition of nearly 200 new hybrid buses for Muni and the construction of the Islais Creek Maintenance Facility, the first new rubber-tire maintenance facility in 60 years.
  - » Street resurfacing, traffic signal upgrades, sidewalk repairs, and new curb ramps on sidewalks citywide.

1 The 2004 Plan is available on the authority web site: http://www.sfcta.org/documents-and-data/documents/2004-countywide-transportation-plan

Top to bottom: Projects as diverse as the Central Subway, new bicycle facilities, the T-Third light rail line, and Western SoMa streetscape enhancements are all part of the legacy of the 2004 Countywide Transportation Plan.

THE SAN FRANCISCO COUNTY TRANSPORTATION AUTHORITY

Created in 1989, the Transportation Authority:

- Develops San Francisco's long-range transportation plan (SFTP)
- Helps analyze and fund transportation system improvements
- Administers the Prop K half-cent local transportation sales tax program and the Prop AA vehicle license fee.
- Manages the Transportation Fund for Clean Air (TFCA).
- Serves as Congestion Management Agency (CMA) for San Francisco under state law. Prop 111, passed in 1990, increased the state fuel tax and required urban counties to designate a CMA responsible for coordinating transportation planning, funding and other activities in a congestion management program. To learn more about the Transportation Authority, visit our web site at www.sfcta.org.

THIS PAGE LEFT INTENTIONALLY BLANK

CHAPTER TWO

OUR TRANSPORTATION CHALLENGES AND OPPORTUNITIES

SEVERAL CRITICAL CHALLENGES AND OPPORTUNITIES must be considered as we strive to achieve our transportation system goals for livability, world-class infrastructure, economic competitiveness, and a healthy environment. The following section highlights these issues, and Appendix B provides additional detail. Appendix K (San Francisco Travel at a Glance) depicts three key travel trends that shaped the SFTP.

LIVABILITY

San Francisco aims to be a livable city—one where walking, bicycling, and transit are safe, comfortable, and convenient modes of travel. Accordingly,

- The SFMTA has set a goal of more than 50% of trips by walking, bicycling, and transit by 2018.
- The Mayor's Executive Directive 10-03 called for a 50% reduction in severe and fatal pedestrian injuries by 2021.
- The Board of Supervisors set a goal of achieving a 20% bicycle mode share by 2020.

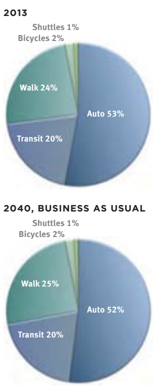
Achieving the desired growth in bicycling, walking, and transit trips while reducing the rate of injuries and fatalities will require increased investment, education, and re-allocation of street space—sometimes with difficult trade-offs—to these modes.

We asked "what would it take?" to achieve San Francisco's ambitious goals. Some of our goals, such as world-class infrastructure would require major increases in funding. Others require both new funding and bold policies that prioritize transit, walking, and bicycling in our limited rights of way. See page 19 for a summary.

MANY WANT TO WALK AND BIKE TODAY, BUT DON'T DUE TO SAFETY CONCERNS

Supporting travel by walking and bicycling requires safety improvements. Safety concerns discourage pedestrians: about 820 pedestrians are killed or injured every year in San Francisco, many on arterials roadways identified in the Walkfirst Investment Plan (Figure 6). Without

FIGURE 7. SHARE OF TRIPS BY MODE OF TRAVEL, 2013 (TOP) AND 2040 BUSINESS AS USUAL (BOTTOM)



SOURCE: SFCTA, SF CHAMP

significant new investment, this number could grow as high as 980[1] by 2040 due to projected increases in automobile trips.

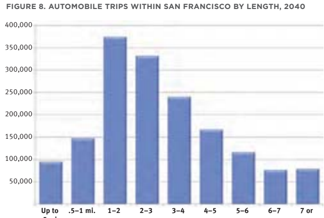
San Francisco's aging population also adds to the challenge of achieving this goal. San Francisco is projected to experience 68% growth in number of people 65 and older by 2040, making this group 20% of the population (compared to 16% today[2]). Older pedestrians are more vulnerable to serious injury or death when struck by an automobile.

Safety concerns also discourage bicycling. Surveys conducted for the SFMTA's 2012 State of Cycling Report indicate that almost half of those who do not currently bicycle say they are uncomfortable bicycling in mixed flow traffic with cars, and only 13% said they feel safe from traffic when bicycling. At the same time, 94% of respondents said they would feel comfortable riding in bicycle lanes.

UNRELIABLE TRANSIT DISPROPORTIONATELY AFFECTS OUTER NEIGHBORHOODS

Livable neighborhoods are accessible by transit, not just during peak commute periods, but throughout the day and evening. This

FIGURE 8. AUTOMOBILE TRIPS WITHIN SAN FRANCISCO BY LENGTH, 2040



SOURCE: SFCTA, SF CHAMP

1 Based on SFDPH Eastern Neighborhoods Impact Analysis which indicated that holding all other variables constant, a 15% increase in vehicle volume produces a 10% increase in pedestrian injury collisions.

2 Based on Association of Bay Area Governments population projections for San Francisco.

FIGURE 6. HIGH-INJURY PEDESTRIAN CORRIDORS

supports San Franciscans' ability to get to and from school, medical appointments and recreational activities by transit. Analysis of transit transfer rates and input received during outreach indicate that outlying neighborhoods, including the Bayview and Sunset, are less accessible throughout the day by transit. A shortage of maintained vehicles results in turning back buses and light rail vehicles before they serve outer neighborhoods, forcing riders into extra waits. The transit network in the lower-density Sunset neighborhoods and hilly Eastern Neighborhoods is less dense, resulting in fewer transit alternatives and fewer direct rides—and making reliability all the more important.

PLANNED INFILL LAND USE PATTERNS SUPPORT WALKING, BICYCLING, AND TRANSIT

The land use plans adopted by the San Francisco Planning Commission and Board of Supervisors over the last decade are expected to move us in the right direction, supporting infill and making walking and bicycling easier. As new residents and jobs locate in areas already convenient for bicycling and walking, the share of trips made by bicycling and walking is expected to grow slightly (Figure

7) but additional investment is needed to meet the city's goal of more than 50% of trips by walking, bicycling and transit. San Francisco has a great potential for further increasing rates of walking and bicycling—as Figure 8 (previous page) shows, nearly 60% of all local automobile trips projected in 2040 will be less than three miles in length, a convenient distance for non-motorized travel.

COMMUNITY SUPPORT FOR TRADEOFFS IS CRITICAL TO ACHIEVE SAFE, EFFICIENT NETWORKS

Research shows that walkability contributes to the livability and affordability of neighborhoods and overall competitiveness of cities. Accordingly, the City has developed strategies that provide a vision for significantly improving the safety of pedestrian and bicycle networks (specifically, the SFMTA Bicycle Strategy and the Mayor's Pedestrian Strategy), but implementation requires investment and, at times, challenging tradeoffs. This is especially so where many of the easy, lower-cost fixes to improve bicycling and walking infrastructure (e.g., striping and signage) are already complete.

Improvements that more significantly benefit bicyclists and pedestrians do so by physically separating these travelers from vehicular traffic or by reducing vehicle traffic and speeds, which may require parking removal or increased signal delay for vehicles. Implementing these improvements requires leadership and community acceptance in return for increased safety for bicyclists and pedestrians.

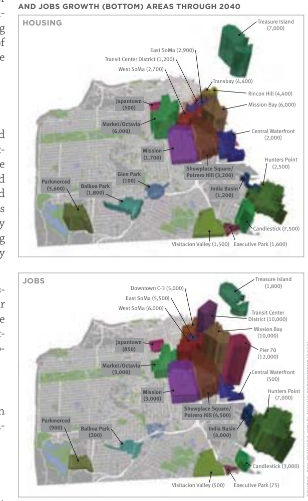
ECONOMIC COMPETITIVENESS

San Francisco's economic competitiveness depends on having an affordable and reliable transportation system with sufficient capacity to accommodate our travel needs efficiently.

PLANNED HOUSING AND JOB GROWTH CONTRIBUTES TO A MORE SUSTAINABLE CITY AND REGION

The Association of Bay Area Governments has forecast significant job and housing growth in the city. A city of about 800,000 residents and 570,000 jobs today is forecast to house nearly 1.1 million residents and more than 750,000 jobs by 2040—much of this

FIGURE 9. SAN FRANCISCO'S PROJECTED HOUSING GROWTH (TOP) AND JOBS GROWTH (BOTTOM) AREAS THROUGH 2040



San Francisco's economic competitiveness depends on having an affordable and reliable transportation system with sufficient capacity to accommodate our travel needs efficiently.

By 2040, new growth will result in about 300,000 new transit trips per day on a system that is already strained by crowding and reliability issues.

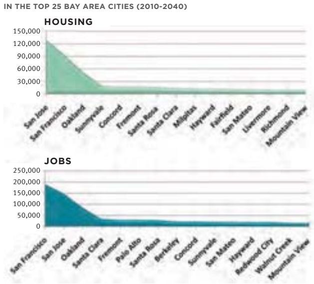
growth is expected in the downtown core, southeast, and southwest (Figure 9). This would mean adding about 9,800 new residents each year for the next thirty years, compared to about 4,200 residents that have been added per year over the prior thirty years.

These projections reflect expectations for robust regional growth and regional policy stemming from Senate Bill 375 (2008), which required regional governments to reduce greenhouse gases from transportation. To meet the SB 375 target, the Regional Transportation Plan, known as Plan Bay Area, calls for concentration of growth in densely developed areas with good transit access especially in San Francisco, San Jose, and Oakland (Figure 10)—a pattern that supports less driving and produces fewer greenhouse gases.

INCREASED TRANSIT CAPACITY AND SERVICES ARE NEEDED TO ACCOMMODATE GROWTH

Concentrating jobs and housing in San Francisco is good for the city's economy as well as the environment, but will also increase congestion and transit system crowding in downtown San Francisco and Eastern neighborhoods. By 2040, new growth will result in about 300,000 new transit trips per day on a local and regional system that is already strained by crowding and reliability issues. The San Francisco Planning Commission has adopted land use plans that direct much of the city's projected growth in the central and eastern neighborhoods, where crowding is already acute. Figure 11 compares transit crowding today and in 2040, and shows that crowding will grow most on the lines expected to serve these areas and the new development areas, such as the southeast waterfront, Treasure Island, and Parkmerced.

FIGURE 10. POPULATION AND EMPLOYMENT GROWTH PROJECTIONS IN THE TOP 25 BAY AREA CITIES (2010-2040)



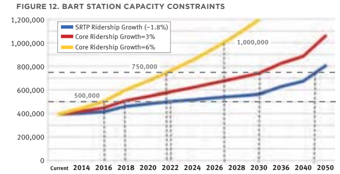
SOURCE: METROPOLITAN TRANSPORTATION COMMISSION, PLAN BAY AREA (2013)

FIGURE 11. CROWDING* ON MUNI IN 2013 (TOP) AND IN 2040 (BOTTOM)

SOURCE: SFCTA, SF CHAMP

* Crowding is defined by the percent of person-hours traveled in crowded (passenger-volume-to-vehicle-capacity ratio is 85% or higher) or over-capacity conditions (volume to capacity ratio is more than 100%).

FIGURE 12. BART STATION CAPACITY CONSTRAINTS



SOURCE: BART

Many regional bus and rail operators already face peak-period crowding and would also see that increase significantly by 2040. BART ridership to, from, and within San Francisco is projected to grow by 37%, and as such, the system's two most crowded stations, Embarcadero and Montgomery, are forecast to hit limits in their person-carrying capacity. BART estimates that at 500,000 daily system riders, stations will be at capacity in 2016, and at 750,000 system riders, the stations will experience significant backups at escalators and overcapacity platforms (Figure 12).

CAPACITY NEEDS MOST ACUTE IN THE CORE: DOWNTOWN, SOUTH OF MARKET, MARKET/OCTAVIA, AND EASTERN NEIGHBORHOODS

36% of trips to, from, or within San Francisco begin or end in the downtown and South of Market neighborhoods, more than any other neighborhood (Figure 13). Expected growth will significantly increase transit crowding and street congestion downtown. With projected growth and no new investment beyond already-planned projects, increased traffic will slow speeds to gridlocked conditions for cars and buses alike during peak hours. A nearly 30% reduction in projected private vehicle traffic would be necessary to avoid this condition (see Appendix C for detail). Strategies recommended to achieve this reduction are discussed on pages 29–30, and are incorporated into the SFTP Investment Plan, SF Investment Vision, and associated policy recommendations.

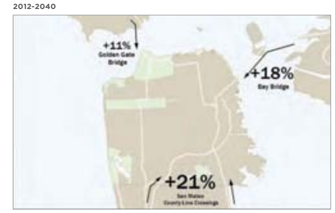
FIGURE 14. CHANGE IN DAILY COUNTY LINE CROSSINGS BY AUTOMOBILE, 2012-2040



SOURCE: SFCTA, SF CHAMP

NETWORK DEVELOPMENT AND MANAGEMENT NEEDED FOR THE SOUTHEAST AND PENINSULA CORRIDORS

Over the SFTP period, daily automobile trips entering San Francisco from the South Bay are expected to grow by 21% (Figure 14). This results in worsening congestion on Highway 101 and 280. The planned extension of Caltrain to the new Transbay Transit Center would help accommodate this growth and provide access for the future high speed rail system, but funding is incomplete. Better management of existing freeway space through high-occupancy vehicle lanes or other solutions is also needed.

WORLD CLASS INFRASTRUCTURE

San Francisco's transportation system relies on aging infrastructure that will need significant repair or replacement in the next decades. Without a significantly increased financial commitment to reach and maintain a state of good repair, riders will see increasing delays and crowding related to vehicle breakdowns, reduced service levels, and worsening pavement condition.

Without a significantly increased financial commitment to reach and maintain a state of good repair, riders will see increasing delays and crowding related to vehicle breakdowns, reduced service levels, and worsening pavement condition.

TRANSIT VEHICLE REPLACEMENT AND BETTER MAINTENANCE WOULD IMPROVE RELIABILITY

After decades of underinvestment, Muni and regional transit agencies that serve San Francisco have significant unfunded capital needs amounting to more than $5 billion through 2040 (see Appendix B for detail). These needs include new or updated facilities for maintaining transit vehicles, rail and overhead wire replacement, vehicle maintenance and replacement, and other needs.

As a result of resource limitations, Muni's vehicles have not received mid-life rehabilitations or timely replacement, resulting in a fleet that has high service unreliability and frequent expensive emergency repairs, as well as frequent unscheduled vehicle turnbacks. Figure 15 shows that vehicle maintenance is responsible for a large share of transit-service delays. Increased investment in routine maintenance and timely vehicle replacement would significantly reduce these delays and improve reliability. Figure 16 shows how breakdowns can be minimized with proper maintenance and mid-life replacement.

TRANSIT OPERATING COSTS ARE GROWING FASTER THAN REVENUES

The cost of providing transit service has risen rapidly in recent years, a trend which destabilizes Bay Area transit systems and affects riders impacted by resulting service cuts. Figure 17 (next page) shows the rising real (inflation-adjusted) costs of transit

FIGURE 15. MUNI LIGHT RAIL: MAY 2013 REASONS FOR DELAY

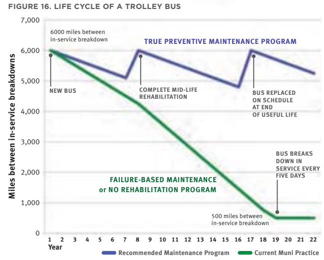
FIGURE 16. LIFE CYCLE OF A TROLLEY BUS



SOURCE: SFMTA (FIGURE IS CONCEPTUAL)

FINAL REPORT • SAN FRANCISCO TRANSPORTATION PLAN
SAN FRANCISCO COUNTY TRANSPORTATION AUTHORITY • DECEMBER 2013

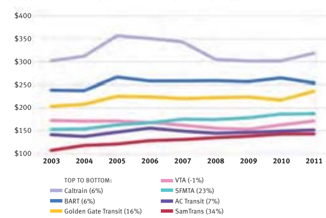
service for major Bay Area transit operators. In its Transit Sustainability Project (TSP) Report, the Bay Area MTC found that cost increases are primarily the product of employee fringe benefit cost growth (e.g. health care and pensions). Between 1997 and 2008, real fringe benefit costs at SFTMA, BART, and AC Transit grew by 72% (after adjusting for inflation), or about 5% per year.

Declining transit performance also affects operating costs. The TSP indicated that speeds on SFMTA's bus and light-rail system fell by more than 10% between 1997 and 2008. Slower speeds mean the same driver and vehicle can complete fewer route runs in a day, leading to less service for the same price.

RECENT IMPROVEMENT IN AVERAGE PAVEMENT CONDITION NEEDS INVESTMENT TO MAINTAIN

The city's Pavement Condition Index (PCI) has slowly fallen over time to the low 60s (fair) from 70s (good). The 2011 Proposition B streets bond enabled an increase in the PCI from 64 to 66 and provides increased funding levels until 2016. The PCI score is projected to fall into the 50s (at risk) by 2030. Without an additional investment in street rehabilitation and replacement, reaching and maintaining a PCI of 70 in the longer term will require about $2 billion more than what is already committed to street resurfacing over the life of the SFTP, but this is ultimately more cost-effective than further deferring maintenance needs. Maintaining pavement at a good condition costs $9,000 per block. If the PCI score lowers below 50, the cost to maintain pavement would balloon to $436,000 per block.

FIGURE 17. TRANSIT COSTS PER REVENUE SERVICE HOUR



SOURCE: NATIONAL TRANSIT DATABASE TS2.2, SERVICE DATA AND OPERATING EXPENSES TIME-SERIES BY SYSTEM, AND THE CALIFORNIA DEPARMENT OF FINANCE (FOR BAY AREA INFLATION DATA).

MORE EFFICIENT AND EFFECTIVE PROJECT DELIVERY IS NEEDED GIVEN GROWING CITYWIDE NEEDS

Small project delivery research indicates consensus that small projects and complete street projects can be delivered more efficiently, helping to lower unit costs or make improvements more quickly. As discussed on page 11, the scope of the city's goals for supporting bicycling, pedestrians, and efficient transit require that we construct improvements faster than we have historically. The Project Delivery Strategic Initiative of the SFTP (Appendices H and I) sought to identify opportunities to improve the timeliness, transparency, and efficiency of project implementation in San Francisco's transportation sector.

Research indicates that small projects and complete streets can be delivered more efficiently, resulting in more improvements and more "bang for the buck" as we invest in our streets.

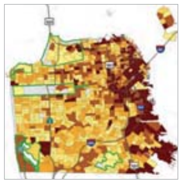
HEALTHY ENVIRONMENT

Reducing vehicle pollution—including greenhouse gases and other pollutants—is critical for a healthy environment. More stringent state vehicle emissions regulations will reduce vehicle pollution over the SFTP period, but growth in driving means that additional action will be necessary to for San Francisco to meets our aggressive greenhouse gas reduction goals.

VEHICLE TRAVEL GROWTH EXPECTED, ESPECIALLY TO AND FROM THE EASTERN NEIGHBORHOODS AND SOUTHWEST SAN FRANCISCO, THE PENINSULA

Miles driven by private vehicles, or VMT (vehicle miles of travel), are the main source of greenhouse gases and air pollutants from the transportation sector. Growing population and employment in San Francisco and regionally is expected to result in VMT in-

FIGURE 18. VEHICLE MILES TRAVELED IN 2040. (DARKER COLORS INDICATE MORE VEHICLE MILES OF TRAVEL.)



Workplace Vehicle Miles of Travel per Worker

Household Vehicle Miles of Travel per Household Automobile

SOURCE: SFCTA, SF CHAMP

creases of approximately 30% by 2040 under a business as usual scenario. Much of this VMT will be generated by driving trips to and from the downtown core (for workplace VMT), and outlying southwest and southeast neighborhoods (for household VMT)—(Figure 18).

VEHICLE TECHNOLOGY ALONE WILL NOT ACHIEVE SAN FRANCISCO'S AMBITIOUS GOALS

Technology will do much to reduce climate change impacts from private vehicles. Tough state laws (Pavley I and II) regulating vehicle emissions are expected to reduce greenhouse gases by more than 40%. However, this is not sufficient to allow San Francisco to achieve its aggressive greenhouse gas reduction goals, set by ordinance 81-08, which call for an 80% reduction below 1990 levels by 2050 (Figure 19). This is five times more aggressive than regional greenhouse gas reduction goals, and will take tremendous local committment and regional, state, and Federal support to achieve.

DEMAND MANAGEMENT STRATEGIES ARE CRITICAL TO ACHIEVING PROGRESS TOWARD OUR GOALS

Scenario testing conducted for the SFTP (see the "What would it take" sidebar box on page 19) revealed that, though necessary, supply-side investments such as major new transit lines and transit frequency are alone not very cost-effective at reducing greenhouse gases. Among the more cost-effective strategies are those that reduce vehicle tripmaking by more directly linking the cost or impact of driving to the decision to make a trip:

- **CONGESTION MANAGEMENT.** The Transportation Authority's 2010 Mobility, Access and Pricing study found that implementation of a peak-period congestion charge in San Francisco's northeast cordon would reduce vehicle delay by 21%, and greenhouse gases by 5% citywide, among other benefits. Congestion can also be managed through direct regulation of vehicle trips to the worksite.
- **EMPLOYER OUTREACH AND INCENTIVES.** Incentive and outreach programs in partnership with employers can provide employee travel counseling, transit promotions, tools to facilitate shared rides, and supportive services such as guaranteed ride home programs.

FIGURE 19. SAN FRANCISCO GREENHOUSE GAS (GHG) REDUCTION GOALS

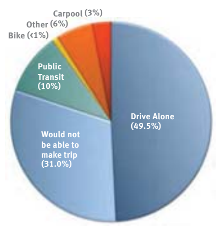
SOURCE: SFMTA, SAN FRANCISCO CLIMATE ACTION PLAN

FIGURE 20. SHARE OF SHUTTLE USERS WHO WOULD DRIVE ALONE WITHOUT THE SHUTTLE*



SOURCE: SFMTA

*Surveys have indicated that shuttles are serving about 35,000 commute trips per day, or about 1% of all trips to, from, and within San Francisco.

- **PARTNERSHIPS WITH THE PRIVATE SECTOR AND COMMUNITY BASED ORGANIZATIONS.** The private sector is increasingly involved in providing transportation services, many of which could reduce single occupancy vehicle trips and greenhouse gases. The SFMTA Shuttle Partners program, for example, seeks to allow private employer shuttles to use Muni stops in exchange for a fee. SFMTA's data indicates that shuttles displace over 45 million vehicle miles traveled and 11,000 metric tons of GHG per year, and about half of shuttle riders say they would drive alone without shuttle access (Figure 20).

WHAT WOULD IT TAKE TO MEET SFTP GOALS?

To meet our adopted goals and targets for livability, world-class infrastructure, economic competitiveness, and a healthy environment would require significantly increased funding; commitments to prioritize our limited rights of way for transit, walking, and bicycling; and closer linking of the cost of driving to the decision to make a trip. Each of the aspirational scenarios described below includes a package of supply-side and demand-side improvements valued at about $10 billion above and beyond revenues we expect to have. The complete findings of "what it would take" to meet San Francisco's ambitious goals are included in Appendix B and summarized below.

LIVABILITY. We examined what it would take to meet the city's "transit first" goal of no more than 50% of daily trips by car. Expanding the capacity of transit (such as a with a second BART tube across the bay) and elevating safety through citywide traffic calming, road diets, a cycle track network, and more, decreased the expected share of trips by car by 6 percentage points to 53%. Only when paired with demand-management measures (congestion pricing) is the goal achieved (Muni and San Francisco's share of BART and Caltrain).

WORLD-CLASS INFRASTRUCTURE. We asked how much funding would be required to maintain our road conditions and transit system in a state of good repair in 2040. The unfunded cost to meet this goal is approximately $5 billion for the transit system and $1.5 billion for streets, which is in excess of the uncommitted funding available over the plan period. New revenues will be required just to meet these basic needs.

ECONOMIC COMPETITIVENESS. Competitive and reliable travel times are critical for businesses and their workers, customers, and suppliers. We analyzed what it would take to keep commute travel times from worsening in the future, given the large projected increase in new residents and jobs in the city. We found that transit and driving commute times in 2035 could be maintained at today's levels (average of 40 minutes), but it would take $5 billion worth of investments in new transit supply including an extension of Caltrain to downtown, bus rapid transit projects on key corridors, and other improvements, as well as demand management approaches including peak period area pricing and related mobility improvements.

HEALTHY ENVIRONMENT. In partnership with the city's Climate Action Plan team, we tested what it would take to meet the city's goal of reducing greenhouse gas emissions to 80% below 1990 levels by 2050. We found this goal is only possibly attainable with a robust combination of aggressive local and regional vehicle pricing, widespread use of electric vehicles, and major new infrastructure (including a new BART tube across the Bay at a cost of $10 billion).

A consistent finding across all scenarios was that strategies to manage travel demand, such as community outreach and education campaigns, employee programs, peak-period or area pricing, and parking pricing, are much more cost-effective in achieving desired goals than supply-side investments.

THIS PAGE LEFT INTENTIONALLY BLANK

CHAPTER THREE

FUNDING OUR TRANSPORTATION NEEDS

SAN FRANCISCO'S NEEDS FOR TRANSPORTATION FUNDING—even to maintain the existing transit and street networks in today's condition—far exceed expected revenues, and most funds are already committed to specific projects and purposes. The SFTP proposes ways to invest expected funding most effectively to make progress toward our goals, but analysis shows that this progress is limited without policy changes and additional investment from new revenues. Based on public input and technical analysis, we have developed two scenarios (Figure 21) that invest strategically in a diverse set of projects to make meaningful progress towards each of the SFTP's four goals. Because there is far more need than available revenues for transportation, each scenario anticipates some new revenues:

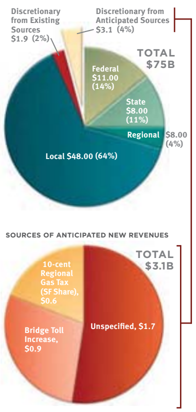
- The Investment Plan shows how existing and some anticipated new federal, state, and regional revenue (consistent with the Bay Area's long-range transportation plan, Plan Bay Area) could be spent.
- The SF Investment Vision imagines how we could get further towards our goals with major new sources of local revenue.

This chapter summarizes the revenue forecasts for the two scenarios. The next chapter describes the investments we could make and what they could achieve, along with supporting policy recommendations to get the most out of our investments.

FIGURE 21. THE INVESTMENT PLAN AND SF INVESTMENT VISION

moveSmartSF SAN FRANCISCO TRANSPORTATION PLAN 2040

FIGURE 22. PLAN REVENUES BY SOURCE
(IN BILLIONS OF YEAR-OF-EXPENDITURE DOLLARS THROUGH 2040)



SOURCE: SFCTA (SEE APPENDIX D FOR DETAIL)

INVESTMENT PLAN: INCLUDES BOTH EXISTING AND ANTICIPATED NEW FEDERAL, STATE, AND REGIONAL REVENUE

The SFTP Investment Plan proposes how we should invest revenues we expect to have through 2040, including some expected new federal, state, and regional funds. About $75 billion in federal, state, regional and local revenue is expected for transportation in San Francisco through 2040. Figure 22 illustrates the sources of existing and anticipated new revenues for the Investment Plan. SFTP Appendix D describes the assumptions used to estimate expected revenues in more detail. All revenues are expressed in billions of year-of-expenditure dollars over the SFTP period.

MOST EXPECTED REVENUE IS FROM LOCAL AND REGIONAL SOURCES

The federal gas tax that funds transportation is not indexed to inflation, and has not been increased since 1992. Similarly, the state has struggled with budget deficits for years. As a result, the responsibility of paying for our transportation system increasingly falls on the shoulders of local and regional governments, or through direct user payment. Over 65% of the $75 billion expected for the Investment Plan comes from local and regional funding sources, such as the Prop K transportation sales tax and the $10 Prop AA vehicle registration fee.

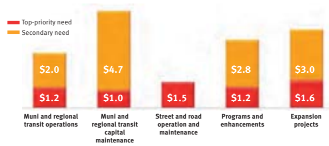
MOST EXPECTED REVENUES ARE ALREADY COMMITTED

Over 90% ($70 billion) of the expected funds are already committed to specific projects (such as the Presidio Parkway, Central Subway, and Caltrain Electrification) and purposes (such as transit and local streets operations and maintenance). This means that of the $75 billion in revenue we expect through 2040, only about $5 billion (or 7%) is discretionary, meaning we can decide how it should be invested to improve our transportation system.

ANTICIPATED REVENUES ARE INSUFFICIENT TO MEET OUR EXISTING AND FUTURE SYSTEM NEEDS

San Francisco's unfunded transportation needs far exceed the expected $5 billion in uncommitted revenue. Even if we spent every cent of discretionary funds on transit and streets maintenance, repair and replacement projects, we still would not have enough just to maintain the existing transportation system in a state of good repair—let alone make safety and livability enhancements or address planned growth. Figure 23 summarizes the transportation system investment need by category.

FIGURE 23. UNFUNDED TRANSPORTATION NEEDS BY CATEGORY



SOURCE: SFCTA, SFMTA, SFDPW, BART, MTC

TWO-PRONGED REVENUE STRATEGY

The SFTP (through its investment plans and policy recommendations) proposes ways to cost-effectively invest expected transportation funds, but analysis shows that this progress is limited unless we identify new revenues. So, the SFTP recommends a two-pronged revenue strategy. First, the Investment Plan seeks to position San Francisco well to compete for the anticipated additional new federal, state, and regional funding sources. Second, the SF Investment Vision calls for an additional $7.5 billion in locally-controlled transportation revenues. With $7.5 billion in additional local revenues, the SF Investment Vision achieves more of our maintenance, livability, and economic competitiveness goals, and makes more progress towards our ambitious environmental goals.

SF INVESTMENT VISION

NEW LOCAL SOURCES OF FUNDING UNDER CONSIDERATION

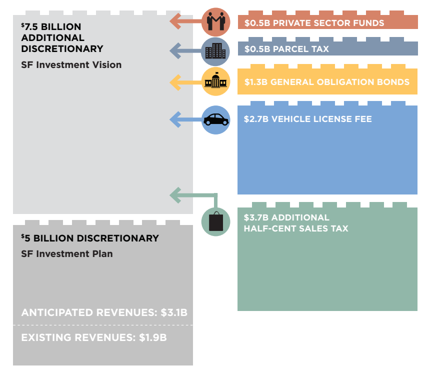
For the SFTP, we evaluated a range of potential new local revenue sources, considering factors like revenue stability, growth potential, equity, and likelihood of being put into place. The SFTP Revenue White Paper provides a comparison table and information on the primary local sources we evaluated. A combination of sources pictured in Figure 24—such as general obligation bonds, a Vehicle License Fee, additional half-cent sales tax, or others could provide the $7.5 billion needed beyond the Investment Plan to achieve the $82.5 billion SF Investment Vision.

MAYOR'S 2030 TRANSPORTATION TASK FORCE

We coordinated SFTP development with the Mayor's 2030 Transportation Task Force. The Task Force has developed recommendations for potential new local transportation revenues, and has recommended that voters approve $1 billion in general obligation bonds, a half-cent increase in the sales tax, and a 1.35% increase in the vehicle license fee to generate just over $2.95 billion ($2013) in new transportation revenues between 2015 and 2030.

FIGURE 24. A COMBINATION OF SOURCES CAN PROVIDE $7.5 BILLION ADDITIONAL DISCRETIONARY

$12.5 BILLION TOTAL IN DISCRETIONARY TRANSPORTATION FUNDS



THIS PAGE LEFT INTENTIONALLY BLANK

CHAPTER FOUR

INVESTMENT PLANS AND POLICY RECOMMENDATIONS

THE SFTP IS THE BLUEPRINT for the future of our city's transportation system through 2040. With input from the public (detailed in Appendix E), and informed by other agencies and robust technical analysis (Appendices A, B, and F), we've developed two investment scenarios that will allow us to make meaningful progress toward our transportation goals: the Investment Plan and SF Investment Vision. The result is a diverse investment plan paired with specific policy actions and new revenues.

CONTENTS OF THE INVESTMENT SCENARIOS

The Investment Plan and SF Investment Vision are organized into three major categories of spending:

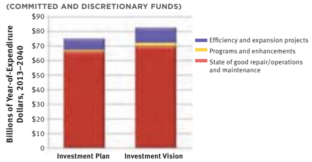
- **ONGOING MAINTENANCE AND OPERATIONS FUNDING.** Each investment scenario recommends funding levels for the ongoing maintenance and operations of our street network (including roadway-repaving street sweeping, traffic signal maintenance); and transit system operation, maintenance and replacement. The vast majority of funding is dedicated to this category.
- **TRANSPORTATION PROGRAMS AND ENHANCEMENTS.** This category includes funding for seven transportation programs that improve safety, expand or enhance the transportation system through small-to-medium scale improvements for all modes.
- **EFFICIENCY AND EXPANSION PROJECTS.** This category recommends funding for a list of major capital projects that would improve the efficiency of the existing system or cost-effectively expand system capacity.

Figure 25 (next page) provides an overview of the amount of funding dedicated to these categories in the Investment Plan and Investment Vision, and the remaining sections describe each category in detail.

The SFTP also recommends policy actions. This chapter highlights some of the key policy recommendations. For a complete list, see Appendix G.

We've developed two investment scenarios that will allow us to make meaningful progress toward our transportation goals: the Investment Plan and SF Investment Vision. What it takes is a diverse investment plan paired with specific policy actions and new revenues.

FIGURE 25. MAJOR USES OF INVESTMENT AND VISION REVENUES (COMMITTED AND DISCRETIONARY FUNDS)



SOURCE: SFCTA

DISCRETIONARY INVESTMENT: USES OF $5B AND $12.5B IN DISCRETIONARY FUNDS

As discussed in Chapter 3, 90% of the expected $75 billion in transportation revenue is dedicated to specific projects or purposes. This leaves $5 billion in expected and new revenues that we can decide how to spend. With the SF Investment Vision, a combination of new local funding sources can provide the additional $7.5 billion needed beyond the Investment Plan to go further toward our goals. Figure 26 summarizes the uses of expected and new discretionary funds in the Investment Plan and SF Investment Vision.

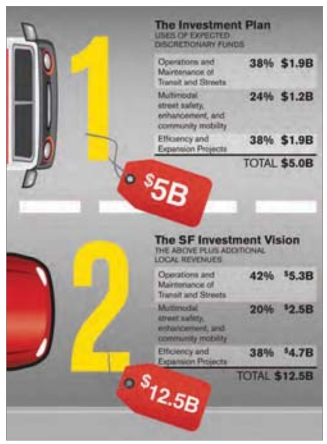
PLAN AND VISION INVESTMENTS

The following sections describe the investments proposed in the SFTP Investment Plan and SF Investment Vision.

DEDICATED MAINTENANCE AND OPERATING FUNDING

About $60 billion of the expected $75 billion in transportation revenue is already committed to operations and maintenance of the existing system and major projects that rehabilitate existing infrastructure. These include the Presidio Parkway, Yerba Buena Island Ramp Improvements, and Transbay Transit Center Phase 1. As discussed on page 16, an additional $5 billion is needed to maintain transit capital assets in an optimal state of good repair. Another $1.54 billion is needed to achieve the city's pavement condition goals. An additional $1.2 billion would be required to provide all of the transit service Muni is scheduled to provide today.[1] Figure 27 shows how we allocated funding to help address some of these maintenance and operations needs.

FIGURE 26. USES OF DISCRETIONARY FUNDS



SOURCE: SFCTA

1 Funding constraints are one factor that currently prevents Muni from operating all scheduled service.

FIGURE 27. COMPARISON OF PLAN AND VISION FUNDING LEVELS FOR MAINTENANCE AND OPERATION

INVESTMENT CATEGORY	INVESTMENT LEVEL	PLAN	VISION
State of Good Repair / Operations and Maintenance			
Muni and Regional Transit: Operations. Provides funding to operate Muni and regional transit service.	**PLAN:** Maintain today's funding and actual service levels. **VISION:** Fully fund all today's scheduled service levels.	$43.80	$45.00
Muni and Regional Transit: Capital Asset Maintenance. Provides funding to maintain and replace Muni and regional transit vehicles, stations, and maintenance facilities.	**PLAN:** Fully fund transit vehicle replacement needs for all operators; all MTA vehicle mid-life overhauls; and 70% of Score 16 (most important) assets. **VISION:** Fund 100% of Muni Score 16 needs.	$12.41	$14.06
Local Streets and Roads: System Preservation. Provides funding to re-pave streets and roads.	**PLAN:** Maintain today's pavement condition. **VISION:** Reach and maintain pavement condition index of 70 ("good").	$3.27	$3.83
Local Streets and Roads: Operations. Provides funding for street sweeping, signal maintenance, and other roadway upkeep.	**PLAN AND VISION:** Maintain today's levels of street operations.	$2.80	$2.80
Local Street and Bridges Structures: Capital Maintenance. Provides funding to maintain or replace aging structures (e.g. bridges and tunnels).	**PLAN AND VISION:** Fund unmet need of $3M/decade.	$0.01	$0.02
State of Good Repair Projects. Funds major capital replacement and rehabilitation projects.	**PLAN AND VISION:** Provide full funding for the Presidio Parkway; Transbay Transit Center Phase I Improvements; and Yerba Buena Island Ramp Improvements.	$4.01	$4.01
	SUBTOTAL (AMOUNT IN $BILLIONS YOE)	$66.30	$69.72
	PERCENT OF TOTAL INVESTMENT	88%	84%

The Investment Plan provides sufficient funding to support mid-life vehicle overhauls for Muni, extending the life of each vehicle and reducing the incidence of vehicles that are out of service.

RECOMMENDATION:
PRIORITIZE REVENUES TO FULLY FUND TIMELY VEHICLE REPLACEMENT AND REHABILITATION

Underfunding vehicle maintenance contributes to reduced reliability and unscheduled service turnbacks in outlying neighborhoods, a top concern recorded during public outreach. The Investment Plan provides sufficient funding to meet vehicle replacement needs for all transit operators as well as to support mid-life vehicle overhauls for Muni, extending the life of each vehicle and reducing the incidence of vehicles that are out of service.

Local funds prioritized for this purpose will leverage significant regional and federal monies. An example is MTC's Transit Core Capacity program, which benefits Muni, BART, and AC Transit (all of which provide San Francisco service).

RECOMMENDATION:
EXPAND TRANSIT SERVICE WHILE SUPPORTING STEPS TO STABILIZE COSTS

New funding will be necessary to increase transit service frequencies to reduce crowding and serve new riders. However, new funding should be accompanied by measures to stabilize the rapid rise in transit operating costs (described on page 17). Such measures could include prioritizing projects to speed up Muni vehicles, such as the Transit Effectiveness Project; implementing transit operator fringe benefit cost control strategies recommended in the MTC's Transit Sustainability Project; and seeking a regional funding solution to stabilize Caltrain operating and capital funding. SFMTA and other transit agencies have already committed to a 5% real reduction in costs by fiscal year 2016–2017.

RECOMMENDATION:

ACHIEVE CITY GOALS FOR AVERAGE PAVEMENT CONDITION

Smoother roads benefit all modes of travel. The SFTP Investment Vision dedicates sufficient funding for San Francisco to achieve and maintain an average pavement condition index of 70, or "good," over the life of the plan. Streets maintained at pavement score 70 are several times less expensive to keep up than streets which aren't maintained at this level.

FIGURE 28. COMPARISON OF PLAN AND VISION FUNDING LEVELS FOR PROGRAMS AND ENHANCEMENTS

INVESTMENT CATEGORY	INVESTMENT LEVEL	PLAN	VISION
Programs			
Walking and Traffic Calming. Supports new and widened sidewalk construction, sidewalk bulb outs to shorten crossing distances, crosswalk upgrades, pedestrian countdown signals, landscaping, and vehicle speed control treatments.	**PLAN:** Provides $10m/year (exceeds historic funding levels). **VISION:** Funds full build out of the Mayor's Pedestrian Strategy.	$0.28	$0.63
Bicycling. Supports physical improvements on the citywide bicycle network, such as new cycle tracks (bike lanes physically separated from moving cars), bike lanes and paths, repair of existing lanes, bicycle parking, and bicycle outreach and education.	**PLAN:** Funds a citywide cycle track network. **VISION:** Funds full buildout of the SFMTA Bicycle Strategy.	$0.15	$0.60
Regional Transit Enhancements. Supports improvements for regional transit operators serving San Francisco, including BART, Caltrain, and Golden Gate Transit, such as additional escalators at stations, new signage, and station access improvements (e.g. more bike parking).	**PLAN:** Maintain historic levels. **VISION:** Increase moderately over historic levels.	$0.20	$0.35
Muni Enhancements and Customer First Treatments. Supports new Muni equipment to improve transit reliability and passenger amenities, such as on-vehicle cameras, ticket vending machines, and new station platform information displays, as well as new and improved transit stops.	**PLAN:** Maintain historic levels. **VISION:** Increase moderately over historic levels.	$0.19	$0.29
Street and Signal Upgrades and Street Network Development. Supports new traffic signs and signals, red light photo enforcement equipment, management of major arterials such as Guerrero or Lincoln, and new streets in developing areas of the City such as Hunters Point and Candlestick Point.	**PLAN:** Doubles historic funding levels. **VISION:** Triples historic funding levels.	$0.21	$0.28
Transportation Demand Management. Supports educational, outreach, and regulatory programs that reduce single-occupant vehicle use for commuters, schools and universities, and institutions.	**PLAN:** Increase of 20% over historic funding. **VISION:** Doubles historic funding levels.	$0.06	$0.10
Equity. Supports planning, project development, and service to promote equitable access and investment.	Provides $10M/year for planning, operations, and/or implementation	$0.14	$0.28
	SUBTOTAL (AMOUNT IN $BILLIONS YOE)	$1.23	$2.53
	PERCENT OF TOTAL INVESTMENT	2%	3%

TRANSPORTATION PROGRAMS AND ENHANCEMENTS

The Investment and SF Vision Plans provide $1.2 and $2.5 billion, respectively, to eight transportation safety and enhancement programs. Figure 28 describes how the funding levels compare to historic funding and the need.

RECOMMENDATION:

BUILD THE PEDESTRIAN AND BICYCLE STRATEGIES TO ESTABLISH SAFER NEIGHBORHOOD NETWORKS CITYWIDE

As discussed on page 11, the City has set aggressive goals for increasing the share of trips made by bicycling and walking while improving safety. Public outreach indicated that bicycling and walking infrastructure are top public priorities after basic transit operations and maintenance (See Appendix E). Accordingly, the plan and vision scenarios increase funding for traffic calming, walking, and bicycling programs (combined) by 80% and 400%, respectively, over historic funding levels. The vision-level funding is sufficient to support full implementation of the SFMTA's Bicycle and Pedestrian Strategies.

Funding for pedestrian and bicycle safety can be spent most effectively by focusing it on the roadways with the highest incidence of pedestrian and bicyclist injuries and fatalities, many of which are arterial roadways. The Pedestrian Strategy has identified these 70 miles of High-Injury Corridors, which represent only 6% of San Francisco's street miles, but 60% of severe and fatal injuries.

RECOMMENDATION:

CREATE MORE COMPLETE STREETS (AT LOWER COST) THROUGH COORDINATION WITH REPAVING

Safety and enhancement projects can be implemented more efficiently through coordination with roadway repaving, which occurs on a regular schedule city-wide. The SFTP recommends setting aside some Prop K funds to advance safety project coordination with re-paving projects, utility projects, and/or major capital investments. It also recommends developing a checklist for all re-paving projects to facilitate consideration of complete streets elements.

RECOMMENDATION:

INCREASE INVESTMENT IN EMPLOYER, SCHOOL, AND COMMUNITY TRIP REDUCTION PROGRAMS

As described on page 16, San Francisco's downtown—especially as growth expands in SoMa and Mission Bay—will see transit performance decline if growth occurs as expected and travel behavior remains the same. The City's 1985 Downtown Plan introduced then-innovative demand management strategies, such as incentives for employers to provide employee travel counseling, helping to reduce peak period congestion and the need for parking. A new generation of incentive and outreach programs is needed for our growing downtown, especially South of Market and Eastern Neighborhoods. These partnerships with employers, institutions, and residential associations can provide travel counseling, incentives for taking transit, tools to facilitate shared rides, and supportive services such as guaranteed ride home programs. The SFTP increases funding for these travel demand management incentive programs by 20% and 100% over historic levels in the Investment Plan and Investment Vision, respectively.

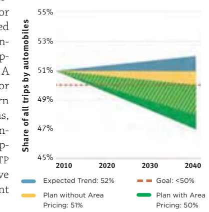
RECOMMENDATION:

INCREASE TRANSPARENCY AND PROMOTE PUBLIC INVOLVEMENT BY SHARING AGENCY PRIORITIZATION AND DEVELOPMENT PROCESSES

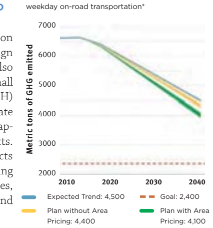
Often during SFTP outreach, the public would express confusion about how San Francisco agencies identify, prioritize, and design street improvements. Fragmented institutional roles can also contribute to slower-than-desired project delivery rates. Small Project Delivery research conducted for the SFTP (Appendix H) found that coordination within and among agencies is inadequate to deliver a multi-modal vision, and that a consensus-based approach to project design diminishes the benefits of many projects. Strategies to increase project delivery and support quality projects include dedicating funds for increasing agency capacity, increasing transparency and coordination of agency prioritization processes, and enhancing public involvement in project development and planning efforts.

FIGURE 29. CONTRIBUTION OF AREA PRICING TO PLAN GREENHOUSE GAS AND AUTOMOBILE TRIP REDUCTION BENEFITS

LIVABILITY
Percent of all trips made by auto*



HEALTHY ENVIRONMENT
Greenhouse Gas Emissions
weekday on-road transportation*



* 2040 forecasts are derived from the Transportation Authority's regional travel demand Model, SF-CHAMP; the more ambitions end of the range represents additional travel demand management (TDM) program assumptions such as bikesharing, shuttles, carsharing, and other TDM policy efforts, which are calculated outside of the SF-CHAMP model and applied on top of modeling results.

A COMPREHENSIVE STRATEGY FOR THE SOUTH OF MARKET AND EASTERN NEIGHBORHOODS

The City's original 1984 Downtown Plan introduced new measures such as Transportation Management Associations (TMAs) to address the congestion caused by employment growth. Now a new wave of growth in the downtown, South of Market, and Mission Bay will significantly increase core crowding conflicts and congestion (see Appendix C). A comprehensive strategy is needed for the new, expanded core to manage congestion and maintain livability, including: transit capacity and other infrastructure; dedicated transit and bicycle networks; pedestrian safety measures; area-wide congestion and freeway management measures; and strengthened trip-reduction programs in partnership with employers.

RECOMMENDATION:
CONTINUE TO DEVELOP PRICING APPROACHES TO CONGESTION MANAGEMENT

Scenario testing conducted for the SFTP (see the "what would it take" sidebar box on page 19) revealed that the most cost-effective ways to reduce greenhouse gas emissions are those that reduce vehicle tripmaking by more directly linking the cost or impact of driving to the decision to make a trip. The Investment and SF Vision Plans recommend considering peak or area pricing in the Northeast Cordon, in addition to the pricing already approved for Treasure Island.[2] These projects require about $0.03 billion in start-up capital costs, which is less than .01% of the Investment Plan Cost, but generate almost half the benefits of the Plan (Figure 29). They would also generate as much as $2.5 billion in revenue that could be re-invested into multimodal projects and programs.

2 Analysis of Congestion Pricing can be found in the Mobility, Access, and Pricing Study (2008) on the Transportation Authority web site at www.sfcta.org. Information about Treasure Island pricing can be found at www.sfcta.org/TIMMA.

FIGURE 30. SFTP EFFICIENCY AND ENHANCEMENT PROJECT LIST

PROJECT	PLAN	VISION
Transbay Transit Center Phase 2/Caltrain Downtown Extension: Extension of Caltrain to the Transbay terminal	$2.60	$2.60
Central Subway: Extension of the T-Third light rail to downtown and Chinatown	$1.58	$1.58
Developer Funded Projects (Parkmerced, Mission Bay, Treasure Island, SE Waterfront Local Streets)	$0.90	$0.90
Caltrain Electrification/Signal System (SF remaining share of total cost)	$0.48	$0.48
Van Ness Avenue Bus Rapid Transit: Dedicated bus lanes and transit-priority treatments.	$0.13	$0.13
Long-Range Transit Network Development, including Transit Performance Initiative, one or more major projects to improve BART/Muni transit travel time, and reliability at key bottlenecks, such as the Embarcadero Muni Metro turnaround, the J-Church and N-Judah merge point, and at West Portal.	$0.14	$1.54
Expanded Transit Service and New Vehicles, Muni and Regional Operators: Increases funding for transit service by 1% over expected revenues and purchases new vehicles.	$0.41	$0.71
BART Metro: One or more major construction projects that allow BART to run more frequent transbay service to the core of San Francisco	$0.00	$0.50
M-Line West Side Alignment and Grade Separation: Relocate the M-Ocean View light rail line from the center of 19th Avenue near Stonestown to a dedicated transit lane on the west side of the road to remove conflicts with 19th Avenue auto traffic, improving pedestrian safety and transit travel speed/reliability (only environmental phase funded).	$0.12	$0.43
Better Market Street (transportation elements only): Re-designs and improves Market Street for transit, bicycling, and pedestrians.	$0.20	$0.39
Transit Effectiveness Project: Improves Muni reliability and reduces travel times system-wide through stop improvements such as bus bulb-outs, stop placement, lane modifications, signals, and other tools to prioritize transit.	$0.34	$0.34
Geary Corridor Bus Rapid Transit: Dedicated bus lanes and other transit priority treatments on Geary Boulevard to increase the speed and reliability of the 38/38-Limited lines.	$0.24	$0.24
Bayshore/Potrero Bus Rapid Transit: Dedicated bus lanes and other transit-priority treatments on Potrero Avenue and Bayshore Boulevard to increase the speed and reliability of the 9/9-Limited lines.	$0.13	$0.13
Freeway Performance Initiative: Convert freeway lanes and ramps to carpool and transit lanes, such as on I-280 between 6th Street and US 101.	$0.04	$0.13
Bi-County Program: Includes extension of the T-Third Street to Caltrain Bayshore Station and the Geneva-Harney Bus Rapid Transit	$0.09	$0.09
Bi-County Program, T-Third Street to Caltrain Bayshore Station: Extend the T-Third Muni Metro line and provide new service from Bayshore/Sunnydale to the Bayshore Caltrain station.	$0.05	$0.05
Bi-County Program, Geneva-Harney Bus Rapid Transit: Dedicated bus lanes from Bayshore Boulevard to Prague Street and transit-preferential treatments such as transit signal priority in mixed-traffic lanes from Prague to Ocean Avenue to increase the speed and reliability of the 28-Limited line.	$0.04	$0.04
Oakdale Caltrain Station: New Caltrain station at Oakdale Avenue in the Bayview.	$0.05	$0.05
Waterfront transit capacity and performance, e.g., E-Historic Streetcar Service between Fisherman's Wharf and the 4th Street Caltrain Station: Construct a turn-around track for streetcars at the Caltrain station necessary to provide permanent direct historic streetcar service between Fisherman's Wharf and the 4th Street Caltrain station.	$0.05	$0.05
Express Bus Service: Service from Candlestick and Hunters Point to Downtown.	$0.03	$0.03
Area Pricing, Capital Startup Costs: Northeast Cordon and Treasure Island.	$0.03	$0.03
Area Pricing, Ongoing Operations: Northeast Cordon and Treasure Island: Install a peak period congestion charge for cars entering or leaving downtown or Treasure Island, and invest net revenues in its implementation and related transit, pedestrian, bicycle and carpool alternatives.	N/A*	
Southeast Waterfront Transit Priority and Increased Service	N/A**	
SUBTOTAL (AMOUNT IN $BILLIONS YOE)	$7.57	$10.35
PERCENT OF TOTAL INVESTMENT	10%	13%

FIGURE 30 (CONTINUED)

* The area pricing program raises approximately $2.5 billion in revenue (not reflected above) that is invested into supportive multimodal projects and programs.

** Southeast Waterfront improvements proposed to be funded by future growth in the general fund resulting from development.

FINAL REPORT • SAN FRANCISCO TRANSPORTATION PLAN
SAN FRANCISCO COUNTY TRANSPORTATION AUTHORITY • DECEMBER 2013

EFFICIENCY AND EXPANSION PROJECTS

About six billion of the expected $75 billion in transportation revenue is dedicated to committed efficiency or expansion projects, including those under construction (Central Subway), fully funded (some development-related projects), or prioritized in regional agreements (e.g., Van Ness Avenue Bus Rapid Transit). The Investment Plan recommends dedicating about $2 billion in discretionary funding to plan our long-range transit network and provide efficiency and expansion investments. This includes new transit service and defined capital projects beyond existing commitments. See Appendix A for detail on how we prioritized projects for inclusion. Figure 30 lists project costs, and Figures 31 and 32 (pages 32, 33) illustrate project locations.

RECOMMENDATION:
CONTINUE RAPID TRANSIT NETWORK DEVELOPMENT, INCLUDING BUS RAPID TRANSIT

The most cost-effective transportation projects are those that make the most efficient possible use of existing infrastructure. Bus Rapid Transit is an affordable approach to creating a network of rapid transit along key corridors throughout San Francisco, including Geneva Avenue and Potrero / Bayshore Boulevard. Another example of making the most efficient use of existing infrastructure is the Transit Effectiveness Project, which cost-effectively improves transit travel times and reliability through transit-priority treatments on Muni's Rapid Network, the top lines that carry 75% of total transit ridership. Bus Rapid Transit could also be deployed to fill gaps in regional transit connections to the city's west side.

RECOMMENDATION:
CONTINUE TO COORDINATE TRANSIT INVESTMENT WITH LAND USE DEVELOPMENT PLANS

With new state requirements to focus on reducing greenhouse gas emissions through more coordinated land use and transportation planning, regional funding frameworks increasingly emphasize Priority Development Areas (PDAs), where cities are planning for infill, transit-oriented growth. San Francisco agencies have identified PDAs, generally in the eastern part of the city. The Transportation Investment and Growth Strategy identifies the transportation needs to support this growth. As area plans and major developments are contemplated, such as along the Eastern Waterfront, transportation needs in all categories—operations and maintenance, safety and enhancements, and efficiency and expansion—should be identified and prioritized.

RECOMMENDATION: INVEST IN PLANNING AND PROJECT DEVELOPMENT TO REDUCE DISPARITIES

In response to concerns heard during SFTP outreach, we analyzed how transportation conditions such as safety, transit access, and reliability vary geographically in the city (see Appendix F). We found some disparities. For example, low-income communities experience disproportionately high numbers of pedestrian and bicyclist injuries and fatalities, and outlying neighborhoods experience worse transit reliability. We responded by proposing a set-aside equity funding program with $140 million for projects that improve equity and including equity as a consideration in project prioritization.

RECOMMENDATION:

SET A VISION FOR MANAGING THE CITY'S FREEWAY NETWORK

San Francisco's greatest increases in vehicle travel are projected to be to and from the eastern neighborhoods and the Peninsula/South Bay. Overall development and management strategies are needed for the US 101 and I-280 corridors. As the region develops the Bay Area Express Lane Network, San Francisco agencies should partner with Caltrans, the MTC, and neighboring cities and counties to develop a local strategy for managing our freeway network and related surface streets such as Potrero and Bayshore.

RECOMMENDATION:

IDENTIFY THE NEXT GENERATION TRANSIT NETWORK PRIORITIES FOR BART, CALTRAIN, AND MUNI

Addressing bottleneck points in our local and regional rail networks will significantly improve rides for existing and passengers and allow for new passengers on our system. and The SFTP identifies the need to establish a long-range, multi-operator transit network development strategy. The SF Investment Vision identifies up to $1.5 billion in expected and potential new revenues for expanding the capacity of BART, Caltrain, and Muni.

RECOMMENDATION:

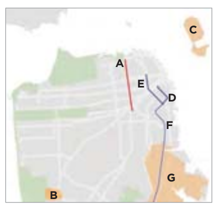
CONSIDER ALL OPTIONS FOR DELIVERING PROJECTS

Transportation projects may fall behind schedule and experience cost increases, and the public generally perceives delivery as taking too long. The SFTP Small and Large Project Delivery White Papers (Appendices H and I) explore strategies to aid project delivery. Key recommendations include consideration of a wide range of public-private partnership opportunities for major capital improvements such as the Caltrain Downtown Extension to the rebuilt Transbay Terminal, and the Treasure Island Transportation Improvement Plan.

INVESTMENT PLAN AND VISION SCENARIO BENEFITS

San Francisco's needs for transportation funding far exceed expected revenue. The SFTP proposes ways to invest the dollars we expect to have to most effectively make progress towards our goals, but analysis shows that our progress will be limited unless we identify new revenues. Figure 33 (pages 34–35) illustrates the additional benefits possible through higher funding levels. See Appendix J for more detail on plan performance results.

FIGURE 31. COMMITTED EFFICIENCY AND ENHANCEMENT PROJECTS



$9.43 billion in expected revenue is dedicated to projects that San Francisco has already committed to building.

A. Van Ness Bus Rapid Transit

B. Improvements to support development of Parkmerced

C. Improvements to support development on Treasure Island including

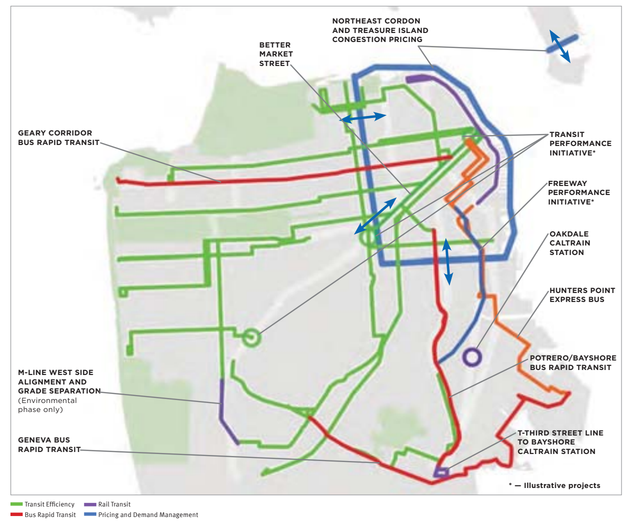
D. Extension of Caltrain to Downtown

E. Central Subway

F. Caltrain Electrification and signal system upgrade

G. Improvements to support development of Candlestick Point/Hunters Point-Shipyards

FIGURE 32. INVESTMENT PLAN DISCRETIONARY EFFICIENCY AND ENHANCEMENT PROJECTS



WORLD CLASS INFRASTRUCTURE

SAFE STREETS AND VIBRANT NEIGHBORHOODS

HEALTHY ENVIRONMENT

ECONOMIC COMPETITIVENESS

1

$5B

The Investment Plan

USES OF EXPECTED DISCRETIONARY FUNDS

Operations and Maintenance of Transit and Streets	38%	$1.9B
Multimodal street safety, enhancement, and community mobility	24%	$1.2B
Efficiency and Expansion Projects	38%	$1.9B
	TOTAL	$5.0B

World Class Infrastructure

- **70%** — 70% of highest priority transit maintenance needs met. Increased vehicle maintenance to reduce service turnbacks, increase reliability
- **19%** — Reduce transit crowding 19% on ten most crowded Muni lines. Maintains today's pavement condition

Safe Streets and Vibrant Neighborhoods

- **20MI** — About 40% of the City's Pedestrian Safety Strategy funded (nearly 20 miles) of pedestrian safety improvements
- **22%** — Nearly 22% of the City's Bicycle Strategy funded

Healthy Environment

- **10%** — Up to 10% reduction in auto trips. Expanded employer, school and community trip reduction partnerships
- **12%** — Up to 12% reduction in GHG emissions

Economic Competitiveness

- **15MI** — 15 miles of protected transit lanes including Bus Rapid Transit on key corridors
- **14%** — 14% improvement in Muni speeds on rapid network

2

$12.5B

The SF Investment Vision

THE ABOVE PLUS ADDITIONAL LOCAL REVENUES

Operations and Maintenance of Transit and Streets	42%	$5.3B
Multimodal street safety, enhancement, and community mobility	20%	$2.5B
Efficiency and Expansion Projects	38%	$4.7B
	TOTAL	$12.5B

World Class Infrastructure

- **100%** — 100% of Highest Priority Transit Maintenance Needs Met
- **38%** — Reduce transit crowding 38% of ten most crowded Muni lines. Pavement condition improves to "good" levels

The SF Investment Vision also funds some maintenance of local bridges and street structures.

Safe Streets and Vibrant Neighborhoods

- **40MI** — 100% of the City's Pedestrian Safety and Bicycle Strategies (Over 40 miles of pedestrian safety improvements)
- **100%** — 100% of the City's Bicycle Strategy funded

Both scenarios include dedicated planning funds to develop safety and mobility projects in Communities of Concern and neighborhoods citywide

Healthy Environment

- **14%** — Up to 14% reduction in auto trips. Freeway management and transit efficiency strategies to increase safety and encourage carpools.
- **15%** — Up to 15% reduction in GHG emissions

Multimodal investments and demand management, including area pricing, downtown and on Treasure Island account for half of these benefits in both scenarios

Economic Competitiveness

- **33MI** — Up to 33 miles of protected transit lanes. Increased BART capacity and reliability
- **18%** — 18% improvement in Muni speeds on rapid network. Muni Metro system bottlenecks addressed to improve reliability and travel times

Additional Caltrain service and/or BART express buses increase rapid connections to the South and East Bays.

FIGURE 33. COMPARISON OF PLAN AND VISION SCENARIO BENEFITS

THIS PAGE LEFT INTENTIONALLY BLANK

CHAPTER FIVE

NEXT STEPS

THE SFTP WILL SHAPE THE WORK of the Transportation Authority and our partner agencies in the years to come. Major next steps are:

- Rolling out the first five years of SFTP investments through an Early Action Program.
- Coordinating with the Mayor's 2030 Transportation Task Force and other local and regional partners to pursue new local revenues to address unmet transportation needs.
- Conducting monitoring and evaluation to ensure efficient and equitable progress towards SFTP goals.

Additionally, the SFTP itself will be updated approximately every several years.

EARLY ACTION PROGRAM

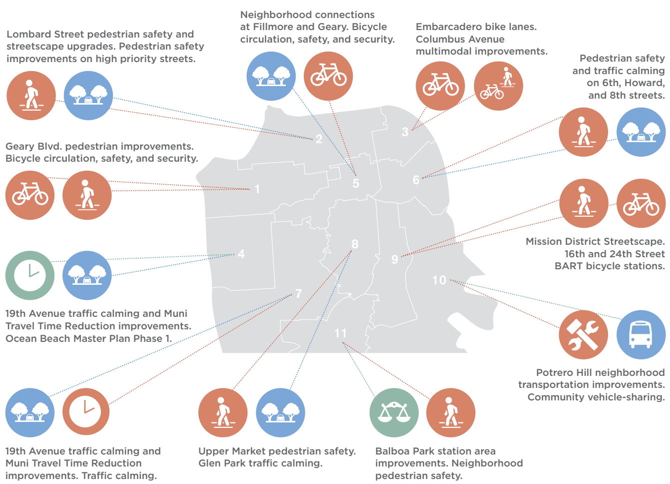
The Early Action Program represents the first five years of the 30-year SFTP and will fund improvements in every part of the city for every mode of travel. The Early Action Program uses the Prop K transportation sales tax and its ability to leverage federal, state and other funds to direct hundreds of millions of dollars toward SFTP investments. Over the next five years, city and regional agencies will work to define and implement these projects. The Figure 34 (next page) shows a representative sample of potential Early Action Program projects. We anticipate Early Action Program projects in each District. Information about these projects is available through the Authority's interactive web site, www.mystreetsf.com. We anticipate Transportation Authority Board approval of the Early Action Program in Spring 2014.

NEW REVENUES

We evaluated a range of potential new local revenue sources to meet existing and future transportation needs. A combination of sources such as private sector funds, a parcel tax, sales tax, and vehicle license fee are possible candidates for generating the additional $7.5 billion recommended for the SFTP vision. Over the past year, we worked closely with the Mayor's 2030 Transportation Task Force, which has recommended a vehicle license fee, general obligation bonds, and a half-cent sales tax increase for the 2014 and 2016 ballots. We will continue

The Early Action Program represents the first five years of investments for the 30-year SFTP and will fund improvements in every part of the city for every mode of travel.

FIGURE 34. EARLY ACTION PROGRAM: REPRESENTATIVE PROJECTS IN THE FIRST FIVE YEARS OF THE SFTP



to work with the Mayor's Office, partner agencies, and stakeholders to pursue new local, regional, state, and federal transportation funding sources. The Mayor's Transportation Task Force is further analyzing next steps for potential new local revenues.

MONITORING AND EVALUATION

Performance measurement is one of the Transportation Authority's statutory functions in its capacity as Congestion Management Agency, and as administrator of the Prop K half-cent transportation sales tax. The Transportation Authority will focus on performance tracking and evaluation in the following areas of policy interest, spanning the monitoring of system needs and trends, project delivery, and project effectiveness:

- **ONGOING MONITORING AND REPORTING.** Through biennial monitoring as Congestion Management Agency, and through www.mystreetsf.com, the Transportation Authority will track and provide information to the public on the delivery of transportation projects, including those identified for implementation in the Early Action Program. The Transportation Authority will also support the City's efforts to monitor the transportation obligations within development agreements.
- **DEMOGRAPHIC AND TRIP-MAKING TRENDS.** The Transportation Authority will continue to monitor demographic and travel behavior trends and the effect of new growth on the transportation system.
- **TRANSIT SYSTEM PERFORMANCE, ESPECIALLY EQUITY AND RELIABILITY.** SFTP outreach revealed that transit reliability is a socioeconomic and geographic equity issue, as well as a top priority for the general public. Yet data measuring and tracking reliability are limited. More research is needed to improve reliability measurement. Equity monitoring should additionally track safety trends and affordability outcomes.
- **DOCUMENTING THE COST EFFECTIVENESS OF TRANSPORTATION INVESTMENTS THROUGH BEFORE-AND-AFTER STUDIES.** The Transportation Authority will work with implementing agencies to strategically evaluate the effectiveness of new projects and programs to inform future project selection and prioritization, especially in the areas of pedestrian safety, traffic calming, and travel demand management.

Major next steps are: Rolling out the first five years of SFTP investments through an Early Action Program, pursuing new local revenues to address unmet transportation needs, and conducting monitoring and evaluation to ensure efficient and equitable progress towards SFTP goals.

STAFF ACKNOWLEDGEMENTS

The Transportation Authority gratefully acknowledges the staff who produced this document. Rachel Hiatt, Principal Transportation Planner, served as project manager, and was assisted by: Bill Bacon, Liz Brisson, Colin Dentel-Post, Kyle Gebhart, Ryan Greene-Roesel, Chad Rathmann, Bridget Smith, Dan Tischler, and Lisa Zorn under the direction of Elizabeth Sall, Maria Lombardo and Anna LaForte.

Assisting consultants included: Barbary Coast Consulting, Zabe Bent, Cambridge Systematics, Eisen | Letunic, and lowercase productions.

Numerous interns also contributed to this work including Matthew Bruno, Melanie Curry, Arthur Dao, Ted Graves, Becca Homa, Joshua Karlin-Resnick, Kim Lucas, Stephen Newhouse, and John Urgo.

Appendix B: White Paper

TRANSPORTATION NEEDS

KEY TOPICS

- The performance of San Francisco's transportation system, under both current and future (2040) baseline conditions
- Issues that need to be addressed to make progress towards the four major SFTP goal areas: world-class infrastructure; economic competitiveness; livability; and healthy environment
- "What it would take" to achieve San Francisco's ambitious goals in these four areas
- Issues and opportunities related to visitor and student travel and goods movement

1 Introduction

In 2040, San Francisco will host 200,000 new jobs and more than 250,000 additional residents, bringing its population over one million for the first time. Over the next 30 years, the city's transportation system will need to adjust to accommodate the trips made by these new residents and visitors. It will also need to confront the significant challenges it faces today, including years of underinvestment in system upkeep, escalating operating costs, challenges delivering new projects in advance of growth, an overcrowded transit system, and a road network that lacks capacity to absorb the projected growth in driving (even assuming the emerging innovations from the technology sector, including car- and ride-sharing and private commuter shuttles).

We analyzed these trends and their implications for San Francisco's transportation system to inform development of the San Francisco Transportation Plan (SFTP). This report describes the analysis in detail. It is organized in four sections corresponding to the four SFTP goal areas: world-class infrastructure, economic competitiveness, healthy environment, and livability, with a final section analyzing the transportation needs of specific groups of travelers – visitors, students, and companies making deliveries in the city. Specifically:

- **SECTION 2: ECONOMIC COMPETITIVENESS** describes projected housing and employment growth through 2040 and resulting roadway congestion and transit crowding. It shows how system expansion, especially in the downtown core, is needed to ensure new workers, visitors, and residents can be accommodated.

- **SECTION 3: WORLD-CLASS INFRASTRUCTURE** examines what will be required to maintain a state of good repair across our transit and roadway systems. It details the transit system performance impacts of capital asset maintenance deficiencies, identifies key transit systems' capital asset maintenance funding needs, and discusses the condition of the city's roads and bridges. Key needs include a large unfunded backlog of vehicle maintenance needs that will contribute to further declines in transit system reliability if not addressed.

- **SECTION 4: LIVABILITY** analyzes trends in bicycling and walking, especially safety, relative to San Francisco's goals for nonmotorized transportation and describes future investments needed to ensure the city can meet its goals for the share of trips made by bicycling and walking while ensuring safety.

- **SECTION 5: HEALTHY ENVIRONMENT** describes environmental goals for our transportation sector, including those stemming from SB 375 (which set greenhouse gas emission reduction targets for the Bay Area). It describes trends in GHG emissions and vehicle travel under current and future baseline "business as usual" conditions, and explains what it would take to achieve our ambitious environmental goals. The section identifies strategies such as congestion pricing and travel demand management that could help reduce existing vehicle traffic and greenhouse gases.

- **SECTION 6: VISITOR, GOODS MOVEMENT, AND SCHOOL TRANSPORTATION NEEDS** describes the transportation issues faced by these three groups, whose needs do not fit neatly into the sections above. This section discusses strategies to reduce visitors' reliance on private automobile travel to help reduce congestion. It describes the effects of increasing congestion on goods movement and proposes some ways to solve the problems. Then it presents information from a survey of students and their parents about factors that prevent them from taking transit, walking, or riding a bicycle to school.

In addition to the analysis in these sections, we also assessed the performance of the future transportation system through the lens of geographic and socioeconomic equity (see SFTP Appendix F), and did a focused study of future conditions in the downtown core where transportation congestion and crowding are expected to be most acute (see SFTP Appendix C).

THE FUTURE BASELINE:
THE TRANSPORTATION SYSTEM OF THE FUTURE ASSUMING BUSINESS AS USUAL

Most of the quantitative transportation system performance measures in this document are generated by the SFCTA's travel demand model, SF CHAMP. To identify emerging needs, we compared performance today with performance in a 2040 future baseline scenario. The future baseline includes all projected housing and job growth as well as committed transportation improvements (See SFTP Appendix A for a definition of committed improvements) such as the Central Subway, the Van Ness Bus Rapid Transit, and the Presidio Parkway, among others. The future baseline represents conditions without any new investment beyond what is already committed, and illustrates performance gaps where additional investment is needed.

2 Economic Competitiveness

SECTION SUMMARY:
- San Francisco is planning for jobs and housing to each grow by 30 percent over the plan period.
- Crowding in transit vehicles and at popular transit stations will worsen without investments in new capacity, especially in the highest-growth areas such as the northeast core and southeast waterfront.
- Projected levels of new development will increase street congestion, particularly in the northeast core. Traffic forecasts predict that the city would need to reduce private-vehicle traffic by more than 25 percent to avoid peak-period gridlock in this area.
- Trip-making patterns will evolve with increased density along the eastern waterfront and in the city's southwest, suggesting a need for more investment in these areas.

This section describes the transportation performance indicators most closely related to economic competitiveness, the city's ability to continue drawing jobs and talent. Today, San Francisco is home to 11 percent of Bay Area residents and 17 percent of Bay Area jobs. While the city is projected to grow significantly over the plan period, the ability of San Francisco's transportation system to handle the trips of hundreds of thousands of new residents and workers will determine whether these projections can, in fact, become reality. This section analyzes key aspects of the transportation system and assesses what new investments will be necessary for it to handle forecast growth.

2.1 | Goals and Performance Measures

The SFTP economic competitiveness goal is to ensure the transportation system can accommodate new demands from a growing population and employment, and in doing so, ensure that Bay Area residents, employers, and visitors continue to want to live, work, and play here.

Key metrics associated with this goal are:

- Major changes in trip making patterns in growing markets
- Commute travel times
- Transit crowding (expressed as person-hours traveled in crowded conditions)
- Street congestion (expressed as percent of roadways experiencing congestion)
- Transit speeds

2.2 | Trends and future conditions

2.2.1 | OVERALL GROWTH TRENDS

San Francisco's economy has seen dramatic growth over the last two decades. As Figure 1 shows, even with the national downturns in 2001 and 2008, the per-capita gross domestic product of the metropolitan area centered on San Francisco outpaced both statewide and national economic productivity over the first decade of the 21st century. This robust economy has led to steady increases in real-estate demand, making San Francisco one of the most expensive places to live in the United States.[10]

Figure 1 Economic Productivity in Per Capita Private-Sector GDP, 2001-2012 (2005 dollars)

Source: United States Bureau of Economic Analysis. State and Regional Data, Per Capita Real GDP (Chained 2005 Dollars). Retrieved from www.bea.gov on 10/17/13.

Those economic dynamics, combined with state and regional policies aimed at encouraging development in areas that are already urbanized and transit-oriented (see Section 5 for more on these policies), are why the Association of Bay Area Governments has forecast significant job and housing growth in the city. A city of 800,000 residents and 570,000 jobs today is forecast to house nearly 1.1 million residents and more than 750,000 jobs by 2040.[11] This would be the fastest growth in population and jobs since the 1950s (see Figure 2).

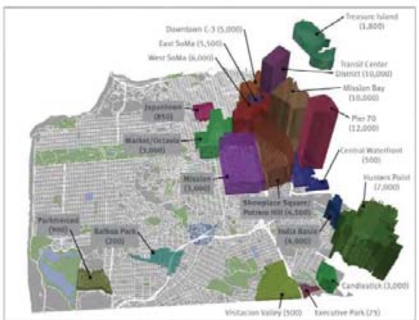
The SF Planning Department is planning to accommodate much of the city's projected growth in the northeast core and along the eastern waterfront, both areas the city and region have identified as appropriate for densification given their central locations or access to transit (Figures 3 and 4). Major development projects like those in Mission Bay, Hunters Point/Candlestick Point, Treasure Island, the Schlage Lock site in Visitacion Valley, and Parkmerced will contribute a great deal to this projected growth, but smaller-site projects throughout the eastern third of the city will also house a significant portion of the planned growth.

Much of the new development will also be concentrated in SoMa, which already has significant new transit infrastructure that is already under construction. Two major Planning Department efforts demonstrate this focus. The Central Corridor Plan, for the area around the new Central Subway, includes zoning changes and increases in height limits for a 28-square-block area between Market, Townsend, 2nd, and 6th streets. The Transit Center District Plan, for the area around the new Transbay Terminal, also includes significant increases in zoned density and height limits, among other changes, for the area between Market, Folsom, Steuart, and 3rd streets. The Central Subway and the new Transbay Transit center will help accommodate some of this growth.

Figure 3 Projected Housing Growth by Neighborhood

Figure 4 Projected Job Growth by Neighborhood



Source: SF Planning Department

The forecast growth in jobs and residents over the plan period is projected to lead to major increases in trip-making across all modes in San Francisco. The city is projected to see 600,000 daily new person-auto trips by 2040.[12] A portion of these new trips are forecast to come from outside the city, and as Figure 5 shows, the bridges and major San Mateo county line crossings are projected to see major increases in daily traffic volumes. However, almost three quarters of all daily auto trips to downtown are forecast to come from elsewhere in San Francisco.

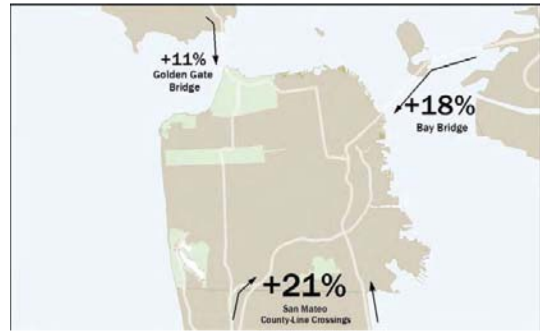
SAN FRANCISCO TRANSPORTATION PLAN 2040 FINAL REPORT APPENDICES

Figure 5 Change in Daily County Line Crossings by Automobile, 2012-2040



Source: SF-CHAMP 4.3.

Figure 6 illustrates changes in auto trip-making patterns within the city: darker lines show the neighborhood pairs that will see the highest growth in auto trips between them, and these lines are concentrated along the city's eastern and southern borders. Darker brown circles indicate the neighborhoods that will see the biggest growth in internal auto trips, and again, they concentrate in the east and south. The transit system is also projected to see changes in trip-making patterns (Figure 7). The transit system is centered on the northeast core today, but the biggest increases in transit demand will be for trips across town, to and from the eastern neighborhoods.

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

Economic Competitiveness: What Would it Take?

The SFCTA analyzed what it would take to meet specific quantitative transportation system performance targets for each SFTP goal area. The analysis results for economic competitiveness are presented below.

- **CHALLENGE:** One of the transportation-related factors that affects where employers choose to locate or expand is commute travel times for their employees. Commute travel times are expected to worsen in the future due to new growth.
- **TARGET:** Keep commute travel times (combined for car and transit commuters) to and from downtown San Francisco in 2035 from degrading relative to 2010.
- **IMPROVEMENTS:** This scenario analyzed three levels of investment, as described below.
  - **LOW:** Frequency improvements to local and regional transit service, Caltrain electrification, and lower-cost capital projects such as bus priority measures and more extensive traffic management on key commute corridors.
  - **MEDIUM:** The above plus more extensive programmatic investments in transit, congestion pricing, and higher-cost capital projects such as Caltrain's downtown extension and bus rapid transit on key corridors. A sensitivity test was conducted to determine the effect of a hypothetical regional policy that modestly increases parking prices in other major Bay Area employment centers.
  - **HIGH:** The above plus major capital projects, namely a new cross-bay BART tube and high-speed rail service.

Table 1: Performance of Economic Competitiveness Scenarios

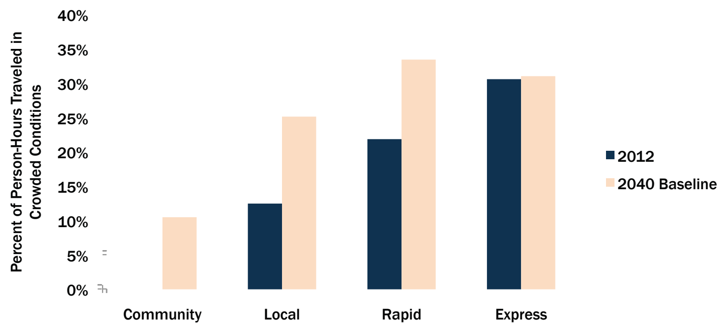
	2010	2035 BASE	2035 LOW	2035 MED	2035 MED + PARKING PRICING	2035 HIGH
Total average commute time to SF including non-motorized (minutes)	40	42	41	40	40	41
Auto	38	39	39	35	35	36
Transit	48	51	49	48	48	49
Cost (millions of $)	–	–	$2,000	$5,000	$5,000	$20,000
Cost Effectiveness	—	–	High	Med	Med	Low

- **COST:** From $2 billion (low level of investment) to $15 billion (high level of investment).
- **RESULTS:** Three of the scenarios (medium, medium with pricing, and high) keep combined car/transit commute travel times from degrading (see table above).
- **CONCLUSIONS:** The target under this scenario appears achievable. Between the low and medium levels, it takes an extra $3 billion in improvements to reduce travel times by one minute. The high level performs worse than the medium level perhaps because major investments such as a new BART tube increase overall travel significantly by improving accessibility. An additional finding was that because so many of San Francisco's commute trips begin or end in other cities, San Francisco's progress is greatly affected by policies implemented elsewhere. SF needs to take an active role in supporting regional policies that support its goals.

2.2.2 | TRANSIT CROWDING

By 2040, the city is forecast to see 300,000 new transit trips per day on a system that already suffers from crowding and reliability issues. Figure 8 shows that a significant percentage of transit passengers experience crowded conditions when traveling during peak hours today and that the issue is projected to get significantly worse under a 2040 baseline scenario. The baseline scenario includes the existing transit system and expansions or enhancements that have already secured significant funding or are already under construction. Crowded conditions are defined as vehicles with loads at 85 percent of capacity or more. As the figure shows, crowding is expected to increase significantly on all Muni service types except the express series.

Figure 8 Daily Person Hours of Travel in Crowded Conditions for Different Muni Service Types



Source: SF-CHAMP 4.3.

ADDRESSING CROWDED CONDITIONS

Expected crowding can be addressed, in part, by providing additional transit service during peak periods. However, the need to add peak-hour service should be balanced with consideration of cost-effectiveness (peak service is costly to provide), and equity concerns. Some lower-income shift workers depend on having adequate service during off-peak periods.

Crowding is particularly acute on the ten most crowded lines, with more than 60 percent of person-hours traveled spent in crowded conditions and a slight worsening of conditions on these lines by 2040. The total number of lines with any crowding is projected to grow from 31 to 50 over the plan period.

Figure 9 shows the current and projected spatial distributions of crowding. While Muni vehicles typically reach their most crowded points near the center of the system today, the extent of crowding moves outward from the core by 2040, in part as a result of significant new development at the end of several key lines and in part because of the increased employment pull of downtown and the eastern waterfront.

Regional operators will also feel the effects of San Francisco's growth. As Figure 10 shows, bus operators, including SamTrans, Golden Gate Transit, and AC Transit, already face peak-period crowding and would see that increase significantly by 2040. Caltrain and BART are both currently below 85 percent full during peak periods but would see some lines go over the threshold during the SFTP plan period.

For regional operators, crowding will have noticeable effects outside of transit vehicles as well. Projected ridership growth will make it more difficult to access stations and could make stations themselves crowded at key points in the system. BART ridership to, from, and within San Francisco is projected to grow by 37 percent, and as such, the system's two most crowded stations, Embarcadero and Montgomery, are forecast to hit limits in their capacity.[13] According to a BART study, delayed peak-hour conditions could lead to significant backups at escalators and crowding-related safety issues on platforms. Demand for travel to the system's core will also create station access issues outside San Francisco. Even with new transit-oriented developments around stations, BART will likely see issues like full parking lots and crowded feeder-bus routes throughout the system.

The agency has started to work solutions to all of these problems, exploring ways to redesign Embarcadero and Montgomery stations and improve parking management and bike and bus access,[14] but the agency and partner municipalities, including San Francisco, will need to identify funding for such changes once plans are in place. Caltrain could see similar problems up and down its corridor with projected ridership growth.

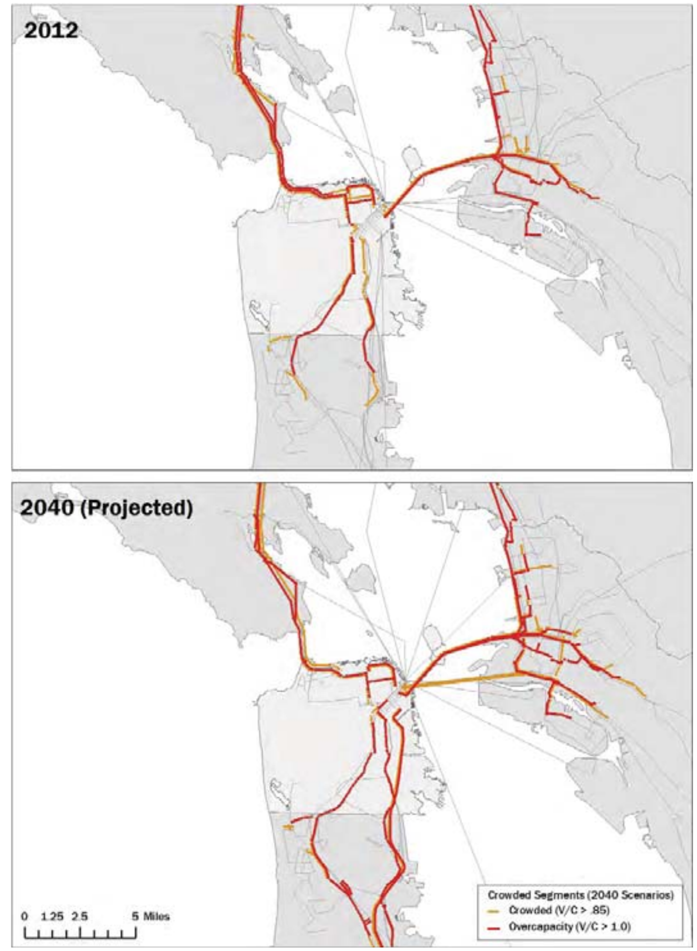
SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

Figure 10 Regional Transit Crowding, 2012 and 2040.



Source: SF-CHAMP 4.3.

2.2.3 | STREET CONGESTION

New population and employment will result in about 30 percent more automobile trips on the network compared to today, or an increase of about 600,000. Figure 11 illustrates the effects of this increase on the street network, and shows that many streets will reach or exceed levels considered congested or overcapacity.[15]

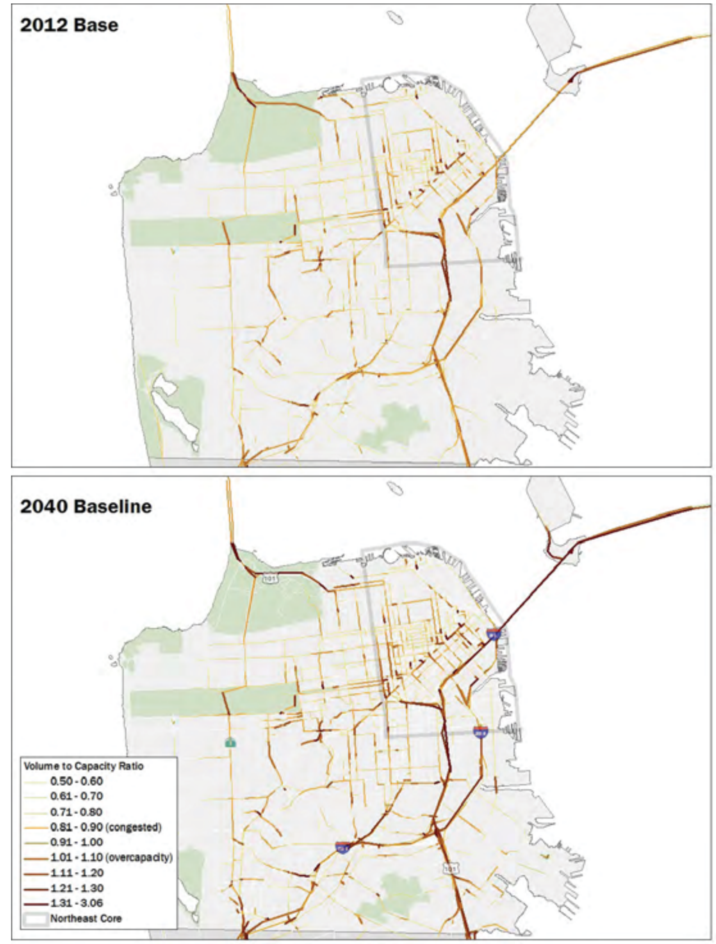
2.2.4 | TRANSIT SPEEDS

Overall modeled daily average speeds on the Muni network are around 11 miles per hour today. Projections for the 2040 baseline scenario show those speeds remaining the same in the future although street congestion worsens due to population growth. This is in part because several major transportation improvements included in the future baseline (such as the Van Ness Bus Rapid Transit Project, the Central Subway, and others) improve conditions for transit and offset the negative effects of congestion.

[15] Congestion is defined as a ratio between a road's volume and its capacity of between .8 and 1.0. "Congested" means vehicle volumes are between 80% and 100% of the volumes the road was designed to handle. "Overcapacity" is defined as a ratio of more than 1.0, in which a road carries volumes that are greater than the levels for which it was designed.

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

Figure 11 Congestion, 2012 and 2040



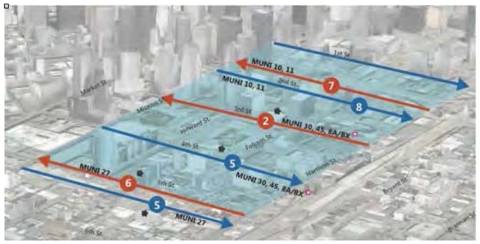
Source: SF-CHAMP 4.3.

2.2.5 | CONGESTION IN THE NORTHEAST CORE

The effects of increased congestion will be most acute in SoMa, given the area's significant projected job and housing growth and its location between Interstate 80 and the city's dense job core. The forecast increase in auto traffic is projected to lead to gridlock during peak periods, with queues at traffic lights spilling into downstream intersections and bringing multi-block areas to a standstill. Avoiding these cascading effects in this critical part of the system would require a 27 percent reduction in private-vehicle traffic in SoMa.[16]

Gridlocked conditions in SoMa would slow transit vehicles as well as cars. As Figure 12 shows, some of the bus lines that run through the neighborhood would slow to the low single digits during the evening peak hour. Such slow speeds would have a ripple effect across Muni's bus system, tying up drivers and vehicles and exacerbating reliability issues throughout the city.

Figure 12 Projected 2035 SoMa Bus Speeds (miles per hour), Evening Peak Hour



Source: SF-CHAMP 4.3 volumes for "Baseline Prime," Fehr + Peers SimTraffic Analysis, 2012

2.3 | Summary of needs

San Francisco needs to improve its transportation system, especially in the downtown core, to accommodate new growth. The following strategies could help address transit and roadway crowding caused by development growth:

- **ENHANCED TRANSIT CAPACITY IN GROWING AREAS (E.G. CORE, SOUTHWEST, SOUTHEAST), ESPECIALLY ON REGIONAL TRANSIT.** BART has already started to explore increasing its capacity in the most heavily used parts of its system through the BART Metro concept, which could increase service levels, platform capacity, and/or the number of stops between the Mission in San Francisco and downtown Oakland. Caltrain is also working to increase the number of trains it can run every hour through electrification (see Section 2) and new communications equipment that would allow the system to safely run trains closer together during peak times. Implementing these ideas could help reduce auto traffic on downtown streets.
- **IMPROVED DIRECT REGIONAL TRANSIT SERVICES FOR AREAS OF THE CITY LESS WELL SERVED BY TRANSIT.** Much of the west side of San Francisco is at least a bus ride away from the Bay Area's regional transit system. A regional express-bus system providing direct connections from San Francisco's west side to regional transit and regional employment centers could help address the growing numbers of trips expected between the west and east sides of the city.

[16] Brisson, Liz, Kyle Gebhart, and John Urgo. "Core Network Circulation Study – Evaluation Framework and Baseline Analysis Findings." 9/14/2012.

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

- **IMPLEMENTATION OF INVESTMENTS CRITICAL TO MEET NEW DEMAND GENERATED BY DEVELOPMENT.** The city and developers have already agreed to a set of transit enhancements to serve the major developments that will come online between now and 2040. Timely implementation of these investments – including enhanced bus and ferry service to and from Treasure Island, light-rail enhancements serving San Francisco State University and Parkmerced, express-bus service to Candlestick and Hunters points, and the other enhancements already underway as part of the Southeast Waterfront Transportation Plan –will be critical to accommodating new growth in these areas.
- **MORE EFFICIENT USE OF FREEWAY CAPACITY TO SERVE TRAVELERS, ESPECIALLY IN THE SOUTH BAY MARKET.** High occupancy vehicle lanes on the city's freeway system and other performance enhancements could encourage carpooling and ensure that commuters are making efficient use of ever more crowded infrastructure.
- **DIRECT CONGESTION MANAGEMENT AND PARTNERSHIPS WITH PRIVATE OPERATORS.** The city will also need to provide financial disincentives to driving alone into the congested core through congestion pricing and transportation demand management partnerships with private companies. See Section 5 for more detail.

3 World-Class Infrastructure

SECTION SUMMARY:

- After years of underinvestment, Muni and regional transit agencies that serve San Francisco have significant unfunded capital needs.
- Poor vehicle condition is already responsible for many transit service delays and the situation will worsen without increased investment.
- Operating costs are growing rapidly and will crowd out critical capital investments if transit agencies do not take steps to control growth in costs.
- Pavements will require significant new investment to maintain adequate conditions.

San Francisco's transportation system relies on aging infrastructure that will need significant repair or replacement over the course of the plan period. This section discusses investments needed to achieve the goal of world-class infrastructure and maintain a state of good repair.

It includes the following sections:

- **TRANSIT OPERATING NEEDS** discusses what it will take to keep the existing system running given rising transit operating costs. It does not discuss the additional service expansion necessary to accommodate San Francisco's growing population and employment, which were covered in the prior section on Economic Competiveness.
- **TRANSIT MAINTENANCE NEEDS** discusses what it will take to repair and replace vehicles and fixed infrastructure at the appropriate times in their lifecycles over the course of the plan period and the performance consequences of not investing sufficiently in capital asset maintenance.
- **ROADS, BRIDGES, AND STRUCTURES** discusses investments needed to meet city pavement-condition goals and keep bridges and other structures in safe operating conditions for all users.

3.1 | Goals and Performance Measures

The SFTP world class infrastructure goal is to improve the condition of San Francisco's infrastructure so that it is reliable and can be maintained cost-effectively. Key goals and performance measures for this section include:

- Stabilize transit operating costs
- Improve transit system reliability through adequate maintenance
- Achieve a pavement condition index of 70 [Proposition B streets bond goal]
- Maintain road and bridge structural sufficiency

3.2 | Trends and future conditions

3.2.1 | TRANSIT OPERATING NEEDS

Transit operating expenses include the cost of wages for vehicle drivers, maintenance and customer-service staff, system administrators, and others. They also include the cost of fuel or energy to power transit

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

vehicles and parts or other materials for regular maintenance tasks. Transit operating needs alone will take up nearly 60 percent of available revenues. If current trends continue, funding needs could be even higher and could crowd out system-efficiency projects and those aimed at serving new trip patterns. Among these trends:

- **RISING COSTS:** The real cost of providing transit service has been rising over the last several decades (Figure 13). According to the Metropolitan Transportation Commission's Transit Sustainability Project, rising fringe benefit costs are a major contributor to cost growth. The cost of fringe benefits like health care and pensions nearly doubled between 1997 and 2008 (Figure 14).
- **SLOWER SPEEDS AND LOWER RELIABILITY FOR SFMTA AND REGIONAL BUS OPERATORS:** A less direct but still important operating-cost driver, speeds slowed significantly on SFMTA's bus and light-rail systems between 1997 and 2008 (see Figure 15). Slower speeds mean a driver and vehicle can complete fewer route runs in a day, leading to less service for the same price.

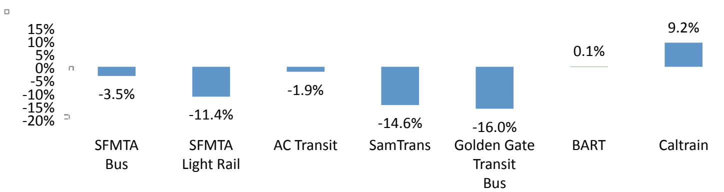
Figure 13 Cost per Hour of Service, 2003-2011 (Inflation-Adjusted)

SOURCE: NATIONAL TRANSIT DATABASE TS2.2 - SERVICE DATA AND OPERATING EXPENSES TIME-SERIES BY SYSTEM, AND THE CALIFORNIA DEPARMENT OF FINANCE (FOR BAY AREA INFLATION DATA).

Figure 14 Growth in General and Fringe Benefit Costs for Agencies Serving San Francisco, 1997-2011 (Inflation-Adjusted)

Agencies included: SFMTA, BART, AC Transit, Golden Gate Transit, and SamTrans. Caltrain contracts for operations and maintenance, so fringe benefit data only covers administration and was not included.

Figure 15 Change in Average Speed, 1997-2008



Source: Metropolitan Transportation Commission. Transit Sustainability Project: Background and Findings. September 2011, page 8.

Agencies are already taking steps to make their operations more efficient. The MTC's Transit Sustainability Project created an incentive program that is aimed at reducing agencies' operating costs[17] by 5 percent by the middle of this decade. Implementation of additional cost-control recommendations from the TSP, such as capping agency contributions to health insurance costs, could also be explored.

Strategies to improve transit vehicle speeds and reliability can also help address crowding, since faster-moving vehicles are less expensive to operate. SFMTA is moving forward with its Transit Effectiveness Project, which aims to improve speeds and make operations across the system more efficient through route changes, stop consolidation, and small-scale investments like curb bulb-outs and painted transit-only lanes at key bottlenecks. Caltrain is moving forward with a plan to power its trains by overhead wires rather than diesel locomotives, which is projected to save fuel costs and trim travel times up and down the corridor due to faster acceleration and deceleration rates. BART is also studying expanded service in the system's core, between downtown Oakland and the Mission in San Francisco, allowing it to more efficiently meet demand in the highest ridership portion of the system. Many of these projects support both the world class infrastructure and economic competitiveness goals.

3.2.2 | PARATRANSIT

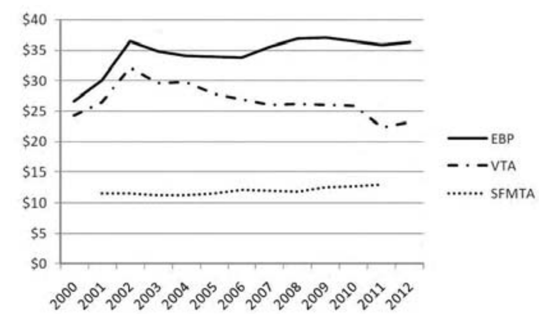
Growth in San Francisco's senior population and accompanying demand for paratransit services may also put additional growth pressure on operating costs, though SFMTA and other large paratransit operators in

[17] The MTC Transit Sustainability Project's final recommendations say these reductions can be per service hour, per passenger, or per passenger mile.

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

the Bay Area have effectively controlled the cost of such services on a per-trip basis in recent years (see Figure 16).[18] As of 2011, paratransit services made up just over 5 percent of transit operating costs region-wide.

Figure 16 Paratransit Operating Cost per Eligible Passenger Trip, Large Bay Area Operators



Source: Metropolitan Transportation Commission. "Transit Sustainability Project: Draft Paratransit Final Report." August 29, 2011. Page 3-10. Note: Dollars adjusted for inflation. VTA is Valley Transportation Agency, EBP is East Bay Paratransit.

San Francisco's senior population is projected to grow by 68 percent over the plan period, which should increase demand and thus the total cost of paratransit over time. However, several recent research reports on the strength of the relationship between the size of a city's elderly population and the level of paratransit demand have reached conflicting conclusions. While data shows that paratransit demand increased by 37% nationally between 2000 and 2009, and the American Public Transportation Association forecasts a 32% increase in paratransit demand by seniors between 2010 and 2020, a 2007 report concluded that demand is more closely related to an area's total population than to its senior population.[19] Further study is needed to quantify precisely how costs will increase as the elderly population grows.

[18] Metropolitan Transportation Commission. "Transit Sustainability Project: Draft Paratransit Final Report." San Francisco: August 29, 2011, page 3-10.
[19] *Ibid*, 3-18.

3.2.3 | TRANSIT CAPITAL NEEDS

Bay area transit operators face significant transit capital shortfalls totaling approximately $5 billion over the SFTP plan period. These capital needs include new vehicles and mid-life overhauls and for repairing or rebuilding existing infrastructure. Table 1 shows the total need, San Francisco share, and projected funding shortfall for Muni and the regional operators that serve San Francisco.

Table 1 Transit Capital Revenue and Need, 2012-2040 (In Billions, Year-of-Expenditure Dollars)

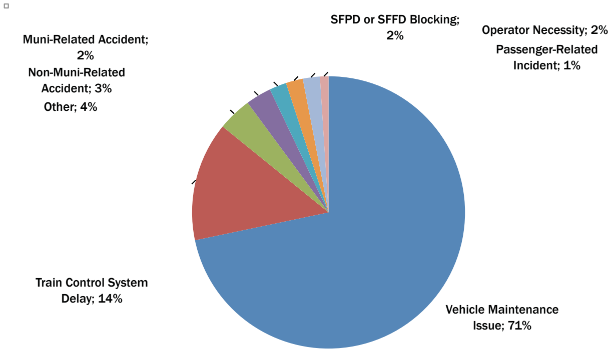
Operator	Total Need[1]	Revenue Vehicle and Score 16[3] Need	Revenue Vehicle and 70% of Score 16 Need	Expected Transit Capital Revenue	Total Shortfall
SFMTA	$12.7	$9.1	$7.6	$8.4	$4.3
Caltrain (SF Share)	$1.1	$0.7	$0.5	$0.4	$0.8
BART (SF Share)[2]	$2.1	$2.1	$2.1	$2.1	N/A
GGBHTD (SF Share)[2]	$0.3	$0.3	$0.3	$0.3	N/A
Grand Total	$16.16	$12.13	$10.48	$11.10	$5.07

[1] Need to meet target of 0% of assets past useful life.
[2] For the purpose of this assessment we are not expecting SF to have a discretionary share of the BART and GGBHTD capital need. BART and GGBHTD needs will be addressed at the regional/partner level.
[3] Score 16 vehicles are those the regional government has identified as top priority for replacement.

Shortfalls in state-of-good-repair investments can lead to significant reliability, safety, and customer-satisfaction issues. Specifically, they can, over time, cause:

- **VEHICLE BREAKDOWNS.** Failing to perform routine service on buses and rail cars can increase maintenance issues later in vehicles' lives. Poor transit vehicle maintenance has significant reliability impacts, resulting in service breakdowns, unscheduled turnbacks, and delays in tunnels. Illustrating this point, Muni's aging light-rail fleet had on-time performance of 50 percent in May 2013, and vehicle mechanical issues were responsible for 71 percent of the delays (see Figure 17).
- **INFRASTRUCTURE PROBLEMS.** Failing to invest appropriate amounts in fixed infrastructure can lead to cracked or worn-down rails, electricity issues, and communications problems along whole segments of the system, causing more frequent service suspensions for emergency repairs. It can also require initiation of "go slow" zones, further reducing speeds. As shown in Figure 17, train-control system delays were the second-largest cause of light-rail delay in May 2013. These maintenance-related delays are experienced on top of the routine delays associated with street congestion, traffic signals, and so forth.
- **DEGRADATION IN PASSENGER SAFETY AND COMFORT.** All of these issues have an impact on passenger safety and comfort, as they lead to lower adherence to service schedules and more frequent inconveniences like vehicle turn-backs and pass-ups. Additionally, they can lead to unevenness in passenger loads, with significant crowding on delayed vehicles.

Figure 17 Muni Light Rail Reasons for Delay, May 2013



Source: SFMTA 2013.

Table 1 shows that transit capital needs are very large and that much of the need is unfunded. This is because of the age of the region's transit systems, many of which are among the oldest in the state. The region as a whole, and San Francisco in particular, relies heavily on rail systems, which require higher ongoing maintenance investments than other modes because of the significant amount of fixed infrastructure they require.[20] Budget pressure over the last several years, which resulted in some deferred maintenance in addition to service cuts, also contributed to the large amount of need going forward. The following sections describe operator capital needs in more detail.

MUNI

Based on the direction set in its 2010 Fleet Plan, the agency aims to steadily lower the average age of its fleet through smaller vehicle procurements every few years instead of large procurements every five or 10 years, as it has done in the past.[21] As of 2010, the average Muni vehicle age was 7.5 years, but the agency projects that it can reduce that to 4 to 6 years by 2030. This approach would help keep enough operational vehicles available for peak service and reduce stress on the agency's maintenance department by spreading out lifecycle maintenance demands.

[20] Metropolitan Transportation Commission. *Plan Bay Area.* Draft, March 2013. Page 67.
[21] San Francisco Municipal Transportation Agency. *2010 SFMTA Transit Fleet Management Plan.* Revised April 2011. Retrieved from http://beta.sfmta.com/cms/rhome/documents/2010FleetPlan_MainText-FinalAccessible.pdf on 9/16/13.

Beyond vehicles, Muni has several other areas of need related to maintaining a state of good repair. The agency estimates that, given the need for more vehicles of all types due to increased peak-hour demand, it will need more than 17 additional acres for maintenance facilities through 2030.[22] A portion of the total need also includes repairing or replacing rails, wires, and systems for train control and communication.[23]

REGIONAL TRANSIT OPERATORS

Caltrain will be transitioning from its current diesel-powered trains to new electric-powered trains by 2019. As such, the system's needs are related to both existing vehicles' ages and the need to buy train cars that are compatible with the new technology. Many of Caltrain's locomotives are more than 25 years old, near the end of their useful lives, and their age is already resulting in increased delays and maintenance issues.[24]

BART's vehicle fleet is one of the oldest and most heavily used in the industry, with an annual average of 95,000 miles of use per car.[25] As such, the agency's vehicle-replacement and maintenance needs make up a significant proportion of its total capital needs over the plan period. The agency also expects that it will need 30 percent more rail cars by 2030 to serve a growing number of riders. Given all of these factors, the agency's total capital shortfall is the largest of any Bay Area operator.[26]

Golden Gate Transit's capital needs are all related to replacing its more than 200 buses and 5 ferries at the end of their useful lives and growing its fleet as needed to meet passenger demand.[27]

World Class Infrastructure: What Would it Take?

- **CHALLENGE:** San Francisco has an extensive and aging transportation infrastructure. Funding is not sufficient to adequately maintain the system in a state of good repair.
- **TARGET:** Raise the city's transportation system to a state of good repair, defined as:
    - Transit: fully fund transit vehicle replacement and mid-life overhauls and replace all capital assets at the end of their useful life; maintain today's levels of transit operations.
    - Roads: achieve a pavement quality index of 70 and maintain today's levels of street operation.
- **IMPROVEMENTS:** This scenario estimated the funding needed to achieve the state of good repair performance measures listed above. It does not include any needs associated with meeting additional demand due to population and employment growth.
- **CONCLUSIONS:** An additional $5 billion in year-of-expenditure dollars through 2040 would be needed to fully fund all transit capital maintenance needs. An additional $1.5 billion is necessary to reach and maintain a pavement condition index of 70. Existing revenues are sufficient to maintain today's levels of street and transit operation.

3.2.4 | STREETS AND BRIDGES

Maintaining San Francisco's road and bridge infrastructure is another key element of achieving the goal of world-class infrastructure. Smooth and well maintained streets increase safety and reduce wear and tear on both private cars and transit vehicles and make conditions safer for bikers and pedestrians.

As of 2011, the average pavement condition on local streets was "fair," with a pavement condition index rating of 64 out of 100, although TRIP: A National Transportation Research Group recently ranked the San Francisco-Oakland metropolitan area's roads the second worst in the country, with 60 percent of roadways in poor condition.[28]

In developing the Proposition B streets bond in 2011, the Department of Public Works and the San Francisco Capital Planning Committee set a goal of achieving an average citywide PCI score of 70, which is considered "good" condition, by 2021. Proposition B increased San Francisco's annual street resurfacing budget from $26 million in 2011 to $65.5 million in 2012 and provided funds for this increased investment level for four additional years. Achieving and maintaining a PCI score of 70 over the long term will require a total investment of $3.83 billion over the life of the plan, $1.53 billion more than is already committed to street resurfacing. Without a sustained, long-term increase in street resurfacing funding, San Francisco's PCI score will fall below 60 and into "poor" condition by 2030.

Streets and roads also require an investment of $2.84 billion in street operations like street cleaning, pothole filling, and signal maintenance; this funding is available through existing sources.

[28] TRIP: A National Transportation Research Group. "Bumpy Roads Ahead: America's Roughest Rides and Strategies to Make our Roads Smoother." Washington, DC: October 3, 2013. Retrieved from http://www.tripnet.org/docs/Urban_Roads_Report_Oct_2013.pdf on 10/11/13.

Bridges and other structures, including the state-owned freeways that run through San Francisco, will require additional investments over the coming decades. According to a recent study by Transportation for America, most of San Francisco's bridges are in good condition, but segments of U.S. 101 and a few non-freeway bridges will be in need of attention in the next 20 years.[29] In many cases, bridge decks (the concrete road beds on which surface asphalt rests) are the element that needs the most urgent attention, rather than deeper structural elements.

Caltrans owns and maintains state and US highways and interstates and will be responsible for funding the upkeep and replacement of highway bridges and structures. San Francisco government agencies can play an important role in advocating for timely investment in these structures. The Department of Public Works maintains a number of additional local-road bridges, retaining walls, and stairways that will need to be repaired or rebuilt over the life of the plan. The department prioritizes and funds maintenance needs through a citywide 10-year capital planning process.

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

4 Livability

SECTION SUMMARY:

- Infill development near transit within San Francisco is expected to slightly increase the share of trips made by bicycling and walking by 2040, but this will be insufficient to achieve the city's aggressive goals. Additional investment will be needed.
- Investments in safety for walkers and bicyclists is a critical step necessary to allow growth in walking and bicycling.
- The SFMTA's Bicycle Strategy provides a vision for a safe, interconnected network of protected bicycle-ways, but funding is not sufficient to complete the network.
- The SFMTA's Pedestrian Strategy provides a vision for reducing collisions on the 44 miles of the most dangerous roadways. Funding is not sufficient to implement the strategy.

The concept of livability has become a key focus in recent years. Former U.S. Secretary of Transportation Ray LaHood described livability as "being able to take your kids to school, go to work, see a doctor, drop by the grocery or post office, go out to dinner and a movie, and play with your kids in a park, all without having to get in your car.[30]" The SFCTA also recently held a twitter contest to define livability and received numerous creative responses (Figure 18).

Figure 18 Responses to SFCTA Twitter Contest on Defining Livability

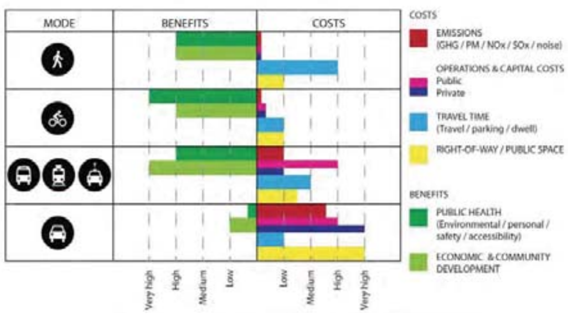
This section reviews recent trends and future needs with respect to improving the quality of alternatives to the automobile, with a particular emphasis on bicycling and walking.[31] It includes discussion of the current

[30] See the U.S. DOT's livability web page: http://www.dot.gov/livability
[31] Mass transit is covered in the World Class Infrastructure and Economic Competitiveness sections.

condition of bicycling and walking infrastructure, recent planning efforts in the area of bicycling and walking, and a summary of future investments needed to make bicycling and walking as safe and attractive as possible.

Bicycling and walking are the focus of efforts to improve livability because they are environmentally sustainable, pollution-free, and healthful modes of travel, and are inexpensive relative to other modes of travel, as illustrated in Figure 19. Additionally, if bicycling and walking investments shift even a small number of trips out of crowded transit vehicles, significant savings can be realized since peak-period demand is a key driver of the cost of providing transit service.

Figure 19 Cost Effectiveness of Bicycling, Walking, Transit, and Automobile Use



Source: SFMTA Bicycle Strategy.

4.1 | Goals and performance measures

The SFTP livability goal is to improve the quality and safety of the bicycle, pedestrian, and transit networks so that San Franciscans can have multiple attractive options for getting where they need to go. Performance measures for this area include:

- **THE SHARE OF TRIPS MADE BY BICYCLING, WALKING, AND TRANSIT.** SFMTA has set a goal of greater than 50 percent of trips by these non-automobile modes. The Board of Supervisors set a goal of a 20 percent bicycle mode share by 2020.
- **BICYCLE AND PEDESTRIAN SAFETY.** The Mayor's Pedestrian Safety Task Force set a goal of reducing severe and fatal pedestrian collisions by 50 percent by 2021.
- **TRIP LENGTHS** (shorter trips are more easily made with non-motorized modes).

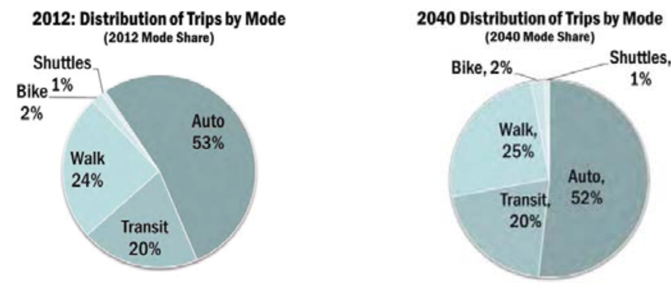
4.2 | Trends and future conditions

The outlook for increased rates of bicycling and walking is good. As San Francisco adds population and employment to areas already convenient for bicycling and walking (see the Economic Competitiveness section for a discussion of land use projections), the share of trips made by bicycling and walking is expected to grow slightly (by about a percentage point) without any additional infrastructure investment (Figure 20).

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

Nevertheless, as the following discussions demonstrate, additional investment will be needed for the city to meet its aggressive goals for increasing the share of trips made by bicycling and walking.

Figure 20 Distribution of All Trips To, From, and Within San Francisco by Mode, 2012 and 2040 Baseline

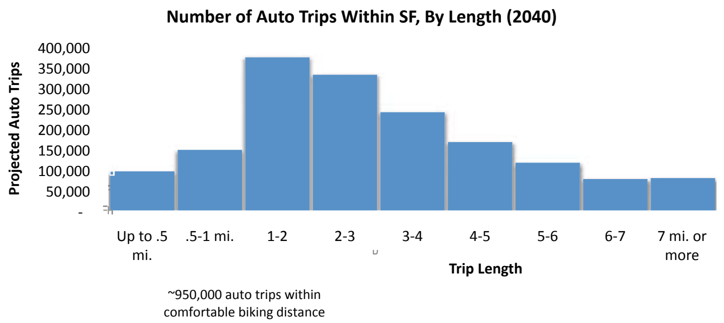


Source: SF-CHAMP 4.3 with manual adjustments to include private shuttle sector.

4.2.1 | BICYCLING

Bicycling is on the rise in San Francisco. The SFMTA's State of Cycling Report indicates that bicycle trip volumes are approaching 75,000 bicycle trips per day; nearly a third of San Francisco residents report bicycling at least occasionally. Rates of commuting by bicycle are also growing, and San Francisco now ranks third in the nation behind Portland, Oregon and Seattle, Washington in bicycle commuting rates among major US cities. The potential for further increasing rates of bicycling is high – as Figure 21 shows, nearly 60 percent of all local automobile trips will be less than three miles in length by 2040, a convenient distance for bicycling.

Figure 21 Projected Auto Trip Lengths, 2040



The SFMTA and its partners are making rapid progress towards improving infrastructure. Since completion of the city's Bicycle Plan in 2009, 50 bicycle projects and nearly 30 miles of bicycle lanes have been added, along with more than four thousand shared lane markings (sharrows), hundreds of new bicycle racks, numerous innovative pilot projects such as the Green Wave on Market Street, and initiation of a regional bicycle sharing system in San Francisco.

These improvements are helping support the trend towards more and more bicycling, but are not sufficient to allow achievement of the aggressive goal – set by the San Francisco Board of Supervisors in 2010 – of achieving a 20 percent bicycle mode share by 2020. To grow bicycling further, San Francisco must do more to address cyclist safety. Surveys conducted for the SFMTA's 2012 State of Cycling Report indicated that almost half of those who do not currently bicycle say they are uncomfortable bicycling in mixed-flow traffic with cars, and only 13 percent said they feel safe from traffic when bicycling. At the same time, 94 percent of respondents say they would feel comfortable riding in bicycle lanes. Network fragmentation is also a challenge to improving cyclists' sense of safety. Many of the existing bicycle facilities are disconnected from one another (Figure 22), and cyclists may find it impossible to complete their whole trip on protected bicycle ways or bicycle lanes.

SAN FRANCISCO TRANSPORTATION PLAN 2040 | FINAL REPORT APPENDICES

Figure 22 Bicycle Network Fragmentation

The SFMTA's recent Bicycle Strategy (2013) envisions a world-class bicycle facility network for San Francisco – one on which cyclists of all ages and abilities would be safe and comfortable. Full network build-out would include the following actions:

- Complete the bicycle plan (10 miles)
- Upgrade 200 miles of the existing bicycle network to premium bicycle facilities
- Construct 35 miles of new bicycle facilities
- Upgrade 200 intersections to accommodate bicycles
- Install 50,000 bicycle parking spaces
- Deploy and maintain a 3000+ bicycle / 300+ station bicycle sharing system. Support electric bicycles. This system was recently launched with the implementation of the Bay Area Bike Share Program in 2013, which includes an initial 700 bicycles and 70 stations throughout the Bay Area (including San Francisco).
- Provide supportive programs ($10m/yr).

CHALLENGES IN IMPROVING BICYCLING AND WALKING INFRASTRUCTURE

Many of the "easy fixes" to improve bicycling and walking infrastructure have already been completed or are underway. These include pedestrian crosswalk restriping, countdown signals, curb cuts, and striping of new bicycle lanes and sharrows.

Improvements that more significantly benefit bicyclists and pedestrians by physically separating them from vehicular traffic or by reducing vehicle traffic and speeds are frequently more challenging to implement, as they may require re-allocation of roadway space. These include road diets, widened sidewalks, and separated bike-ways, or signal timing changes such as more crossing time for pedestrians. Implementing these improvements requires political and community acceptance of parking or lane removal, or signal delays for vehicles.

The SFMTA's Strategy estimates the total cost of this strategy to be approximately $600 million in year-of-expenditure dollars through 2040; most of this is unfunded.

4.2.2 | WALKING

San Francisco is a walking city, with nearly 20 percent of trips made by walking. The condition of the city's streets – whether noisy or calm, crowded or spacious, clean or dirty, safe or scary – greatly impacts how San Franciscans and visitors experience the city as they walk around, and is a major determinant of livability.

Although many of San Francisco's streets are inviting and pleasant, many are not, and some are inhospitable to pedestrians. This is evidenced by the fact that on average, 20 pedestrians are killed and 800 injured in collisions with motor vehicles every year.[32] In 2008, Gavin Newson initiated the Mayor's pedestrian safety task force and set a goal of reducing serious and fatal pedestrian injuries by 25% by 2016 and by 50% by 2021. The Task Force's report identified key sources of pedestrian danger, including speeding, failure to yield, and conflicts involving drivers making left turns, and identified 70 miles of the highest-injury corridors for pedestrians. These miles account for 60 percent of all pedestrian collisions in the city, and include most of the city's busiest arterial roadways (Figure 23).

Figure 23 High-Injury Corridors and Pedestrian-Injury Collisions

Source: SFMTA 2013.

Achieving the Mayor's goals will be a major challenge and will require high levels of investment in pedestrian infrastructure. The challenge is compounded by growing population and employment, which will bring an increase in walking trips, automobile trips, and pedestrian-automobile collisions unless aggressive action is taken.

[32] SFMTA Pedestrian Strategy, page 5

Aging of the population is another major challenge for pedestrian safety. San Francisco is projected to experience a 68 percent growth in the number of people 65 and older by 2040, making this group 20 percent of the population (compared to 16 percent today[33]). Older pedestrians are more likely to be killed when struck by an automobile.

Another notable recent effort to improve pedestrian safety and livability is the Better Streets Plan, which creates a unified set of standards, guidelines, and implementation strategies to govern how the city designs, builds, and maintains its pedestrian environment. The Plan seeks to balance the needs of all street users, with a particular focus on the pedestrian environment and how streets can be used as public space.

The Mayor's Pedestrian Safety Task Force report presented a vision for improving pedestrian safety and walkability in San Francisco. Key strategies referenced in the plan include:

- Upgrading the 44 miles of high-injury corridors to provide pedestrian safety features throughout
- Providing extra pedestrian crossing time at 800 intersections citywide
- Re-engineering streets around at least five schools and in 2 areas with high numbers of senior injuries annually
- Updating or creating at least nine plazas
- Re-opening 20 closed crosswalks
- Planning a city-wide network of 140 miles of green streets to help people walk safely to parks and the waterfront
- Upgrading 13,000 curb ramps
- Installing pedestrian countdown signals at 184 intersections by 2021
- Targeting enforcement of high-risk behaviors such as speeding and red-light running on high-injury corridors and intersections, and reporting quarterly on injury collisions and enforcement
- Pursuing state legislation for prioritizing sustainable transportation and targeted enforcement, such as speed cameras, congestion pricing, and vulnerable user laws

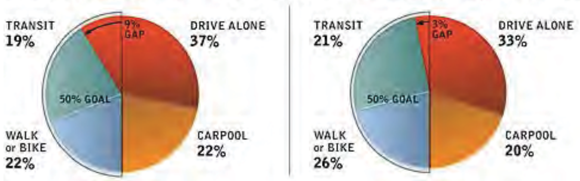
Full funding of the SFMTA Pedestrian Strategy would require approximately $600 million over the life of the SFTP; most of this is unfunded.

[33] Association of Bay Area Governments population projections

Livability: What Would it Take?

- **CHALLENGE:** San Francisco has a "Transit First" policy, yet under the Baseline almost 60% of trips in the city will be made by car (this includes carpooling). Such high levels of car use will have significant negative impacts on traffic safety, neighborhood cohesion, noise levels and other important aspects of urban livability.
- **TARGET:** Less than 50% of trips to, from and within San Francisco are made by car. Reaching this target means shifting approximately 430,000 trips daily in 2035 from cars to "Transit First" modes (transit, walking and biking).
- **IMPROVEMENTS:**
  - Transit projects that improve frequency or reliability or that reduce travel times, transfers or crowding; includes big-ticket items such as new rail lines and a second cross-bay tube for BART
  - Projects to promote walking, such as traffic calming, road diets, street closures and streetscaping
  - Projects to encourage bicycling, such as a network of cycletracks, more secure bike parking (including bike stations at major transit hubs) and bike sharing
  - In order to make it sufficiently different from other scenarios, this scenario did not incorporate congestion pricing
- **COST:** $15 billion.
- **RESULTS:** This scenario results in a shift in mode share from cars to "Transit First" modes of 6 percentage points compared to the Baseline scenario: the percentage of trips made by car decreases from 59% of all trips to 53% while the percentage of trips made by transit, walking and bicycling increases from 41% to 47% (see figure below).

Figure 1. Performance of Livability Scenario: 2035 Baseline (LEFT), Livability Scenario (RIGHT)



- **CONCLUSIONS:** The scenario makes significant progress toward its target but does not reach it. To achieve the target, an additional shift in mode share of 3 percentage points is necessary. That shift could be accomplished through congestion pricing: based on other analyses, congestion pricing would yield an additional shift in mode share from cars to "Transit First" modes of 3–5 percentage points.

5 Healthy Environment

SECTION SUMMARY:

- San Francisco has set aggressive goals for reducing greenhouse gas emissions from transportation; the goals would require 80 percent reduction in greenhouse gas below 1990 levels, which is five times more aggressive than regional greenhouse gas reduction goals.
- More stringent state vehicle emissions regulations will cause greenhouse gas emissions to fall by about 30 percent by 2040, but this is insufficient to achieve the goal.
- Some of the most promising strategies to achieve additional progress include congestion management, employer outreach, and partnerships with the private sector.

Transportation has significant environmental impacts. For example, emissions from cars and trucks account for one third of San Francisco's greenhouse gas emissions.[34] Addressing these impacts, particularly greenhouse gas emissions, is a key focus of the SFTP. This section reviews trends in greenhouse gas emissions, and discusses possible additional strategies that could help San Francisco achieve its goals, especially congestion management, employer outreach, and private sector partnerships.

5.1 | Goals and performance measures

The SFTP healthy environment goal focuses on minimizing the negative environmental effects of motorized transportation. Key performance measures include:

- Vehicle miles of travel
- Greenhouse gases associated with vehicle travel

5.2 | Trends and future conditions

Technology will do much to reduce climate change impacts from private vehicles. Tough state laws (Pavley I and II) regulating vehicle emissions are expected to reduce greenhouse gases by more than 40% compared to a business-as-usual scenario. However, this is not sufficient to allow San Francisco to achieve its goal of an 80% reduction below 1990 levels by 2050,[35] especially given the large amount of population and employment growth San Francisco expects to absorb. Additional, aggressive strategies will be needed to meet these goals.

[34] Brisson, Elizabeth, Elizabeth Sall, and Jeffrey Ang-Olson. "Achieving Goals of San Francisco, California, for Greenhouse Gas Reductions in Transportation Sector: What Would it Take?" Transportation Research Record: Journal of the Transportation Research Board. No. 2287, 2012, p89.

[35] From local ordinance 81-08. This is the amount climate scientists say is needed to stabilize the climate and prevent major sea level rise, extreme heat events, and other impacts.

Miles driven by private vehicles, or "VMT" (vehicle miles of travel) is the main source of greenhouse gases and air pollutants from the transportation sector. Growing population and employment in San Francisco and regionally is expected to result in a VMT increase of approximately 30% by 2040 under a business-as-usual scenario.[36] As shown in Figures 24 and 25, much of this VMT will come from the downtown core (for workplace VMT), and outlying southwest and southeast neighborhoods (for household VMT). The maps illustrate that major institutions such as medical centers and universities generate significant vehicle miles of travel.

PLAN BAY AREA: REGIONAL GREENHOUSE GAS REDUCTION GOALS

Plan Bay Area is the regional transportation plan developed by the Bay Area's regional transportation planning agency (the Metropolitan Transportation Commission). Approved in 2013, it sets a goal of reducing greenhouse gas emissions by 15% between 2005 and 2035, a statutory requirement of the California Air Resources Board.

Plan Bay Area shows how this reduction will be met by concentrating new growth in already built-up transit-accessible areas and through regional transportation investments and policies. Notably, San Francisco is expected to take on more new jobs than any other city, and more new housing than all other cities except San Jose. Concentrating jobs and housing in San Francisco supports efficient travel patterns and greenhouse gas reduction, but could also result in severe congestion and transit system crowding in downtown San Francisco unless major new system investments are made. See the Economic Competitiveness section for more detail.

[36] O:\Active Studies\CWTP Update\Data\Scenarios\Data\GraphicsSheets-E.xlsx Economic competitiveness. Includes VMT within SF only.

SAN FRANCISCO TRANSPORTATION PLAN 2040 FINAL REPORT APPENDICES

Figure 24 Household Vehicle Miles of Travel, 2040

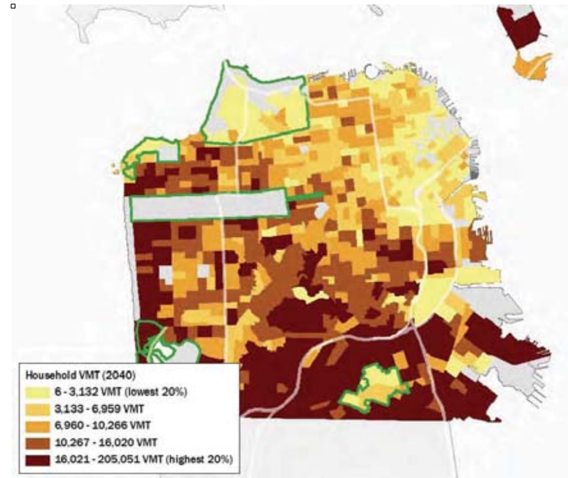


Figure 25 Vehicle Miles of Travel to Workplaces, 2040

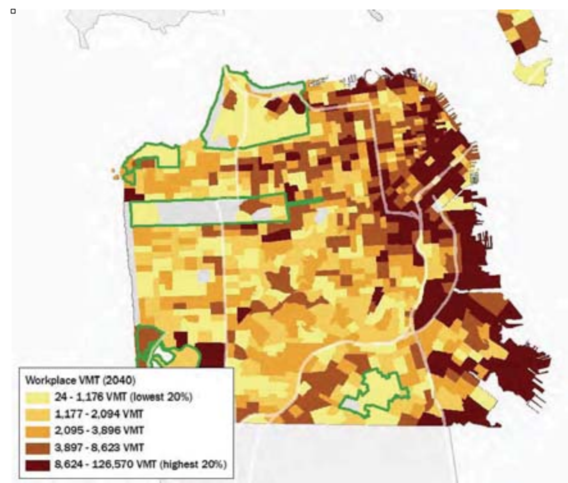
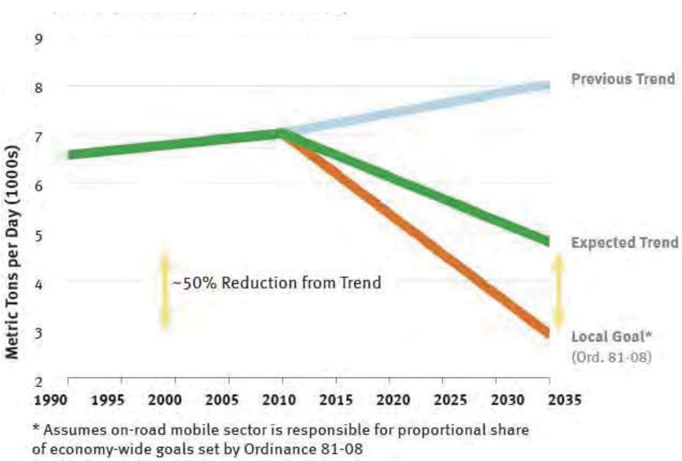


Despite this VMT growth, greenhouse gases are expected to fall by about 30 percent between 2012 and 2040 due to the state emissions regulations described above. As shown in Figure 26, this will be insufficient to achieve the levels of GHG necessary to meet San Francisco's goals expressed in the city's Climate Action Strategy, which sets a very aggressive goal of reducing GHGs by 80 percent below 1990 levels by 2050, the reduction scientists consider necessary to stabilize the climate.[37] This goal is five times more aggressive than regional GHG reduction goals outlined in the One Bay Area Plan.

Figure 26 San Francisco Greenhouse Gas Reduction Goal Compared to Expected Trend



As described in the sidebar box above, the SFCTA conducted scenario testing to determine what it would take to achieve this goal. Multiple strategies were tested, focusing on road pricing, transit investments, and travel demand management activities. While even the most aggressive scenarios were insufficient to achieve San Francisco's goals, they allowed up to an 85 percent reduction relative to the expected trend.

The analysis also revealed which are the most cost-effective strategies for reducing greenhouse gases, namely congestion pricing, subsidized transit passes, and travel demand outreach programs. Investments in new mass transit services and electric vehicles were less cost-effective methods. The section below describes how the most cost-effective programs could be expanded and advanced in the future.

5.3 Approaches to achieving GHG reduction goals

This section describes three cost-effective approaches to reducing greenhouse gases in San Francisco: congestion management programs, outreach/incentive programs, and leveraging of private sector

[37] From ordinance 81-08.

investments. Ideas in this section are drawn from the city's Climate Action Plan and the Core Circulation Study (Appendix C).

5.3.1 | CONGESTION MANAGEMENT

Managing congestion through roadway pricing or similar means is one of the most effective tools available for reducing greenhouse gas emissions from transportation. One form of pricing already implemented in San Francisco is the SF*park* Program, which uses variable pricing on parking spots to reduce congestion (and associated greenhouse gases) associated with drivers searching for parking.

Another form of pricing has also been considered for downtown San Francisco. In 2010, the Transportation Authority published the Mobility, Access and Pricing study, which examined the feasibility of implementing a congestion charge for vehicles entering or leaving the northeast quadrant of San Francisco. The study found the following potential benefits of the program:

- 12 percent fewer peak-period vehicle trips
- 21 percent reduction in vehicle hours of delay
- 5 percent reduction in greenhouse gases citywide
- Increase in transit speeds of 20-25 percent
- Reduction in pedestrian incidents of 12%
- Generation of $60-$80 million in annual net revenue for mobility improvements

On December 14, 2010, the Transportation Authority Board unanimously approved the MAPS Final Report and voted 8–3 in favor of pursuing additional study of the concept.

Vehicle travel can also be limited through regulation. For example, a 1998 ordinance implemented in Cambridge, Massachusetts, requires any employer who expands available parking by more than five spaces to develop a plan for limiting vehicle trips to the worksite through employee incentives, parking pricing, technology, or other means. Implementation of the plan is enforced by the city and employers must demonstrate through surveys and driveway vehicle counts that they are not exceeding their vehicle trip allowance. The program has reduced vehicle miles of travel by 24 percent between 2000 and 2010, and has successfully allayed community concerns regarding traffic impacts from new development.

5.3.2 | INCENTIVE PROGRAMS AND OUTREACH

Incentive and outreach programs can also be a cost-effective method of reducing private vehicle travel and associated environmental impacts. Programs that involve personal interaction, monetary incentives, and tailored information are particularly effective in supporting behavioral change. One example is King County, Seattle's "In Motion" program, which involves provision of targeted marketing materials to encourage alternatives to driving paired with free transit passes to neighborhoods in King County on a rolling basis. Since 2004, about 13,000 residents have participated, and follow-up surveys indicate that vehicle miles of travel have been reduced by 2.4 million miles. Crowding on San Francisco's transit vehicles (covered in Section 3) and budget shortfalls make widespread provision of free transit passes impractical, but other types of incentives can be explored.

TRAVEL DEMAND PARTNERSHIP PROGRAM

The San Francisco Travel Demand Partnership Program is an innovative inter-agency effort to pilot test several innovative approaches to managing greenhouse gas emissions from transportation. Pilot projects include employer ridesharing and shuttle programs, a sustainability marketing campaign, and a flexible employee benefits program designed to reduce solo commuting. These pilot programs will inform development of the next generation of travel demand management strategies in San Francisco. The program is being funded through the Metropolitan Transportation Commission's Climate Initiatives Program.

5.3.3 | PRIVATE SECTOR TRANSPORTATION SERVICES AND TECHNOLOGY

Another approach to cost-effectively reducing greenhouse gases is to leverage private sector investment. In recent years, the private sector, and the technology sector in particular, have become more active in the transportation sector, both by providing direct transportation services to their employees in San Francisco, and by creating new services and technologies to serve the general public. Many of these innovations have significant potential to reduce single occupancy vehicle trips and greenhouse gases. Examples include:

- **CAR-SHARING AND SCOOTER-SHARING -** Private car-sharing companies have expanded rapidly, with multiple companies such as Zipcar, CityCarshare, Getaround, and the scooter-sharing company Scoot now offering services in many neighborhoods. Some companies, like Getaround and Relayrides, allow private vehicle owners to share their personal vehicles with others. Studies have indicated that access to car-sharing vehicles can allow residents to reduce the number of vehicles owned[38], which can support reductions in driving and associated greenhouse gas emissions. When car-sharing is offered at the worksite, it can also support employees who want to avoid driving to work but need access to a car during working hours.
- **RIDE-MATCHING -** Technological advances are allowing people to share rides more easily. Many private vendors are now offering customizable software programs that employers can offer to their employees to help them identify co-workers with similar travel needs – examples include Zimride, ride Amigos, rideShark, Greenride, TwoGo, and many others. Another set of companies, including Lyft, Uber, and Sidecar, have developed smartphone applications that allow drivers to find potential riders in exchange for a donation.
- **PRIVATE EMPLOYER SHUTTLES -** Many of the larger technology sector employers, such as Google and Genentech, are now offering private shuttles for their employees' commutes. Surveys have indicated that shuttles are serving about 35,000 commute trips per day, or about 1 percent of all trips to, from, and within San Francisco. About half of riders indicate they would drive alone if the shuttle were not provided.

[38] Martin, E., Shaheen, S., Lidicker, J. Carsharing's Impact on Household Vehicle Holdings: Results from a North American Shared Used Vehicle Survey. 2010 Transportation Research Record, March 15, 2010.

The public sector can play a key role in supporting growth of these services while minimizing any negative impacts on the transportation system. Some examples of possible roles the public sector can play include:

- **ADOPTING REGULATORY POLICY THAT SUPPORTS GROWTH IN PRIVATE SECTOR TRANSPORTATION SERVICES.** One such effort is the Shuttle Partners Program, a pilot program within the TDM Partners Project described previously. The program would allow private employer shuttles access to select MUNI stops in exchange for a fee. Successful implementation of this program will clear a path toward expansion of the private shuttle sector while addressing community concerns around shuttle impacts. Another example is the city planning department's policy of allowing developers to purchase residential car-share accounts to justify exceptions to maximum parking allowances.
- **ALLOWING PRIVATE SERVICES ACCESS TO STREET SPACE.** In July 2013 the SFMTA adopted a formal policy to guide the agency's facilitation of car-sharing in its off-street parking lots and garages, as well as approving a two-year pilot to test the use of on-street parking spaces as car-share spaces ("pods"). This pilot builds on lessons learned from a small-scale pilot of on-street car-share pods carried out in 2011 and 2012, and will make as many as 900 on-street parking spaces available across all districts of the city for use by qualified car-share organizations over the two years of the pilot.
- **SUPPORTING MARKETING OF PRIVATE SERVICES.** City staff can aid in the marketing of private sector services that support sustainability goals by incorporating information on these services into marketing materials provided to employees, and on city web sites.

Healthy Environment: What Would it Take?

- **CHALLENGE:** The city has an ambitious official policy to reduce emissions of greenhouse gases to 80% below 1990 levels by 2050. However, the large number of new residents and workers anticipated for San Francisco in coming decades will greatly blunt the impact of even such effective measures as the state's "Pavley Law," which tightens fuel-economy standards for cars and light trucks.
- **TARGET:** To reduce the city's transportation-related emissions of greenhouse gases by 2035 to 2,900 metric tons daily below the post-Pavley trend (this translates the city's official policy to the SFTP's horizon year and to the percentage contributed by transportation sources to total emissions).
- **IMPROVEMENTS:** This scenario included the projects, programs, and policies identified below. An additional, more aggressive sensitivity analysis was also conducted incorporating a regional road-pricing strategy that doubles the operating cost for a car and estimates a penetration rate for electric vehicles of 25%.
  - Increased penetration of electric vehicles into San Francisco's private-vehicle fleet to 9–16%
  - A $6 congestion-pricing toll in downtown San Francisco during peak periods
  - New designated transit lanes and rail extensions
  - Employer-subsidized transit passes and additional employer-based TDM measures
  - Mandatory transit passes for new housing units and other residential TDM measures, including personalized outreach on commute alternatives and increased car-sharing
  - Bicycle improvements, including a network of cycle tracks
  - School-based TDM measures, including Safe Routes to School-type investments, and outreach and other tools to facilitate carpools and school-pools, at both primary and secondary schools
- **COST:** $10 billion ($4 billion excluding second cross-bay BART tube and high-speed rail service).
- **RESULTS:** The basic scenario reduces post-Pavley emissions by 1,600–1,800 metric tons daily (see chart below). With the aggressive sensitivity analysis, the reduction is 2,200–2,600 metric tons daily.
- **CONCLUSIONS:** The basic scenario falls well short of its target even with the most aggressive measures. It is worth noting that each improvement analyzed presents trade-offs in terms of performance, cost-effectiveness, political acceptability, and co-benefits. Electric vehicles, for example, reduce emissions very cost-effectively but lack the co-benefits of strategies aimed at reducing car travel, such as reducing congestion or improving traffic safety. These tradeoffs were considered in the evaluation of improvements for inclusion in the preferred and vision alternatives.

6 Visitor, Goods Movement, and School Transportation Needs

SECTION SUMMARY:

- Of the thousands of people who visit San Francisco every day, more than 25 percent are from the Bay Area, and many of these visitors drive. Reducing this group's reliance on automobile travel could have a significant impact on congestion in the northeast core, where many visitor trips end.
- Increasing congestion could have an impact on goods movement, delaying delivery vehicles and causing inconveniences and economic hardships for delivery recipients. A combination of citywide congestion-mitigation programs and neighborhood-level parking-management strategies will be required to solve this problem.
- Reliability, safety, and other factors prevent students from taking transit to school instead of getting a ride from a parent.

The prior sections discussed the transportation investments necessary to make progress towards the SFTP goals of world-class infrastructure, economic competitiveness, a healthy environment, and livability,. This section discusses the transportation needs of three important constituencies whose needs do not fit neatly within the SFTP goal areas: visitors, companies moving goods through the city, and students.

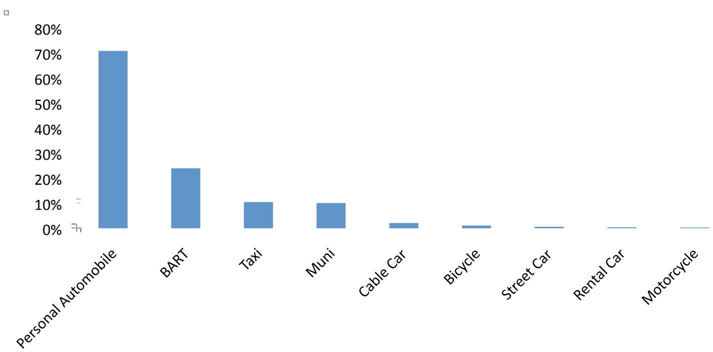
6.1 | Visitors

The San Francisco Convention and Visitors Bureau estimates that approximately 131,000 people visit San Francisco every day,[39] generating an estimated 500,000 miles of daily vehicle travel[40]. While this is far less vehicle travel than generated by daily commutes, it can still contribute to intense congestion as it clusters in specific times and places, such as around popular tourist sites, for major sports events, and during Sunday afternoons.

Visitor travel is concentrated in the city's congested northeast core, and as Figure 27 shows, many visitors from the Bay Area, who make up nearly a quarter of all visitors, come to the city by car.[41] Shifting them to other modes will be critical in reaching the San Francisco Transportation Plan's goals.

[39] San Francisco Convention and Visitors Bureau. "San Francisco Visitor Industry Statistics." Retrieved from http://www.sanfrancisco.travel/research/ on 10/7/13.
[40] Estimate assumes each visitor makes 4 trips per day; about 30 percent of trips are by automobile; and trips are three miles in length.
[41] San Francisco Convention and Visitors Bureau. "Visitor Profile Research." Presentation, January-September 2010. Slide 14.

Figure 27 Bay Area Residents' Mode of Travel to San Francisco for Day Trips



Source: San Francisco Convention and Visitors Bureau, 2010.

While visitors from further away have more varied travel patterns, they still center on the automobile. Seventy-six percent of international visitors and 61 percent of domestic visitors travel by taxi or rental car.

Some potential strategies for addressing congestion associated with visitor demand include:

- Distributing transportation information and, potentially, Clipper cards, to hotels. The SFMTA has already begun outreach to hotels and convention centers.
- Working with major event venues to manage demand, such as through advertising alternatives and facilitating shared rides or taxis to events.
- More clearly identifying designated areas for tour bus loading and unloading.
- Providing additional transit services in areas with the highest tourist demand, where appropriate.
- Piloting direct bus services from Bay Area locations to major San Francisco attractions not readily accessible by transit to serve high demand from Bay area visitors.
- Working to deploy bicycle sharing at the most visited locations.

6.2 | Goods Movement

Goods movement is critical to San Francisco's economic competitiveness and livability, two of the San Francisco Transportation Plan's four goal areas. Problems with goods movement in today's transportation

system center on delivery vehicles' competition with private automobiles for space on city roads and at the curbside.

In Spring 2011, the SFTP team conducted eight interviews with a variety of goods movement stakeholders, including merchants, delivery companies, and drivers, the United Parcel Service, and the San Francisco Municipal Transportation Agency. The conversations revealed a number of related issues that impede efficient deliveries:

- **INSUFFICIENT SPACE FOR LOADING AND UNLOADING.** Though yellow curb zones reserve some space for deliveries, delivery vehicles often must compete with cars, large employer shuttles, and other vehicles to drop off goods at local businesses. When there is no curbside space available, drivers double park or must take additional time to cart deliveries from more distant parking spots.
- **POOR MANAGEMENT OF AVAILABLE LOADING AND UNLOADING SPACE.** Stakeholders noted that loading and unloading zones are often too short, poorly placed, have inadequate hours, and are poorly enforced.
- **CONGESTION DURING PEAK TRAVEL PERIODS.** Many delivery-vehicle destinations are in the densest parts of the city, where traffic congestion is the biggest problem. For such vehicles, slower deliveries mean less productivity and, ultimately, lost money.

Shorter-term strategies to remedy these issues include continually refining and rationalizing the hours of yellow zones and determining locations through a community process. Delivery spaces should also be an additional consideration in crafting neighborhood plans.

In the longer term, congestion management strategies can support more efficient goods movement. As described in the Environment section, forecasts show that pricing will significantly reduce congestion in the city's dense northeast core, the destination of many deliveries and the area of the city in which competition between drivers and delivery vehicles is most intense

6.3 | School Transportation

Outreach for the SFTP (described fully in the SFTP Appendix E: Outreach Summary) included a survey of students and parents to gauge their transportation needs. The survey asked participants about factors that hold them back from taking transit, biking, or walking to school (or, in the case of parents, allowing their students to take those modes). More than 1,000 responses were received, and results revealed that the frequency and reliability of transit service is the top priority of students and parents. For students, reduced-price transit passes and transit stops closer to school were also important but significantly less so. For parents, transportation safety was another key area of importance (Figure 28).

The survey findings reveal that the top school transportation needs can be met through projects and programs designed to improve transit service quality, especially those that would serve major educational institutions. Sections 2 and 3 discuss current efforts and possible future strategies to improve transit service.

In addition, other efforts are already underway to support non-auto school transportation. In late 2012, the Board of Supervisors funded a short-term youth-pass pilot to provide students with free Muni passes, more than 18,000 students signed up for the program in the months before it officially began, in March 2013.[42] The pilot will continue for 16 months. The program was developed in response to cuts in San Francisco Unified School District's yellow school bus service and recent increases in the cost of Muni youth passes.[43]

CORE CIRCULATION STUDY

Recognizing that a large share of San Francisco's future growth is planned for the city core (downtown, South of Market, and Mission Bay Neighborhoods), we undertook a study of current and projected circulation patterns in the core as part of SFTP development. The study resulted in a paper accepted for publication at the Transportation Research Board 2014 annual conference (attached). Study findings informed the SFTP Investment Plans and policy recommendations.

Submitted for presentation at the Transportation Research Board Annual Meeting and publication in the Transportation Research Record

ABSTRACT

Several land use and transportation plans propose changes that would affect the "Core" of San Francisco. The Core encompasses the greater Downtown area, including the South of Market (SoMa) neighborhood. SoMa is currently comprised of a predominantly one-way street grid with long blocks of multi-lane arterial streets designed to carry traffic from Downtown to the city's major regional freeway access points. With at least 48,000 housing units and 122,000 more jobs expected in this area, San Francisco has developed plans to aggressively reduce number of general purpose travel lanes on many streets to improve livability and better balance travel options amongst modes. This paper presents analysis and findings of an effort to use quantitative analysis to identify the cumulative transportation performance effects of these proposed changes. The paper presents a combination of activity-based travel demand model, traffic microsimulation, and off-model analysis to describe one of the key problems identified – that plans for the Core could lead to a "carmaggedon" scenario (i.e perpetual gridlock) where the forecast level of auto demand "breaks" the Core network—a particular problem because of the negative impact perpetual gridlock would have for transit operating at-grade. A range of strategies to reduce auto demand are evaluated for their effectiveness, finding that demand management and mobility improvement strategies are essential. The paper closes with two key discussion areas: 1) opportunities and challenges to making transit, walking, and cycling function effectively in extremely congested conditions; 2) a need for the city evolve from the typical forecasting/analysis approaches to long-range transportation planning to solve tomorrow's transport challenges.

INTRODUCTION

To see an example of how traffic congestion impacts other modes of transportation today, you only need to stand for a moment on a street in Downtown, San Francisco during rush hour. You will likely see private autos illegally trespassing in unprotected bus lanes. You will see 50+ passengers on a bus waiting for a single motorist to make a right turn through a pedestrian-filled intersection. You will see frustrated motorists block intersections because they have already waited too long to cross. You will see cyclists risking their lives navigating the slim and unpredictable gaps between vehicles. This problem—of congestion, and its negative travel time, reliability, and safety impacts to all modes of transportation—has been of particular interest to San Francisco given plans underway to rapidly intensify land uses while reducing the number of general purpose travel lanes on many streets to increase livability. Given this context, the City has struggled with questions such as: how much can auto congestion's impacts on other modes be mitigated by simple low-cost solutions or are major capital investments needed? Can we, and/or should we strive to mitigate congestion? What level of intervention is needed to maintain a safe, habitable urban environment while providing sufficient mobility to maintain the City's economic competitiveness? This paper explores these challenging questions and analyzes potential solutions.

BACKGROUND

San Francisco is a city recognized for its leadership in planning for transit-oriented growth. The City's Charter even has a Transit First policy that states that, "decisions regarding the use of limited public street and sidewalk space shall encourage the use of public rights of way by pedestrians, bicyclists, and public transit."*(1)* The City's currently adopted or underway land use plans call for a significant increase of 48,000 housing units and 122,000 jobs within the city's Core *(2)*. The city has made planning for this growth a policy priority. In addition, the Bay Area region (population of approximately 7 million) looks to San Francisco, as well as the other core cities of the region (Oakland and San Jose) as the most important locations to focus most growth due to the existing infrastructure and density within these locations. In fact, in the recently adopted *Plan Bay Area* long-range land use and transportation plan., San Francisco is expected to take on approximately 92,000 housing units and 190,000 jobs to help achieve the region's greenhouse gas reduction goals (*3*). Citywide, this expected growth represents approximately a 25% increase in housing and a 34% increase in jobs, relative to today's levels citywide.

Within this context, San Francisco has placed emphasis on planning for growth within the "Core" of the city, generally those areas adjacent to the Downtown/Civic Center job centers. Combined, approximately 60% of growth in housing units and 85% growth in jobs has been planned to be accommodated in the Core, with a lot of it focused in the neighborhoods directly south of Downtown: the South of Market (SoMa) and Mission Bay neighborhoods *(4)*. SoMa is known for its multi-lane one-way arterial streets that provide access between Downtown and the regional freeway network. As a result of the needs of existing SoMa residents, as well as in response to growth planned, there have been significant efforts to develop and implement plans to increase the neighborhood's livability by re-purposing right-of-way of general purpose lanes to provide safer, more attractive non-motorized facilities and faster, more reliable transit. Mission Bay, just south of SoMa is a redevelopment area with a research and heath-care oriented master plan in the process of building out, and separated from SoMa by a channel to the Bay, with only two streets connecting north-south to SoMa (see Figure 1).

FIGURE 1 Core Study Area

The San Francisco County Transportation Authority (Transportation Authority) undertook a focused study of the Core to inform the 2013 update to the San Francisco Transportation Plan (SFTP), San Francisco's long-range, countywide transportation plan that prioritizes transportation investments and recommends policies to support the city's transportation goals. The purpose of this analysis, known as the Core Network Circulation Study (Study) was to analyze the cumulative impact of growth and changes to the transportation network; identify transportation performance problems; and propose recommendations.

The analysis revealed three key problems: 1) the forecast increase in auto trip-making caused by the intensifying land use would result in more auto demand than could be served, in particular given concurrent projects to promote livability through reducing private vehicle capacity—in other words, if the demand for vehicle travel forecast were realized, a perpetual gridlock or "carmageddon" scenario was expected given current plans; 2) even if auto demand was to be substantially reduced, significant transit performance challenges remained; and 3) the overall increase in trips of all modes would exacerbate multi-modal conflicts endangering the safety of pedestrian and cyclists. The purpose of this paper is to describe the methodology, findings, policy implications, limitations, and conclusions related to the first problem (the problem of "carmaggedon").

METHODOLOGY/ANALYSIS APPROACH

The Study's approach to identifying problems relied on an evaluation framework that included metrics related to performance of each mode of transportation, including transit, walking, cycling, and private vehicle travel. The analysis proceeded in three phases: first, a baseline **travel market analysis** was conducted to understand who is traveling in the Core, in particular which high auto trip markets affected the Core; next, transportation performance was assessed and problems identified, including the problem that is the focus of this paper, forecast **perpetual gridlock congestion** during peak hours; finally, **effectiveness of strategies** to respond to problem areas were identified and evaluated.

Two main scenarios were considered to inform the analysis: a "Base" year, representing current conditions, and a "Planned Future" horizon, that included all land use and transportation network changes planned for in the 2035-2040 timeframe. The study team chose the PM peak hour as representative of a typical daily "worst case" scenario.

A variety of analysis tools were used including:

- The Authority's activity-based travel demand model, the San Francisco Chained Activity Modeling Process (SF-CHAMP) *(5)*. SF-CHAMP incorporates a state-of-the-art approach to forecasting travel demand, sensitive to a broad array of conditions that influence travelers' choices. It incorporates the most recent 2010 Census household travel data, along with calibration to observed data including traffic volumes and transit ridership.
- Micro-simulation traffic analysis software, SimTraffic, which was used to determine how the level of auto trip-making demand forecast in SF-CHAMP would affect on-the-ground performance during PM peak hour conditions. As compared to SF-CHAMP, SimTraffic better accounts for delays under congested conditions and represents more detailed network characteristics such as traffic signal phasing, coordination, turn lanes, and the effects of queuing between intersections.
- Off-model techniques customized to understand the effectiveness of strategies that are not currently represented in SF-CHAMP or SimTraffic. These methodologies are summarized in the following section alongside descriptions of the strategies considered. More detailed documentation is available as a technical appendix *(6)*.

FINDINGS

This section presents findings from each of the three phases of the analysis: travel markets, transportation performance problems, and effectiveness of strategies.

1. Travel Markets

The Travel Market analysis investigates the purpose and characteristics of travel in the Core during PM peak hours including: travel mode, common origins and destinations, and breakdown between trips passing through versus originating or destined to the Core. This was a focus, as understanding the major and changing travel markets would inform which strategies would most effectively respond to problems identified.

Figure 2 summarizes overall trip-making levels in Downtown and SoMa/Mission Bay today and in the Planned Future using SF-CHAMP model output for each scenario. SoMa/Mission Bay is responsible for most of the growth in trip-making—about twice as many in the

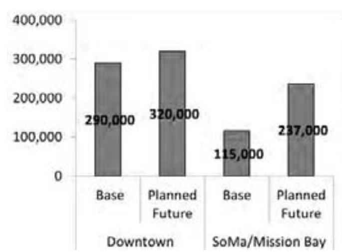

FIGURE 2 Trips to/from/within Downtown and SoMa/Mission Bay: Base vs. Planned Future, pm peak
Source: SF-CHAMP 4.3, Focused Growth

Planned Future than today. However, Downtown still attracts the most total trips. As shown in Figure 3, nearly all the new auto trips to or from the Core in the future are generated by SoMa/Mission Bay.

Figures 2 and 3 show travel occurring to, from, or within the Core, but many other trips pass through the Core without starting or ending there. Figure 4 includes this larger universe of trips and breaks down trips between those that start or end somewhere else within San Francisco (i.e. local), versus those that are regional and have their other end in another Bay Area county. Viewing trip ends and through trips together indicates that over half of the vehicles traveling on the SoMa street network are not going to a destination in SoMa; and, of the trips which pass through, half are local to San Francisco and half have regional destinations. Figure 4 also shows that the share of trips destined to or from this part of the City is increasing, while the share of trips passing through this area is decreasing, potentially indicating that as this part of the city densifies, the local streets are used by more core-related traffic, crowding out vehicles destined to other parts of the City.

Source: SF-CHAMP 4.3, Focused Growth

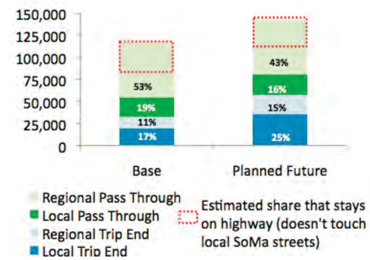

FIGURE 4 SoMa Auto Trips, Pass-Through vs. Trip Ends, Regional vs. Local, pm peak
Source: SF-CHAMP 4.3, Focused Growth

The Study team executed additional analysis focused on short auto trips, due to their greater potential to shift to walk and bicycle trips. Figure 5 shows "sub-areas" that were the focus of the analysis, as well as the number of short auto trips under 2 miles and under 0.5 miles in the Planned Future and the change relative to today.

In the aggregate, PM peak auto trips less than two miles more than double (233% increase) from today to

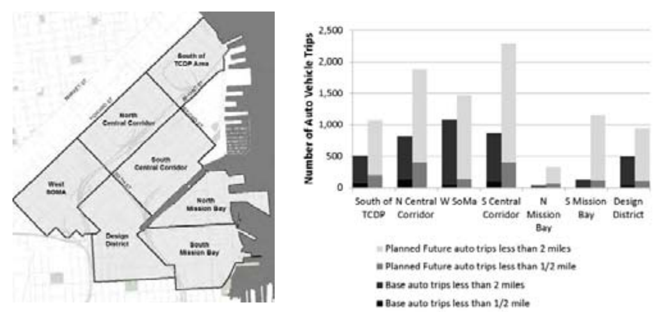

FIGURE 5 Short Auto Trip Analysis: Study Area, and Change in Auto Trips Under Two Miles, 2011 vs. 2035 Baseline
Source: SF-CHAMP 4.3, Focused Growth

the Planned Future. The auto mode share of trips less than two miles actually *decreases* (20% to 17%), yet the share of auto traffic in SoMa/Mission Bay that is completing a trip less than two miles *increases* (18% to 20%). In the context of an overall increase in trip-making, this means a lower percentage of people are choosing to drive for short trips, yet, more vehicles on the network are completing short trips due to changes in land use and density. Many of these short auto trips are likely a result of trip-chaining, which the Study team considered as it developed the strategy response (described in Part 3 of this section). The implication is that transportation demand management (TDM) strategies should be pursued to discourage people from arriving via automobile in the first place, allowing these short auto trips to more easily be shifted to walking and bicycling trips. By encouraging transit, shuttle use, ridesharing, parking policy, and other TDM measures people will be less likely to drive to these districts in the first place, and thus decreasing the possibility of short auto trips. Shifting to walking and cycling is a particular opportunity not only for short vehicle trips but also for short transit trips, which would free up room on overcrowded buses and trains for longer transit commutes.

2. Transportation Performance: Congestion Reduction to Avoid Gridlock

The study team analyzed the auto and transit performance impacts of the forecast increase in net auto travel in the Planned Future. The Study team prepared a SimTraffic microsimulation analysis, assuming the transportation network proposals (i.e. reduction in general purpose travel lanes) were in place, for a subset of SoMa that experiences some of the greatest levels of congestion today. The purpose of this analysis was to determine how much auto demand reduction would be necessary to prevent vehicle queues from spilling into upstream intersections and maintain a saturated, but flowing network. Results determined that an approximate 26% reduction of auto volumes during the PM peak period relative to Planned Future SF-CHAMP forecasted levels of demand was needed to reach an operational point at which traffic could flow (see Figure 6). In other words, the Core San Francisco road network can only accommodate about half of the forecasted auto demand increase before creating a perpetual gridlock condition.

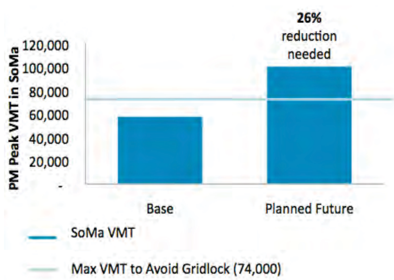

FIGURE 6 PM Peak Vehicle Miles Traveled on SoMa Streets: Comparison of Scenarios *Source: SF-CHAMP 4.3, Focused Growth*

3. Congestion Reduction Strategy Effectiveness

The final aspect of the analysis was to assess the effectiveness of a range of strategies in contributing to achieving the 26% reduction in PM peak VMT needed. Informed by the trip analysis findings, a set of potential strategies were identified for analysis.

Generally, strategies were identified in line with those that responded to a larger needs analysis conducted for the SFTP. In particular, there was a focus on newer and innovative demand management strategies that have

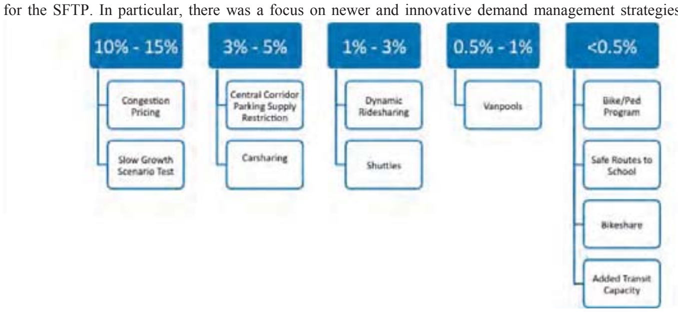

FIGURE 7 Relative Effectiveness of Strategies to Reduce PM Peak SoMa VMT
Source: SFCTA, 2013.

recently come into practice or are under consideration in San Francisco.

Figure 7 summarizes the range of potential impacts of selected strategies to further reduce core VMT from the Planned Future (each strategy listed could individually provide the level of reduction—e.g. congestion pricing and slow growth could each provide a 10-15% reduction in PM peak SoMa VMT). Results found that no single strategy alone could achieve the level of reduction needed, and even all strategies combined may not be able to. The rest of this section contains definitions of each strategy represented as well as the methodological approach to quantify the benefit. It should be noted that the impacts of these strategies are not additive: each strategy is evaluated assuming that no other strategies are implemented. Overlap is likely although in some cases synergies between strategies are also possible.

10% - 15% VMT Reduction

Congestion Pricing: The reduction estimate for congestion pricing is based on travel forecasts conducted as a part of the Mobility, Access, and Pricing Study that explored the feasibility of implementing congestion pricing in Downtown San Francisco (*7*). The 10-15% reduction represents the AM/PM Northeast Cordon scenario, where motorists would be charged a $3 per crossing fee for crossing into or out of the area bounded by Laguna Street, Guerrero Street, 18th Street, and the waterfront during peak periods with net revenue reinvested in multi-modal mobility improvement. Such a policy is still under consideration for San Francisco, and has recently come back into policy and media attention in context of major growth planned in the Core and the resurgence of San Francisco's economy after the recession.

Slow Growth Scenario Test: This scenario test was intended to be a point-of-information were San Francisco's growth to happen at a slower pace, akin to the level of growth forecast for 2020. Under this slower growth scenario, PM peak VMT would need to be reduced by 11%. Of course, growth would continue towards 2040 projections and further reduction strategies would ultimately be needed to avoid perpetual gridlock.

3% - 5% VMT Reduction

Central Corridor Residential Parking Supply Restrictions: This strategy describes results of a model scenario in SF-CHAMP representing the effect of a set of policies that would aggressively limit the growth of parking supply in a part of SoMa known as the Central Corridor (bounded by 2nd, 6th, Mission, and Townsend Streets). The Central Corridor is currently undergoing a planning process to upzone the area as it is adjacent to the route of a major transportation investment (the Central Subway that will connect Southeast San Francisco, SoMa, Union Square, and Chinatown). This policy scenario was specified for the Central Corridor area because the opportunity to regulate parking more aggressively (relative to previous area plans) may be an option, since this area is in the process of being re-zoned.

Carsharing Expansion: This strategy estimates the impacts of an aggressive expansion of carsharing consistent with analysis done by the Metropolitan Transportation Commission (MTC) as a part of *Plan Bay Area (8)*. Such an expansion would be achieved by policies that increase set-aside for off-street parking for car-sharing (current San Francisco policy is one car-share space for every 50 housing units in new developments *(9)*) or expansion of on-street carshare parking spaces as is currently in its nascency *(10)*. Additionally, MTC proposes subsidizing new start-up carshare offices throughout the region. This assumes that 15% of the "eligible population" (defined as adults 20-64) will be become carsharing members by 2040.

1% - 3% VMT Reduction

Dynamic Ridesharing: Dynamic ridesharing explores the potential of heavily investing in outreach and technology to match current single occupant vehicle (SOV) trip-makers to share rides with those having similar trip origins and destinations. In the Planned Future, 59,000 PM peak VMT (60%) are from SOVs. The analysis assumes the market for dynamic ridesharing to be 5% of those who currently drive alone, based on survey results of City and County of San Francisco employees *(11)* and the market research potential of dynamic ridesharing from UC Berkeley *(12)* and MIT (*13)*.

Shuttles: Employer-provided shuttles have emerged as a major new sector within San Francisco's transportation system recently, in particular for workers in certain employment sectors such as technology. According to a survey conducted for San Francisco's Transportation Demand Management (TDM) Partnership Project, regional shuttles represent at least 6,600 daily boardings, while intra-city shuttles account for at least 28,700 boardings *(14)*. The analysis assumes the market is projected to grow by approximately 40% for regional providers and 39% for intra-city providers based on forecast increase in employment in these categories. Using TDM Partnership Project survey results as to what mode would serve the trip if the shuttle was not an option, a Planned Future PM peak VMT reduction was calculated based on the share of shuttles that serve SoMa (27%). This strategy is intended to represent partnering with employers to enable the shuttle system to grow as it has been trending without interfering with public transportation, such as through the city's recent efforts to regulate use of bus stops for shuttles *(15).*

0.5% - 1% VMT Reduction

Vanpools*:* The Vanpool strategy applies the MTC *Plan Bay Area (16)* methodology of a strategy that would provide a $400/month/van subsidy to encourage ridesharing growth in the region. In SoMa, this translates to 1,800 new vanpool riders and 700 fewer vehicles in SoMa.

< 0.5% VMT Reduction

Bicycle and Pedestrian Program: This strategy represents major investments to the city's bike and pedestrian networks including building more than 100 miles of upgraded protected bike lanes or cycletracks, and improving pedestrian conditions through safer, redesigned streets and shorter crossing distances. Savings from the Bicycle and Pedestrian program were calculated using SF-CHAMP, which has recently been upgraded to better represent pedestrian *(17)* and cycling *(18)* trip-making behavior. The savings were calculated by comparing the Planned Future to a model scenario that represents upgraded cycletrack-level bike lanes city-wide, as well as representing improved pedestrian conditions through increasing the pedestrian environment factor and reducing facility type to represent slower streets. The resulting change in evening peak VMT in the core as a result of this strategy is forecast to be modest, which was initially surprising to some of the team members. Additional discussion to interpret this result included determining that many new bicycle riders and pedestrians in the modeling exercise were former transit riders, or those drivers who shifted to non-motorized modes, then freed up space for additional drivers, increasing the overall number of trips and biking and walking trips, rather than reducing SoMa VMT. Another point of information that was used to consider the potential effectiveness of this strategy was the short-trips analysis described in Part 1 of this section that found that in whole, removing all auto trips under a half-mile in SoMa/Mission Bay represents 7% of this desired reduction while trips under two miles (including under half-mile) represent 34%.

Safe Routes to School: This strategy models the effect of continuing and expanding the city's Safe Routes to School (SR2S) program. The San Francisco United School District (SFUSD) launched SR2S to increase the attractiveness and safety of walking or cycling to school beginning in the 2009-2010 school year with three schools and currently has 15 schools participating. Based on empirical evidence from the program and experience from SR2S programs in Marin and Alameda counties, an average family vehicle trip reduction of 14% is assumed to result from the program. Applying this to the 15 schools currently enrolled in the program results in 900 fewer daily vehicle trips in San Francisco. When extrapolated to all SFUSD schools plus private schools, 10,000 fewer daily vehicle trips are projected. The 2012-2013 program currently includes one school in SoMa. Therefore, the SoMa share of the current program translates to 100 fewer 2040 PM peak VMT. Accounting for expansion of the program plus private schools results in an additional 160 VMT decrease, or a total of less than 0.5% VMT decrease.

Bikeshare: This strategy represents the benefits from both a pilot program (500 bikes) that launched in San Francisco in August 2013 as well as a Phase 2 (2,750 bikes) that would launch at a later date (after this analysis was completed, the pilot program has sense been reduced to 350 bikes in San Francisco). The pilot project would have placed 360 bikes in SoMa while Phase 2 would place 538 bikes in SoMa. Using a methodology based on trips generated per bike observed in four cities *(19)* and modal diversions of those trips observed in six cities *(20),* ~40 VMT in the 2040 PM peak are expected to be saved as a result of the pilot and ~60 VMT are expected to be saved from Phase 2. This translates to <0.5% VMT reduction from bikeshare alone. However, one would expect bikeshare to be an integral part of an overall coordinated TDM strategy in SoMa and its value may extend far beyond its independent VMT reduction contribution.

Transit: Several transit-related strategies considered showed no notable change in VMT on SoMa streets. Two scenarios were analyzed using the SF-CHAMP model: 1) a second underground rail tube under the San Francisco Bay for the regional heavy-rail system BART that would run from the East Bay, through SoMa under Mission Street and continue under the Geary corridor to the Richmond; 2) a "capacity unconstrained" scenario, where there would be enough room on local San Francisco buses to accommodate everyone who desired to ride transit (SF-CHAMP was recently upgraded to represent transit crowding *(21)*, and essentially this "knob" was turned off in this scenario).

In both scenarios, change in PM peak period VMT on SoMa streets was flat. This is not to say that improved transit is not imperative to the functioning of the Core, but rather than on its own, will not result in a notable reduction in SoMa VMT. This finding highlights likely latent demand for driving in this part of the city. Road space given up by those who shift to improved transit service will be replaced by new drivers "filling in" newly available capacity.

Potentially Effective Strategies Not Analyzed

"Fix the Grid": This strategy represents an idea to "fix the grid" by reconnecting streets that do not currently connect well. SoMa/Mission Bay is ground zero for several street grids that interface in awkward ways where they meet including between Downtown and SoMa, between Downtown and Market/Octavia, between SoMa and Mission Bay, and between Mission Bay and Potrero Hill/the Mission District. Several opportunities to make these upgrades have been identified. Although analysis was not undertaken, the team expects such a strategy could contribute modest positive benefits towards SoMa congestion reduction by removing bottlenecks in the network.

Auto Trip Cap: Recently, San Francisco planners have discussed the idea of a private vehicle "trip cap" as a potential next-generation TDM strategy. The idea of such a strategy would be to set an allowance for a maximum number of auto trips that allow the network to continue to function, while charging a fee to trip generators who exceed their trip allowance, similar to a cap-and-trade scheme. While this strategy was not analyzed and would require more detailed specification, it may represent a similar magnitude of potential trip shifts as parking supply restrictions or congestion pricing strategies.

Convert Freeway Lanes and Ramps from General Purpose to Transit/Carpool Because SoMa is home to a series of on- and off-ramps to three major highways of I-80, US 101, and I-280, traffic associated with motorists trying to access those ramps is a notable contributor to PM peak congestion on SoMa streets as shown in Figure 4. A strategy that would close or re-purpose some ramps or travel lanes for use only by transit- or carpool-only may both increase the competitiveness of non-SOV modes, and improve the throughput of those facilities that may be degraded by closely spaced interchanges (0.5-0.7 miles apart through SoMa). Several potential options to operationalize this strategy were developed, but the team did not believe the VMT reduction benefits could appropriately be analyzed within the resources and analysis tools available for the current Study (future work is expected to analyze this strategy in a broader planning context).

DISCUSSION OF RESULTS AND POLICY IMPLICATIONS

The team struggled with how to interpret the result that the level of reduction in demand for auto travel would be challenging to achieve, concluding that in areas of above a certain threshold of high land use intensity, *demand* for auto travel at levels higher than available *supply* will always be present and can only be managed through strong demand management strategies that increase price or restrict vehicle access. In order to maintain mobility and economic vitality concurrently, demand management strategies must be paired with improvements in safety, capacity, and performance of other modes of transportation. Given that reality, there are two challenges and policy implications to discuss: 1) what the city can do to ensure effectiveness of other modes in a congested future; 2) how to evolve from typical forecasting/analysis approaches to long-range transportation planning while still having a rational basis for proposing transportation interventions.

Increasing the effectiveness of non-auto modes of transport in a congested future.

In the San Francisco policy context of a city that has made Transit First an official policy, pure auto congestion is not considered a problem in and of itself if it does not interfere with the ability to accommodate mobility for other modes of transportation, as well as if it allows for the city to maintain its economic competitiveness. But, on-the-ground conditions today are such that during peak commute periods auto congestion *does* interfere with other modes. While some of this interference can be addressed by strategies not yet in place such as greater protection for transit and cycling facilities, the team concluded that in a destination like the Core, that is highly attractive due to the concentration of residential, employment, and visitor uses, increasing intensification would require a transition to more active management of transportation conditions such as deploying resources in real-time based on on-the ground conditions and active enforcement of "don't block the box" (i.e. enforcement/ticketing of cars that remain in an intersection on a red light). Such an approach is already utilized effectively in special cases such as during major sports or cultural events. For example, a recent confluence of major events resulted in one million people converging on San Francisco (the so-called "event-maggedon" of America's Cup/Fleet Week, the Castro Street Fair, the Italian Heritage Parade, Giants and 49ers games, the Hardly Strictly Bluegrass Festival and the Double Ten Parade) on the weekend of October 6, 2012 *(22)*.

However, the team also posited maintaining transit speed and reliability would be increasingly challenging to do so at-grade as congestion and overall trip-making grows. While upgrading streets to provide protected transit facilities is important, challenges such as the need to accommodate access to curb space for goods movement loading and disabled persons and the need to allow private vehicles, pedestrians and cyclists to cross transit lanes, all create negative speed and reliability impacts. As a result, transit may only be truly effective as grade-separated after a certain intensity of trip-making. San Francisco already has underground transit including the regional BART heavy rail system and portions of the Muni Metro system that serves some parts of the city. In addition, the newly planned Central Subway under SoMa, Union Square, and Chinatown, and eventually the planned extension of the Caltrain regional commuter system to Downtown as a part of the California High-Speed Rail project will also contribute to addressing this need. Yet, other parts of San Francisco do not currently have fast or reliable access to any below grade opportunity and some below grade facilities are not providing the level of speed or reliability needed to attract or maintain riders. Of course, this problem is particularly challenging to address given the lack of funding for major capital investments relative to past decades. How to respond to these needs are one focus of the SFTP.

Evolving from typical forecasting/analysis approaches to long-range transportation planning

Historical and to some extent state of the practice approaches to travel forecasting and transportation project evaluation have led to problem-solution framing where an input of more people and more jobs indicate an output of demand for auto trip-making that can only be solved by adding roadway capacity. San Francisco has for some time used a more nuanced approach guided by the city's Transit First policy and prioritized improvements to transit, walking, cycling, and reduction in auto lanes. San Francisco's travel demand model, SF-CHAMP, has been created and upgraded to be sensitive to a broader array of multi-modal interventions. But, the finding about the excess of vehicle demand relative to supply indicates a condition that is not physically possible. While there is widespread recognition that the "solutions" of past--increasing vehicle capacity—are wrong, the now well-recognized candidate solutions related to demand management and multi-modal improvements, are not found to do enough to address the problem when applying empirical evidence about their effectiveness from other cities to San Francisco conditions (of course more stringent representation of strategies could be quantifiably demonstrated to be more effective such as a much higher congestion toll or extreme restriction of parking supply, but were not elected to be studied here).

As the team concluded this particular effort, there was a recognition that the analytic work needed to plan to meet transportation needs in San Francisco's core must evolve to utilize different problem-solution framings. Recent ideas about how else to frame long range planning analysis are to focus on quantifying the expected increase in trip-making from new growth, then planning to accommodate those trips based on policy-driven modal split, and planning for the characteristics (performance, safety, capacity) of transit, cycling, and walking networks that are known to be important factors in travel behavior decision-making in favor of those modes. Approaches such as these are sure to be tested in emerging transport planning work in San Francisco.

LIMITATIONS

There are several limitations to the paper's technical analysis (all of which support the second discussion point regarding evolving from typical forecasting/analysis approaches):

- The paper suggests a particular level of auto traffic reduction needed to avoid perpetual gridlock. This level is based on a methodology of inputting auto traffic demand forecast by a travel demand model into microsimulation software. What is implied by the microsimluation finding is that the travel demand model is forecasting more demand than can be accommodated. Ultimately, the 26% VMT reduction should be interpreted to reflect that there would be that much demand for peak hour auto travel even in congested conditions, but in reality some of those trips would change their time of day, route, mode, or not make the trip at all. Given that SF-CHAMP also represents transit crowding, the level of transit demand would likely also not be able to be accommodated with the existing transit supply.
- The strategies specified could have been specified to be a stronger representation: for example, a congestion pricing policy with a higher priced toll would be expected to increase the VMT reduction of that strategy; similarly a higher number of bikes in a bikeshare program could also be more effective. However, the study aimed to represent strategies based on the current or proposed definitions.
- The strategies do not take into account unprecedented cultural shifts. For example, younger generations are not driving as much as past generations, and bicycling has become rapidly more popular. These trends may indicate a greater impact of some strategies than what is quantified here.
- The relative effectiveness of strategies analyzed via the model versus via off-model may not be perfectly comparable and may overestimate the benefit of off-model strategies. Modeled strategies show the induced demand of new vehicle trips "filling in" freed up capacity, while off-model strategies do not.

CONCLUSIONS

This paper finds that in areas of high land use intensity, demand for auto travel at levels higher than available supply will always be present and can only be managed through strong demand management strategies that increase price or restrict vehicle access. In order to maintain mobility, such strategies must be paired with improvements in safety, capacity, and performance of other modes of transportation. In the near-term, San Francisco can reduce traffic congestion's impacts on other modes of transport through more regular active management of the transport network and continuing to re-purpose auto lanes for walking, cycling, and transit space. In the longer term, the city will continue to strategically consider additional below-grade/subway additions and upgrades to the local and regional transit network. Finally, future long-range transport analysis should explore new analytical frameworks for long-range transport planning that may be more apt to solve tomorrow's transport challenges.

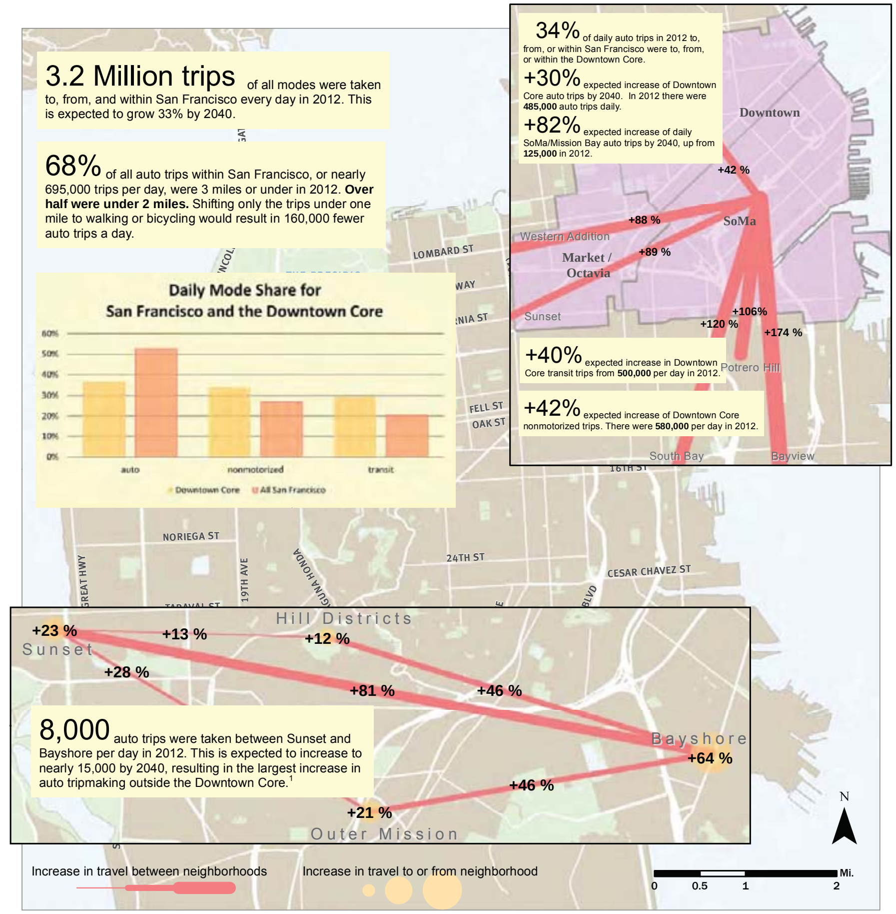
SF TRAVEL AT A GLANCE



San Francisco at a Glance: Daily Tripmaking to, from, and within San Francisco Now and 2040

Three key travel trends that shaped the SFTP

Of the 3.2 million trips to, from, or within San Francisco every day, 53% are taken by private automobile. Growth is expected to put exceptional stress on the surface transportation network in coming years, particularly in the Downtown/SoMa Core, the US 101 Corridor, and the Eastern Neigborhoods. Over two-thirds of trips entirely within San Francisco are under three miles in length, and represent an opportunity to shift to non-motorized modes walking and bicycling.

SAN FRANCISCO COUNTY TRANSPORTATION AUTHORITY

Purpose of the San Francisco Transportation Plan

SAN FRANCISCO TRANSPORTATION PLAN 2040

What is it?

- San Francisco's transportation investment program for all modes, operators to year 2040
- Supporting policies and strategic initiatives
- Funding and implementation strategy

How will it be used?

- Informs **local plans** and investments (Transportation Element Update, SFMTA and CCSF capital plans)
- Guides SF's input to **regional planning** efforts (BART Strategic Plan, 2017 RTP)
  - *Advocating together for San Francisco's fair share*
- Positions SF for future funding opportunities and policy discussions at **state, national** level

New transportation goals and city development objectives

SAN FRANCISCO TRANSPORTATION PLAN 2040

2013 Regional Transportation Plan: new projects

- Blended High Speed Rail/Caltrain Electrification/Transbay/Downtown extension
- BART Metro, Transit Effectiveness Project, SF Pricing Program

SB375, SF Climate Action Strategy

- SF goal: reduce GHGs to 80% below 1990 levels by 2050
- Regional Transportation Plan Update includes a Sustainable Communities Strategy

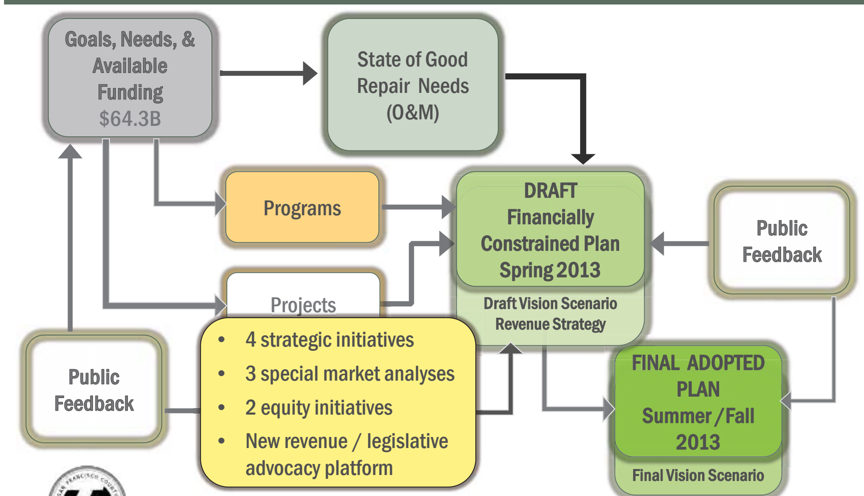
Bicycle and Pedestrian Safety Directives

- BoS: 20% Bicycle Mode Share by 2020
- Mayor's Directive: 50% reduction in pedestrian injuries by 2020

Demand Management to Support Approved Plans

- Bayview Waterfront, Treasure Island, Park Merced Plans
- SFMTA Parking and Shuttle Management policies

Developing the SFTP



SFTP needs assessment framework

Transportation System Performance

- Total trip-making
- Mode share
- Avg Occupancy (PMT/VMT)
- Transit: Auto Travel Time Ratio

Economic Competitiveness

- Congested Streets, Commute times
- Peak: Off-peak Drive Travel Time
- Goods movement needs and visitor access

Healthy Environment

- Vehicle miles traveled
- Greenhouse gas emissions
- Active Transportation (walking & biking) Trips

Livability

- Travel safety
- Transfers/Transit trip
- Non-auto trip shares
- School trip needs

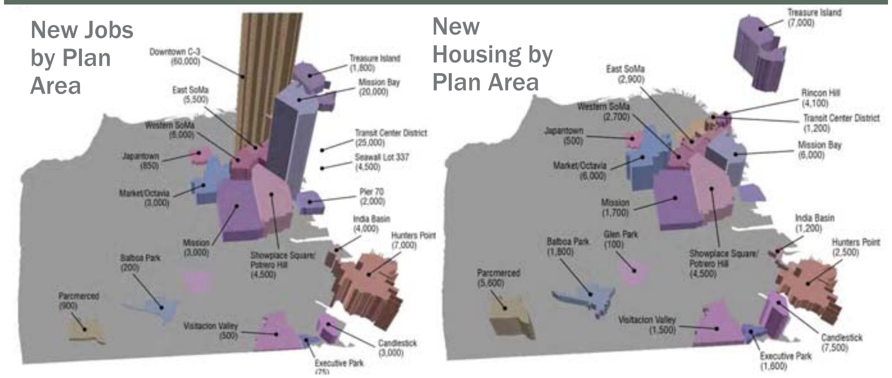
State of Good Repair

- Crowded Transit Lines
- Pavement Condition Index
- Transit Reliability
- Structural Sufficiency

Equity
Public Input

Our growth and transportation challenge

Planned growth through 2040



- 101,000 new households
- 191,000 new workers
- 603,000 more daily car trips (more than the combined daily volume of Bay Bridge and Golden Gate Bridge crossings)

> 5 Million trips to/from/within SF by 2040

33% more trips than today

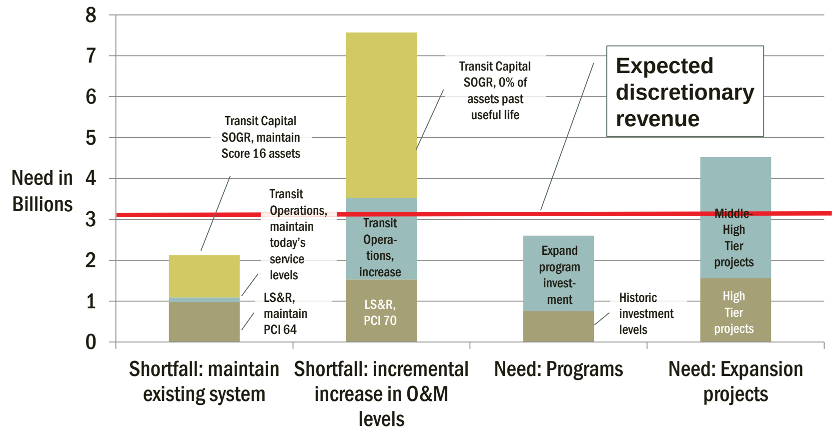
Needs far exceed expected revenue



Knitting it all together

Investment Scenario Options

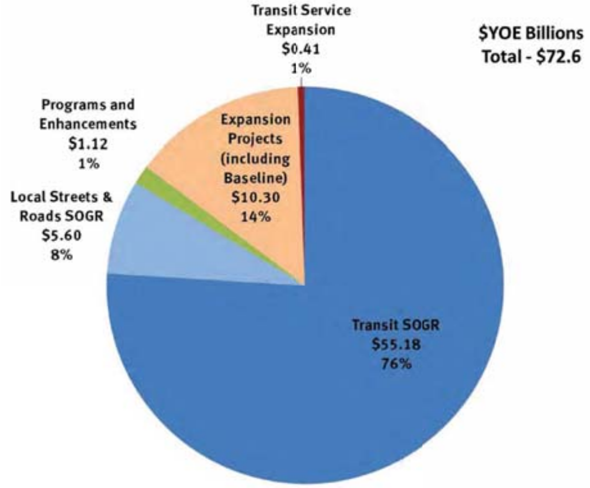
- Complementary choices among investment types (e.g. replacement vehicles, rapid transit network development can increase effective level of transit service)

But also:

- Tradeoffs between and within investment types (e.g. Operations, Maintenance, Programs, Expansion), modes, geographic areas and

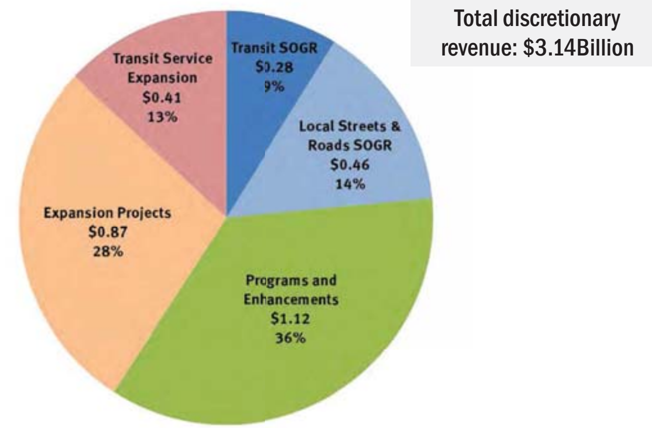
Plan development should consider multiple factors: Need, Performance, Cost-Effectiveness, Public Input , Policy/Plan status, Equity

Draft SFTP Financially Constrained Investment Scenario



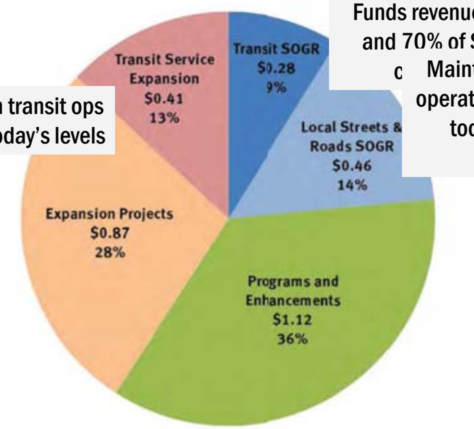
Draft SFTP Financially Constrained Investment Scenario

Discretionary Revenue Investment by Type, YOE Billions



Transit service expansion and SOGR

Discretionary Revenue Investment by Type, YOE Billions



1% increase in transit ops funding over today's levels

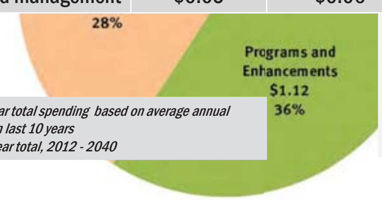
Funds revenue vehicles and 70% of Score 16 c

Maintains current road operations levels, but not today's pavement condition

Programs and enhancements

Discretionary Revenue Investment by Type, YOE Billions

Program	Historic funding level*	Proposed funding level**	% Increase over historic
Complete streets, signals and signs	$0.14	$0.20	43%
Walking and traffic calming	$0.19	$0.28	47%
Bicycling	$0.05	$0.15	200%
Demand management	$0.05	$0.06	20%

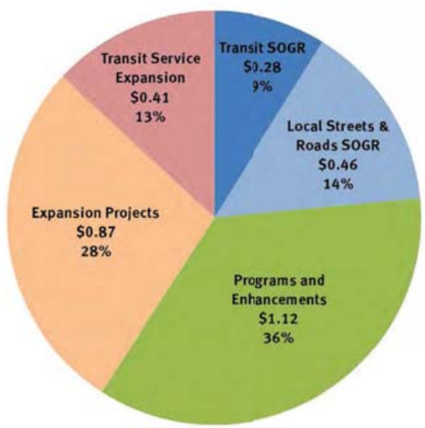


** Estimated 28 year total spending based on average annual funding levels from last 10 years*
*** Proposed 28 year total, 2012 - 2040*

Increased funding for local streets, walking and traffic calming, bicycling, and demand management

Draft SFTP Financially Constrained Investment Scenario

Discretionary Revenue Investment by Type, YOE Billions



Expansion projects inclusion criteria

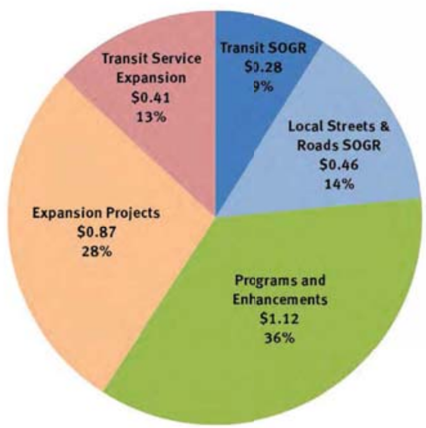
- All projects from "High" cost-effectiveness tier receive funding
- Additional projects from Middle-High Tier included based on:
  - Ability to address equity issues
  - Approval in Prop K Expenditure Plan or City Development Agreement
  - Support for Priority Development Area (PDA) growth

High Tier Projects
Better Market Street
Congestion Pricing
Caltrain Oakdale Station
E-line extension to Caltrain
Freeway Performance Initiative (FPI)
Potrero / Bayshore BRT
Transit Effectiveness Project
Transit Performance Initiative (TPI)
Middle-High Tier Projects
Bayshore intermodal station
Express buses - Hunter's & Candlestick Points
Geary Boulevard BRT
Geneva TPS / BRT
M-line west side alignment

Questions for feedback

- Level of investment by type – are we on the right track?
- How to prioritize within SOGR and Programs?
- How to incorporate equity findings into the investment strategy?

Discretionary Revenue Investment by Type, YOE Billions



Strategic policy initiatives

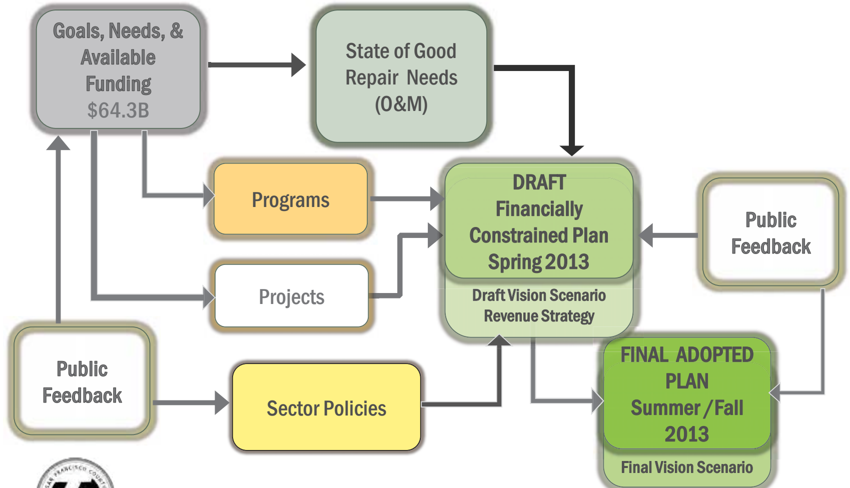
❶ **Complete Streets:** Clarify policies, create a cost-effective complete streets approach

❷ **Next-generation TDM:** Broaden, deepen TDM efforts including new ways to leverage Employer/Community-initiated efforts

❸ **Local-to-regional connection:** Re-imagine freeway, transit interfaces with region

❹ **Project delivery / performance effectiveness:** Improve project and program delivery, leverage private investment

Developing the SFTP



SFTP adoption timeline

Fall 2012 and earlier
- Revenue Estimate
- Investment Needs/Shortfall Analysis
- Public Outreach, Budget Game
- 3 Sub-market analyses

Winter 2012/13

Re: **Hydrology, Water Quality and Biological Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 21, 2015, letter report authored by Matt Hageman (attached as Exhibit 1) and the July 21, 2015, letter report authored by Erik Ringelberg and Kurt Balasek (attached as Exhibit 2).

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Wastewater Treatment Infrastructure Impacts.

The DSEIR concedes the Project's cumulative wastewater flow , in combination with other approved projects, will exceed the Mariposa Pump Station's capacity, and therefore, the Project will have a significant and unavoidable impact because it "would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects." (DSEIR, p. 5.7-13 - 5.7-20 [Impact C-UT-2].) But the DSEIR's disclosure of the nature and severity of the potentially significant impacts of building these new wastewater treatment facilities falls far short of CEQA's requirements.

The DSEIR generally describes the type of new wastewater treatment facilities that might be built, stating:

> the SFPUC anticipates that improvements might include actions such as complete pump station replacement, enlarging or realigning the existing sewer main on Mariposa Street between 3rd Street and the Mariposa Pump Station; upgrading and adding dry weather pumps with potential temporary wet weather pump modifications; upgrading or replacing the dry-weather sump in the pump station; constructing new connections to the transport and storage box structure and rehabilitating the structure; and improving the hydraulic capacity of the downstream gravity sewers, if needed. If a new dry weather pump station is required, it could potentially be constructed within approximately a quarter mile radius of the existing Mariposa Pump Station.

(DSEIR, p. 5.7-14.)

The DSEIR then identifies a number of potentially significant impacts of constructing new wastewater treatment facilities necessitated by the Project, stating:

> These construction activities would be expected to result in temporary increases in truck and construction employee traffic, noise, and air pollutant and greenhouse gas emissions. In addition, depending on the site-specific design and location, the pump station improvements could result in physical effects on cultural resources, biological resources, water quality, and hazardous materials.

(DSEIR, p. 5.7-14.)

The DSEIR then vaguely suggests that these impacts could be mitigated to less than significant levels by adopting "typical" mitigation measures, stating:

> Most, if not all, of these potential impacts can generally be mitigated to a less-than-significant level with typical mitigation measures, similar to those identified in the Initial Study and the SEIR for this project. Long-term operational impacts would likely be less than significant because operation of the pump stations would be similar to existing operations of these facilities.

(DSEIR, p. 5.7-14.)

These vague descriptions fail to discharge the City's legal obligations under CEQA to fully

describe the Project, including its "reasonably foreseeable consequence" of necessitating the construction of additional wastewater treatment facilities, and to include an "analysis of the environmental effects" of this future action and the mitigation measures that may reduce those impacts. (See e.g., *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396 (*Laurel Heights I*) ["an EIR must include a analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects].)

As shown in both the DSEIR's analysis of mitigation measures and the Mission Bay Alliance's comments on many types of impacts that construction of additional wastewater treatment facilities will cause (e.g., air quality, noise, traffic), the "mitigation measures ... identified in the Initial Study and the SEIR for this project" do not ensure that "impacts can generally be mitigated to a less-than-significant level."

Finally, the DSEIR states:

> In the event that additional future wastewater flows would exceed the pump station capacities before the needed wastewater system improvements could be completed, it is assumed that the SFPUC would make internal operational or piping changes to accommodate the additional flows in the interim in order to remain in compliance with RWQCB permit requirements. The interim system modifications would be subject to the approval of the RWQCB under the terms of the Bayside NPDES permit. Approval by the RWQCB would ensure that water quality of the Bay would be protected during the interim period. Any interim system modifications are assumed to be operational or internal to the existing pump stations and therefore would not result in any physical environmental effects.

This remarkable passage suggests that the City is prepared to approve and allow construction of this Project without ensuring the construction of additional, adequate, sewage treatment capacity required by the Project. This is the opposite of responsible planning. Moreover, the City is apparently poised to take this action based on several unsupported assumptions. First, the DSEIR assumes, without discussion or evidentiary support, that interim modifications will not have a significant effect on the environment.

Second, the DSEIR assumes the Project's wastewater impacts on the Bay will only be "interim" until the SFPUC builds or expands permanent new wastewater treatment facilities; and that in this supposedly "interim" period, the Regional Water Quality Control Board will mitigate any "interim" impacts to less than significant. But there is no evidence to support the assumption the Project's wastewater can be treated to avoid significant adverse effects on Bay water quality before the SFPUC builds or expands permanent wastewater treatment facilities. Nor is there evidence that

Regional Water Quality Control Board regulation during any purported "interim" period would avoid significant adverse effects on Bay water quality. Nor is there any evidence as to how long this purportedly "interim" period will last, or how many other projects that will cumulatively exceed the Mariposa Pump Station's capacity will commence operations during this purportedly "interim" period.

Indeed, this DSEIR's approach represents a total abdication of the City's legal responsibility under CEQA to identify the Project's significant effects, to identify mitigation measures that would substantially reduce those effects, and to adopt all feasible mitigation measures that would substantially reduce those effects. To put it colloquially, punting the problem to the SFPUC or Regional Water Quality Control Board does not pass muster under CEQA.

II. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Contaminated Stormwater Impacts on San Francisco Bay Water Quality or Biological Resources.

In the chapter on the Project's Water Quality impacts, the DSEIR evaluates the impact of Combined Sewage Discharges (CSDs or CSOs) to the Bay that exceed treatment capacity of the Mariposa Pump Station due to the combination of increased storm water flows combined with sewage wastewater flows. The DSEIR uses two thresholds of significance based on the City's NPDES permit, stating:

> ● Wet weather flows to combined sewer system: The impact analysis examines whether project related increases in wastewater flows would contribute to combined sewer discharges during wet weather. The impact is considered less than significant if the increased flows would not increase the frequency of combined sewer discharges above the long-term average specified in the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and Bayside wet-weather facilities.
>
> ● Effluent discharges from SEWPCP: For the analysis of impacts related to changes in the quality of effluent discharges from the SEWPCP, the analysis considers whether discharges of wastewater to the combined sewer system would cause effluent quality to exceed the discharge limitations of the NPDES permit for the SEWPCP. If not, the impact is considered less than significant.

(DSEIR, p. 5.9-30.)

Thus, for purposes of complying with CEQA's requirement that it identify the Project's significant impacts, the DSEIR makes two unsupported assumptions: (1) that City compliance with its NPDES permits will avoid significant impacts, and (2) that the City will in fact comply with its NPDES permits. The DSEIR must support these assumptions with evidence.

In addition, the first threshold quoted above only looks at "frequency of combined sewer discharges above the long-term average" and ignores increases in quantity and duration of overflows. (See DSEIR, pp. 5.9-34 to 5.9-36.) The DSEIR notes:

> The model analyzed the effects of discharging the average flows from the proposed project in combination with the existing average flows in the drainage area. Under this scenario, the frequency of CSDs would not increase, but the volume of the CSDs would increase from 5.34 to 5.63 million gallons and the duration would increase from 17.2 to 17.3 hours.

(DSEIR, 5.9-35.) The DSEIR finds this impact less than significant because it defines "significance" solely in terms of the *number* of CSD events and compliance with the City's NPDES permit, regardless of the *quantity* of sewage discharged, stating:

> Because average and peak wastewater flows from the project site would not increase the frequency of CSD events from the Mariposa sub-basin and would be consistent with the requirements of the NPDES permit, project level water quality impacts related to contributions to an increase in CSD frequency would be *less than significant.*

(DSEIR, 5.9-35, 36.) The DSEIR makes the same finding for the Project's cumulative impact based on the same evidence and the same rationale. (DSEIR, 5.9-35, 36.)

This is a legal error because the DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.[1]

---

[1] *See*, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city's general plan); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718

The 1998 Mission Bay FSEIR sets the stage for this legal error in its finding that CSO impacts on the Bay are less than significant, stating:

> The same conclusions for the proposed project apply to the cumulative effects of Bayside projects, in that the cumulative increase in pollutant mass load from these projects would have a less-than-significant effect on water quality. As shown in Table V.K.8, the project would represent less than 3% of the increased total pollutant load from the Bayside. The cumulative loads for pollutants would generally increase by 4-6%. Thus, the project would cause approximately half of this cumulative increase for the Bayside. To put this in context, City discharges are a very small portion of the region-wide discharges to the Bay. Compared to municipal dischargers in the Bay Area, the load contribution of the Southeast Plant represents about 12 % of all other municipal dischargers, and the Mission Bay project would represent less than 3 % of that 12% (or 0.36% of all municipal wastewater discharged to the Bay). In addition, besides municipal wastewater, other sources of pollutant loading to San Francisco Bay include riverine inputs, nonurban runoff, urban runoff, point sources, dredging/sediment disposal, spills, and atmospheric deposition. Of these sources, point sources, including municipal dischargers and other permitted industrial dischargers, represent about 1-6 % of the total load input to the Bay-Delta estuary. Regarding stormwater discharges, San Francisco Bayside stormwater flows are about 1.8% of the total regional urban storm flow to the Bay. Considering the contribution of the project and of the cumulative Bayside projects in the context of all the other pollutant inputs to the Bay, the cumulative pollutant loading from Bayside projects would be extremely small.

(1998 MB FSEIR, p. V.K.52.)

This logic reflects the "de minimis" and "ratio" rationales rejected in *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"], and *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent

---

(agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].) *Communities* and Kings *County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

Therefore, accepting the Hydroconsult numbers at face value, the starting point for assessing whether adding 2.9 million gallons per year[2] of incompletely treated CSD pollution to the existing condition of San Francisco Bay is significant is the existing condition of San Francisco Bay.[3] The DSEIR says very little on the topic. The 1998 Mission Bay FSEIR provides some information, but the DSEIR does not discuss how much of the 1998 Mission Bay FSEIR's information may be outdated as a result of the passage of seventeen years, and is, therefore, unknown.

The 1998 Mission Bay FSEIR characterizes "municipal wastewater" as follows:

> Municipal wastewater is a relatively strong waste stream containing high concentrations of organic matter that will decompose (measured as biochemical oxygen demand because the decomposition requires oxygen), inorganic particulates (measured as total suspended solids), nutrients (measured as total nitrogen and phosphorus), and pathogenic microorganisms. It also contains oil and grease and small quantities of toxic metals, pesticides, solvents, and plasticizers (additives in plastics that maintain softness and pliability). Conventional secondary treatment, as employed by San Francisco at its Southeast Water Pollution Control Plant, greatly reduces the concentrations of most substances in municipal wastewater. On the other hand, dissolved metals and organic substances that are resistant to breakdown by bacteria, may pass through the plant relatively unaltered. This waste stream, after

---

[2] 5.63 – 5.34 = 0.29 x 10 = 2.9.

[3] "If the rainstorm is a large one, and the capacity of the storage/transport box sewers is exceeded, treated combined sewer overflows (CSOs) occur at outfalls along the City's shoreline. When combined sewage is temporarily stored in transport/storage structures, floating materials are removed from the water surface and some solids settle to the bottom of the structures. The accumulated solids are then flushed to the treatment plant after the storm has subsided. The treatment that occurs within the structures is approximately equivalent to primary treatment." (1998 MB FSEIR, p. V.K.8-9.)

treatment, is referred to as municipal wastewater effluent in this SEIR.

(1998 MB FSEIR, p. V.K.4.)

The 1998 Mission Bay FSEIR characterizes "urban stormwater " as follows:

> Urban stormwater is a large-volume wastewater stream. Pollutants contained in urban runoff include street litter, sediment (mostly inorganic particulates, measured as total suspended solids), oil and grease, oxygen-demanding substances, pathogenic microorganisms, toxic metals, and pesticides. The concentrations of oxygen-demanding substances, nutrients, and pathogenic microorganisms are much lower than in untreated municipal wastewater. CSOs exhibit a blend of the untreated characteristics of municipal wastewater and urban stormwater runoff.

(1998 MB FSEIR, p. V.K.4.)

The 1998 Mission Bay FSEIR characterizes the "impairment of Central San Francisco Bay" as follows:

> The State Water Resources Control Board (SWRCB) has listed central San Francisco Bay as impaired on the basis of field surveys of the water column, sediments, sediment toxicity, bivalve bioaccumulation, and water toxicity. The determination relates to mercury, copper, selenium, diazinon, and polychlorinated biphenyls (PCBs).
> • Mercury. The main source of mercury in the Bay is erosion and drainage from abandoned gold and mercury mines. Other sources include natural sources, atmospheric deposition, and various industrial and municipal sources.
> • Copper. Copper enters the Bay through municipal sources, stormwater runoff (primarily through automobile brake pad dust), and other nonpoint sources (such as soils and abandoned mines). These are the three main sources, and they contribute roughly equivalent amounts.
> • Selenium. Selenium enters the Bay through industrial point sources (e.g., oil refineries), agriculture, and natural sources. Control programs are in place to address selenium discharges from oil refineries
> • Diazinon. Diazinon is a pesticide that enters the Bay as runoff from agriculture and, to a lesser extent, residential land uses. Diazinon is a primary component of insecticides. Homeowner pesticide use peaks in late spring and early summer.
> • PCBs. Although PCBs are no longer manufactured in the U.S., PCBs previously released to the environment enter the Bay through stormwater runoff and transport through the food chain. PCB levels in fish have resulted in health advisories for fish consumption.

(1998 MB FSEIR, p. V.K.8-9.)

The above information shows the existing environmental harm (or "preexisting cumulative effect" in the words of *Communities, supra*) is severe, and this Project will make it worse. Therefore, the DSEIR's finding that the Project's cumulative CSD impacts on the Bay are less-than-significant is erroneous as a matter of law. It is based on two legal errors: (1) the exclusion of CSD *quantity* from its threshold of significance, which reflects the "de minimis" and "ratio" rationales rejected in *Communities, supra* and *Kings County, supra*; and (2) the DSEIR's reliance on another agency's regulatory standards (i.e., the NPDES permit) to determine significance under CEQA.

As discussed in the attached reports by Matt Hageman and Erik Ringelberg, the Project's CEQA documents (i.e., the 1998 Mission Bay FSEIR, 2014 NOP/IS, and 2015 DSEIR), fail to analyze or develop mitigation measures to reduce the Project's likely contribution of a suite of toxic chemicals, including PCBs, to San Francisco Bay in amounts deleterious to the Bay's biota.

Further, it is impossible to place the discussion of this entire issue (at DSEIR pages 5.9-34 to 5.9-36) in a meaningful context, because the DSEIR does not inform the reader if the discussion assumes construction or expansion of permanent wastewater treatment facilities by the SFPUC.

Also, the DSEIR says: "the [Hydroconsult] model estimated the annual average frequency, volume, and duration of CSDs that would occur once the Mariposa wet- and dry-weather pump stations reach the combined capacity of 11.2 mgd under existing and project conditions. The model estimates that under existing conditions, CSDs from the Mariposa sub-basin occur approximately 10 times per year with an average volume of 5.34 million gallons and duration of 17.2 hours." (DSEIR, p. 5.9-35.) This text implies that the "Hydroconsult" model includes wet-weather flows and wet-weather CSDs. But the only Hydrocunsult memo cited and included in Appendix HYD states:

> Three scenarios were analyzed: base case, project, and cumulative. The base case scenario includes existing conditions plus developments and improvements expected to be substantially complete previous to occupancy of the GSW arena. The project scenario adds the DWF from the arena only and the cumulative scenario adds the project DWF plus DWF from reasonably foreseeable projects in the basin. In all three scenarios, the wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay. All DWF from the proposed GSW arena is assumed to flow to the Mariposa pump station (MPS), therefore Mariposa is the only basin analyzed.

(DSEIR, Appendix HYD, p.1.) The statement "wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay" makes sense if it refers only to stormwater from the Mission Bay Redevelopment Area, because all of that stormwater will be separated from wastewater flows when the separate stormwater system for Mission Bay is completed in 2015. (See DSEIR, p. 5.7-4.)[4] But the DSEIR also states that storm water from areas outside Mission Bay will continue to combine with wastewater flows to the Mariposa Pump Station and will contribute to wet weather CSDs. (DSEIR, p. 5.7-7.)[5] If this is correct, then the Hydroconsult dry-weather analysis is beside the point.

Also, the numbers for Mariposa Pump Station capacity and wastewater or stormwater flows are confusing. For example, DSEIR page 5.9-35 says the Mariposa wet- and dry-weather pump stations have a "combined capacity of 11.2 mgd." DSEIR page 5.7-7 also refers to "the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd)."[6] But DSEIR page 5.9-34 says: "The potential effect would be greatest in the reconfigured Mariposa sub-basin, which has a *wet weather capacity of 12 mgd* (italics added)." Which is correct?

---

[4]"The separate stormwater system for the Mission Bay South Plan area is currently being implemented by the master developer and includes four drainage zones within the geographic boundaries of the reconfigured Central sub-basin that have already been constructed and one drainage zone within the geographic boundaries of the reconfigured Mariposa sub-basin which is currently under construction. Stormwater in each of the drainage zones flows by gravity to one of five stormwater pump stations in the locations shown on **Figure 5.7-2**, including Pump Station SDPS-5 near the east end of 16th Street. When construction of the fifth drainage basin is completed (anticipated in 2015, prior to construction and operation of the proposed project), all stormwater runoff from Mission Bay South will be conveyed through the separate stormwater system and discharged to the Bay and China Basin Channel (Mission Creek)." (DSEIR, p. 5.7-4 (pdf151).)

[5]"The 240-acre reconfigured Mariposa sub-basin of the combined sewer system is divided into two tributary areas that direct flow to the Mariposa Pump Station. Tributary B includes Potrero Hill to the south of Mariposa Street and is outside of the Mission Bay Plan area; this tributary area directs both rainwater and wastewater to the pump station. Tributary A includes areas to the north of Mariposa Street that are located within the Plan area; in this area, stormwater flows are directed to the separate stormwater system constructed for the Mission Bay South development, and only wastewater flows are directed to the Mariposa Pump Station." (DSEIR, p. 5.7-7.)

[6]"In the event that wet weather flows in the Mariposa subbasin exceed the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd), the excess flows are discharged to the Bay as a combined sewer discharge after receiving flow-through treatment in the transport and storage structure."

III. The DSEIR Is Not Sufficient as an Informational Document with Respect to Project Impacts on Biological Resources, Including Wetlands and Wildlife.

A. The City's decision to exclude the Project's impacts on biological resources from the DSEIR is erroneous.

The City's decision to exclude the Project's impacts on biological resources from the DSEIR (see DSEIR, p. 5.1-1) is erroneous as a matter of law. Both the NOP/IS and the DSEIR announce that their analyses are "tiered" to the 1998 Mission Bay FSEIR pursuant to CEQA Guideline 15168(c). (IS, p. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR also announce that the standards used to exclude resource topics from the DSEIR are the standards used to determine if a subsequent EIR is required under CEQA section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.)

Based on these predicates, the City decided to prepare a focused EIR, and to conduct no environmental review with respect to the following resources: Biological Resources, Aesthetics, Land Use Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. As discussed in more detail in the July 27, 2015, letter from the Mission Bay Alliance's legal counsel regarding "tiering," the City's assumption that it may prepare an EIR for this Project that tiers to the 1998 Mission Bay FSEIR is legally incorrect. As discussed in several comment letters submitted on behalf of the Mission Bay Alliance, and below regarding the Project's impacts on biological resources, the evidence relating to these excluded resource topics meets both the "fair argument" standard, as well as the CEQA section 21166 standards. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all of the Project's environmental impacts.

B. There is substantial evidence supporting a fair argument the Project will have a significant adverse effect on biological resources.

While the NOP/IS give short shrift to on-site biological resources, there is substantial evidence, in the NOP/IS and the attached reports from Matt Hageman and Erik Ringelberg, supporting a fair argument the Project may have significant effects on (1) migratory birds; (2) off-site special status species downstream of the Project, including steelhead (Oncorhynchus mykiss); and (3) the on-site wetland and its ecology and associated wildlife.

With respect to migratory birds, the NOP/IS admits that the 1998 Mission Bay FSEIR did not assess the redevelopment Plan's effects on migratory birds. (NOP/IS, p. 81.) In addition, the NOP/IS concedes the Project may have significant impacts on migratory birds because it recommends the adoption of mitigation measures to substantially reduce these impacts, stating: "With implementation Mitigation Measures M-BI-4a, Preconstruction Surveys for Nesting Birds, and M-BI-4b, Bird Safe Building Practices, the project would not result in any new or substantially more severe significant impacts on resident or migratory bird species than those identified in the FSEIR." (NOP/IS, p. 81.)

This approach violates CEQA in a number of ways. First, as discussed above, the Project is a separate project from the 1998 Redevelopment Plan, or at a minimum, is not within the scope of the 1998 Mission Bay FSEIR. This fact precludes the City from "tiering" to the 1998 FSEIR for any resource, including impacts on biological resources such as migratory birds.[7] Second, trying to mitigate significant impacts before assessing their nature and extent puts the cart before the horse.[8] Third, as discussed above, the NOP/IS's concession that the Project may have significant impacts on migratory birds is substantial evidence supporting a fair argument the Project will have a significant adverse effect on migratory birds; therefore, the City is required to include an assessment of these impacts in the DSEIR.[9] Fourth, even if the City's assumption that CEQA section 21166 applies is correct, the addition of a 750,000 square foot sports arena and an additional 160 foot office tower to the Mission Bay Redevelopment Plan are substantial changes in the Redevelopment Plan that give rise to new potentially significant effects on birds that must be analyzed in the subsequent EIR.

With respect to impacts on special status species, the NOP/IS states:

> At the time of preparation of the Mission Bay FSEIR, the project site contained several buildings and facilities and was noted as lacking any notable vegetative habitat, with no state listed threatened, endangered or rare plants, or rare, threatened or endangered animal species known to occur in the upland portion of the Mission Bay plan area, including the project site. Subsequent to that time, the project site has been subject to building removal, grading, excavation, and construction of paved surface parking lots, fencing and utilities on portions of the site. Other than the creation of the depression as a result of remediation actions, no other changes in the site since the preparation of the FSEIR have altered the characteristics of the site in relation to biological habitat. These changes in conditions on the project site have

---

[7] *Sierra Nevada Conservation, supra.*

[8] CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

[9] *Protect the Historic Amador Waterways*, *supra*.

> not altered the fact that the site provides no suitable habitat for any sensitive or special status species due to the sparse and ruderal nature of onsite vegetation, as well as the site's location in a densely urbanized environment, as confirmed through the reconnaissance survey and database review of special status species occurrences within the vicinity of the project site. In addition, there have been no substantial changes with respect to the circumstances under which the project would be undertaken, nor has any new information become available that demonstrates new or more severe impacts associated with the proposed project.

(NOP/IS, pp. 78-79.)

But as Mr Ringelberg points out:

> the potential project impacts to the closest federally designated critical habitat is steelhead Oncorhynchus mykiss are ignored. This habitat runs directly adjacent to the project area. In addition, San Francisco manzanita (Arctostaphytos franciscana) critical habitat is present approximately 2.6 miles to the west and should also have been identified and analyzed. The federal critical habitat analysis is missing, and the provided analysis itself is defective. The potential project's impact(s) to these listed species and their critical habitat are therefore unexamined. The project's dust, stormwater, surface flooding, and groundwater place those species at risk from hazardous chemicals.

(Exhibit 2, p. 11.)

As both Mr. Hageman and Mr. Ringelberg point out, none of the Project's CEQA documents assess the effects of toxic chemical runoff on Bay biota, including steelhead. Where, as here, the lead agency fails to study an area of possible environmental impact, a fair argument may be based on the limited facts in the record because deficiencies in the record may enlarge the scope of fair argument by lending a logical plausibility to a wider range of inferences." (*Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311.)

Further, there is substantial evidence in the reports from Matt Hageman and Erik Ringelberg supporting a fair argument the Project may have significant effects on steelhead from toxic runoff. Again, even if CEQA section 21166 applies, CEQA requires including this issue in the subsequent EIR. The Phase 11 reports showing the site is contaminated with a suite of toxic compounds is significant new information showing the potential for new significant effects not previously identified.[10]

With respect to potential impacts on the on-site wetland, the NOP/IS indicates the DSEIR will not assess impacts on the wetland even though the 1998 FSEIR did not, and could not have, analyzed the wetland since it was apparently created sometime after 2005. (See Exhibit 2, Figure 1 and accompanying text.)

Typically if there is a potential wetland resource, there would be a formal delineation prior to release of the DEIR so the resource can be analyzed, and appropriate mitigation developed. Here, the NOP/IS claims it may not be jurisdictional (p. 80), and at the same time attempts to suggest mitigation (p. 81) in case it is. But the mitigation suggested is not enforceable, in violation of CEQA. Further, as discussed above, trying to mitigate impacts before assessing their significance puts the cart before the horse. (*Lotus v. Department of Transportation*, *supra*.)[11]

In addition, the NOP/IS' evidentiary basis for dismissing the wetland from the DSEIR is flimsy, stating:

> Because the excavation depressions on the site are small, isolated features resulting from recently completed hazardous materials remediation activities and are surrounded by paved areas and urban development, these features do not provide the important biological habitat functions and values that are typically associated with federally protected wetlands.

(NOP/IS, pp. 78-79.) But as Mr. Ringelberg points out:

> Conversely, and in rebuttal to their prior assertion that there are readily substitutable habitats nearby, small wetland features can have exceptional ecological value, in particular if they are one of the few remaining features in an urban setting.

(Exhibit 2, p. 6.)

Further, there is substantial evidence in the report from Erik Ringelberg supporting a fair argument the Project may have a significant effect by destroying the on-site wetland. Again, even

---

[10]See Letter to Marty Glick re: Phase 2 Subsurface Investigation Approval, Golden State Warriors Arena, Blocks 29-32, San Francisco, CA 94158; Phase II Environmental Site Assessment, Golden State Warriors Arena, Blocks 29-32, Mission Bay, San Francisco, California.

[11]Also, the NOP/IS fails to even mention the state wetland policy (WRAPP) under Porter Cologne (fn. 49).

if CEQA section 21166 applies, CEQA requires including this issue in the subsequent EIR because the presence of the wetland is a change in circumstances since certification of the 1998 FSEIR that gives rise to the potential for new significant effects not previously identified.

IV. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Flooding Risk.

Chapter 5.9 of the DSEIR does not examine the potential for Project induced increases in storm water runoff to "contribute considerably" to cumulative risk of flooding. (See DSEIR p. 5.9-9 to 5.9-18.) Chapter 5.7 does not do so either. Instead, it analyzes whether the Project will require construction of new or additional storm drainage capacity. (See DSEIR, pp. 5.7-18, 19 [Impact C-UT-3].) But the question whether the Project will require construction of new facilities is different than the question whether it will cause the impact such new facilities are intended to avoid. (See e.g., Chapters 5.7 and 5.9 regarding CSD impacts, and the discussion of same in section 1 above.)

The DSEIR's analysis of cumulative stormwater (C-UT-3) states that the impact is less than significant because the capacity of the new, separated stormwater system is adequate. (DSEIR, p. 5.7-18.) This section of the DSEIR cites to "BKF, Mission Bay Blocks 29-32 - Stormwater Memorandum, January 6, 2015." (DSEIR, p. 5.7-18, note 20.) This Stormwater Memorandum, in turn, states:

> G. Major Storm Events
> The storm drain system and pump station are designed to handle runoff from a 5-year storm event. During larger events such as a 100-year storm event, runoff is conveyed through the streets to a controlled overflow to the Bay. The overland flow analysis was studied in the "Revised Summary Drainage Study for the South of Channel Watershed for Mission Bay Project", dated December 1, 2000. Based on December 2000 study, overland flow from drainage basin, where the Project is located (i.e., "Drainage Basin B"), currently enters the Bay via an existing overflow near Mission Bay Boulevard North (North Overflow). Overland flow in Project perimeter streets, except 16th Street, is conveyed to this North Overflow. Overland flow in 16th Street is conveyed to overflow located to the south of Project near park P24. Refer to attached Figure D for the location of the overland flow release.
> The Project will be sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment. Flood proofing will include using protective measures to prevent storm runoff from inundating and/or damaging equipment such as furnaces, boilers, air conditioning compressors, air ducts, electrical system components, electrical wiring, dry conduits, electrical and gas meters, utility rooms, septic tanks, control panels, HVAC systems and fuel systems."

(BKF, Mission Bay Blocks 29-32 - Stormwater Memorandum, January 6, 2015, p. 6.)

There are two missing pieces of this analysis. First, the memorandum tells us "The Project will be sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment." This may be good news for the Project itself, but it tells the reader nothing about the extent to which this Project will contribute to increased flood risk to surrounding properties. The DSEIR does not examine the potential for Project induced increases in storm water runoff to "contribute considerably" to cumulative risk of flooding around the Project. (See DSEIR p. 5.9-9 to 5.9-18.) Second, the DSEIR does not describe the "flood proofing" measures that it says will avoid inundating below grade structures of the Project.

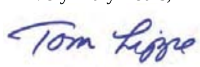
V. The DSEIR Is Not Sufficient as an Informational Document with Respect to Inundation Impacts of the Project.

The DSEIR concedes the Project will be vulnerable to inundation and flooding as a result of a combination of climate change induced sea level rise and storm surge. (DSEIR, pp. 5.9-10-16.) The DSEIR also describes several government initiatives to plan for and protect against such inundation. (DSEIR, p. 5.9-17-18.)

This discussion makes it clear the Mission Bay area, and the Project site in particular, will need to be protected from inundation in the foreseeable future. Therefore, the construction of protective measures is a reasonably foreseeable consequence of Project approval, and the construction of protective measures will change the nature and extent of the Project's environmental impacts. Therefore, the DSEIR must describe these measures and their environmental effects. (Laurel Heights I, supra.)

Thank you for your attention to this matter.

Very Truly Yours,



Thomas N. Lippe

Subject: Comments on the Event Center and Mixed-Use Development Project at Mission Bay Blocks 29-32

Dear Mr. Lippe:

We have reviewed the June 5, 2015 Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development Project ("Project") at Mission Bay Blocks 29-32. GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an approximately 11-acre site on Blocks 29-32 within the Mission Bay South Redevelopment Plan Area of San Francisco. The proposed event center would host the Golden State Warriors basketball team during the NBA season, and provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences, and conventions.

We have found significant shortcomings in the DSEIR in identifying impacts on Hydrology and Water Quality. A revised DSEIR should be prepared to address these inadequacies and to incorporate mitigation to reduce impacts which otherwise would degrade the water quality of San Francisco Bay.

Hydrology and Water Quality

The DSEIR acknowledges that the San Francisco Bay is impaired under Section 303(d) of the Clean Water Act for chlordane, DDT, dieldrin, dioxins, furan compounds, mercury, polychlorinated biphenyls (PCBs), invasive species, and trash (p. 5.9-22). Of these, PCBs are of the greatest concern for Project water quality impacts. A total maximum daily load (TMDL), limiting PCB discharges, has been issued by the San Francisco Bay Regional Water Quality Control Board (RWQCB) for PCBs in San Francisco Bay and it is proving very difficult and very costly for Bay Area cities, who are responsible for limiting PCB discharges,

to meet. According to the RWQCB, Bay Area municipalities will spend millions of dollars to achieve the ten-fold reduction in PCBs required by the TMDL.[1]

The DSEIR utterly fails to evaluate how Project construction may result in discharge of PCBs to San Francisco Bay, leading to further impairment. Failure to conduct this analysis flies in the face of the TMDL mandate which requires reduction of PCB discharge to the Bay and ignores guidance issued by the San Francisco Bay Regional Water Quality Control Board (RWQCB) on reducing PCB discharges at sites that require cleanup and where buildings that likely contain PCBs in construction materials will be torn down.

The Project poses significant threats to water quality of San Francisco Bay from the release of PCBs upon construction from two sources: (1) contamination in soil at sites that will undergo cleanup; and (2) PCBs used in former building materials at the Project site.

Contaminated Sites Pose Potential PCB Impacts

The DSEIR fails to acknowledge the PCB-contamination threat posed from numerous sites that will require cleanup prior to Project construction. The Initial Study (IS), in summarizing information in the Mission Bay SEIR, stated that land uses at Blocks 29-32 included crude oil storage, offices, railroad tracks, trucking-related activities, maintenance and repair facilities, junk yard, stock corral, a gravel plant, bus company facility, equipment rental, storage yard, auto body shop, and a warehouse (p. 108). No evaluation of these sites for PCB-containing equipment was included in the DSEIR and no analysis of any spills that would have originated from such equipment was conducted.

The RWQCB has identified PCBs originating from sites undergoing cleanup on the margins of San Francisco Bay are a major threat to water achieving the TMDL, stating:

> Stormwater runoff from sites containing residual PCBs in soils after state and federal ordered cleanups contribute to PCB sediment concentrations in the Bay and such contributions must be essentially eliminated in order to achieve the TMDL target. For cleanup sites, the TMDL calls for implementing "on-land source control measures, to ensure that on-land sources of PCBs do not further contaminate in-Bay sediments."

The IS acknowledges the potential threats that contaminants pose during Project development, stating:

> The Mission Bay FSEIR discussed various types of construction activities, including excavation, grading, trenching, soil movement/transport, pile installation, building demolition and removal of underground storage tanks that would potentially expose workers and the public to contaminated soils, dust, soil gases and other hazards. The Mission Bay FSEIR also noted the potential for construction dust-related effects on the aquatic and terrestrial environment.

However, the Mission Bay FSEIR pre-dates the issuance of the RWQCB TMDL for PCBs in San Francisco Bay and mitigation in the Mission Bay FSEIR make no provisions for ensuring that PCBs are not mobilized and transported to the Bay during Project construction. As stated by the RWQCB:

[1]San Francisco Bay Regional Water Quality Control Board, September 2013, San Francisco Bay PCBs TMDL Implementation at Cleanup Sites: http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/TMDLs/sfbaypcbs/SF%20Bay%20PCBs%20TMDL%20-%20Considerations%20for%20Cleanup%20Sites%20September%205%202013.pdf, p. 1

> Of particular concern, and often overlooked, is the fact that PCBs in surface soil can be mobilized by stormwater runoff and flow to the Bay.

The RWQCB's concerns are justified by the failure of the DSEIR in identifying how Project construction might contribute to the PCB impairment of San Francisco Bay. The DSEIR, in ignoring this issue, provides no PCB-specific mitigation to prevent the flow of PCBs to the Bay upon construction. Mitigation identified in the Mission Bay FSEIR specified only minimum parameters to be included in a Risk Management Plan for the addressing contaminated soils and groundwater prior to and during construction of individual development projects.

PCBs, when spilled and released to soil, stick strongly to the soil particles that is entrained with stormwater when mobilized during rain events and which leads to PCB deposition in the Bay. The DSEIR offers no mitigation to address this likelihood, and only provides tepid assurance that stormwater will be managed consistent with "San Francisco Stormwater Design Guidelines" (p. 5.9-25). The cited San Francisco Stormwater Design Guidelines makes no special provisions for PCB contamination other than to say:

> Control of PCBs and mercury will be implemented through design measures that limit the mobilization of these pollutants in contaminated soils.[2]

The San Francisco Stormwater Design Guidelines make no further statements about what the PCB design measures would entail and how specifically PCB discharge in stormwater will be limited. The San Francisco Stormwater Design Guidelines are mute on the urgency that faces San Francisco in preventing PCB discharges, in stark contrast to the language use by the RWQCB in issuing the following edict in eliminating all PCB discharges from cleanup sites:

> … it is important that cleanup sites do not contribute any PCBs to surface water runoff. Remedial actions should be conducted so as to eliminate all means of conveyance of PCBs from cleanup sites, including sediment runoff, vehicular drag out, and airborne dust.

Because the issue of PCBs is not specifically addressed, the DSEIR offers an inadequate basis for making the following statement on stormwater contamination:

> Implementation of BMPs and other stormwater control measures required by the updated Phase II General MS4 NPDES Permit; Article 4.2 of the San Francisco Public Works Code, Section 147; and the City's Stormwater Design Guidelines would ensure that the project does not contribute to an increase in discharge of stormwater pollutants to the Bay in discharges from the separate stormwater system. Therefore, impacts related to degradation of water quality and providing an additional source of stormwater pollutants are less than significant in relation to direct stormwater discharges.

Without mitigation and specific measures to address PCB contamination in the Project area, the impacts from Project construction on the already impaired San Francisco Bay may be significant. The DSEIR should acknowledge the PCB contamination potential and offer concrete mitigation to address the

[2] San Francisco Stormwater Design Guideline, September 2009
http://www.sfwater.org/Modules/ShowDocument.aspx?documentID=2779, p. 14

stormwater transport of PCB-contaminated soils to the Bay. Concrete steps to incorporate, as mitigation in a revised DSEIR and prior to Project construction, include:

- A thorough parcel-by-parcel review of the potential use of PCB-containing equipment;
- Site inspections of each parcel which used electrical equipment and sampling of soil where PCB-containing equipment is identified; and
- Cleanup of PCB-impacted soil at concentrations that exceed 25 ug/kg, consistent with RWQCB guidance.[3]

PCBs in Originating from former land uses at the Project Site have not been Adequately Evaluated

Polychlorinated biphenyls (PCB) contamination originating from materials used in building construction is receiving intense scrutiny from regulatory agencies. The U.S. EPA has acknowledged that demolition of 1950s- to 1970s-era buildings, or cleanup of those sites, may disturb PCB-containing materials used in caulking and as a plasticizer in paints and other coatings.[4] In fact, a recent report has found that PCBs are prevalent in the caulk in Bay Area buildings constructed from 1950 to 1980. PCBs were detected in 88% of the caulk samples tested; 40% of the samples contained greater than 50 ppm PCBs and 20% contained greater than 10,000 ppm PCBs.[5] PCBs were used in electrical transformers manufactured between 1929 and 1977 and are a well-recognized source of soil contamination when fluid is leaked.[6]

According to the US EPA[7]:

> PCBs do not break down in our environment and can have severe health effects on humans. PCBs in the air eventually return to our land and water by settling or from runoff in snow and rain. In our water, PCBs build up in fish and can reach levels hundreds of thousands of times higher than the levels in water. Fish consumption advisories are in effect for PCBs in all five of the Great Lakes. PCBs are the leading chemical risk from fish consumption.

Because PCBs do not break down, PCBs may be present at the Project site from former land uses which include:[8]

- Bulk fuel storage and distribution (approximately 1902 to 1966).
- Railroad operations (approximately 1904 to 1939).
- A machine shop (approximately 1904 to 1927).
- A boiler house (approximately 1904 to 1927).
- Steel mill (approximately 1906 to 1928).
- Well casing manufacturer (1907 to 1975).

[3] San Francisco Bay Regional Water Quality Control Board, September 2013, San Francisco Bay PCBs TMDL Implementation at Cleanup Sites:
http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/TMDLs/sfbaypcbs/SF%20Bay%20PCBs%20TMDL%20-%20Considerations%20for%20Cleanup%20Sites%20September%205%202013.pdf, p. 2
[4] US EPA, PCBs in Caulk in Older Buildings: http://www.epa.gov/pcbsincaulk/
[5] San Francisco Estuary Project, PCBs in Caulk Project: http://www.sfestuary.org/taking-action-for-clean-water-pcbs-in-caulk-project/
[6] US EPA, Polychlorinated Biphenyls (PCBs) http://www.epa.gov/reg3wcmd/ts_pcbs.htm
[7] Ibid.
[8] Letter from the San Francisco Department of Public Health to Golden State Warriors Arena, June 8, 2015, p. 2

- Warehousing, shipping, and receiving operations for a variety of products including agricultural chemicals, lumber, food, automobiles, metals, etc. (approximately 1910 to 2006).
- A fruit cannery (approximately 1935 to 1961).
- Junk yards, vehicle parking, and vehicle maintenance facilities (approximately 1950 to 2004).
- Ready-mix concrete facilities (approximately 1972 to 2010).

Of these uses, the 1950s-1980 land uses, which include well casing manufacturing, warehousing, a cannery, junk yards, and concrete manufacturing, could have been operated out of building that were constructed with PCB-containing materials and which were supplied with power by PCB-containing transformers. If PCB-containing building materials, such as caulking or paint, were weathered and disposed in soils adjacent to the former buildings, the could remain at concentrations that would serve as a source for contamination of San Francisco Bay, upon erosion by wind or stormwater.

In fact, a limited study conducted in January 2015 did detect PCBs in soil at the Project site. In this study, which took soil samples from only seven locations at the 10.9-acre site, PCBs were detected at 0.016 mg/kg or 16 ug/kg in one sample of the seven locations.[9] Although this is less than the 25 ug/kg RWQCB cleanup requirement, it is 16 times greater than the target PCB sediment concentration of 1 ug/kg in San Francisco Bay.[10] Given that the Project site is located less than 500 feet from the Bay, construction activities that disturb soil pose a significant potential for documented PCBs at the Project site to be transported to the Bay.

I have found no analysis of PCBs used in the building materials of the previously existing structures at the site in the DSEIR or in the Mission Bay FSEIR or how PCBs, documented in soil at the Project site, may be mobilized by construction or by cleanup of contaminated sites, and transported to the Bay. The RWQCB has offered guidance on how to test for materials that may contain PCBs and how to evaluate sites undergoing cleanup on the Bay margin, guidance which was not mentioned in the DSEIR.

The failure to thoroughly analyze the presence of PCBs in the Project area and how Project construction activities would potentially mobilize the PCBs, leading to further impairment of San Francisco Bay, is a significant oversight which ignores a regulatory mandate for construction projects on the Bay margin to evaluate PCBs. A DSEIR should be prepared to include the results of a full evaluation of the potential of former Project site buildings to contain PCBs. A soil sampling study should be targeted to areas where PCBs may have been released or spilled. To ensure the adequacy of the PCB investigation, the study should be conducted under the oversight of the San Francisco Bay Regional Water Quality Control Board which should be engaged, specifically on the issue of potential PCB contamination to originate from Project construction.

The revised DSEIR should identify mitigation that would be necessary to protect PCB-containing materials from being mobilized though stormwater transport and aerial deposition to San Francisco Bay. The revised DSEIR should also include measures to protect construction workers and the health of adjacent residents who may be exposed to PCB-containing dust during demolition or renovation

[9] Letter from the San Francisco Department of Public Health to Golden State Warriors Arena, June 8, 2015, p. 9
[10] San Francisco Bay Regional Water Quality Control Board, September 2013, San Francisco Bay PCBs TMDL Implementation at Cleanup Sites: http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/TMDLs/sfbaypcbs/SF%20Bay%20PCBs%20TMDL%20-%20Considerations%20for%20Cleanup%20Sites%20September%205%202013.pdf, p. 1

activities. The DSEIR should also identify proper disposal practices that are compliant with 40 CFR § 761.62 of the Toxic Substances Control Act. Under this provision, PCB bulk product waste must be disposed in a permitted solid waste landfill or through regulatory approval of risk-based process.[11]

Other Contaminants Pose Risks to the Bay

Recent sampling[12] at the Project site has detected soil contaminants, in addition to the PCB contamination noted above, that include:

[11] US EPA, Contractors: Handling PCBs in Caulk During Renovation: http://www.epa.gov/epawaste/hazard/tsd/pcbs/pubs/caulk/caulkcontractors.htm
[12] Letter from the San Francisco Department of Public Health to Golden State Warriors Arena, June 8, 2015, pp. 8-10

- 1.2.4-Trimethylbenzene
- Acetone
- Carbon disulfide
- Ethylbenzene
- 2-Butanone
- Xylenes
- Acenaphthene
- Acenaphthylene
- Anthracene
- Benzo(a)anthracene
- Benzo(b)fluoranthene
- Benzo(g,h,i)perylene
- Benzo(k.)fluoranthene
- Chrysene
- Dibenz(a,h)anthracene
- Fluoranthene
- Fluorene
- Indeno(l,2,3-c,d)pyrene
- Naphthalene
- Phenanthrene
- Pyrene
- Antimony
- Barium
- Beryllium
- Cadmium
- Cobalt
- Copper
- Mercury
- Molybdenum
- Silver
- Vanadium
- Zinc

Of these compounds, mercury is identified in the DSEIR as an impairment in San Francisco Bay under Section 303(d) of the Clean Water Act (p. 5.9-22). Mercury, along with the other contaminants listed above, may sorb tightly to soil and be mobilized and transported to the Bay when eroded by stormwater, further degrading water quality.

No specific provisions to manage these contaminants to prevent discharge to the Bay are included in the DSEIR. The DSEIR provides only vague assurance that stormwater will be managed consistent with "San Francisco Stormwater Design Guidelines" which do mention mercury (along with PCBs, as noted above) but offer no specific mitigation to manage these contaminants (p. 5.9-25).

A revised DSEIR should be prepared to identify specific stormwater best management practices (BMPs) to prevent the discharge of contaminated sediment during rain events. The BMPs should be tailored to the each of the contaminants documented in soil at the Project site to prevent discharge and should include consideration of the use of sorbent or flocculent materials, retention basins, berms, silt fences, and bales.

Sincerely,

Matt Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:
As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:
As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:
Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Subject: **DRAFT Biological Resources Review**
Mission Bay Subsequent Environmental Impact Report
San Francisco, California

Dear Mr. Soluri:

Per your request, BSK Associates (BSK) reviewed publicly available documents associated with the Draft Subsequent Environmental Impact Report (SEIR) on the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32. BSK assessed these documents for potential project impacts on biological resources (following the California Environmental Quality Act [CEQA] Appendix G). The Draft SEIR (DSEIR), the associated 2014 Notice of Preparation-Initial Study (NOP-IS), and the prior Mission Bay Final Subsequent Environmental Impact Report (1998 FSEIR [FSEIR]) were compared to each other, as well as to State of California and federal Geographic Information System (GIS) databases, scientific and technical resources prepared by others, as well as current and historic aerial photographs.

SUMMARY

In our opinion, the SEIR, in several key areas related to biological resources, failed to adequately characterize the nature and the extent of the site's resources; failed to identify the full range of potential significant impacts from the proposed project on those resources; failed to examine those impacts at a sufficient level of detail to understand the project impacts; and, failed to provide adequate mitigation for those resources, both during construction and cumulatively. Specifically, key species and sensitive habitat(s) were left out of the discussion, and mitigation measures were missing, or inadequate, to reduce the impacts of the project on those species below the threshold of significance; and finally, significant changes have occurred at the site affecting both the applicable policies and the relevant resource use since the original analysis.

ECOLOGICAL CONDITIONS REVIEW

The project area has two boundaries, the larger "Mission Bay Redevelopment Plan Area Boundary," (Plan Area) which is described in the 1998 FSEIR and the current "site" boundary (site), which includes Blocks 29-32 within that larger planning boundary (Figure 1). Both boundaries will be used for the purposes of discussion as they relate to the corresponding environmental analysis documents and the project's potential impacts on biological resources. A current aerial photo is provided for detailed site context (Figure 2).

The Plan Area's near surface soils are the result of mixed fills and have been identified by the Natural Resource Conservation Service as: 134, Urban land-Orthents, reclaimed complex, 0 to 2 percent slopes (Figure 3). The soils are the result of historic filling of the Mission Bay with debris, earthquake waste spoils, and other material to reclaim the site from the San Francisco Bay (ESA 2014; Pg. 1). This soils information is consistent with other analyses, developed by others, discussed later.

The U.S. Fish & Wildlife Service, National Wetlands Inventory (NWI) identified several features adjacent to the Plan Area, but none within the site (Figure 4). The relative elevation of these features both within (and nearby) the project boundary appear to correlate with the local shallow water table (ESA 2014; LTR 2015; Pg. 13-14 and Figures A-2 and A-3).

The site itself appears to be a largely ruderal area that has been subject to various anthropogenic disturbances, within an urban setting, containing two large surface parking areas. The site currently contains an open water feature, actively used by wildlife, and a narrow swale to the east (Figure 5). The site's current conditions are detailed in the following site observations.

SITE OBSERVATIONS

The Blocks 29-32 footprint consists of two large paved areas (Southwest parking lot approximately 79,910 sq.ft./1.83 ac. and Northeast parking lot approximately 91,776 sq.ft./2.11 ac.)[1] currently being used as paid parking lots; an area of soil stockpiles (31,066 sq.ft./0.71 ac) on the eastern edge of the property (Terry A. Francois Boulevard); and an adjoining large open field, open water (22,115 sq.ft./0.51 ac) and wetland swale complex, (904 sq.ft./0.02 ac.) (closest to the Southwest parking lot) shown on Figure 2. A series of photographs were taken of the site and the adjoining areas (Attached Photo Plates).

At the time of observation, the open water area encompassed the majority of the water feature, with a patchy, but substantial fringe of palustrine emergent (predominately alkali bulrush [*Bolboschoenus maritimus*]) and riparian plants (willows [*Salix sp.*]). The emergent plants and shrubs were concentrated on the two narrower ends of the water feature. The narrower channel and the seasonal wetlands

[1]2015 Google Earth

apparent from the aerial photographs (Figures 2a-i) were not clearly visible from the site perimeter fence(es).

Numerous native birds were observed within, and in some cases flying to and from the water body. Several Canada geese (*Branta canadensis*) were seen, including what appear to be adult plumage juveniles; three killdeer (*Charadrius vociferous*), including two juveniles; a female mallard and a juvenile (*Anas platyrhynchos*); several crows (*Corvus brachyrhynchos*); two non-native Eurasian collared-doves (*Streptopelia decaocto*); and numerous non-native rock doves/pigeon (*Columba livia*). The site has significant use for nesting and foraging by these bird species.

2015 DSEIR

The DSEIR uses an incomplete description of the environmental setting in its impact assessment.

The DSEIR incompletely characterizes the site's biological resources in the project site description and existing uses. The sole description of the site as it related to its biological resources in the DSEIR is as follows:

"Immediately east of, and adjacent to, Parking Lot B is a depressed area (measuring approximately 320 feet by 280 feet) created by an excavation and backfill associated with a prior environmental cleanup of that portion of the site. A surface swale extends west within this portion of the site to allow for drainage of surface water into the depression." (Pg. 3-10)

This description fails to mention any of the site biological resources, such as plants or animal or habitats, or the fact that there is a large permanent pond and wetland features in the middle of the site. There is no mention of wildlife use and the existing habitat(s) on the site in the DSEIR. The site's biological resources, including waters, wetlands, wildlife habitat and species are then not discussed at all in the DSEIR (except for the Appendix containing the NOP-IS).

The DSEIR failed to protect species and identify the appropriate list of sensitive natural communities, as well as Critical Habitat designations

1. The potential for Western pond turtles and California red-legged frog is stated as "low" since by their estimation, "No suitable habitat present." However, the perennial pond feature (and for the frog a constructed water feature in particular) is not ideal, but it is certainly suitable habitat. In particular, the analysis (and inferred conclusion) is faulty since low potential does not mean "no" potential, and therefor reasonable steps should be taken to establish or reject the presence of the species and as needed, mitigation. These simple mitigation measures are commonly applied to similar activities

throughout California, and include rare plant surveys, and targeted (focused) species surveys.[2, 3, 4] The rare plant surveys must be timed to the appropriate season, and the focused surveys for the right life stage of the target species. In our experience both in preparing EIRs, and supporting similar construction projects, that in virtually every case, where natural(ized) features exists that can potentially support species of concern, there is an additional mitigation measure that provides a preconstruction survey (or surveys); and if species of concern are likely to occupy the site, the preparation and implementation of a Worker Environmental Awareness Plan (WEAP). The DSEIR solely has a pre-construction breeding bird survey.

2. The potential use (given the habitat values present and prior observations by others) of the site for at least foraging habitat is identified for Peregrine falcon[5], Red-tailed hawk, American kestrel[6], Great blue heron[7], American goldfinch[8] but its loss is not mitigated for (NOP-IS Appendix A. Table 2 A-8). Note: Two species that do not appear to meet the section 3503.5 Eggs, Nests, and Nestlings Protected under the California Department of Fish and Game Code provisions are identified as such in the text.

3. There is significant new information related to the federal designation of Critical Habitat for the listed anadromous fish, the steelhead (*Oncorhynchus [Salmo] mykiss*)[9]. The DSEIR failed to identify that the project has the potential to impact the defined Critical Habitat for the steelhead. This designation was completed in 2005 and was not described in the 1998 Mission Bay FSEIR. Neither the potential of the project activities to impact the steelhead (*See*: Other Biological Resource Issue Areas), or the designation of the status of this plan area was identified in the DSEIR.

The Project's impacts adequately are not fully disclosed in the DSEIR

1. The project fails to identify, assess, and mitigate for the proposed project impacts on the biological resources associated with the site water bodies.

2. The DSEIR analysis restates that there are no new or significant changes to biological resources and appears to rely entirely on the NOP-IS (Pg. 1-9; Pg. 5.1-1; Pg. 1-58/59). Despite these statements, there is in fact a significant new impact identified in the DSEIR from the project to birds identified in the text on Pg. 3-28, "The project sponsor proposes to incorporate bird-safe design measures that would reduce

[9] Federal Register / Vol. 70, No. 170 / Friday, September 2, 2005 / Rules and Regulations

the potential effects of the proposed buildings, signage and lighting on birds." And, that impact requires and was provided a new mitigation measure: The project sponsor shall design and implement the project consistent with the San Francisco *Standards for Bird-Safe Buildings* and Planning Code Section 139, as approved by OCII. OCII shall consult with the Planning Department and the Zoning Administrator concerning project consistency with Planning Code Section 139." (Pg. 1-59)

Nowhere in the DSEIR is there an analysis of which bird species would be subject to these strike impacts, what time of year, or which types of impacts they were subject to. There was no discussion of the determination of thresholds for the bird injury and/or death associated with the project, and no explanation about how or why the mitigation proposed would be sufficient to reduce those injury and/or deaths below a specified threshold.

The Project's impacts are not appropriately mitigated in the DSEIR

The DSEIR analysis, at a minimum, should have been fully developed to reflect the 2015 federal Wetland Policy modifications, the observations of its own wetland experts, and the numerous state and federal wetland policies and regulations that apply to this site. It is our opinion that the DSEIR fails to mitigate for impacts to waters and wetlands at the site; as well as the potential impacts to biological resources within and around the site through contact with hazardous waste. Effective mitigation measures are available to reduce the impacts below significance. These comments are more fully explained under the NOP-IS analysis below.

2014 NOP-IS

The 2014 NOP-IS Applies the Prior Impact Analysis to the Modified Current Setting

1. The NOP-IS (Pg. 76) re-characterizes the 1998 FSEIR in order to minimize the type, extent and value of current ecological features of the site. The analysis conflates the prior CEQA analysis with the current ecological conditions, without fully assessing the significant changes that currently exist under and the impacts of the project on the biological resources. The analysis further parses the "upland" species and habitat from the aquatic species and habitat, without identifying and relating the project impacts associated with each of those contexts. For example, the proposed project has both direct (loss of habitat) and indirect environmental impacts (potential contamination) to both terrestrial and aquatic resources, within and adjacent to the site (dust, groundwater and stormwater), but these impacts are not fully identified (impacts identified only to nesting and flying birds). The project must be evaluated with an associated impact analysis that defines the specific project impacts on the site's (and Plan Area) biological resources.

2. There are substantially new ecological conditions at the site that differ from the description provided in the FSEIR, the project analysis under the NOP-IS newly identifies water bodies as wetland features, but fails to provide analysis of the project impacts on those features, define their regulatory status, and

identify suitable mitigation according to its regulatory status (NOP-IS, Pg.78; ESA 2014; WRA 2014). For example, if the features are only determined to be regulated by the State there is typically one set of mitigation measures similar to those identified in the IS-NOP, if they are both state and federal, additional measures may be required, however those measures are dependent on a series of tests, and since the project may be subject to CWA 404(b)(1) provisions, significant additional analysis and mitigation may be required.

Instead, the analysis claims that the habitat is: "…limited due to the sparse and ruderal nature of onsite vegetation, as well as the site's location in a densely urbanized environment. While several bird species were observed foraging and hunting onsite, these species are common to San Francisco and would continue to be supported by vegetation communities and water features found in the project vicinity." By its own admission the analysis states that these features would be permanently lost, but that impact doesn't matter because there is some other place for the species to go. It fails to fully define what the biological impacts are, and then identify where (to which nearby features) these species would go.

Further the analysis states: "Because the excavation depressions on the site are small, isolated features resulting from recently completed hazardous materials remediation activities and are surrounded by paved areas and urban development, these features do not provide the important biological habitat functions and values that are typically associated with federally protected wetlands." Conversely, and in rebuttal to their prior assertion that there are readily substitutable habitats nearby, small wetland features can have exceptional ecological value, in particular if they are one of the few remaining features in an urban setting.

This biological resource information in the NOP-IS was only analyzed in a cursory manner, simply recapitulating the site observations, without fully identifying and evaluating the CEQA-required biological resource impacts from the project. Without a full technical understanding of which resources are impacted, mitigation cannot, and indeed was not, adequately developed- as these measures depend on the nature and extent of the resources impacted. The standards of significance are not identified, and fail to show the application of thresholds to the project impacts for wetlands and other special ecological habitats.

For example, on Pg. 78 of the analysis, the NOP-IS identifies use of the site's open water and wetland by a variety of native plants and animals:

"Site reconnaissance revealed the deepest part of the excavation within this area contains standing water with a mixture of ruderal vegetation described above, and wetland plants, including alkali bulrush (*Bolboschoenus maritimus*), brass buttons (*Cotula coronopifolia*), fat-hen (*Atriplex prostrata*), and saltgrass (*Distichlis spicata*), present around its perimeter. The standing water supports common wildlife as evidenced by a snowy egret (*Egretta thula*) hunting at the water's edge and a black phoebe (*Sayornis nigricans*) sallying insects from a vegetative perch."

Despite these observations, the analysis fails to accurately characterize the site habitats, and reconcile the appropriate list of species regulatory concern (Table 1, Attachment 1). The habitats observed by BSK (2014) and ESA (2014) at the site appear to include: open water, shallow water with emergent vegetation (alkali wetland), mud flats, riparian fringe (locally called scrub), ruderal grassland, seasonal wetlands, and open/disturbed shrubland. California identifies one of these habitat types as sensitive: *Bulboschoenus maritimus* (Salt marsh bulrush marshes) Alliance, status S3[10] (S3 = Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the state.)

For illustration of the biological resources analysis defects, as they related to waters and wetlands, the following section provides a site waters and wetland feature history and summary analysis of how the provided data and analysis are insufficient or incorrect.

WATERS AND WETLAND FEATURE HISTORY

The term "wetlands" from a Clean Water Act (CWA) 404 perspective generally means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands typically include swamps, marshes, bogs, and similar areas. These are typically identified using a three-part test, examining the presence of water, wetland (hydric) soil, and wetland dependent (hydrophytic) vegetation, following specific guidance(s). The federal CWA section 404(b)(1) Guidelines list both wetlands and mud flats as types of "special aquatic sites."

A wetland under California's regulations contains the following features, an area that is covered by shallow water or where the surface soil is saturated, either year-round or during periods of the year; where that water coverage has caused a lack of oxygen in the surface soil; and, has either no vegetation or plants of a type that have adapted to shallow water or saturated soil. Some examples are fresh water marshes, bogs, riparian areas, vernal pools, coastal mud flats and salt marshes. In this case, there are both a permanent water body and a seasonal feature (possibly a small complex) with wetland characteristics by the admission of the experts who prepared the environmental documentation for the project. These characteristics meet the definitions contained in the various regulations, including 14 CCR 13577(b), Cal. Pub. Res. Code § 30121. The open water feature and its wetland (hydrophytic) vegetation were verified in the field, and through the use of aerial photos, showing their presence over time, both by season and by year.

The site is within the footprint of the historic Mission Bay, which has been filled in over time (ESA 2014; Pg. 1). The original Bay muds are still found below the site, as evidenced by the site soil borings (LTR 2015; Pg. 13 and Figures A-2 and A-3). The excavation intercepted local shallow groundwater and is

[10] https://www.dfg.ca.gov/biogeodata/vegcamp/pdfs/natcomlist.pdf

evidently maintained by that natural source (LTR 2015; Pg. 14). The site also has seasonal wetland features which appear to be dominated by stormwater. It is not clear that these seasonal features would not be maintained for far longer in the spring, but they have been captured through an excavated trench apparently intended to drain them to the open water body (ESA 2014; Pg. 2). The site "remedial" activities thus captured the local water table and allowed for the expression of open water and wetland features (ESA 2014; Pg. 2). The ESA analysis goes on to specifically identify that the: "…deeper excavation and surrounding shallow depressions within the proposed project site are features that exhibit hydrology and vegetation characteristics of wetlands. Hydric soil is presumed present due to the year-round inundation and presence of obligate wetland plants." (ESA 2014; Pg. 3)

Federal Jurisdiction-Wetlands created by human actions fall under discrete classes under Federal jurisdiction. Most typically these are agricultural features that are caused by the movement of water from one location to another, such as a dam providing water to a canal constructed in uplands. In this case however, the site was originally a tidal mudflat or estuary wetland which has since reverted back to a wetland (ESA 2014). In addition, even if it was not originally a water or wetland, it currently meets those adjacency, and direct hydrologic connectivity requirements under the Final Clean Water Rule (2015; 33 CFR Part 328 and 40 CFR Parts 110, 112, 116, 117, 122, 230, 232, 300, 302, and 401); and, even manmade wetlands and water bodies have restrictions on discharges under 33 CFR 323.4(b).

There are Federal exemptions for specific construction associated activities. These exemptions (33 CFR 323.4 - Discharges not requiring permits) are invalidated, however: "If any discharge of dredged or fill material resulting from the activities listed in paragraphs (a) (1) through (6) of this section contains any toxic pollutant listed under section 307 of the CWA such discharge shall be subject to any applicable toxic effluent standard or prohibition, and shall require a section 404 permit." (33 CFR 323.4(b)).

The site's water and soils include several chemicals identified under CWA section 307 as toxic pollutants (BBL 2006; LTR 2015).[11] Those chemicals include the following 12 Priority Pollutants found in the Phase II (LTR 2015; Table 4 and Table 5):

1. Benzene
2. Naphthalene
3. Cyanide
4. Antimony
5. Arsenic
6. Chromium
7. Copper
8. Lead
9. Mercury
10. Nickel

[11] http://water.epa.gov/scitech/methods/cwa/pollutants-background.cfm

11. Selenium
12. Zinc

Therefore, the site is *not exempted* under 33 CFR 323.4 because it contains 12 of the chemicals identified as priority pollutants under section 307.

The proponents' consultant, WRA, in a separate analysis, claims exemption from the CWA under yet a different test (without identifying that any exemption is *invalidated* by the section 307 test described above (WRA 2014; Pg. 2)). WRA states that: "1986 (51 Fed. Reg. 41206) (e) Water-filled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and until the construction or excavation operation is abandoned and the resulting body of water meets the definition of waters of the United States."

The site owner's continuing failure to backfill the excavation and its abandonment for the past decade, despite being under Order No. R2-2005-0028 and its RRMP, constitutes abandonment and its clear reversion to the definition of waters, wetlands and/or other special aquatic site. WRA's explanation, contrary to demonstrating how the site may be exempted as an incidental construction feature, documents how that feature has been abandoned. Therefore the exemption also does not apply on that basis.

Indeed, there is no merit to the further argument made by WRA (Pg. 4) that: "As described in the RWQCB Order No. R2-2005-0028, the Project Area was to be excavated and backfilled in preparation for future development as part of the overall Mission Bay redevelopment plan." The site was not backfilled. It should be noted by WRA's argument there could never be a case for reversion under the CWA, because any naturalized feature would simply 'be ready' for some postulated future backfilling. The provided analysis fails to show: 1. How the feature has not reverted and 2. How the exemption override under 33 CFR 323.4 does not apply due to the presence of section 307 toxic chemicals. Regardless, WRA is silent on the open water and wetland features in context of the State water and wetland policy and applicable regulations.

California Jurisdiction-California does not have the same exemptions in its waters and wetland framework as exist under the CWA. California derives its authority from different sources (Porter-Cologne Water Quality Control Act and various other Acts) for its policies, and includes all man-made features under its jurisdiction. Therefore the site's water features, regardless of origin, appear to be regulated and protected waters and wetlands of the State.

The NOP-IS acknowledges that the project would result in the fill of a wetland (and without identifying it Pg. 76, its associated fringe riparian zone), however, the proponent has not yet (and does not propose to) characterized the wetlands to determine their jurisdictional status (Pg. 78). The failure to prepare the jurisdictional determination prior to public comment eliminates full public disclosure and the ability to assess the potential reasonableness and efficacy of mitigation measures. Moreover, the specified failure to establish specific (offsite) mitigation may violate CEQA's mandate to impose all feasible mitigation measures, and may fail to meet both Porter Cologne and the Clean Water Act permitting requirements for filling wetlands and waters.

SITE ABANDONMENT AND NEW EXPOSURES

The Site's Failure to Fill the Excavation Has Led to Wetland Formation and New and Unanalyzed Exposures

The site petroleum-related remedial activities exposed the local water table and allowed for the expression of wetland characteristics and the site which have become naturalized over time (ESA 2014; Pg. 2). These activities have resulted in the creation of stockpiles of material adjacent or near to these wetland features that in some cases: "…contains contaminants that exceed hazardous waste threshold concentrations and will require special handling and disposal," (LTR 2015; Pg. 1). These activities took place over several years culminating in a Phase II remedial action that left the excavated area open and abandoned in 2005 (LTR 2015; Pg. 6). The Revised Risk Management Plan (RRMP, BBS; Pg. 2-3 and 2-3) infers that the excavation was backfilled, however, it was not.

The RRMP further identifies that: "1. Because North Terminal, Parcel X4, OAS and 16th Street East OUs are currently under development, interim risk management measures (IRMMs) designed for undeveloped parcels are not relevant to the protection of human health on those OUs. If development ceases or areas are created with uncovered native soils, IRMMs may again be necessary." (BBS 2006; Table 1) The development of the site still has not occurred, and there is no evidence that the IRMMs have been applied.

The site's open water and wetland features are thus a direct result of the abandonment of a site cleanup allowed to revert back to a 'natural state' for approximately a decade. Not only did natural features evolve in response to this abandonment, but the very abandonment created conditions that may have exposed wildlife to a variety of hazardous chemicals through their use of that habitat (LTR 2015).

The Project Impact Evaluation Modifies the Appendix G Question in a Manner that Eliminates Critical Analysis

The project Impact Evaluation BI-1 fails to follow the language of Appendix G by removing the second half of the question, and reduces the subject matter and detail of its impact analysis accordingly (Pg. 77). The current (2015) Appendix G states:

IV. BIOLOGICAL RESOURCES -- Would the project:

> a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans,

> policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Instead the NOP-IS states:

> "Impact BI ‐ 2: The proposed project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations. (No Impact)"

The result of this text deletion is that the potential for the project to impact U.S. Fish and Wildlife Service designated critical habitat is not analyzed. Therefore, the potential project impacts to the closest federally designated critical habitat is steelhead *Oncorhynchus mykiss* are ignored. This habitat runs directly adjacent to the project area. In addition, San Francisco manzanita (*Arctostaphytos franciscana*) critical habitat is present approximately 2.6 miles to the west and should also have been identified and analyzed. The federal critical habitat analysis is missing, and the provided analysis itself is defective. The potential project's impact(s) to these listed species and their critical habitat are therefore unexamined. The project's dust, stormwater, surface flooding, and groundwater place those species at risk from hazardous chemicals. This issue is discussed in detail in Other Biological Resource Issue Areas.

OTHER BIOLOGICAL RESOURCE ISSUES

The DSEIR is silent on the potential project impacts on offsite fish and wildlife issues associated with stormwater and other discharges from the site to the surrounding area, Mission Creek Channel, and the San Francisco Bay. The DSEIR Appendix MIT Mission Bay FSEIR Mitigation Measures: Applicability to Proposed Project K. Hydrology and Water Quality section (MIT-27 through -29) states that the project would fall under different mitigation measures under different programs (such as the General Stormwater Permit) and that the detailed mitigation requirements from the 1998 FSEIR would not be used. The site's hazardous material history show that the proposed project construction activities pose risks to the environment and its biological resources through the release of hazardous chemical to surface waters, through wind redeposition, stormwater drainage, or unabated stormwater sheet flow above a 5-year design rain event (BBL 2006, LTR 2005). The RMP has not protected these resources because it was not intended to covers these features, followed superseded analytical methods, and even if it was applicable and current, has had implementation failures. Some of these issues are identified in greater detail in a separate document, SWPPP Memorandum BSK Associates, 2015.

There is a direct route from the site to the surrounding area, including the Bay, from dust and stormwater. Stormwater can take several routes off the site, and may enter a sediment trapping system, or not, and flows over a 5-year event run unabated into neighboring properties and the Bay. Currently, there are what appear to be multiple failures to implement and maintain effective Best Management Practices (BMPs) for dust and stormwater. The DSEIR fails to identify these risks and conditions, and fails to identify the potential environmental impacts from the substantially changed new environmental conditions as a result of the site remedial activities. The DSEIR further identifies that there were detailed mitigation measures for these potential impacts as they related to stormwater (but not biological resources) in the FSEIR, but that they deleted the hazardous material protective elements and simplified the sediment management. The site stormwater operations have management issues that need reconciliation, but the evidence shows a likelihood of these contaminants reaching surface waters, despite the prior BMPs and this must be fully analyzed and the mitigation measures modified correspondingly to reflect those significant new conditions in order to protect biological resources, designated critical habitat and listed fish and wildlife.

CUMULATIVE IMPACTS

In our opinion, the project's impacts on listed species, waters and wetlands, and their loss, were not analyzed in sufficient detail or context to be able to understand what the likely cumulative impacts would be on those and other biological resources. It seems probable that there would be cumulatively considerable impacts from the project given the limited availability of those habitats, and that there are mitigation measures available for those impacts. However, the IS-NOP analysis discusses some broadly applicable mitigation measures for wetlands, then fails to identify or apply any of those mitigation measures in Table 1-2 (NOP/IS Pg. 1-58) Appendix MIT (Pg. MIT-30). There are only two mitigation measures described as applicable to biological resources at the site in the DSEIR, breeding bird use protection and bird strike impacts.

The DSEIR's cumulative impact analysis lacks the degree of detail that the 1988 DEIR completed and fails to apply that analysis to the current waters and wetlands, and contradicts the current DSEIR's findings:

"Wetland habitats in the San Francisco Bay Region continue to be eliminated and altered. Wetlands provide a continuity of habitat between the open waters of the Bay and upland areas. Wetlands increase the wildlife diversity by providing additional habitats, and by providing many of the animals' life history requirements (e.g., feeding, mating, and nesting) in one area." (1988 FEIR Pg. VI.M.12)

According to the project analysis: "The proposed project could potentially result in adverse effects on various bird species through disruption of nests, collisions with buildings, or disorientation from night lighting. These impacts, in combination with other projects along the San Francisco waterfront, could potentially result in cumulative impacts to birds." (NOP/IS Pg. 84) There is no assessment of how many birds or which species would be impacted and how the mitigation would achieve that reduction below the unstated threshold. The document then fails to identify how the mitigation measures would result in a less than significant finding over the cumulative impact analysis area. There is also no supporting analysis for these bird impacts in the 1988 FEIR or 1998 FSEIR.

1998 FSEIR

HABITAT ANALYSIS

No Prior Interior Wetland Presence and Analysis

The 1998 FSEIR states: "This section focuses on the aquatic and wetland habitats of China Basin Channel. Terrestrial habitats in the remainder of the Project Area do not support any significant biological resources, as discussed in the Initial Study (see Appendix A)." At the time of that analysis, there were no documented interior water and wetland features at the site, and therefore the project impacts on waters and wetlands were not analyzed (Pg. II.30). It also is important to note that the mitigation used for the China Basin Channel may, and in some cases may not, be applicable to the project impacts on the current interior wetlands, and thus require significantly new and more detailed analysis for both the impact to these features, and the impacts on their associated species.

HAZARDOUS CHEMICALS

Hazardous Chemical effects on Biota

The FSEIR identified that for the purposes of analyzing wastewater impacts from the project, that "Near-Shore Effects-Treated combined sewer overflows currently occur at Bayside discharge facilities, including facilities at China Basin Channel, at the end of Mariposa Street, and in Islais Creek. The proposed project would marginally increase treated combined sewer overflows and direct stormwater discharges to near-shore waters of the Bay, including China Basin Channel and Islais Creek. Near-shore discharges are not subject to the same rapid mixing and dilution as the deep-water discharges from the Southeast Plant." (Pg. II.27) This effect is generally correct and holds for both wastewater, and typically to an even greater degree, most particulate or soluble chemicals that would come off the site through the groundwater, aerial re-deposition or stormwater/surface transport.

However, in the immediately following section, Effects of Stormwater Discharges, it states that "Under the project, the volume of stormwater directly discharged to near-shore waters of the Bay from the Project Area would increase about 2%. The concentrations of pollutants in the stormwater discharge would change, because the project would intensify land use in the Project Area. Neither the increase in stormwater flow, nor the change in pollutant concentrations would constitute a significant effect on aquatic biota." (Pg. II.28) The recent findings of Class 1 and Class 2 hazardous waste is not taken into account for these analyses and comprise significant new information that requires analysis in the 2015 SEIR because of the different and significantly greater biological impacts of these hazardous materials (LTR 2015).

The FSEIR identifies an analysis of potential adverse ecological effect associated with the current conditions at the site in 1998 (Pg. I.54). It states: "As noted by ENVIRON, no criteria have been developed for the assessment of risk to ecological receptors in the aquatic environment based on comparisons to groundwater chemical concentrations. However, ambient water quality criteria for the protection of marine (saltwater) organisms are used as a conservative means of evaluating the potential risk to surface water organisms." (Pg. I.57) However, since 1998, the San Francisco Regional Water quality Control Board has developed these very criteria as described below.

The 1998 analysis relied on Preliminary Remediation Goals (PRGs) for its analysis, however the San Francisco Regional Water Quality Board (SFRWQB) states in its current guidance document that: "The U.S. EPA Regional Screening Levels or RSLs (formerly PRGs; U.S. EPA, 2013d) address human health concerns associated with direct exposure to chemicals in soil, but do not address ecological concerns. Exposure routes and receptors not addressed by the RSLs, but included in the ESLs [Environmental Screening Levels] are listed below: …groundwater screening levels for the protection of aquatic…habitats/surface water quality…soil screening levels for urban area ecological concerns; (SFRWQB 2013; Pg. 1-3). These exposure routes which apply and are specific to the site are identified in the current Environmental Screening Levels (ESLs). This is new and substantial information that affects the potential environmental impacts to biological resources which was not used in the DSEIR.

Further, the ESLs (the PRGs for that matter) are not legal limits, but they are intended to inform decision-making. However, they may not be protective enough in particular for "…sediment or sensitive ecological habitats (such as wetlands or endangered-species habitats). The need for a detailed human health or ecological risk assessment should be evaluated on a site-by-site basis for areas where significant concerns may exist (SFRWQB 2013; Pg. ES-1 and 2).

The prior FEIR analysis identifies that in their opinion there were no significant species or habitats at the site, and therefore the analysis was specifically intended not to be protective of terrestrial habitat or interior wetlands, and therefore does not apply to the current conditions: "As previously described, chemicals present in the soils could potentially impact the health of the ecological environment if terrestrial or nesting avian species come into direct contact with soils which contain elevated levels of chemicals, or if the chemicals in exposed soil were to be released into China Basin Channel or San Francisco Bay through surface water runoff. Additionally, chemicals present in the soil and groundwater could potentially impact the aquatic environment if the chemicals leach from the soil into the groundwater and subsequently migrate to China Basin Channel or San Francisco Bay. As discussed in the Mission Bay Final Environmental Impact Report (FEIR), the current and future conditions within the Project Area do not provide a habitat capable of supporting a significant terrestrial or nesting avian wildlife community. Accordingly, potential exposures that terrestrial species could have with soils would not represent a significant effect on the terrestrial wildlife community." FEIR 1998; Pg. I.54) The current conditions are significantly different and specifically excluded from the prior 1998 analysis and the current ESL methods do apply to these conditions.

The 1998 "risk analysis" applies the PRG criteria for impacts on biological resources in the Bay as a result of offsite groundwater movement only. It also uses average values and only for selected contaminants.

This is an artificial narrowing of chemicals that can have biological impacts, and likely a major reduction of the risk by not using the maximum observed concentration and the biologically relevant risk drivers. For example, species are exposed to actual concentrations, not site averages. By using the observed peak concentrations, it establishes the appropriate worst case scenario and sets the upper limits for the purposes of developing mitigation.

However, groundwater is but one of several potential routes by which contaminants can leave the site. Wind can blow contaminated dust and stormwater (containing both fine sediment and dissolved contaminants) can also run off the site. The RMP and RRMP also do not apply and cannot be relied upon because they specifically rely on the previous risk analysis, which does not look at terrestrial or interior wetlands.

Additional Mechanisms of Impacts to Biological Resources

Some of the mechanisms for biological impacts from the project's contribution to contaminants are through bio-accumulation, as well as the unanalyzed bio-concentration: "These contaminants could be directly lethal to smaller organisms, and could accumulate in the food chain and become successively more concentrated in a process known as bio-accumulation. Through bio-accumulation, the toxic concentrations could reach levels in which they are lethal to larger organisms, such as birds or marine mammals. Turbidity and toxicity from re-suspended sediments could also interfere with beneficial uses of the channel, such as spawning of Pacific herring." (1998 FSEIR Pg. II.31) The FSEIR analysis describes just one of the potential mechanisms for biological impacts from the project-associated hazardous chemicals, then identifies that it is significant and mitigatable, but then simply ignores that potential mechanism for other species that would potentially come in contact with the same material. The analysis should instead examine the various chemical of concern, their individual and joint biological impacts (chemicals can have additive (or counteracting) or multiplicative effects) and their routes of exposure (wind, groundwater or stormwater) and asses the risk drivers for each species (or trophic surrogate).

There are newly identified Class 1 and 2 hazardous waste materials at the site, the newly identified use of the site by diverse biota, the designated Critical Habitat, and similar release pathways off of the site. These changed conditions require analysis of both onsite impacts and offsite impacts. The lines of reasoning, based on high contaminant concentrations at/close to the site, poor mixing in the shallows, and bio-concentration/bio-accumulation should also be applied to the current physical conditions and the elevated contaminant concentrations.

Mitigation for Hazardous Materials

The analysis provided above in the 1998 FSEIR relied on the dilution effect of the Bay, despite its own earlier analysis that there would be significant impacts which required mitigation, but cumulatively there would be no impact (1998 FSEIR Pg. II.27). General stormwater impacts are not the same as impacts from solid phase and dissolved phase hazardous materials. Specific analysis must be developed to identify which capture or treatment systems are required for which hazardous constituent in which phase. For example, large particles traveling in the stormwater system could be trapped through a conventional filtration system, however, overflow of that system (and/or poor maintenance) by design flow above a 5-year rain event could cause that material to be flushed directly into the Bay. Very fine size and dissolved phase chemicals typically require specific treatment technologies to stop their direct movement to the Bay during mobilizing rain events. The mitigation does not appear to be sufficient to protect biota from hazardous materials identified at the site in the LTR 2015 report.

Cumulative Hazardous Issues

The same failure to identify, and therefore analyze cumulative impacts, as a result of newly identified hazardous materials also applies to cumulative impacts from these chemicals: "To put this in context, City discharges are a very small portion of the region-wide discharges to the Bay. Considering the contribution of the project and of the cumulative Bayside projects in the context of all the other pollutant inputs to the Bay, the cumulative pollutant loading from the Bayside projects would be extremely small." (1998 FSEIR Pg. II.29) The cumulative impacts of hazardous materials (not just generalized pollutants) would be specific to certain species in the Bayside proximate to the site, not generically in the context of the entirety of the Bay. It is inappropriate to consider the entirety of the Bay in the cumulative impacts specifically because of the mechanics of chemical redistribution identified in another section in the FSEIR (1998 FSEIR Pg. II.27, and see above). The analysis provided in the FSEIR does not cover the hazardous materials and fails to look at the appropriate biological context, including resident and locally foraging migrants, and must be reanalyzed in light of the new cumulative impact information. In our opinion, because of the new analysis methods and standards, and the lack of mitigation for soluble or stormwater transportable hazardous materials, the project's impacts on aquatic biological resources is cumulatively significant after mitigation. Mitigation measures are readily available for these potential impacts, but they require a careful analysis of the specific hazardous constituents and what levels of contamination are acceptable to develop.

LIMITATIONS

Our review was limited to the Ecological-related aspects as they are identified in the project environmental documents provided or otherwise made available for review. Additional information related to the project may be available through other sources, but were not reviewed for the purposes of this analysis.

The observations, assessment and recommendations submitted in this report are based upon the data obtained from listed reports prepared by others, limited field investigation, and site observations. The report does not reflect variations which may occur beyond the assessed area. BSK's services were be performed in a manner consistent with the level of care and skill ordinarily exercised by other professionals practicing in the same locale and under similar circumstances at the time the work is performed. No warranty, either expressed or implied, is included. The findings of the field observation may have a potential for negative impact(s) on the value or suitability of the site for some purposes. BSK cannot assume liability for any such negative impact(s). Permitting requirements or permit interpretations may change over time. The findings of this report are valid as of the present. However, changes in the conditions of the site can occur with the passage of time, whether caused by natural processes or the human-induced changes on this property or adjacent properties. In addition, changes in applicable or appropriate standards or practices may occur, whether they result from legislation, governmental policy, or the broadening of knowledge.

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with any questions regarding the review comments presented this letter.

Erik Ringelberg – Ecological Services Group Manager

Professional Background:

Mr. Ringelberg began his career as an environmental scientist in 1992. His academic background includes a B.Sc. in Microbiology from Colorado State University, a M.Sc. in Environmental Science from Lesley University in Cambridge, Massachusetts, and he is a Ph. D. candidate at the University of Montana, in Riparian and Wetland Ecology. He has directed organizations, managed departments, technical staff, contractors, and volunteers for the public and private sectors. He has coordinated development and restoration projects with state and federal oversight agencies, and developed threatened and endangered species management plans. Mr. Ringelberg directed and advised non-profit, tribal, and local government agencies on special studies, wildlife mitigation measures, habitat management and restoration for listed species.

Mr. Ringelberg has completed numerous California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) analyses and associated field studies, including protocol studies for listed avian, terrestrial, and aquatic species and their associated habitats in California, Nevada, and Montana. He has delineated over 30 miles of Streamside Management Zones, US Army Corps of Engineers - Wetlands and Ordinary High Water Marks, and California “isolated” waters. Mr. Ringelberg has also directed both large and small-scale wetland and river restorations.

Relevant Project Experience:

Field Studies

Multi-species Habitat Utilization Analysis
Glacier National Park, including spotted sandpiper (*Actitis macularius*), Barrows goldeneyes (*Bucephala islandica*), Harlequin duck (*Histrionucus histrionucus*) and common merganser (*Mergus merganser*).

Habitat Reconstruction Analysis
Reconstruction of pre-impact conditions using stratified random statistical analysis of NHP data, and site specific data from local informants, for the Yerington, Nevada area.

Avian Mitigation Measure Development
Stone Lake National Wildlife Refuge Association (CEQA/NEPA EIR/EIS in development); Yolo Basin Foundation Putah Creek Stream Restoration (CEQA EIR in development); and, numerous CEQA projects in the Central Valley of California.

Breeding Bird Surveys
Caltrans-Highway 50; and, numerous development projects in Alameda, Glenn, Madera, Sacramento, San Joaquin, Solano, Stanislaus, Tehama, and Yolo Counties.

QUALIFICATIONS

Certifications:
DFW Scientific Collections Permit SC-10511, 2015
Hazardous Analysis and Critical Control Point: Aquatic Nuisance Species, USFWS, 2003
Constructed Wetland Designer; UW, Madison, 1993
40-CFR Hazardous Waste Handling, 1992-1993

Education:
Ph.D., candidate (ABD) Riparian and Wetland Research Program, University of Montana, School of Forestry, Missoula, MT, 2003

M.Sc., Environmental Science, Lesley University, Cambridge, MA, 1991

B.Sc., Microbiology (Business concentration), Colorado State University, Fort Collins, CO, 1987

Experience:
BSK Associates 2009-Present
Wallace-Kuhl 2009-2006
PLF 2006-2003
KYNF 2003-2000

Bat Surveys
Multi-species bat surveys for development projects in Yolo County.

Burrowing owl (*Athene cunicularia hypugaea*). Protocol-level field surveys in Fresno, Solano and Yolo Counties, California.

Northern spotted owl (*Strix occidentalis caurina*). Protocol-level field surveys in Napa County for wind projects.

Swainson's hawk (*Buteo swainsoni*). Protocol-level field surveys in Solano and Yolo Counties, California.

California tiger salamander (*Ambystoma californiense*). Supported protocol-level field surveys in Calaveras County.

Red-legged frog (*Rana draytonii*). Supported rotocol-level field surveys in in Calaveras County.

Clear Lake Hitch (*Lavinia exilicauda chi*). Hatchery establishment, field collections and protocol development in Lake County.

Focused Rare Plant Surveys (various). Surveys in Calaveras, Kern, Napa, Sacramento, San Joaquin, Solano, Stanislaus, Tehama, and Yolo Counties.

Worker Environmental Awareness Protection Plans
Preparation and presentation of Worker Environmental Awareness Protection (WEAP) Plans for project which may have potential to impact Special status species and breeding birds in Kern, Solano and Yolo Counties.

Field Ecology

Putah and Cache Creek Plans, Yolo County, CA, Washoe County, and Lyon County NV - Technical Advisor on habitat analysis, restoration (and SMARA-equivalent) planning for Yolo County Resource Management Planning Area for Cache Creek, advisor for large-scale watershed restorations (and dam removal) on Putah Creek; and, restoration and management plans for the Pyramid Lake Paiute Reservation. Developed historic species lists for Cache Creek and Yerington region.

Pyramid Lake Paiute Tribe, Big Valley, Robinson, and Upper Lake Rancherias, in Washoe County NV and Clear Lake County, CA - Directed a multi-disciplinary lake and river research-management program for threatened and endangered species. Provided technical support for federal and state-listed species and those of tribal concern (Lahontan cutthroat trout, Cui-ui, Clearlake hitch, Sacramento perch, and tui chub), including managing 6 hatcheries, a water quality laboratory, and tagging programs.

Missoula County Riparian Inventory and Classification Project, Missoula County, MT - Co-funded, developed, and managed the Missoula County riparian inventory. Researched the integration of riparian and wetland vegetation, habitat, and stream classifications.

Confidential Client - Ethnographic study assessing cultural uses of plants, animal, insects and minerals.

Kurt Balasek, PG, CHG, QSD – Senior Hydrogeologist

Professional Background:

Mr. Balasek is the Sacramento Senior Hydrogeologist for BSK. He has more than 25 years of experience providing geologic, hydrogeologic and environmental consulting to western U.S. businesses and government agencies. His experience includes managing teams of scientists and engineers on projects ranging from large-scale brownfield developments, and CEQA compliance to third party consultation and groundwater studies. He has provided project management of water resource evaluations and conjunctive use studies, as well as numerous petroleum hydrocarbon-related soil and groundwater contamination investigations and remedial designs. Mr. Balasek has completed geologic hazard studies for proposed school sites in accordance with the Office of State Architect requirements and has completed detailed geologic surface mapping assignments in the foothills of the Sierra Nevada.

Mr. Balasek has spent his career working to evaluate hundreds of properties for the purposes of development, redevelopment and preservation as conservation easements. Conducting or leading these evaluations has given Mr. Balasek vast experience preparing site investigation strategies with an emphasis toward negotiating with regulatory agencies regarding future land use. Mr. Balasek has worked with redevelopment teams in numerous northern California cities and extensively under EPA community-wide assessment grants in the Cities of West Sacramento, Esparto, and Rancho Cordova. He has worked with local, State, and Federal agencies in evaluating a wide range of environmental, contaminanted and blighted sites, assessing community needs, and using tools to develop site cleanup goals. His skills of using land use covenants and maintenance tools provides for blighted property that have led to showcases community revitalization efforts. Mr. Balasek has completed numerous landfill characterization studies and provided detailed analysis to assist in consolidation and clean closure decision making.

Representative Project Experience:

City of Rancho Cordova, CA, Community Redevelopment Agency, Brownfield Assessments– Mr. Balasek provided senior management oversight on a community-wide assessment of over 460 properties in Rancho Cordova, California. Approximately 30 parcels warranting Phase I and/or Phase II Environmental Site Assessments (ESAs) were identified. To date, a Phase I and II ESA were conducted on two parcels of a planned community college campus.

Putah Creek Park North Bank Improvement Project- The North Bank Improvement Project stemmed from a federal appropriation of 2 million dollars to enhance the

Solano County Transportation Department's automobile bridge replacement at the City of Winters. The project funds are administered by **CalTrans** so extensive coordination with this agency regarding project description and permitting has been a substantial portion of this project. The project was developed by the City of Winters. Mr. Balasek and his team were initially tasked with obtaining the biological opinion for mitigation as it related to disturbance of Valley Elderberry shrubs. Instead of purchasing mitigation credits from a Service-approved mitigation bank, Mr. Balasek and his staff devises a unique plan to develop a small on-site mitigation area within the Winters Putah Creek Nature Park. If approved, the mitigation area will provide enough mitigation credits to offset the Solano County Bridge project, the north bank improvement project and a proposed pedestrian bridge. Money will be set aside for maintenance of the mitigation area in perpetuity but will enable the project proponents to mitigate habitat damage locally and keep local control of the money. To develop this plan, Mr. Balasek and his team developed the financial model to predict the amount of money required to establish a non-wasting endowment. This model was submitted to USFWS and is undergoing review. U.S. Representative Mike Thompson and his staff are involved in the project and are assisting with negotiations with USFWS.

Winters Putah Creek Park Revised Master Plan CEQA Support- Winters, CA- Mr. Balasek and his team prepared the Initial Study/Mitigated Negative Declaration (IS/MND) based on the revised master plan for Winters Putah Creek Park. This document was compiled in advance of implementing several projects outlined in the park master plan. The document was reviewed by the Winters City Council and adopted by the Winters planning commission without comment by the trustee agencies and with only one comment from the public. The document framed the foundation for environmental permitting for all of the following restoration-related projects.

City of West Sacramento, Housing and Community Investment Division, West Sacramento, CA– Mr. Balasek has managed several Environmental Projects for the City of West Sacramento, including: West Capitol Corridor Study, 427 "C" Street, Tower Court, Sacramento Generator, and Vlad's Toyota.

City of Winters PG&E Training Center, Winters CA– During critical property negotiations, due diligence studies revealed the historic presence of an underground fuel storage tank. Me. Balasek we retained by the City on an emergency basis to advise City Council and staff. Mr. Balasek mobilized BSK resources and conducted a comprehensive, soil, groundwater and soil vapor investigation on the site. Mr. Balasek also advised the City throughout the project and represented the City in numerous negotiations with PG&E. As a result of a well planned and executed investigation, a $70 million state-of-the-art training facility project is moving through the CEQA process and is scheduled to break ground late in 2015. This project is a huge success for the small City of Winters and will act as a catalyst for a downtown hotel project. Mr. Blazek's work in the field and at the negotiating table was a key part of the success of this project.

Stockton Worknet Center, Stockton, California– Provided project management for a contaminated site. The site characterization and remediation was funded by a State of California Brownfield Grant. The source of contamination was determined to have come from a pipeline located under railroad tracks. Removal and backfill of soil from an excavation that was 35 feet wide by 400 feet long was completed prior to construction of the new center.

River City Baseball – River Cats Stadium, West Sacramento, California- The site was located adjacent to a chemical mixing plant and as part of the owner's due diligence an environmental assessment was conducted. Contamination of volatile organics was determined and remediation followed. Based on these findings the foundation design was also adjusted to accommodate shallow groundwater. Based on Mr. Balasek's recommendation, Gorsorb™, a passive form of soil vapor testing, was used to delineate the contamination. A Risk Assessment report was provided to determine if the level of contamination exposure based on the properties intended use. All this work was completed at an accelerated pace to facilitate construction.

Colusa County, Three UST Sites, Colusa, California– Underground storage tanks at the County Sheriff's Department, Central Services, and County Jail were removed soil and water samples were tested for contamination. As project manager, Mr. Balasek managed the team who provided soil excavation and shallow groundwater monitoring for petroleum hydrocarbons. The three projects took place concurrently resulting in a cost savings to the county.

Sacramento International Airport Terminal Construction, Sacramento, California- - Mr. Balasek and his team installed monitoring wells and conducted aquifer performance tests in advance of massive dewatering efforts to facilitated construction at the new Sacramento International Airport Terminal project. Data developed from this study was used to quantify discharge volumes and evaluate water quality. The data was subsequently used as the basis for dewatering design related to a large basement structure extending approximately 17 feet below grade for the entire terminal building as well as subterranean tunnel structures. The new Sacramento Terminal opened in the fall of 2011.

Yolo Ranch Agricultural Landfill Remediation, Yolo County, California- Provided project management and oversight during landfill excavation and remediation. This project involved careful coordination with regulatory personnel from the Illegal Abandoned Landfill Group at the former California Integrated Waste Management Board to remove and/or encapsulate a wide range of ag-related waste in the Yolo ByPass. The work involved remediation and subsequent site closure of an agricultural landfill adjacent to sensitive natural habitats. This work was done as part of a property transaction and demonstrated creative problem solving that included an on-site solution which saved the client tens of thousands of dollars.

Butte County, California- Mr. Balasek and his team conducted the base-line hydrogeologic analysis of the site vicinity in support of the gravel mining permit application submitted to Butte County. Mr. Balasek's team also conducted the slope stability evaluations for the propose mine. Both technical documents were used to support an EIR commissioned by Butte County on behalf of the project proponent. In addition, Mr. Balasek's team provided consultation on pit capture and anadromous fish entrapment if high water resulted in overtopping of the pit. The work also involved analyzing resource data to identify the bottom of economically recoverable resource.

Cold Spring Rancheria, Tollhouse, California- Mr. Balasek oversaw the preparation of a comprehensive long range water development program for the Cold Springs Rancheria. This program examined available surface and groundwater resources, outlined potential problems with existing infrastructure and water rights and prioritized projects for improvement. Mr. Balasek and his staff also prepared a revised Quality

Assurance Assessment Plan (QAAP) for the Rancheria that outlined procedures for all field sampling activities. These plans were funded by the Bureau of Indian Affairs and are required planning documents in advance of project implementation funding.

San Francisco Bay PCBs TMDL – Implementation at Cleanup Sites

PCB TOTAL MAXIMUM DAILY LOAD (TMDL)

Basin Plan section 7.2.3, San Francisco Bay Polychlorinated Biphenyls TMDL, should be considered during site investigations and cleanups throughout the Region, particularly but not exclusively at sites located on the Bay margin. Of particular concern, and often overlooked, is the fact that PCBs in surface soil can be mobilized by stormwater runoff and flow to the Bay.

Fish tissue PCB concentrations are the direct cause of impairment to the Bay, and therefore the numeric target of the TMDL is a fish tissue PCB concentration protective of human health. The TMDL's fish tissue screening level of 10 ng/g represents a ten-fold reduction in fish tissue PCB concentration. To achieve this, surface sediment PCB concentrations in San Francisco Bay must be reduced to an average of 1 ug/kg. The TMDL's wasteload allocations were developed with the goal of achieving a ten-fold decrease in PCB sources to the Bay.

Of the sources to the Bay, stormwater runoff contributes the greatest mass of PCBs. The PCB TMDL establishes a wasteload allocation for stormwater of 2 kg/yr total PCBs, which represents a ten-fold decrease over the current estimated load. In an effort to achieve this reduction, Bay Area municipalities are pilot-testing remedial actions in areas where street sediments contain PCBs in the 1 mg/kg range *before any remedial action is taken*. Municipalities will spend millions of dollars to achieve the ten-fold reduction in PCBs required by the TMDL.

ACHIEVING THE PCB ALLOCATION AT CLEANUP SITES

Stormwater runoff from sites containing residual PCBs in soils after state- and federal-ordered cleanup contributes to sediment concentrations in the Bay, and such contributions must be essentially eliminated in order to achieve the TMDL target. For cleanup sites, the TMDL calls for implementing "on-land source control measures, to ensure that on-land sources of PCBs do not further contaminate in-Bay sediments."

PCBs cleanups that occur in urban areas often have a cleanup goal based on protection of human health, and this can allow residual PCB concentrations close to or exceeding 1 mg/kg to remain in surface soils. **Regardless of the cleanup goal, it is important that cleanup sites do not contribute any PCBs to surface water runoff. Remedial actions should be conducted so as to eliminate <u>all</u> means of conveyance of PCBs from cleanup sites, including sediment runoff, vehicular drag out, and airborne dust**. Achieving this may require a durable cover of soil, hardscape, or structures to prevent surface exposure of PCBs. The goal is to have zero discharge of residual PCBs at cleanup sites.

PCBs in aquatic environments require cleanup to ecological risk-based concentrations that are generally much lower than the one mg/kg human health level. For example, a San Francisco Bay tidal marsh PCB cleanup concentration was established at 90 ug/kg PCBs to protect clapper rails.

RECOMMENDED PCB ANALYTICAL METHODS

Sampling and analyses are needed to confirm that PCB levels are low enough to achieve the TMDL targets. For cleanup sites in the San Francisco Bay area, the analytical method for PCBs in soils should be capable of detecting total PCBs ***well below*** 1 mg/kg dry weight and approaching 25 ug/kg dry weight for soil, with a high likelihood that all PCBs present in the sample are detected. The Water Board's own Surface Water Ambient Monitoring Program uses a Reporting Level of 0.2 µg/kg for most PCB congeners in sediment.

Analytical methods that we know will attain this data quality objective, and that we recommend using at all cleanup sites, include the following:

- EPA Method 8270D (semivolatiles in soils/waste) modified by EPA Method 1625. Method 1625 is the application of isotope dilution/recovery correction to GC/MS methodology. Total PCBs are determined by summing the individual congener results. Results can be reported as either, or both, congeners or aroclors. Ball-park cost for this analysis is $375/sample.[1]
- EPA Method 1668A or 1668C, which combine high-resolution GC with high-resolution mass spectrometry (HRGC/HRMS). Results are reported for all 209 congeners in µg/kg dry weight. Ball-park cost for this analysis is $800-900/sample.[1] An alternative is to use the same method, but report results for the 40 PCB congeners monitored by the SF Bay Regional Monitoring Program: PCBs 8, 18, 28, 31, 33, 44, 49, 52, 56, 60, 66, 70, 74, 87, 95, 97, 99, 101, l05, 110, 118, 128, 132, 138, 141, 149, l51, 153, 156, 158, 170, 174, 177, 180, 183, 187, 194, 195, 201, and 203. Cost for this alternative may be about 15% less than the full congener analysis.[1]
- Note that cleanups conducted under the authority of the Toxic Substances Control Act (TSCA) have their own PCB analysis requirements. Contact the U.S. Environmental Protection Agency, Region 9, TSCA staff or see http://www.epa.gov/Region9/pcbs/ for further information.

Other analytical methods (such as 8082) generally do not identify and quantify all the PCB congeners that may be present at a cleanup site, which can result in inadequate cleanups. Municipalities are finding PCBs in roads and gutters that may be traced back to "closed" cleanup sites that did not use reasonably rigorous analytical methods and/or cleanup standards.

Methods such as 8082 identify and quantify aroclors by gas chromatography (GC) with an electron capture detector (ECD). Each aroclor consists of a number of PCB congeners. The aroclor is identified by the retention times of the highest peaks in the chromatogram, and is quantified by comparing the height or area of those peaks to those of a pure aroclor standard. Between 5-8 aroclors are typically reported in an 8082 method, depending on the lab method used. Some high production aroclor mixtures, such as 1270 (almost 100% congener 209), are rarely included in the method. In addition, PCBs in the environment undergo volatilization, partitioning, chemical transformation, photo-degradation, and biodegradation over time. These changes confound the matching of an environmental sample to an aroclor pattern. **As a result, other analytical methods often do not measure the total PCBs present in an environmental sample, and we do not recommend relying on such methods at this time.**

[1] Axys Analytical, personal conversation. May 1, 2012.

CAULK SAMPLING & ANALYSIS[2]

Structures, especially non-residential buildings, constructed or renovated between 1950 and 1980 may have PCBs in caulking and other building materials. A local study found that PCBs are prevalent in the caulk in Bay Area buildings constructed during that timeframe. PCBs were detected in 88% of the caulk samples tested; 40% of the samples contained > 50 ppm PCBs and 20% contained > 10,000 ppm PCBs. Please refer to the study's project page for more information about PCBs in caulks and sealants.

The following methods are recommended for sampling and analyzing caulk and sealants suspected of containing PCBs: Remove a one inch strip (or ~10 g) of the sealant sample from the structure using a utility knife with a solvent-rinsed, stainless-steel blade. Collect one sealant sample per sealant type on each structure to fully characterize the PCB content in the structure's sealants.

PCBs can be present in the percentage range in caulk, so a high resolution method is not necessary. EPA Method 8270 (semi-volatile organic compounds by gas chromatography-mass spectrometry) is appropriate. Report analytical results as the total of 209 PCB congeners, or the shorter list of 40 congeners above may be used.

BMPs for Controlling PCBs

Best management practices (BMPs) for controlling PCBs during removal from structures can be found at http://www.epa.gov/epawaste/hazard/tsd/pcbs/pubs/caulk/caulkcontractors.htm.

BMPs for controlling sediment during site grading and other construction activities are available at http://cfpub.epa.gov/npdes/stormwater/swppp.cfm.

[2] Further information on PCB-containing caulks and sealants can be found at http://www.sfestuary.org/projects/detail.php?projectID=29 and http://www.epa.gov/pcbsincaulk/.

CONTENTS

San Francisco Stormwater Design Guidelines

Stormwater management is a critical municipal responsibility that has a direct impact on public health and safety, surface water quality, and wildlife habitat.

Like many California municipal agencies, the San Francisco Public Utilities Commission (SFPUC) and the Port of San Francisco administer Stormwater Management Programs developed in accordance with the federal Clean Water Act and a State of California National Pollution Discharge Elimination System (NPDES) Permit.

NPDES permits for stormwater specify a suite of activities that municipalities must undertake to reduce pollution in stormwater runoff. One of these is the development, implementation, and enforcement of a program to reduce pollutants in stormwater runoff from new development and redevelopment projects. This effort is commonly referred to as a *post-construction stormwater control program*.

In February 2007, Port and SFPUC staff initiated a community planning effort to develop a regulatory guidance document that fulfills state and federal requirements for post-construction stormwater runoff control. The San Francisco Stormwater Design Guidelines (*Guidelines*) represent the culmination of this effort. The *Guidelines* describe an engineering, planning, and regulatory framework for designing new infrastructure in

Linked bioretention cells are a central part of the design for the Glashaus development in Emeryville, CA.

a manner that reduces or eliminates pollutants commonly found in urban runoff. The *Guidelines* are designed to work within the context of existing San Francisco regulations and policies, and are consistent with the City's and Port's Building Code and Planning Code requirements.

The *Guidelines* are currently directed primarily to San Francisco's **separate storm sewer areas**, which include the Port of San Francisco, Hunters Point Shipyard, Mission Bay, Treasure Island, Candlestick Point, and areas that discharge to inland receiving waters such as Lake Merced. However, the thresholds presented here and the general strategies described to achieve compliance also apply to **combined sewer areas**. While the thresholds and strategies are the same for both combined and separate sewers, the performance measures are different. For information about requirements in combined sewer areas, see page 62.

Low Impact Design

In keeping with San Francisco's policy goals for promoting sustainable development, the *Guidelines* encourage the use of Low Impact Design (LID) to comply with stormwater management requirements. LID applies decentralized, site strategies to manage the quantity and quality of stormwater runoff. LID integrates stormwater into the urban environment to achieve multiple goals. It reduces stormwater pollution, restores natural hydrologic function to San Francisco's watersheds, provides wildlife habitat, and contributes to the gradual creation of a greener city. LID can be integrated into all development types, from public open spaces and recreational areas to high-density housing and industrial areas.

Master-planned or Multi-Parcel Projects

Many future projects in San Francisco will be located in large redevelopment areas and will include construction of significant horizontal infrastructure and open space in addition to subdivided parcels and individual buildings. Master-planned projects, such as Treasure Island, Hunters Point Shipyard, and the Port's Sea Wall Lot 337, can make use of larger LID strategies that provide superior treatment, wildlife habitat, recreational amenities, and other benefits that may not be possible with smaller projects. Constructed wetlands and large-scale rainwater harvesting are just a few examples of LID strategies presented in these *Guidelines* that are ideally suited to large projects.

Using the Stormwater Design Guidelines

The *Guidelines* are intended to lead developers, engineers, and architects through a planning and design process that incorporates stormwater controls into site design. The *Guidelines* provide a policy overview, describe the regulatory context for post-construction stormwater control requirements, and explain how these requirements will be incorporated into San Francisco's planning and permit review process.

The *Guidelines* introduce the stormwater performance measures that must be achieved for project approval and provide detailed instructions for developing a Stormwater Control Plan (SCP), a document which will allow city staff to assess compliance. A worked example illustrates how to complete each step in the design process, and a template for the SCP is included at the end of the document. The *Guidelines* include compliance strategies, a decision tree to assist in the selection of stormwater controls, and spreadsheets for sizing stormwater controls. The requirements outlined in the *Guidelines* are of a technical nature and most project applicants will require the assistance of a qualified civil engineer, architect, or landscape architect in order to comply.

Every applicant seeking a building permit or every project that requires compliance with California Environmental Quality Act (CEQA) process on or after **January 1, 2010** for a new or redevelopment project over 5,000 square feet must complete a SCP showing that they have incorporated appropriate stormwater controls into their project and have met the stormwater performance measures described in these *Guidelines*. SFPUC and Port permit staffs will review SCP submittals for adequacy.

Native plants in bloom in the swales at the Sunset Circle parking lot, an LID feature that protects the water quality of Lake Merced.

Introduction

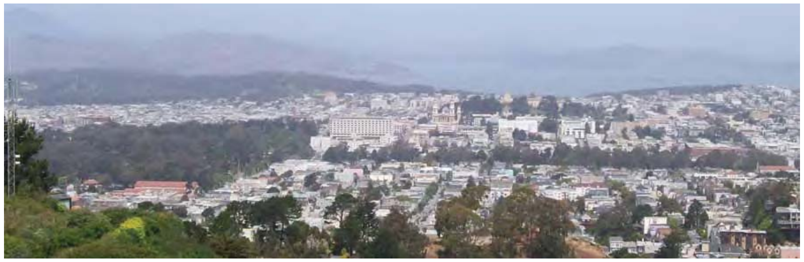
San Francisco's location adjacent to the Pacific Coast and San Francisco Bay, the largest estuary on the west coast of the United States, gives the City significant environmental, social, and economic advantages; it also confers unique responsibilities for water quality protection upon the City and its citizens.

The San Francisco Public Utilities Commission (SFPUC) and the Port of San Francisco (Port) have partnered to create the *San Francisco Stormwater Design Guidelines* (*Guidelines*) for San Francisco's developers, designers, engineers, and the general public. The *Guidelines* are designed to help project applicants implement permanent post-construction stormwater controls. Water quality regulations under the federal Clean Water Act require such controls for new and redevelopment projects in areas served by municipal separate storm sewer systems (MS4s).

While water quality protection is the fundamental driver behind stormwater management, well-designed stormwater controls offer many ancillary benefits. These *Guidelines* encourage innovative and multi-purpose design solutions for meeting stormwater requirements in San Francisco's urban setting. In addition to protecting water quality, well-designed multi-purpose solutions will contribute to attractive civic spaces, open spaces, and streetscapes. They will also protect and enhance wildlife habitat and have the potential to effectively integrate stormwater management into the redevelopment of historic sites.

By implementing the stormwater management strategies articulated in this document, each project applicant will contribute to the incremental restoration of the health of the City's watersheds, protect the Bay and Ocean, and build a greener San Francisco. Patrick Condon, Chair in Landscape and Livable Environments at the University of British Columbia, underscores the contribution that each site can make to a region: "What the cell is to the body, the site is to the region. And just as the health of the body is dependent on the health of the individual cells that make it up, so too is the ecological and economic health of the region dependent on the sites that comprise it."

The *Guidelines* function as both policy document and design tool. They explain the environmental and regulatory drivers behind stormwater management, demonstrate the concepts that inform the design of stormwater controls, describe the benefits that green stormwater infrastructure bring to San Francisco, and take project applicants through the process of creating a Stormwater Control Plan (SCP) to comply with stormwater regulations. The *Guidelines* are specific to San Francisco's environment; they reflect the city's density, climate, diversity of land uses, and varying topography.



Regulatory Context

The federal Clean Water Act (CWA) establishes the foundation for stormwater regulation across the country. State, regional, and municipal laws and policies under the CWA help to ensure that San Francisco's stormwater requirements are appropriate to the city's geography, climate, and development patterns.

The Clean Water Act

In 1972, Congress passed the Clean Water Act (CWA) to regulate the discharge of pollutants to receiving waters such as oceans, bays, rivers and lakes. Under the CWA, waste discharges from industrial and municipal sources are regulated through the National Pollutant Discharge Elimination System (NPDES) Permit Program. Approximately 90% of San Francisco is served by a **combined sewer system** (see map on page 10) that conveys both sewage and stormwater for treatment to three sewage treatment plants before being discharged to receiving water. Discharges from the treatment plants are subject to the requirements of NPDES permits.

Stormwater runoff, now recognized by the United States Environmental Protection Agency (EPA) as a leading contributor to water quality degradation in the United States, was unregulated until 1987 when section 402(p) was added to the CWA. Section 402(p) established a two-phase plan to regulate polluted stormwater runoff under NPDES. The Phase I permits, finalized in 1990, regulate **municipal separate storm sewer systems (MS4s)** serving populations of 100,000 or more. Stormwater discharges associated with certain types of industrial facilities and construction sites greater than five acres are also

Note: Map currently undergoing annual review. An updated version will be available in Janurary 2010.

Best Management Practices

Stormwater Best Management Practices (BMPs) are measures or programs used to reduce pollution in stormwater runoff. The EPA defines a BMP as a "technique, measure or structural control that is used for a given set of conditions to manage the quantity and improve the quality of stormwater runoff in the most cost-effective manner."

regulated under Phase I. Phase II permits, finalized in 2000, regulate MS4s serving populations of 100,000 or less.

The California State Water Resources Control Board (SWRCB) serves as the implementing agency for NPDES regulations. In 2003, the SWRCB issued the *General Permit for Discharges of Stormwater from Small Municipal Storm Sewer Systems* (General Permit) to regulate small MS4s. San Francisco's MS4 areas cover approximately 10% of the City and serve fewer than 100,000 people. They are therefore subject to Phase II requirements in the General Permit.

The General Permit

To comply with NPDES Phase II regulations, the General Permit requires agencies holding the Phase II NPDES Permit (SFPUC and Port) to develop Stormwater Management Plans (SWMPs) describing the measures that will be implemented to reduce pollution in stormwater runoff in the MS4 areas.

The General Permit requires Permittees to implement four measures for post-construction stormwater management in new and redevelopment projects located in areas served by separate sewers:

1. Develop, implement, and enforce a program to address stormwater runoff from new and redevelopment projects to ensure that controls are in place to prevent or minimize water quality impacts;
2. Develop and implement stormwater management strategies, including a combination of structural and/or non-structural best management practices (BMPs) appropriate for the community;
3. Use an ordinance or other regulatory mechanism to control post-construction runoff from new and redevelopment projects to the extent allowable under the law; and,
4. Ensure the adequate long-term operation and maintenance of BMPs.

Under the General Permit, Permittees have two options for adopting the post-construction stormwater management requirements listed above. The first is to use the minimum design standards listed in Attachment 4 of the Phase II General Permit as a framework for administering post-construction control programs (http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/final_attachment4.pdf).

The second option for compliance is for Permittees to develop a functionally equivalent program that is acceptable to the San Francisco Bay Regional Water Quality Control Board (RWQCB). The Port and the SFPUC have chosen to pursue the latter option by implementing these *Guidelines*, which are largely based on the C.3 Provision of the San Francisco Bay Area Phase I stormwater permits. The C.3 requirements are similar to those in the General Permit, but require more effort on the part of the Permittee to develop a post-construction control program suitable for its climate, geography and development patterns.

Effective January 1, 2010, these *Guidelines* will apply to all projects greater than 5,000 square feet in the City of San Francisco. The *Guidelines* **do not** apply to those projects that have received 1) building permits and/or 2) discretionary approvals by the San Francisco Planning Department, the San Francisco Department of Building

Project Type	Excluded Projects
Commercial, industrial or residential development	Projects with fewer than 5,000 square feet of developed area that are not part of a larger common plan of development.
Single family residential development	Construction of one single family home that is not part of a larger common plan of development and is fewer than 5,000 square feet, with the incorporation of appropriate source control measures, and using landscaping to appropriately treat runoff from impervious surfaces.
Redevelopment and repair projects	Interior remodels and routine maintenance and repair, such as roof replacement, exterior painting, utility trenching and repair, pier apron repair and pile replacement, pavement resurfacing, repaving and structural section rehabilitation within the existing footprint.
Parking lots	Parking lots of fewer than 5,000 square feet.

Table 1. *Projects excluded from Stormwater Design Guidelines requirements*

Requirement

All project sites with an area greater than 5,000 square feet must incorporate post-construction stormwater controls that meet the performance measures set forth in these *Guidelines*, including minimizing the sources of stormwater pollutants (see Source Controls, beginning on page 75) and treating a specified flow or volume of stormwater (see Treatment BMPs, beginning on page).

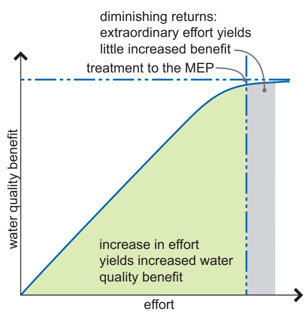

Figure 2. *As the maximum extent practicable (MEP) standard is approached, additional investment in BMPs yields reduced benefit.*

Inspection, the Port of San Francisco Planning Division, or the Port Building Department by January 1, 2010. All new project applications, incomplete project applications, and amendments received thereafter will be subject to these *Guidelines*. Table 1 lists the types of projects that are excluded from the *Guidelines*.

The RWQCB monitors San Francisco's implementation of General Permit requirements. The Port and the SFPUC must submit ongoing reports on their respective development review efforts, the number and type of projects reviewed, and the stormwater control measures included in the projects. To assess the effectiveness of stormwater control measures, the Port and SFPUC must define criteria for compliance. The RWQCB and the EPA require that stormwater control measures be designed to reduce pollution in stormwater runoff to the Maximum Extent Practicable (MEP).

The Maximum Extent Practicable Treatment Standard

MS4 permits require stormwater management strategies to "reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods."

Treatment to the maximum extent practicable (MEP) can be achieved by applying the BMPs that are most effective at treating pollutants in stormwater runoff. The SWRCB has said of the MEP standard that there "must be a serious attempt to comply, and practical solutions may not be lightly rejected." The SWRCB also states that if project applicants implement only a few of the least expensive stormwater BMPs, it is likely that the MEP standard has not been met. If, on the other hand, a project applicant implements all applicable and effective BMPs except those shown to be technically infeasible, or those whose cost would exceed any benefit to be derived, then the project applicant would have achieved treatment to the MEP. As technology and design innovation improve, stormwater BMPs become more effective. The definition of MEP continually evolves with the field to encourage innovation and improved water quality protection. Because of this, some end-of-pipe strategies such as vortex separators, which were considered to meet the MEP standard ten years ago, are no longer accepted as such. Similarly, in cases where just one BMP may have gained project approval in the past, today there are many cases where multiple BMPs will be required in order to achieve treatment to the MEP.

Pollutants of Concern

Because stormwater runs off of diverse sites, it mobilizes many kinds of pollutants. The following list summarizes the main categories of pollutants found in stormwater, their sources, and their environmental consequences.

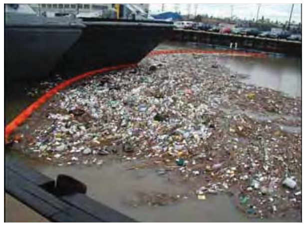
Gross pollutants mobilized by stormwater include litter, plant debris and floatable materials. Gross pollutants often harbor other pollutants such as heavy metals, pesticides, and bacteria. They also pose their own environmental impacts; they degrade wildlife habitat, water quality, the aesthetic quality of waterways, and are a strangling and choking hazard to wildlife.

Sediment is a common component of stormwater runoff that degrades aquatic habitat and can be detrimental to aquatic life by interfering with photosynthesis, respiration, growth, reproduction, and oxygen exchange. Construction sites, roadways, rooftops, and areas with loose topsoil are major sources of sediment. Sediment is a vehicle for many other pollutants such as trace metals and hydrocarbons. Over half the trace metal load carried in stormwater is associated with sediment. Because of this, sediment removal is a good indicator for reduction of a broader range of pollutants. For the purpose of developing stormwater controls, engineers and designers must consider both coarse and fine ("suspended") sediments.

Oil and grease include a wide range of organic compounds, some of which are derived from animal and vegetable products, others from petroleum products. Sources of oil and grease include leaks and breaks in mechanical systems, spills, restaurant waste, waste oil disposal, and the cleaning and maintenance of vehicles and mechanical equipment.

Nutrients like nitrogen and phosphorous are typically used as fertilizers for parks and golf courses and are often found in stormwater runoff. They can promote excessive and accelerated growth of aquatic vegetation, such as algae, resulting in low dissolved oxygen. Un-ionized ammonia, a form of nitrogen, can be toxic to fish. In San Francisco, nutrients carried in runoff are a significant concern for enclosed freshwater bodies such as Lake Merced, more so than they are for the San Francisco Bay and Pacific Ocean.

Oils and gross pollutants pose a significant threat not only to water quality but also to bay area wildlife.



Stormwater runoff transports trash to local water bodies, where it creates an aesthetic nuisance, harms wildlife, and pollutes receiving waters.

Pesticides (herbicides, fungicides, rodenticides, and insecticides) are often detected in stormwater at toxic levels, even when they have been applied in accordance with label instructions. As pesticide use has increased, so have concerns about their adverse effects on the environment and human health. Accumulation of these compounds in simple aquatic organisms, such as plankton, provides an avenue for biomagnification through the food web, potentially resulting in elevated levels of toxins in organisms that feed on them, such as fish and birds.

Organics can be found in stormwater in low concentrations. They include synthetic compounds associated with adhesives, cleaners, sealants, and solvents that are widely used and are often stored and disposed of improperly.

Bacteria can enter stormwater via sources such as animal excrement, decay of organic materials, and combined sewer discharges. High levels of bacteria in stormwater runoff can lead to beach closures and fishing advisories.

Dissolved metals including lead, zinc, cadmium, copper, chromium, and nickel are mobilized by stormwater when it runs off of surfaces such as galvanized metal, paint, automobiles, and preserved wood, whose surfaces corrode, flake, dissolve, decay, or leach. Metals are toxic to aquatic organisms, can bioaccumulate in fish and other animals, and have the potential to contaminate drinking water supplies.

PCBs and Mercury are legacy contaminants that are found in low concentrations in soils associated with historically industrialized areas. San Francisco Bay is listed by the USEPA as an "impaired water body" for these contaminants. Control of PCBs and mercury will be implemented through design measures that limit the mobilization of these pollutants in contaminated soils.

Synergy with other Regulations and Initiatives

The *Guidelines* are designed to work with San Francisco's existing and emerging regulatory programs and policies. For example, development along the San Francisco waterfront is subject to policies adopted by the Port of San Francisco and the San Francisco Bay Conservation and Development Commission (BCDC); the *Guidelines* are consistent with these policies. Federal, state, and local regulations most relevant to the *Guidelines* are shown in Table 2 at the end of this section.

There are three initiatives underway in San Francisco that directly affect stormwater management in the City and that propose policies parallel to those presented in these *Guidelines*: the *Sewer System Master Plan*, the *Better Streets Plan*, and the Green Building Ordinance. These mutually-supportive efforts are consistent with the stormwater management goals and requirements put forward here.

The SFPUC's *Sewer System Master Plan* (Master Plan) is a comprehensive plan that charts a long-term vision and strategy for the management of the City's wastewater and stormwater. The Master Plan is intended to maximize system reliability and flexibility and to lay a path for capital investment and management of the City's infrastructure for the next 30 years. The Master Plan presents Low Impact Design (LID) as a major tool for addressing the City's drainage management needs. LID is an innovative stormwater management approach that is modeled after nature: it advocates managing runoff at its source using decentralized micro-scale facilities. The Master Plan contains protocols for using LID in ongoing repair and replacement projects as a part of its overhaul of drainage infrastructure.

The *Better Streets Plan* is a collaborative effort between the SFPUC, the Planning Department, the Public Works Department, the City's transit agencies, and other relevant agencies, to create a unified set of standards, guidelines, and implementation strategies that will govern how the City designs, builds, and maintains the public rights-of-way. The goal of the *Better Streets Plan* is to update applicable standards to improve pedestrian safety, enhance landscaping, and identify innovative methods for reducing stormwater runoff from the streets and sidewalks to create a more attractive and sustainable public realm in San Francisco.

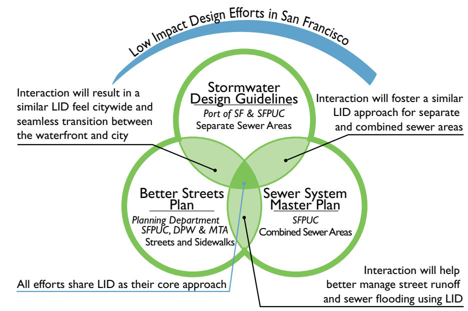


Figure 3. *LID is the common thread linking a number of major planning efforts currently underway in San Francisco.*

A cistern at Mills College in Oakland, CA is a stormwater BMP and a design element. Photo: Ingrid Severson

The Green Building Ordinance is a third initiative that will work in tandem with the *Guidelines*. The ordinance expands the scope of green building standards to apply not only to public buildings but also to private development and redevelopment projects in San Francisco. The task force was charged with creating building requirements that would foster environmentally sensitive design and sustainability in new development projects. As a part of this effort, SFPUC and Port staff developed stormwater management performance standards for new and redevelopment projects over 5,000 square feet. The Ordinance references the *Guidelines* and provides the regulatory authority to implement stormwater management requirements in combined sewer areas.

San Francisco Building Code Requirements

Projects that are implementing the *Guidelines* will also be subject to review by the San Francisco Department of Building Inspection (DBI) or the Port Building Department. Both DBI and the Port administer building codes that include provisions for managing drainage for new construction. Section 306.2 of the San Francisco Plumbing Code and Section 1506.1 of the San Francisco Building Code were amended on June 28, 2005 to allow roofs and other building areas to drain to locations other than the combined sewer. The 2005 amendments anticipated LID strategies such as downspout disconnection and rainwater harvesting, which are described in the *Guidelines*.

They now read as follows:

- **Plumbing Code, Section 306.2:** Roofs, inner courts, vent shafts, light well, or similar areas having rainwater drains shall discharge directly into a building drain or sewer, or to an approved alternate location based on approved geotechnical and engineering designs.
- **Building Code, Section 1506.1:** All storm or casual water from roof areas which total more than 200 square feet shall drain or be conveyed directly to the building drain or storm drain or to an approved alternate location based on approved geotechnical and engineering design. Such drainage shall not be directed to flow onto adjacent property or over public sidewalks. Building projections not exceeding 12 inches in width are exempt from drainage requirements without area limitations.

San Francisco Stormwater Design Guidelines

In the amended codes listed above, "approved alternate location" is the key phrase that allows for downspout disconnection and encompasses all properly designed stormwater management facilities, including rain barrels or cisterns.

In 2008, the SFPUC, DBI, and the Department of Public Health (DPH) signed a Memorandum of Understanding (MOU) for Rainwater Harvesting Systems. The MOU records a technology-based agreement between the three agencies, which concludes that project applicants can safely harvest rainwater and use it for non-potable applications such as toilet flushing, irrigation, and vehicle washing without treating it to potable standards. More detailed specifications and permitting requirements for rainwater harvesting can be found on the "Rainwater Harvesting" fact sheet in Appendix A.

An interior roof drain discharges to a vegetated swale in Emeryville, CA. This properly designed and permitted stormwater facility is an example of an "approved alternate location" for stormwater discharge.

Regulatory Context

Name/Title	Administered By	Summary
FEDERAL REQUIREMENTS		
National Pollutant Discharge Elimination System (NPDES) Phase II General Permit	California Regional Water Quality Control Board (RWQCB)	Requires municipalities to develop programs to control runoff pollution from both new and redevelopment projects. The *Guidelines* provide standards and guidance to implement the requirements of the Phase II Municipal General Permit.
NPDES Industrial Permits	RWQCB	Requires facilities subject to the requirements of the Industrial Permit to implement BMPs to prevent or reduce pollution in stormwater runoff. Newly constructed industrial facilities over 5,000 square feet must implement post-construction controls per requirements of the *Guidelines* .
Federal Clean Water Act 401 Certification	RWQCB	The RWQCB must certify that construction projects taking place in or over federal and state water bodies do not negatively impact water quality. The *Guidelines* will help project proponents comply with post-construction stormwater control requirements often included as conditions of 401 certification.
303(d) Impaired Water Bodies - Clean Water Act - Total Maximum Daily Load (TMDL) Program	RWQCB	San Francisco Bay and other water bodies are impaired by pollutants such as mercury and PCBs. TMDLs require pollutant sources to reduce levels of pollutant loading associated with water quality impairment. Stormwater treatment control selection should consider TMDL pollutant removal.
Secretary of the Interior's Standards for the Treatment of Historic Properties	National Park Service/California State Office of Historic Preservation	In order to qualify for Federal Rehabilitation Tax Credits, construction within designated Historic Districts must avoid or minimize changes that would adversely affect an historic resource's character defining features. Stormwater management measures selected for a given project must comply with these standards as applicable.
Americans with Disabilities Act (ADA) California Code of Regulations Title 24	San Francisco Department of Building Inspection (DBI) San Francisco Department of Public Works (SFDPW)	The ADA establishes requirements for accessibility to places of public accommodation and commercial facilities by individuals with disabilities. Stormwater management measures described in the *Guidelines* must accommodate ADA requirements, including curb ramp standards promulgated through SFDPW Order No. 175,387. Treatment controls located in the public right-of-way must comply with ADA architectural guidelines.
STATE REQUIREMENTS		
California Environmental Quality Act (CEQA)	San Francisco Planning Department	A process to review new and redevelopment projects for potential impacts to the environment and, as necessary, propose mitigation measures to substantially lessen the project's significant environmental effects. The *Guidelines* include measures that will substantially reduce water quality and hydrological impacts associated with new and redevelopment projects.
REGIONAL REQUIREMENTS		
San Francisco Bay Basin Plan	RWQCB	Designates the beneficial uses and water quality objectives designed to protect those beneficial uses for state waters in the San Francisco Bay Region. Stormwater management measures described in the Guidelines promote restoration and maintenance of beneficial uses for waters in and around San Francisco.
San Francisco Bay Sea Port Plan and San Francisco Special Area Plan Maritime Commerce, Land Use and Public Access	San Francisco Bay Conservation and Development Commission (BCDC)	Policies that guide BCDC regulation within 100 feet of the shoreline edge, including most of the Port's piers. Policies are geared to limiting Bay fill, protecting water quality, and encouraging maximum feasible public access that does not impact commercial maritime activities. Wherever practical projects should retain or restore native vegetation buffer zones, rather than hardscape shoreline development. Applicable to waterfront development within 100' of the shoreline. Stormwater management measures described in the *Guidelines* are consistent with BCDC policy goals.

Table 2. *Relevant jurisdictions, codes, and ordinances*

Name/Title	Administered By	Summary
SAN FRANCISCO REQUIREMENTS		
San Francisco Public Works Code	San Francisco Department of Public Works - Bureau of Streets and Mapping (SFDPW-BSM)	SFDPW-BSM permits and approves all work in the public right-of-way, streets and sidewalks (including paper streets). Permits tree-lawns and planting strips. Permits sidewalk, curb and gutter, pavement, or any other facilities in the public right-of-way improvements. Stormwater management measures described in the *Guidelines* must satisfy Public Works Code requirements for design and construction within the public right-of-way.
San Francisco Public Works Code	San Francisco Department of Public Works - Bureau of Hydraulics	San Francisco Department of Public Works - Bureau of Engineering provides technical review on behalf on the San Francisco Public Utilities Commission (SFPUC), and designs and contracts sewer improvements. Stormwater management measures described in the Guidelines must comply with engineering standards administered by San Francisco Department of Public Works - Bureau of Hydraulics.
San Francisco Better Streets Master Plan	Mayor's Office of Greening, San Francisco Planning Department, DPW, Municipal Transportation Agency, and the SFPUC	Guides design and construction within the public right-of -way and streets. Stormwater management measures proposed in the *Guidelines* are consistent with those considered in the *Better Streets Plan* . For design standards applicable to stormwater, the *Guidelines* will take precedence.
Waterfront Land Use Plan - Waterfront Design and Access Element	Port of San Francisco	Guides the physical form of the waterfront revitalization envisioned in the *Port Waterfront Land Use Plan;* provides guidance on public access and waterfront accessibility, planting (both the presence and type of vegetation), protection and preservation of historic resources; and defines distinct geographic areas wherein specific design criteria apply.
Recycled Water Policy	San Francisco Department of Public Health (DPH)	Recycled water must be treated to Title 22 standards, which differ according to the proposed use of the water.
Rainwater Harvesting Policy	Department of Building Inspection (DBI), SFPUC, and the DPH	Rain barrels less than 100 gallons may be installed without a permit if they are used for irrigation and not connected to indoor or outdoor plumbing. Permits must be obtained from DBI for rainwater harvesting systems over 100 gallons that are connected to indoor or outdoor plumbing and are used for irrigation or toilet flushing. Rainwater harvesting systems for indoor uses other than toilet flushing must obtain permits from DBI and DPH.
Greywater Policy	DBI and the DPH	Untreated greywater may be used for subsurface irrigation. For all other uses, greywater must be treated to Title 22 standards, which differ according to the proposed use of the water.
Plumbing and Connections	DBI	The Plumbing Inspection Division (PID) of DBI is responsible for assuring, through permitting and inspection, the proper functioning for installations of drainage, water, gas, and other mechanical systems covered in the Plumbing and Mechanical Codes. These inspections are carried out in buildings that are newly constructed, remodeled, or repaired. Stormwater management measures must be implemented in a manner that satisfies DBI requirements.
San Francisco Planning Code, Article 10	San Francisco Planning Department, Landmarks Preservation Advisory Board and the City Planning Commission	Exterior alterations to San Francisco properties that are designated local landmarks will be reviewed for consistency with requirements set forth in the Secretary of the Interior's Standards for the Treatment of Historic Properties. Stormwater management measures described in the *Guidelines* must comply with Article 10 and the Secretary Standards.
San Francisco Health Code, Article 22A	DPH	The Maher Ordinance regulates construction and post-construction activities for properties constructed on fill materials adjacent to the historic Bay shoreline. Much of the waterfront and other areas in San Francisco are subject to the Maher Ordinance. Soil and groundwater in areas of the San Francisco Waterfront subject to the Maher Ordinance may contain pollutants that preclude the use of stormwater treatment controls using infiltration.

Boardwalks provide access across waterfront bioretention facilities in Seattle, WA.

Before San Francisco developed into the thriving city it is today, it consisted of a diverse range of habitats including oak woodlands, native grasslands, riparian areas, wetlands, and sand dunes. Streams and lakes conveyed and captured rainwater. Wetlands lined the Bay and functioned as natural filtering systems and as buffers from major storms. Rainwater infiltrated into the soil, replenishing groundwater supplies and contributing to stream base flow.

The Urban Watershed

Watershed function

Today, impervious surfaces such as buildings, streets, and parking lots have covered most of the City, preventing rainfall infiltration. Over time, creeks were buried and connected to the sewers, and wetlands were filled. Instead of percolating into soils, runoff now travels over impervious surfaces, mobilizes pollutants like oil and debris, and washes them into the sewer system or receiving water bodies—creeks, lakes, San Francisco Bay, and the Pacific Ocean. During heavy rain events, stormwater runoff can contribute to localized flooding, combined sewer discharges, and the degradation of surface water quality. Moreover, the decrease in infiltration resulting from paved surfaces contributes to groundwater depletion. LID can help to mitigate these adverse effects. With every project contributing incremental improvements, San Francisco can work toward restoring natural hydrologic function in its urban watersheds.

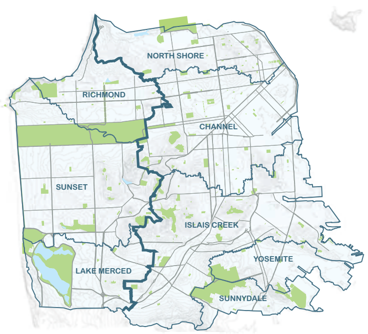

Figure 4. *San Francisco's topography divides the Westside Basins from the Eastside Basins.*

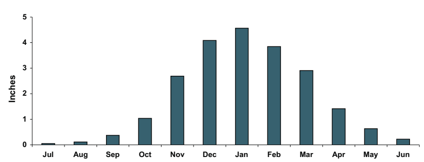

Figure 5. *Average monthly rainfall for San Francisco.*
Source: National Weather Service Gage, Federal Office Building, July 1907 to June 1978

Environment

San Francisco is roughly divided into two major drainages: the eastern and western basins (see Figure 4). These are comprised of eight major sub-basins containing diverse urban neighborhoods with a range of residential, commercial, and industrial land uses, open spaces, and natural areas. Each sub-basin is underlain with unique topography, hydrology, soils, vegetation and water resources that create opportunities and challenges for drainage and stormwater management.

San Francisco has a temperate Mediterranean climate, with dry summers and rainy winters (see Figure 5). In a typical year, San Francisco receives less than an inch total of rain from May through September and an average of 20 inches of rain between November and March. Rainfall is not distributed evenly across the City. It ranges from approximately 22 inches in the south, to 20 inches along the western edge and northeastern quadrant, to 18 inches in the extreme northeast. Like all Mediterranean climates, San Francisco experiences periods of drought punctuated by intense winter rains, often resulting in water scarcity in the summer and flooding in the winters.

The potential for stormwater to infiltrate varies dramatically by location. Infiltration may be limited in areas that have steep slopes, shallow depth to bedrock or to the water table, clay soils, contaminated soils, or are built on bay mud and fill over former creeks and wetlands. However, in many areas of the City, particularly in the western basins, soils are generally sandy and have the potential to provide excellent infiltration rates and pollution removal. Where infiltration is limited, a wide array of stormwater management strategies that do not depend upon infiltration can be implemented.

San Francisco Stormwater Design Guidelines

San Francisco's Stormwater Infrastructure

While the creation of these *Guidelines* is driven primarily by regulatory requirements for the City's separate sewer areas, the majority of San Francisco (90%) is served by a combined sewer system (see Figure 6). The stormwater management goals for areas served by separate storm sewers are different from those for areas served by the combined sewer system. Despite this, many of the fundamental design concepts for stormwater management apply to both areas, and as such, the *Guidelines* can be used as a tool in both the separate and combined sewer areas of San Francisco. Using landscape-based stormwater infrastructure will enhance and diversify the functions of both the separate and combined systems.

Approximately 10% of the City is served by a **separate storm sewer system** or is lacking stormwater infrastructure; in most of these areas stormwater flows directly to receiving waters without treatment. In the separate storm sewer areas, the primary reason for implementing post-construction controls is to improve stormwater quality before it reaches a receiving water body. These controls are aimed at removing specific pollutants of concern and treating what is known as the "first flush". The first flush is the dirtiest runoff, usually generated during the beginning of a rain event; it mobilizes the majority of the pollutants and debris that have accumulated on impervious surfaces since the last rain.

A **combined sewer system** conveys wastewater and stormwater in the same set of pipes. The combined flows receive treatment at wastewater treatment plants before being discharged to the Bay and Ocean. Conventional separate storm sewer systems provide no stormwater treatment, while combined sewer systems treat most urban runoff to secondary standards, including the first flush and most additional stormwater runoff. However, when the capacity of the system is exceeded by large storm events, localized flooding and combined sewer discharges (CSDs) can occur. In the event of a CSD, the system discharges a mixture of partially treated sanitary effluent and stormwater to receiving water bodies. While these discharges are dilute (typically consisting of roughly six percent sewage and 94 percent stormwater), they can cause public health concerns and lead to beach or Bay access closures.

The primary reason for implementing LID measures in a combined sewer system is to reduce and delay the volumes and peak flows of stormwater reaching the sewer system. Volume reductions and peak flow desynchronization can help reduce the number of CSDs, reduce flooding, and protect water quality. Post-construction controls in the combined system can also improve the capacity and efficiency of the City's treatment facilities.

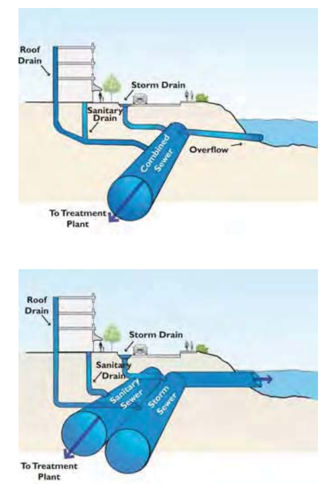

Figure 6. *Combined sewer systems (top) serve 90% of San Francisco. Separate sewer systems (bottom) serve 10%. Image: modified from King County Wastewater Management Division*

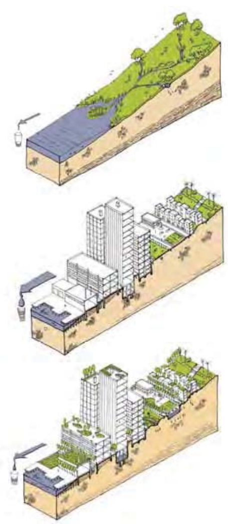

Figure 7. *Low Impact Design seeks to reduce runoff and restore hydrologic function through effective site planning, increased permeability, and landscape-based BMPs.*

Managing Stormwater in San Francisco

Low Impact Design

To lessen the impacts of urbanization on stormwater quality and peak flows, cities around the world are taking advantage of Low Impact Design (LID), which promotes the use of ecological and landscaped-based systems to manage stormwater. LID aims to mimic pre-development drainage patterns and hydrologic processes by increasing retention, detention, infiltration, and treatment of stormwater runoff at its source. This decentralized approach not only treats stormwater at its source and facilitates the best and highest use of stormwater; it also allows greater adaptability to changing environmental conditions than do centralized conveyance systems.

LID strategies direct runoff to BMPs such as flow-through planters, swales and rain gardens. These BMPs capture, filter, and slow stormwater runoff, thereby improving stormwater quality and reducing the quantity of runoff. Strategic placement of BMPs helps to ameliorate the negative water quality and ecosystem impacts of impervious surfaces. LID also emphasizes the integration of stormwater management with urban planning and design and promotes a comprehensive, watershed-based approach to stormwater management.

Figure 7 shows how LID can be incorporated into an urban setting like San Francisco without compromising its character and livability. Vegetated roofs and landscaped areas minimize the amount of stormwater runoff. BMPs are incorporated into the fabric of the city, doubling as recreational areas, wildlife habitat, and landscaping. These measures may increase initial capital costs (approximately 3%), but they bring multiple benefits to the site and the city: not only do they protect water quality and provide open space, they may also decrease downstream stormwater infrastructure costs because they lessen stormwater flows and volumes.

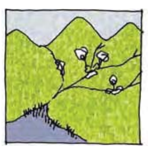
The most effective application of LID is a comprehensive approach that includes *site design*, *source controls*, and *treatment controls*. Careful site design can minimize the impacts of stormwater runoff from the outset. The more that stormwater management is integrated into the design process, the easier it is to create a successful and multi-purpose stormwater management strategy for a given site. The following pages list a set of goals to guide site design.

Mint Plaza, San Francisco, CA is an example of how LID can be integrated into an ultra-urban setting. The design includes rain gardens, permeable paving, and a subsurface infiltration gallery.

Figure 8. Site Design Goals

1. Do no harm: preserve and protect existing waterways, wetlands, and vegetation.

Creeks and wetlands are natural drainage features that can define the character and aesthetic value of a site. Moreover, they are already designed to convey and treat stormwater. Trees and ground cover act as natural stormwater management measures. They capture rainwater in their foliage, slow its progress through the landscape, and facilitate its infiltration into the soil.



2. Preserve natural drainage patterns and topography and use them to inform design.

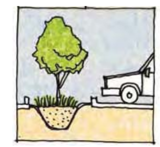
Existing topography and drainage networks can be used as a framework around which to organize development. Changing the topography of a site through grading significantly increases the chances of diminishing water quality by delivering sediment to receiving waters; it also increases project costs.

3. Think of stormwater as a resource, not a waste product.

Stormwater has traditionally been viewed as a nuisance to be eliminated. It is actually an untapped resource that can offset potable water use for irrigation, toilet flushing, cooling towers, and many other applications. It also offers opportunities to create interesting and site-specific designs using water features, rain-irrigated landscapes, and educational elements.

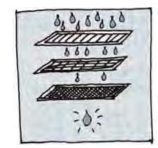
4. Minimize and disconnect impervious surfaces.

Minimizing and disconnecting impervious surfaces allows designers to treat relatively small volumes of runoff from multiple surfaces on a site, rather than treating relatively large volumes of stormwater that have mobilized diverse pollutants from impervious surfaces across an entire site. Disconnecting impervious surfaces and directing runoff to BMPs can be thought of as creating an obstacle course for stormwater; it increases the time needed for runoff to travel from its source to its discharge point, thereby increasing opportunities for treatment, flow reduction, and volume reduction.



5. Treat stormwater at its source.

Treating stormwater pollutants at their source can reduce the need to treat multiple pollutants or higher pollutant loads further downstream in the drainage area. Treating at the source can result in smaller, less costly and more effective stormwater treatment facilities.

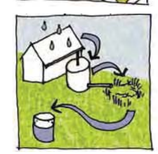


6. Use treatment trains to maximize pollutant removal.

In most scenarios, treatment to the MEP cannot always be achieved with a single BMP. In most cases, a series of linked BMPs called a treatment train must be used to maximize pollutant removal. Like a series of ever-finer sieves, treatment trains clean stormwater by running it through a series of BMPs, each designed to remove specific pollutants, from large pieces of trash, to suspended solids, to dissolved pollutants.

7. Design the flow path of stormwater on a site all the way from first contact to discharge point.

It is important to delineate the path of travel of stormwater from its first surface contact (where it changes from rain to stormwater runoff) to its final discharge point after treatment. All BMPs must have an approved overflow discharge location for storm flows that exceed the design criteria and in case of clogging.



The Ekostaden residential development in Malmo, Sweden, channels all stormwater runoff through BMP treatment features such as bioswales, ponds, and wetlands as shown here.
Photo: Brooke Ray Smith

During the site design process, designers should identify potential sources of stormwater pollution and select appropriate source controls to minimize their impacts. Source controls are stormwater management measures that prevent pollutants from entering stormwater runoff. Source controls can be design measures, such as enclosing trash areas to prevent trash from contacting stormwater; materials choices, such as using non-toxic roofing materials to prevent runoff from entraining pollutants from roof contact; and operational procedures, such as sweeping streets. See page 81 of the *Guidelines* for a description of how to select and locate source controls.

Site design strategies and source control measures minimize the quantity and improve the quality of stormwater runoff from a site. However, it is impossible to eliminate all surfaces that will contribute runoff. Treatment controls must therefore be implemented to accommodate the remaining runoff from the site. Treatment controls are permanent stormwater facilities such as vegetated swales or flow-through planters that are designed to receive and treat runoff from the site. Treatment control BMPs are typically designed to accomplish one or more of the following five stormwater treatment strategies: infiltration, detention, biofiltration, harvesting or retention, or bioretention. Each of these treatment strategies is described in Appendix A. Infiltration is typically the easiest and most cost-effective strategy for managing stormwater but, in areas where this is not feasible, designers can use a combination of the other four strategies. See page 83 of the *Guidelines* for a description of how to select, locate, and size treatment controls.

Multi-Purpose Design

Low Impact Design can be integrated into the site design process in a way that protects water quality, contributes to the quality of the site design, and meets the stormwater performance measures required by the Port and SFPUC.

LID is the multi-purpose integration of infrastructure, architecture, and landscape and can be a catalyst for design innovation in all three disciplines. LID can integrate water quality protection with improvements to the public realm, create and enhance urban wildlife habitat, promote responsible use of water, and advance environmental education and watershed stewardship.

Traditional urban design goals can also be achieved through the implementation of stormwater BMPs. Stormwater facilities can enhance the aesthetics of the built environment, increase pedestrian safety, calm traffic, make streets and public spaces greener, and provide structure, texture, and identity to the City's streets and other public spaces.

Stormwater BMPs bring designers a diverse palette of paving surfaces, vegetation, and drainage strategies, and also a new purpose that can inform design: to improve water quality and restore ecological function.

Open space is a valuable amenity in San Francisco, now the second densest city in the nation. LID measures can double as **civic spaces**, **open spaces and recreational areas**: a constructed wetland filters stormwater and could be the center of a neighborhood nature

Rain gardens and a creek daylighting project are the centerpieces of open space adjacent to the Headwaters development in Portland, OR.

A community in Germany integrates LID into the parking.

area; a vegetated roof that reduces stormwater discharge can also be a gathering area. At Potsdamer Platz, Berlin, Germany, stormwater management strategies include rainwater harvesting for non-potable uses such as toilet flushing and fire safety, vegetated treatment modules, and water features. Stormwater management forms the centerpiece of this major civic space.

LID can also contribute to San Francisco's **urban ecosystem** by enhancing existing wildlife habitats and creating new ones. San Francisco's trees are concentrated in its parks, not on its streets; the city has roughly 40% fewer street trees per mile than the national average and many of its tree lawns and tree wells have been paved over. Expanding the City's urban forest with careful attention to species selection would simultaneously address stormwater issues, increase wildlife habitat, improve air quality, and create a network of green corridors that would contribute to the aesthetics and health of the City's neighborhoods. Habitat can also be created by implementing stormwater BMPs on the roofs and walls of buildings. In London, England, and Basel, Switzerland, vegetated roofs are being used to provide patches of foraging, breeding, and nesting habitat for endangered wildlife. See Appendix D for a vegetation palette listing climate appropriate plants and their habitat value.

Integrating LID into the **streetscape** yields a more attractive pedestrian realm through the inclusion of vegetated curb extensions, sidewalk planters, street trees, pervious surfaces, and other stormwater BMPs that add attractive, pedestrian-scale details. These elements can simultaneously achieve stormwater management goals and improve streets for pedestrians and local residents by encouraging walking, reducing noise, and calming traffic. They can improve neighborhood aesthetics, safety, quality of life, and even property values. In Vancouver, B.C., Canada, a stormwater management project on Crown Street eliminated curbs, added clustered parking, and designed infiltration areas underneath the parking. The narrow street and clustered parking allows more space to be dedicated to biofiltration areas and plantings, which create a lush and pleasant streetscape.

Stormwater is also a valuable **water resource**. Using stormwater on-site rather than releasing it downstream decreases demand for potable water and can protect receiving waters by reducing runoff rates, volumes, and pollutant loads. Rain barrels and cisterns collect stormwater and store it for later use in irrigation and toilet flushing, uses that unnecessarily burden potable water supplies. Stormwater can even contribute to future potable water supplies, by recharging underground aquifers. In Cambria, California, a two-million gallon cistern beneath an athletic field harvests rainwater from the Cambria

Elementary School site. The water is sufficient for year-round irrigation of the multiple athletic fields.

LID can also be a useful tool for **environmental education** when it is integrated into school curricula, public outreach, or interpretive signs. LID concepts can be presented at many different levels of complexity, from an introduction to watersheds to an explanation of the hydrologic cycle and environmental stewardship. LID concepts touch upon numerous disciplines, including biology, ecology, watershed planning, engineering, design, and resource management. The Eco-Center at Heron's Head Park in the Bayview-Hunters Point neighborhood is an environmental education center for local students of all ages. Educational programs at the Eco-Center focus on habitat conservation and community stewardship. A collaboration between Literacy for Environmental Justice, the Port of San Francisco, and the San Francisco Department of the Environment, the Eco-Center includes a vegetated roof, rainwater harvesting, photovoltaic panels, solar hot water generation, native planting, and other LID features. At the time of writing these *Guidelines*, this project was under construction.

Lastly, LID can help the design and development community achieve **environmental performance measures**, which aim to minimize the environmental impacts of development and provide high quality, healthy environments. In San Francisco, both Leadership in Energy and Environmental Design (LEED®), a green building rating system developed by the U.S. Green Building Council, and the GreenPoint Rated system, a rating system developed by the non-profit Build It Green, are being used to assess the environmental quality of site and building design. In both systems, stormwater management facilities can earn points toward certification.

Environmental Justice

Over the past decade, increased attention has been given to the disproportionate impact of environmental pollution on socio-economically disadvantaged communities. The USEPA defines environmental justice as "the fair treatment of people of all races, cultures and income, regarding the development of environmental laws, regulations and policies." This issue is of concern in many areas of San Francisco, and in particular the Bayview-Hunters Point neighborhood, former home to Hunters Point Shipyard, the only federal Superfund site in San Francisco.

The Bayview-Hunters Point neighborhood contains over 100 brownfield sites. The residents of the primarily African-American neighborhood have borne the environmental and health impacts of these brownfield sites. The *Guidelines* proposes LID measures that can effectively manage stormwater runoff at the Shipyard and other areas of Bayview-Hunters Point, while at the same time improving the quality and safety of neighborhoods by providing attractive landscape features, traffic calming measures, and a safer pedestrian realm.

A vegetated roof and other LID features at the Eco-Center at Heron's Head Park help illustrate sustainable design practices to students in San Francisco's Bayview-Hunters Point neighborhood.

LEED Category	Credits		Points
Sustainable Sites	SS6.1	Stormwater quantity control	1
	SS6.2	Stormwater quality control	1
	SS5.1	Protect or restore habitat	1
	SS5.2	Maximize open space	1
	SS7.1	Urban heat island effect - non-roof	1
	SS7.2	Urban heat island effect – roof	1
Water Efficiency	WE1.1	Water efficient landscaping - reduce by 50%	1
	WE1.2	Water efficient landscaping - no potable water use or no irrigation	1
	WE2	Innovative wastewater technologies	1
	WE3.1	Water use reduction - 20% reduction	1
	WE3.1	Water use reduction - 30% reduction	1
		Total stormwater-related credits	**11**

Table 3. *LEED® credits related to stormwater in LEED-NC® Version 2.2.*

In Southern California, Santa Monica's Main Library used an innovative stormwater management design to help achieve its water-saving goals and receive a LEED Gold rating: a 225,000-gallon cistern under the building stores stormwater for irrigation of both landscaping at the library and adjacent street plantings.

Many of the LEED certification systems include credits that explicitly address stormwater. In LEED for New Construction, these credits are in the Sustainable Sites category (see Table 3). Implementing LID measures such as habitat enhancement, reduction of impervious surfaces,

The Academy of Sciences in Golden Gate Park is targeting LEED Platinum certification and includes a 2.5 acre vegetated roof.
Photo: Rana Creek - Living Architecture

vegetated roofs, and rainwater harvesting can also help project applicants earn credits in other areas.

The GreenPoint Rated system includes many measures that are related to stormwater, although it does not propose any quantitative performance measures for stormwater management (Table 4). Stormwater-related points can be earned in the areas of site design, landscaping, exterior finishing, and innovation in the water category. To be considered GreenPoint Rated, a home must achieve 50 total points, with a minimum number of points in each of the five environmental categories (Community, Energy Efficiency, Indoor Air Quality, Water Conservation and Resource Conservation). Single family projects require at least eight points earned in the water category, while multifamily projects require at least three points earned in the water category. The GreenPoint Rating system specifically encourages rainwater harvesting and water efficient landscaping.

GreenPoint Checklist	Feature		Points (Category)
Multifamily	A.3.a.	Protect soil & existing plants & trees	1 (Community)
	A.7.c.	Specify drought-tolerant California natives, Mediterranean or other appropriate species	1 (Water)
	A.7.d.i.	Mulch all planting beds to a depth of 2 inches or greater as per local ordinance	1 (Water)
	A.7.d.ii.	Amend with 1 inch of compost or as per soil analysis to reach 3.5 % soil organic matter	1 (Water)
	A.7.e.i.	Specify smart (weather-based) irrigation controllers	1 (Water)
	A.7.e.ii.	Specify drip, bubblers, or low-flow sprinklers for all non-turf landscape areas	1 (Water)
	A.7.f.	Group plants by water needs (hydrozones)	1 (Water)
	A.9.	Cool site through permeable paving (minimum of 30% of site)	1 (Community)
	C.12.a.	A portion of the low-slope roof area is covered by a vegetated or "green" roof (25% or greater)	1(Community) 1(Water)
	D.14.b.	Use captured rainwater for landscape irrigation or to flush 5% of toilets and/or urinals	4 (Water)
	F.2.a.	Provide O & M manual to building maintenance staff	1 (Energy)
	F.2.b.	Provide O & M manual to occupants	1 (Energy) 1(Water)
		Total points:	**17**
Single Family	A.1.a.	Protect topsoil from erosion & reuse after construction	1 (Community) 1 (Water)
	A.1.b.	Limit & delineate construction footprint for maximum protection	1 (Water)
	C.1.a.	No invasive species listed by Cal-IPC are planted	1 (Water)
	C.1.c.	75% of plants are California natives or Mediterranean species or other appropriate species	3 (Water)
	C.4.	Plant shade trees	3 (Water)
	C.5.	Group plants by water needs (hydrozoning)	2 (Water)
	C.6.a.	System uses only low-flow drip, bubblers or low-flow sprinklers	2 (Water)
	C.6.b.	System has smart (weather-based) controllers	3 (Water)
	C.7.	Incorporate 2 inches of compost in the top 6-12 inches of soil	3 (Water)
	C.8.	Mulch all planting beds to the greater of 2 inches or local water ordinance requirement	2 (Water)
		Total points:	**22**

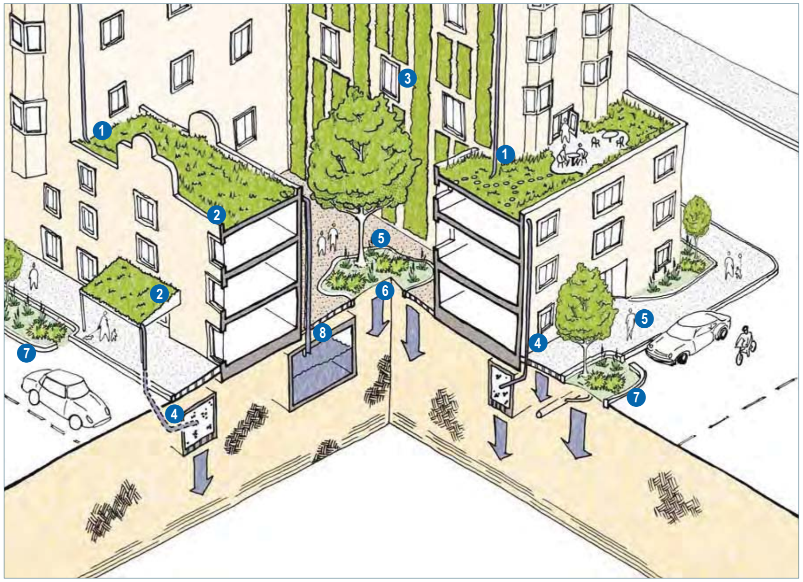
Integrating LID into San Francisco's Urban Landscape

The illustrations on the following pages show how LID can be integrated into San Francisco's diverse land uses to both protect water quality and contribute to the character of a given location. The figures illustrate stormwater management strategies appropriate for each of the following land uses:

- High-density Residential
- Low-density Residential
- Mixed Use
- Industrial
- Open Space and Natural Areas
- Piers over Water
- Former Shipyards

The figures are not meant to provide a comprehensive list of stormwater design solutions that are possible in San Francisco. Rather, they offer ideas and examples of the benefits that result from the implementation of multi-purpose LID.

A creek daylighting project in Zurich, Switzerland protects and improves water quality, by keeping it out of the sewer, and transforms the streetscape.



High-density Residential

Figure 9. High-density Residential

In San Francisco, high-density residential development is classified as 40 or more living units per acre. Some defining characteristics of high-density residential are zero-lot line development, reduced, public open space, and high levels of imperviousness. In this context, the greatest opportunities for stormwater management reside in replacing impervious surfaces with pervious surfaces and adding green space to roofs and interior courtyards. Ample roof space with relatively low pollutant loads provides opportunities for eco-roofs and rainwater harvesting. Interior courtyards can accommodate landscape-based BMPs, permeable paving, and subsurface treatment or capture systems. Sidewalks and streets adjacent to high-density residential development are often the nearest public open spaces available to residents. As such, they are ideal places to site stormwater management BMPs that also improve streetscape aesthetics and provide wildlife habitat, such as biofiltration areas, street trees, green walls, and bioretention bulbouts. All of these measures help to manage stormwater runoff; they also reduce the volumes of stormwater generated by the site in the first place.

1. Downspout Discharges to Vegetated Roof to Reduce Runoff
2. Vegetated Roof to Reduce Runoff
3. Green Wall to Slow Runoff
4. Downspout Connected to Dry Well
5. PermeablePaving in Pedestrian Areas
6. Rain Garden for Bio-Infiltration
7. Bio-Retention Planter with Curb Cuts
8. Downspout Connected to Large-Scale Cistern for Rainwater Harvesting

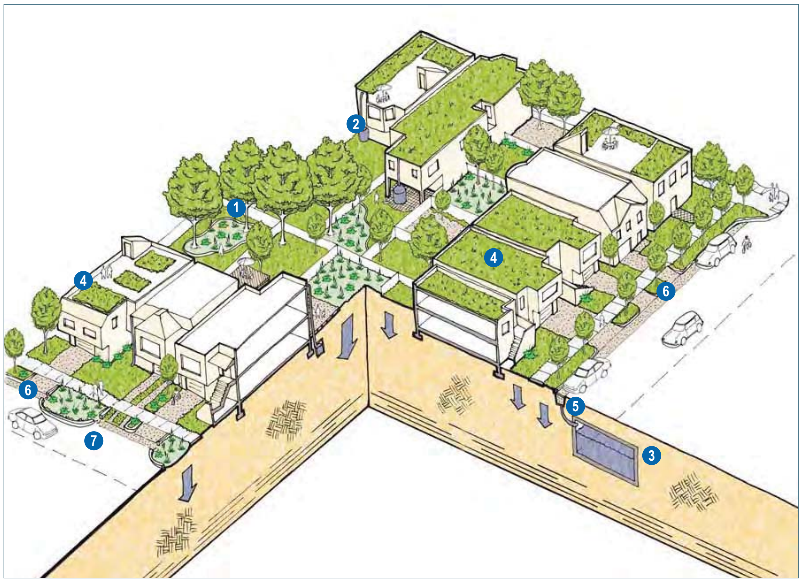


Figure 10. Low-density Residential

In San Francisco, low-density residential development refers to 24 living units per acre or fewer. Low-density residential parcels typically include open space in the form of yards and setbacks, wider sidewalks than those found in high-density residential, and rooftops that are more likely to be under the control of a single owner. Low-density residential parcels therefore tend to both generate less stormwater and have more space in which to manage stormwater than high-density areas. Diverse parcel sizes and shapes, along with variability in building footprints, provide opportunities for site-specific stormwater management designs.

2. Downspout Connected to a Rain Barrel
3. Cistern to Store Rainwater for Irrigation
4. Vegetated Roof to Reduce Runoff
5. Infiltration Trench
6. Permeable Paving
7. Bio-Retention Planter with Curb Cuts

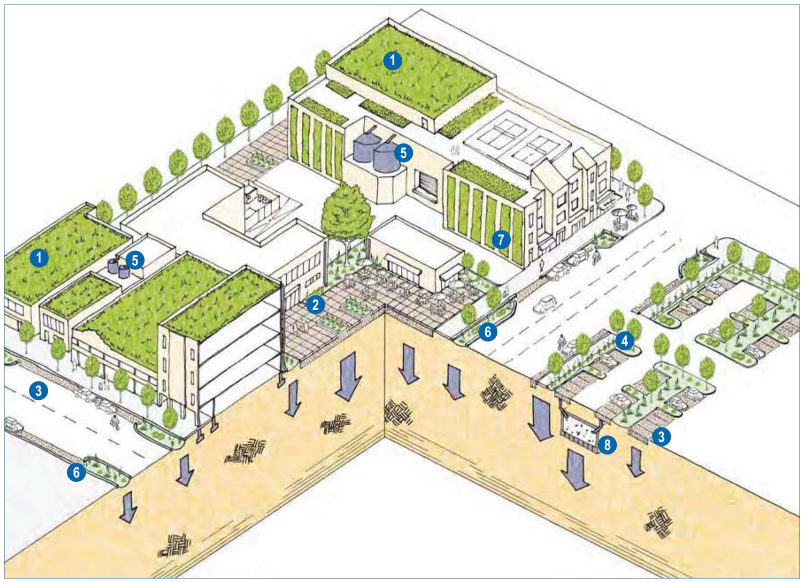

Figure 11. Mixed Use

Many new, redevelopment, and infill projects in San Francisco include mixed-use areas. Mixed use development fosters a high level of activity throughout the day, resulting in an active public realm. Roofs, public plazas, setbacks, parking lots, and the public right-of-way are all spaces that can double as LID measures that improve the quality of the public realm and achieve stormwater management goals. Of these spaces, roofs generally have the lowest pollutant loads while streets have the highest. The commercial elements of mixed use development sometimes require special attention. For example, restaurants and light industrial activities will need to implement source controls targeting grease, litter, and other food wastes.

2. Permeable Paving in Pedestrian Areas
3. Permeable Paving in Parking Areas
4. Swales in Parking Lots
5. Cistern to Store Rainwater for Toilet Flushing
6. Bio-Retention Planter with Curb Cuts
7. Green Wall to Slow Runoff
8. Dry Well

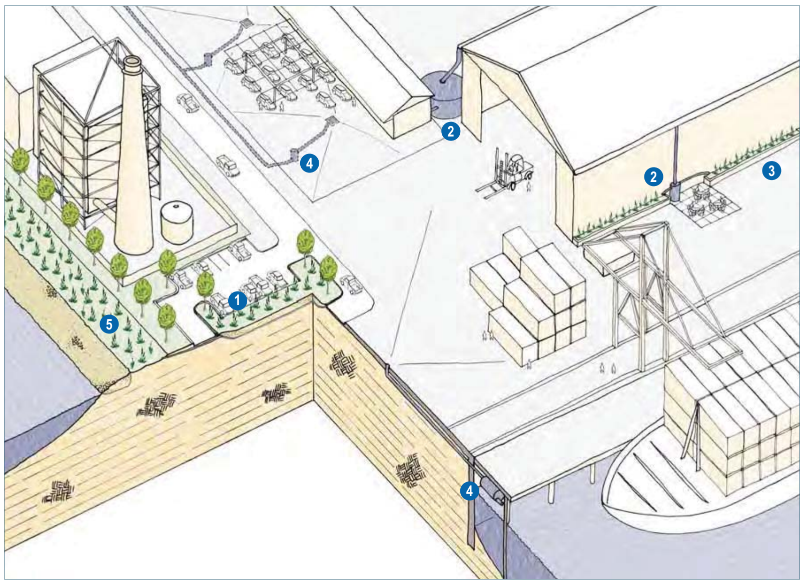

Figure 12. Industrial

Industrial land uses in San Francisco are concentrated in the Bayside watersheds. Because industrial areas often contain potentially polluting activities coupled with large impervious areas, treating stormwater on-site in these areas is essential. Industrial land use is generally characterized by large, low-density structures that provide ample space for treatment measures. Stormwater management strategies in industrial areas can serve not only to protect water quality but also to provide high quality rest areas for workers, act as a buffer for adjacent land uses, and maintain public access to waterfront open space where appropriate. Pollutants associated with industrial activities – chemical waste storage, for example – require special source control strategies such as hydraulic isolation and treatment in areas where polluting activities occur.

1. Swales in Parking Lots
2. Cisterns to Store Rainwater for Vehicle Washing
3. Flow-through Planters to Improve Water Quality
4. Vortex/Swirl Separator or Media Filter
5. Vegetated Buffer Strip

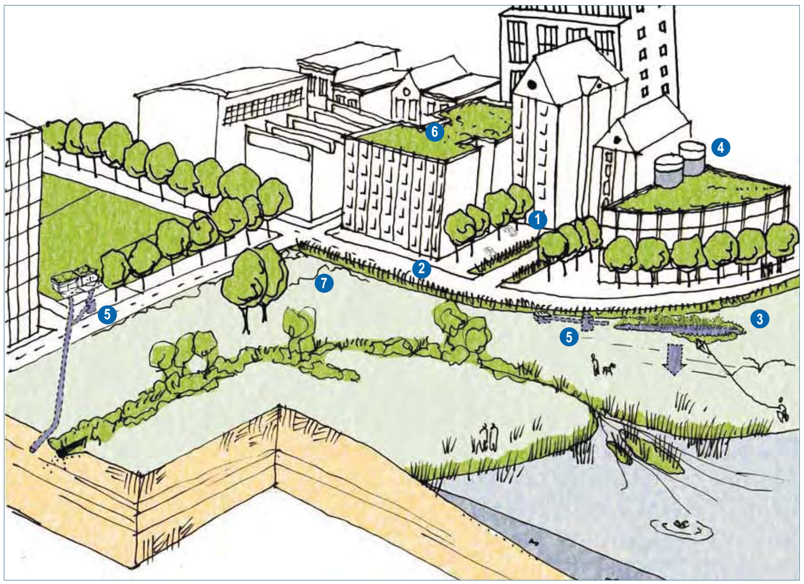

Figure 13. Open Space

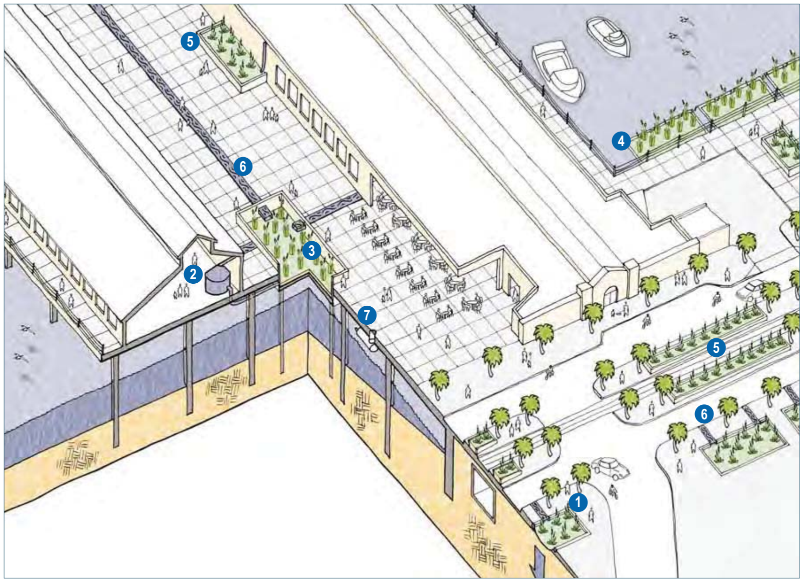
San Francisco's open spaces provide space for passive and active recreation, wildlife habitat, and environmental education. Open space areas also contribute to air and water quality protection. Some open space areas, most notably Lake Merced, include water bodies whose health and function depend upon protection from adjacent polluting activities. To that end, stormwater BMPs can be sited on less sensitive open spaces to protect the more sensitive core areas. Open spaces can often accommodate larger stormwater treatment trains that integrate stormwater management with other ecological functions. Because of this, stormwater management in open spaces can make significant contributions toward restoring natural hydrology and ecosystem health. Open spaces that are opportunity sites for LID include parks, recreational areas, school playfields, and natural areas.

1. Swales in Parking Lots and Roadways
2. Swales to Buffer Open Space from Development
3. Constructed Wetlands to Buffer Open Space from Development
4. Cistern to Store Rainwater for Irrigation
5. Street Drains to Wetland via Swirl Separator; Trash Area Drains to Sewer via Swirl Separator
6. Vegetated Roof to Reduce Runoff
7. Vegetated Slope to Reduce Erosion/Sedimentation



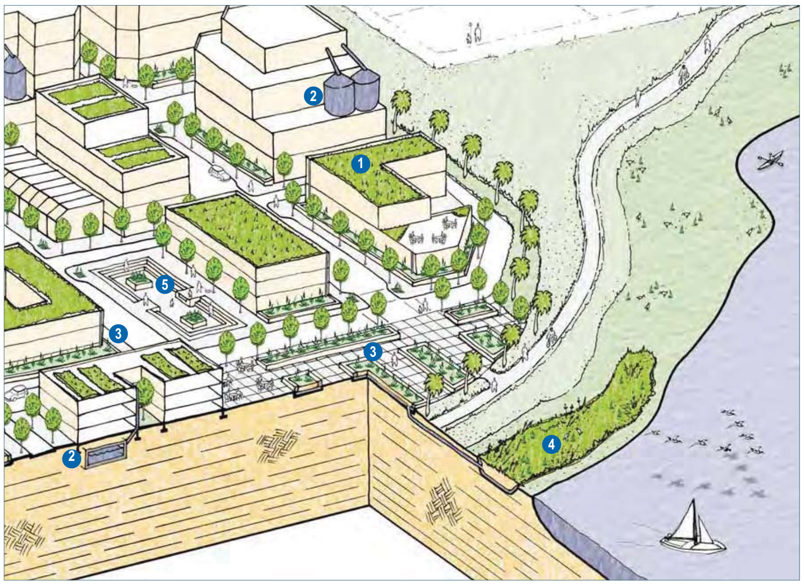
Piers Over Water

Figure 14. Piers Over Water

Piers over water are common along San Francisco's waterfront. They are frequently the site of redevelopment projects seeking to adaptively reuse attractive and unique historic properties. Development on piers over water includes a wide variety of land uses, including commercial, recreational, industrial, and maritime uses. Because runoff from piers over water often flows directly to the Bay without the benefit of dedicated conveyance structures, stormwater management on piers over water requires creative infrastructure solutions. Limited space, cultural and historic preservation requirements, and public access goals all impose additional design constraints. The transition between piers and streetscape may provide opportunities for landscape-based stormwater management strategies that may not be feasible on the piers themselves. In some cases, media filtration devices may be the only feasible option for certain aspects of pier redevelopment.

1. Rain Gardens in the Streetscape
2. Cistern for Rainwater Harvesting
3. Detention Pond
4. Vegetated Pontoons for Biofiltration*
5. Above Ground Planter for Biofiltration
6. Trench Drains for Conveyance
7. Vortex/Swirl Separator or Media Filter

* See the Emerging Technologies factsheet in Appendix C for more about vegetated pontoons.



Former Shipyards

Figure 15. Former Shipyards

A number of San Francisco's redevelopment areas are former shipyards. Former shipyards have a variety of challenging conditions associated with them, such as a high water table, uncompacted fill, and legacy pollutants from historic shipyard activities. Historic pollution can limit the feasibility of certain LID measures, and those LID measures that are implemented will often require engineered liners to prevent mobilization of subsurface contaminants. Despite these challenges, redevelopment of former shipyards offers significant opportunities for innovative and comprehensive stormwater management because it often requires building new infrastructure systems.

1. Vegetated Roofs to Reduce Runoff
2. Cisterns to Harvest Rainwater for Heating and Cooling
3. Rain Gardens for Biofiltration
4. Constructed Wetland to Buffer Water from Urban Development
5. Urban Stormwater Plaza/Detention Pond

To ensure consistent implementation of LID in new and redevelopment projects in San Francisco's separate sewer areas, the Port requires all projects disturbing 5,000 square feet or more to comply with stormwater performance measures in order to gain plan approval.

Project applicants subject to these *Guidelines* will be required to complete a Stormwater Control Plan (SCP) to demonstrate that they have met San Francisco's stormwater requirements. The requirements are performance-based and are very similar to those used in other Bay Area Cities. The stormwater performance measures for projects served by separate storm sewer systems under Port jurisdiction require the capture and treatment of:

- The flow of stormwater runoff resulting from a rain event equal to at least 0.2 inch per hour intensity; **or**
- Eighty percent or more of the annual stormwater runoff volume, determined from unit basin storage volume curves for San Francisco.

Project applicants developing or redeveloping properties subject to these performance measures must complete a SCP for project approval. The SCP will allow the Port, the SFPUC, and the Planning Department to certify compliance with these requirements. The contents of the SCP are described in the next section, and a SCP template is provided in Appendix C.

Project applicants must also ensure compliance with other stormwater regulations that may apply to their project. For instance, construction sites greater than 1 acre are generally required to seek coverage under the *California Statewide General Permit for Stormwater Discharges Associated with Construction Activities*. Specific types of commercial and industrial operations must seek coverage under the *California Statewide General Permit for Stormwater Discharges Associated with Industrial Activities.*

Port Requirement

All qualifying projects in the separate storm sewer area that disturb 5,000 square feet or more of the ground plane are required to capture and treat rainfall from a 0.2-inch per hour event **or** eighty percent or more of the annual stormwater runoff volume, determined from unit basin storage volume curves for San Francisco. Disturbed area includes any movement of earth, or a change in the existing soil cover or the existing topography. Land disturbing activities include, but are not limited to, clearing, grading, filling, excavation, or addition or replacement of impervious surface.

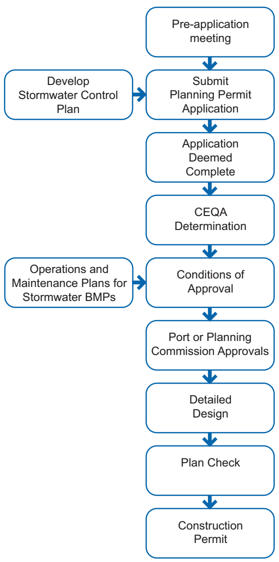

Figure 16. *The SCP submittal and plan approval process.*

The Development Review Process

The Port has integrated SCP review into its existing development review processes. A simplified diagram for a typical development review process is shown in Figure 16.

The SCP must be submitted along with the development application for Planning Review. Planning Department staff will often request that applicants provide a preliminary site layout, preliminary landscaping plan, elevation drawings, or other illustrations for review at a pre-submittal meeting. Project applicants will also discuss their preliminary SCP at the pre-submittal meeting. At this stage project applicants should bring a drainage plan with proposed locations for BMPs.

CEQA

Most projects subject to the requirements of these *Guidelines* will also require some level of CEQA review. The California Environmental Quality Act (CEQA) environmental review imposes both procedural and substantive requirements for environmental protection. CEQA requires local jurisdictions to identify and evaluate the environmental impacts of their actions, including zoning decisions and discretionary land-use approvals. The CEQA process provides decision-makers and members of the public with information about potentially adverse environmental impacts and requires implementation of feasible alternatives and mitigation measures in order to reduce those impacts.

CEQA is intended to minimize the environmental impacts of development activities, which is consistent with the objectives of these *Guidelines*. The basic purposes of CEQA are to:

- Inform decision-makers and the public about the potential significant environmental effects of proposed activities.
- Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible.
- Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

San Francisco Stormwater Design Guidelines

The CEQA Initial Study Checklist

The Phase II General Permit requires local municipalities to evaluate water quality effects and identify appropriate mitigation measures when conducting environmental review of proposed projects. This effort can be integrated into the completion of the CEQA Initial Study Checklist. The CEQA Initial Study Checklist is used to determine whether a given project will have significant impacts on the environment.

The San Francisco Planning Department's Initial Study Checklist contains questions that link potentially significant project impacts to requirements under the CWA and the California Water Code:

- Question 14.a: **"Would the project violate any water quality standards or waste discharge requirements?"** This question evaluates a project's compliance with water quality standards and considers the project's potential effect on water bodies on the Section 303(d) list.
- Question 14.d: **"Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?"** This question investigates the potential effects of increased runoff peak flows and durations.
- Question 14.e: **"Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial new sources of polluted runoff?"** This question evaluates the potential impacts of pollutants in runoff and increased stormwater flows to the collection system.
- Question 14.f: **"Would the project otherwise substantially degrade water quality?"** This question is the most tightly linked to the *Guidelines*. The intent of these *Guidelines* is to ensure that projects do not degrade water quality.

Port, SFPUC, and City Planning staff will work with project applicants to ensure that the CEQA Initial Study Checklist clearly articulates potential impacts that the project may have on the quantity and quality of stormwater runoff. BMPs required by the *Guidelines* will reduce stormwater impacts by controlling sources of pollution, reducing site imperviousness, and providing for treatment facilities that retain, detain, or treat runoff.

The CEQA process is generally administered in several steps:

1. Review of the CEQA checklist to determine the appropriate level of review.

2. Issuance of a Categorical Exemption for projects exempt from CEQA review.

3. Preparation of an Initial Study to characterize the environmental effects of the project.

4. Preparation of an Environmental Impact Report (EIR) or Negative Declaration.

In cases where a higher level of environmental review is required for project approval, such as a Mitigated Negative Declaration or an EIR, the CEQA process may require the consideration of project alternatives. Because the final project configuration is uncertain, it may not be possible to complete a SCP prior to CEQA approval. In such cases, a preliminary SCP would be required to be completed once the project configuration is finalized. The SCP must be completed and approved before the applicant begins final design drawings for the project.

If CEQA approval for a project includes mitigation measures, project applicants will be required to participate in a mitigation monitoring and reporting program (MMRP). CEQA requires the MMRP to ensure compliance with adopted mitigation measures during project implementation. The MMRP specifies the required actions and monitoring that are required for each mitigation measure recommended in the EIR. The requirements for the construction and maintenance of stormwater BMPs described in the SCP can be used in the MMRP for EIRs and Mitigated Negative Declarations.

The San Francisco Planning Department prepares CEQA documents for proposed City projects. If the CEQA analysis determines that a project would have a significant or potentially significant impact on hydrology and water quality, then the project would be required to administer mitigation measures that would reduce the impact to less than significant, or the City would need to make Findings of Overriding Considerations.

Project applicants must meet the stormwater performance measures described in these *Guidelines* to avoid negative impacts to water quality. By doing so, they may avoid triggering CEQA mitigation requirements. Projects receiving a Categorical Exemption or Negative Declaration under CEQA are still required to submit a complete SCP in order to gain project approval.

Multi-Parcel Projects

While compliance with the *Guidelines* is required for all new and redevelopment projects greater than 5,000 square feet, master-planned and multi-parcel projects offer the greatest opportunity for regional LID elements (i.e., stormwater facilities serving more than one parcel) such as treatment wetlands, water features, and wet ponds. The Port and SFPUC will work with project applicants who are proposing large projects to develop a comprehensive Stormwater Control Plan (SCP) that integrates stormwater management approaches across multiple parcels.

Requirements for a comprehensive SCP and associated Operations and Maintenance Plan will follow the methodology for preparation of an SCP, as discussed in later sections of the *Guidelines*. During CEQA review for large projects, greater emphasis will be placed on the relationship between overall stormwater infrastructure development and the development of specific parcels. Please contact Port staff to initiate this process.

SFPUC Plan Approval

To ensure consistent implementation of LID in new and redevelopment projects in San Francisco, the SFPUC requires all projects disturbing 5,000 square feet or more to comply with stormwater performance measures in order to gain plan approval.

In separate sewer areas under SFPUC jurisdiction, applicants proposing new or redevelopment projects that either a) disturb 5,000 square feet or more of the ground plane, or b) are subject to San Francisco's Green Building Ordinance, are required to:

- Capture and treat the rainfall from a design storm of 0.75 inch using acceptable best management practices (BMPs); and
- Complete a Stormwater Control Plan (SCP) demonstrating how the project will capture and treat rainfall from the 0.75-inch design storm.

This performance measure is equivalent to LEED Sustainable Sites Credit 6.2 titled "Stormwater Design: Quality Control." The rainfall depth of 0.75 inch is the LEED-based performance measure for semi-arid watersheds.

In combined sewer areas under SFPUC jurisdiction, applicants will be required to reduce the flow rate and volume of stormwater going into the combined system by achieving LEED Sustainable Sites Credit 6.1 titled "Stormwater Design: Quantity Control."

The SCP requirement will allow the SFPUC, the Department of Building Inspection (DBI), and the Planning Department to verify compliance with stormwater requirements. The *Guidelines* chapter entitled, "The Stormwater Control Plan," describes the required contents of a SCP and also provides sizing instructions for stormwater treatment BMPs to comply with this requirement. A SCP template is provided in Appendix C.

SFPUC Requirement

Developments or redevelopments disturbing 5,000 square feet or more of the ground surface are required to manage stormwater on-site. Land disturbing activities include, but are not limited to, clearing, grading, filling, excavation, or addition or replacement of impervious surface.

In separate sewer areas, applicants must achieve LEED SS6.2 and demonstrate compliance in a SCP.

In combined sewer areas, applicants must achieve LEED SS6.1 and demonstrate compliance in a SCP.

How does LEED Credit SS6.2 compare to the General Permit requirements?

San Francisco's GBO adopts performance measures drawn from LEED, a nationally-recognized standard. Analysis indicates that the performance measure listed in LEED 6.2 is roughly equivalent to the performance measures listed in the General Permit, with LEED 6.2 being slightly more stringent (by about 2%). The proposal to use LEED-based performance measures was approved by the RWQCB on December 19, 2008.

GBO Project Thresholds

Midsize Residential
(5+ units and < 75 feet height to highest occupied floor)

High-Rise Residential
(5+ units and > or = 75 feet height to highest occupied floor)

Mid-Size Commercial Office
Building of a B Occupancy
(>5,000 SF and <25,000 SF)

New Large Commercial Office
Building of a B Occupancy
(>25,000 SF)

Table 5*. Projects required to achieve stormwater points under the Green Buliding Ordinance*

The Green Building Ordinance

On November 3, 2008, the City of San Francisco's Building Code was amended to include Chapter 13C, "Green Building Requirements," known as the Green Building Ordinance (GBO). The code requires certain types of new and redevelopment projects constructed in San Francisco to meet green building standards developed by San Francisco's Green Building Task Force. Many of the standards are based on LEED, a green building rating system developed by the United States Green Building Council (USGBC). Projects that fall into one of four building categories listed in Table 5 must comply with the GBO by obtaining specified levels of LEED certification. For the full text of the GBO, go to http://www.sfenvironment.org/downloads/library/sf_green_building_ordinance_2008.pdf.

The GBO requires projects to obtain LEED's Sustainable Sites credit entitled "Stormwater Design: Quantity Control" (SS6.1) or "Stormwater Design: Quality Control" (SS6.2), depending on whether the site is in a separate or combined sewer area.

For the full text of Credits SS6.1 and SS6.2, see pages 75-87 of the "LEED for New Construction and Major Renovation Reference Guide, Version 2.2."

The GBO refers to both LEED and these *Guidelines* in Section 1304C.0.3:

Stormwater management shall meet the "Best Management Practices" and "Stormwater Design Guidelines" of the San Francisco Public Utilities Commission, and shall meet or exceed the applicable LEED SS 6.1 and 6.2 guidelines.

The applicable LEED credit for separate sewer areas is SS6.2. while the applicable LEED credit for combined sewer areas is SS6.1. SFPUC staff is currently in the process of modeling the impacts of SS6.1 on the combined sewer area and developing calculators for SS6.1. Until this modeling is completed, applicants with questions about projects in the combined sewer should contact SFPUC staff for direction.

Projects subject to stormwater requirements under the GBO that do not disturb 5,000 square feet of the ground surface must achieve LEED Certification and achieve either LEED SS6.1 or LEED SS6.2, but need not submit a Stormwater Control Plan. Only projects disturbing 5,000 square feet or more need to submit a SCP.

The Development Review Process

The SFPUC has integrated the review of SCPs with the City's development review process. All projects disturbing 5,000 square feet or more must submit a SCP. A diagram showing how the SCP fits into a typical development review process is shown in Figure 17.

Project applicants must also ensure compliance with all stormwater regulations that may apply to their projects. For instance, construction sites greater than 1 acre are generally required to seek coverage under the California Statewide General Permit for Stormwater Discharges Associated with Construction Activities. Specific types of commercial and industrial operations must seek coverage under the California Statewide General Permit for Stormwater Discharges Associated with Industrial Activities.

Permit applicants that are also subject to the GBO will be required to receive third-party verification by the Green Building Certification Institute (GBCI), USGBC's official accreditation and certification body; or by the project's Green Building Compliance Professional of Record. The building permit application must include a complete LEED checklist, as stipulated in Administrative Bulletin for Chapter 13C (AB-093), which outlines administrative procedures for meeting green building requirements (see http://www.sfgov.org/site/dbi_index.asp?id=89703). The LEED Version 2.2 checklist includes Credits SS6.1 and SS6.2, and applicants must indicate their intent to comply in order to receive a building permit.

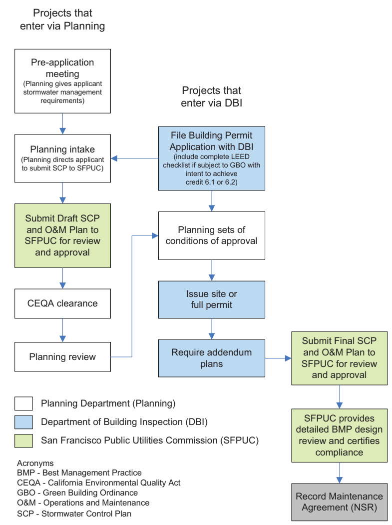

Figure 17*. The Stormwater Control Plan submittal and approval process*

LID measures like the stormwater wetland in Portland's Tanner Springs Park treat polluted street runoff, thereby minimizing negative impacts to water quality.

Inspection & Enforcement

The SFPUC and the Port require periodic inspections to ensure that BMPs are properly maintained and continue to provide effective stormwater treatment.

Once stormwater management facilities are incorporated into new development and redevelopment projects, the SFPUC and Port require periodic inspections to ensure that they are properly maintained and continue to provide effective stormwater treatment. There are three types of inspections under this operation and maintenance verification program: post-construction building permit inspections, annual self-certification inspections conducted by the property owner, and tri-annual inspections conducted by the Port or the SFPUC, depending on who has jurisdiction on the site. The Port and the SFPUC will also inspect BMPs in response to complaints or emergencies. If maintenance requirements identified through inspections are not completed in accordance with the protocols described in this chapter, the SFPUC or the Port will enact enforcement procedures.

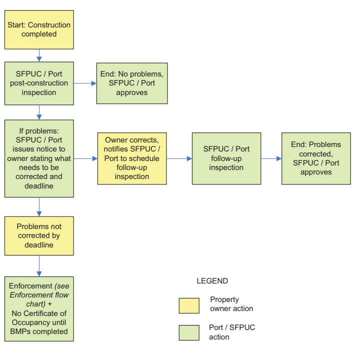

Figure 18. *Post-construction inspections.*

Inspections

Post-construction inspections

The Port or the SFPUC will inspect stormwater BMPs upon completion of construction. These inspections will be based on a standardized inspection checklist. Inspection staff will confirm that stormwater facilities are built in conformance with approved plans.

If there are issues that require follow-up, the Port or the SFPUC will send the property owner a notice stating what corrective action needs to be taken and the timeframe for corrective action. The deadline will be between 24 hours and 30 days from the date of the notice, depending on the severity of the problem. The property owner is responsible for correcting these issues and scheduling a follow-up inspection by the Port or the SFPUC. If the issues are rectified by the time of the follow-up inspection, the Certificate of Occupancy will be issued. A diagram showing the post-construction inspection process is shown in Figure 18.

Annual self-certification

Once BMPs are successfully built, the Port or the SFPUC will send self-certification inspection reminders to property owners at all sites with stormwater BMPs. The reminder will include a submittal deadline and a blank self-certification checklist. The property owner will perform the self-certification inspection and digitally submit the completed checklist and maintenance logs from that year to the SFPUC Collection System Division or to the Port. With this submittal, the property owner will propose either approval or maintenance they will perform if there are outstanding issues that have not been resolved by the submittal date. The Port or the SFPUC will either approve the submittal and renew the certificate of compliance or contact the property owner to schedule an inspection.

If a Port or SFPUC inspection is necessary, the property owner must be present and provide annual maintenance logs. If the issues are rectified by the time of the inspection, the certificate of compliance will be renewed.

For sites at which the property owner does not submit self-certification documents, the Port or the SFPUC will send a notice stating that the deadline has passed and will contact the property owner to schedule an inspection. The notice will include a fee to cover the cost of the inspection plus a penalty. If the inspection indicates that there no maintenance issues requiring follow-up action, the certificate of compliance will be renewed. A diagram showing the annual self-certification process is shown in Figure 19.

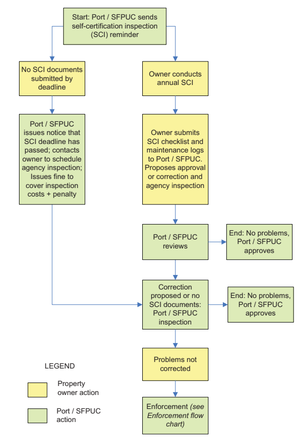

Figure 19. *Annual self-certification inspections.*

Tri-annual Port / SFPUC inspections

Every third year, the Port or the SFPUC will inspect stormwater BMPs. The agency with jurisdiction on the project site will send inspection notices to property owners at sites due for inspection. The notice will include a proposed inspection date and time and a phone number to call should the proposed date not work for the property owner. The property owner must be present and provide annual maintenance logs. If the inspection indicates that there no maintenance issues requiring follow-up action, the certificate of compliance will be renewed.

If there are issues that require follow-up, the Port or the SFPUC will send the property owner a notice stating what corrective action needs to be taken and the deadline. The deadline will be between 24 hours and 30 days from the date of the notice, depending on the severity of the problem. The property owner is responsible for rectifying the issues and scheduling a follow-up inspection by the Port or the SFPUC within the time allotted. If the inspection indicates that the issues are rectified, the certificate of compliance will be renewed. A diagram showing the tri-annual Port or SFPUC inspection process is shown in Figure 20.

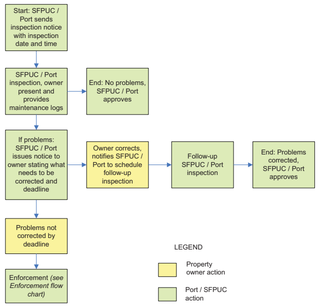

Figure 20. *Tri-annual Port / SFPUC inspections.*

Enforcement

For all three types of inspections, if the property owner is unresponsive or if maintenance issues are not rectified by prescribed deadlines, the Port or the SFPUC will carry out an enforcement action. If an enforcement action becomes necessary, the Port or the SFPUC will issue a warning with a 15-day deadline for the property owner to take corrective action and schedule a follow-up inspection. The warning will include a fee to cover the cost of the inspection plus a penalty. If the inspection indicates that maintenance issues requiring follow-up action have been rectified, the annual certificate of compliance will be renewed. If there are outstanding issues requiring maintenance action or if the owner is unresponsive, the Port or the SFPUC will issue a notice of violation stating that the property owner will be fined. Fines will be levied based upon Article 4.1 of the San Francisco Public Works Code.

If the issues have not been rectified by the end of 25 days, the Port or the SFPUC will perform the required maintenance and will bill the owner for the fine plus the cost of the work. If the owner does not pay the fine and the bill within 30 days, the Port or the SFPUC have the option to initiate lien proceedings against the property. A diagram showing the enforcement process is shown in Figure 21.

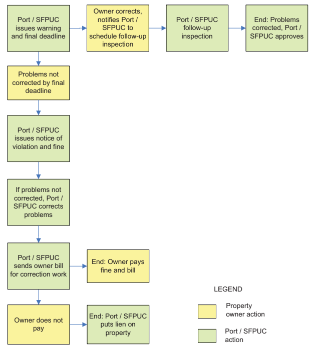

Figure 21. *Enforcement.*

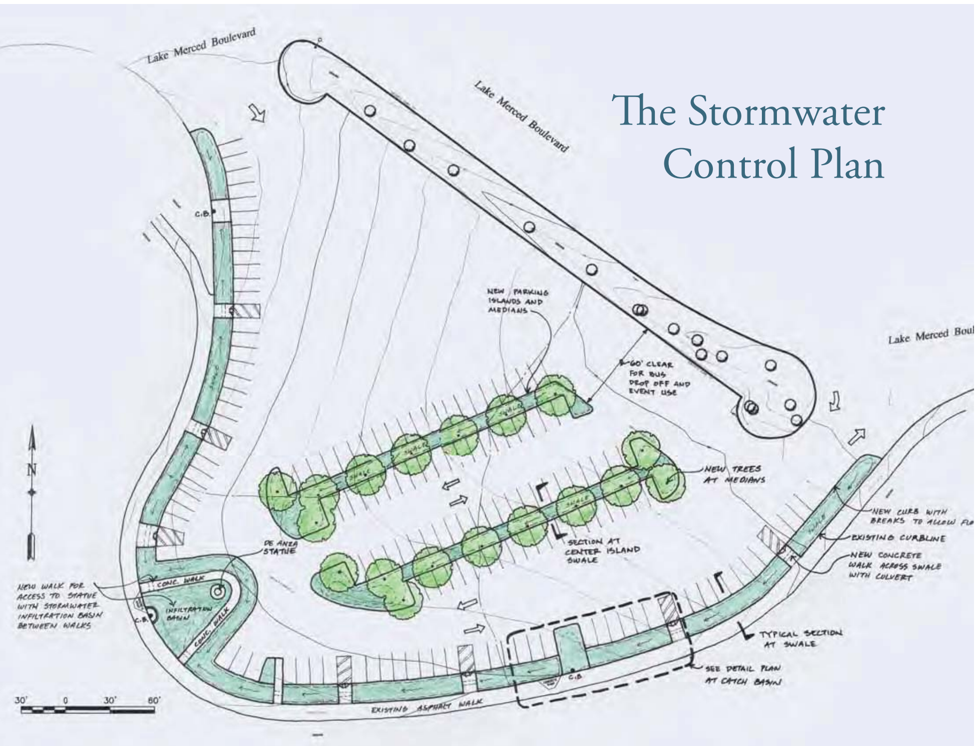
The Stormwater Control Plan



The Port and SFPUC require submittal of a Stormwater Control Plan (SCP) with every development application for discretionary planning approval in San Francisco for all projects disturbing 5,000 square feet or more of the ground plane.

The Port and SFPUC require the submission of a Stormwater Control Plan (SCP). The SCP will allow the Port, the SFPUC, and the Planning Department to review projects that are subject to the *Guidelines* and ensure compliance with them. SCPs must be reviewed and stamped by a California licensed landscape architect, architect, or engineer.

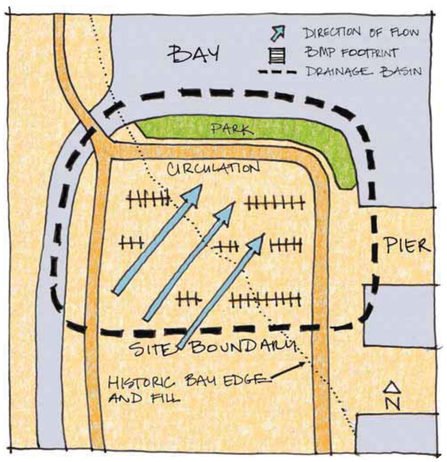
Project applicants must complete each of the following elements in their SCPs to be eligible for project approval:

1. Characterize existing site conditions
2. Identify design and development goals
3. Develop a site plan
4. Develop a site design
5. Select and locate source controls
6. Select and locate treatment BMPs
7. Size treatment BMPs
8. Check against design goals and modify as necessary
9. Develop an operations and maintenance plan
10. Compile the Stormwater Control Plan

Although the elements of the SCP are presented as a series of steps, in practice they should be iterative. For example, although site design comes before BMP sizing in the SCP checklist, BMP sizing results may require designers to make changes to the original site design. The following section provides an overview of each element of the SCP, illustrated by a conceptual drawing. An example of a completed SCP is included in Appendix C.

Requirement

The Stormwater Control Plan (SCP) must be reviewed and stamped by a licensed landscape architect, architect, or engineer.



Step 1

Characterize existing conditions

The stormwater management approach available to a given site is largely dictated by existing site conditions. Soil types, topography and drainage, vegetation types, wildlife habitat, proximity to receiving waters, existing structures, adjacent land uses, and historical and cultural features are all factors that project proponents should consider prior to initiating design of stormwater BMPs. A comprehensive checklist of site conditions that should be evaluated during the site analysis phase can be found in the SCP (Appendix C).

Jurisdictional concerns can influence a site as much as physical conditions. For example, parcels within 100 feet of the San Francisco Bay shoreline are subject to San Francisco Bay Conservation and Development Commission (BCDC) policies governing public access, circulation, and landscaping. Alterations to structures along most of the San Francisco Northern Waterfront are subject to the requirements of a National Historic Register District. Some properties may have deed restrictions establishing requirements for the management of residual soil and groundwater pollution. Port, SFPUC, and City Planning staff will work with project applicants to identify jurisdictional issues that are relevant to the site.

Characterizing existing conditions helps to define the opportunities and constraints that will shape the site design. Opportunities include existing drainage patterns and vegetation, oddly configured or otherwise unbuildable parcels, easements, and landscape amenities, including open spaces that can serve as locations for BMPs. Differences in elevation across the site

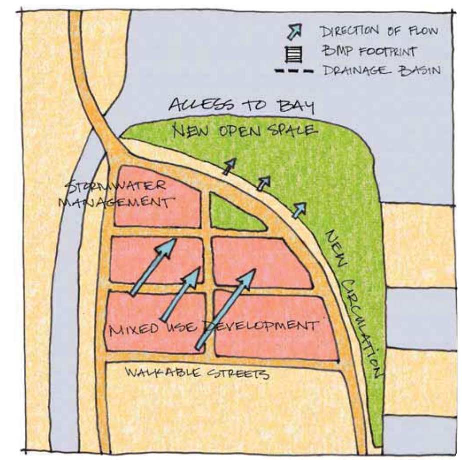
and existing low-lying areas present opportunities to implement BMPs that reduce or eliminate the need for pumping or other mechanical conveyance, a savings in both installation and long-term operation costs.

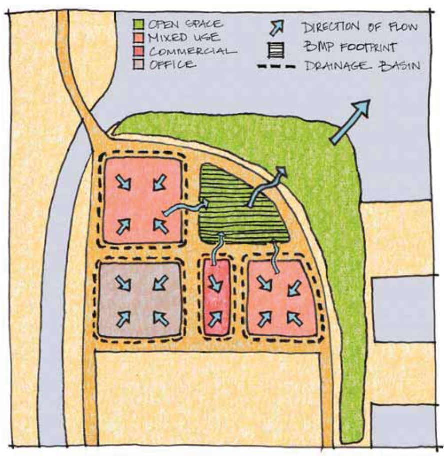
Constraints might include impermeable soils, a high water table, contaminated soils, geotechnical instability, existing utilities, and historic and cultural resources. Site-specific percolation tests and other geotechnical investigations by a certified engineer will be needed to ensure the most effective design solutions.

Step 2

Identify design and development goals

Every project applicant will begin the design process with a set of goals that will impact stormwater management requirements for the site. The program, density, and intensity of land use on a site present both opportunities and constraints for stormwater management. A project applicant intending to build a mixed-use development with high-density housing in the Bayview-Hunters Point neighborhood will approach the design process differently from a project applicant seeking to develop an industrial facility on a waterfront pier. The former might use stormwater to define the character of the public realm and create water features in community open spaces. The latter might use stormwater in cooling towers and wash-down areas to offset potable water use.





Step 3

Develop a site plan

Using the evaluation of existing conditions, along with the design and development goals, project applicants can begin to see how their project will integrate with or alter the hydrology of the site. The site plan should delineate the proposed land uses and major post-development drainage basins and should show, at the conceptual level, how water will move across the site.

Step 4

Develop a site design

Page 28 of this document introduced seven goals to guide the integration of stormwater management into site design. This section identifies strategies to achieve each goal.

Goal 1: Preserve and protect creeks, wetlands, and existing vegetation and other wildlife habitat.

- Incorporate creeks, wetlands, and existing vegetation into the site design (See Appendix D for appropriate vegetation).
- Develop setbacks that protect creeks, wetlands, and sensitive wildlife habitats and also provide usable open space for the public.
- Concentrate development in already developed areas.

San Francisco Stormwater Design Guidelines

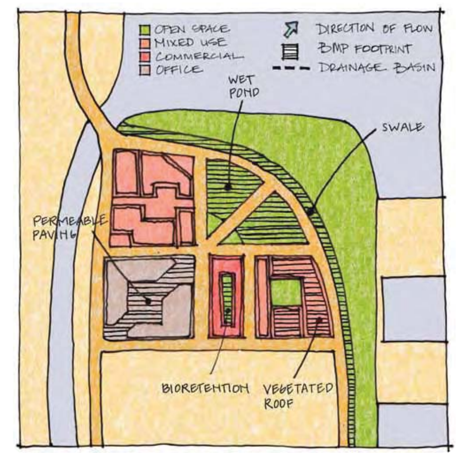
- Encourage high-density, transit-accessible development.
- Encourage clean-up and reuse of brownfield sites.
- Look at each site as an opportunity to protect, enhance, or create wildlife habitat.

Goal 2: Preserve natural drainage patterns and topography and incorporate them into site design.

- Daylight historic watercourses and make them a central element of site design.
- Design stormwater BMPs to take advantage of existing slopes and drainage paths.
- Minimize re-grading and soil impacts.
- Prioritize the use of infiltration-based BMPs where soils, groundwater, and geology allow.

Goal 3: Minimize and disconnect impervious surfaces.

- Design compact, multi-story structures, as allowed by applicable zoning regulations.
- Cluster buildings to reduce the length of streets and driveways, minimize land disturbance, and protect natural areas.
- Design narrow streets and driveways, as allowed by the local jurisdiction.
- Use landscape and permeable paving materials rather than traditional hardscape. Plazas, sidewalks, driveways, streets, parking areas, and patios can be constructed from materials such as crushed aggregate, decomposed granite, turf block, unit pavers, porous asphalt, or pervious concrete.
- Install vegetated roofs to reduce runoff from buildings.
- Minimize parking lot footprints and impacts by building structured parking with alternative roof uses and designing compact parking spaces and space-efficient circulation patterns.



Stormwater treatment facilities enhance public spaces in Portland's South Waterfront redevelopment area.

From the Site to the City

LID is implemented site by site, but each site should be considered in the context of its watershed-wide goals. Over time, incremental improvements will add up to long-term water quality protection for the Bay and Ocean, the restoration of hydrologic function in San Francisco's watersheds, and city-wide greening.

- Drain runoff from impervious areas to pervious areas. In cases where infiltration is not appropriate, landscape features can serve as treatment and conveyance structures and can be fitted with an underdrain to allow for discharge to the municipal storm sewer system or receiving waters.

Goal 4: Design the flow path of stormwater on a site all the way from the first contact to the discharge point.

- Identify the location where stormwater will first enter a site. For example, the first point of contact is often a roof. How will the water travel from the roof to a BMP? In the event that the BMP overflows, where will it discharge?
- Identify an approved discharge location (downstream conveyance system, another BMP or receiving water body) to accommodate flows beyond the capacity of each BMP.
- Design and clearly identify an overflow conveyance system to accommodate flows beyond the BMP's treatment capacity and up to a 100-year storm. All BMPs must have an approved discharge location.

Goal 5: Treat stormwater as a resource, not a waste product.

- Capture stormwater for irrigation, toilet flushing, cooling towers, vehicle wash-down areas, and other non-potable applications.
- Design multi-purpose BMPs that not only manage stormwater but also improve streetscape and public space design.
- Use stormwater for design inspiration.
- Incorporate environmental education and interpretation into LID where appropriate.

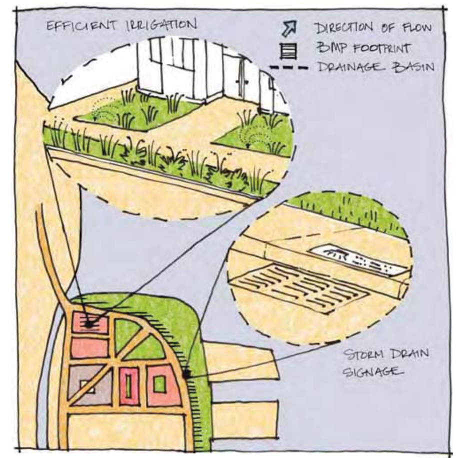
Goal 6: Treat stormwater at its source.

- Identify pollutants of concern and their sources early in the design process and install source control measures where appropriate.
- Aim for ubiquitous infiltration of stormwater on site.
- Place treatment BMPs as close to the source of runoff as possible.

Goal 7: Use treatment trains to address a broad array of pollutants.

- Combine stormwater BMPs that target different pollutants to create a treatment train. This strategy ensures higher levels of treatment and reduces the required size of each BMP in the treatment train.
- Pretreatment BMPs, such as sediment forebays, help reduce maintenance costs and improve the overall performance of stormwater BMPs.

Step 5



Select and locate source controls

Everyday activities such as recycling, trash disposal, and vehicle and equipment washing generate pollutants such as trash, sediments, oil and grease, nutrients, pesticides, and metals that can be mobilized by stormwater runoff and carried to receiving waters. These pollutants can be minimized by applying source control BMPs. Source control BMPs prevent pollutant generation and discharge by controlling pollution at its source, or, at a minimum, limiting pollutant exposure to stormwater.

Source control BMPs include both structural features and operational practices. Typical structural source control BMPs involve covering, berming, or hydraulically isolating a potential pollutant source area.

Operational source control measures include routine pavement sweeping and substituting traditional materials with those that are less toxic; for example, replacing traditional anodized chain link fencing with vinyl coated fencing.

Specific requirements for land uses and activities that will need to implement source control measures are found in Attachment 4 of the Phase II General Permit (http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/final_attachment4.pdf). The Fact Sheets (Appendix A) include a list of resources for source control measures. Form A of the SCP (Appendix C) guides the project proponent through the source control BMP selection process.

Source Control Requirement

The following uses and activities are required to implement specific source control measures as specified in Attachment 4 of the Phase II General Permit (http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/final_attachment4.pdf):

- 100,000 sq. ft. commercial developments
- Restaurants
- Retail gasoline outlets
- Automotive repair shops
- Parking lots

A drain adjacent to a trash compactor is connected to the sanitary sewer system. A concrete berm surrounding the trash storage area hydraulically isolates stormwater runoff in this area from the rest of the site.

Hydraulic Isolation

Hydraulic isolation is the practice of separating one drainage area from surrounding areas such that fluids cannot pass between them. This can be done using grading or constructed barriers. Hydraulic isolation allows designers to treat runoff and waste from the isolated area according to the specific pollutants found there. In some cases, hydraulically isolated areas can be connected to the sanitary sewer system rather than the storm sewer system.

Vehicle wash racks and trash compactor areas are examples of areas that can be hydraulically isolated to protect surrounding areas from the soap, grease, oil, sediments, trash and other pollutants associated with those activities.

Integrated Pest Management

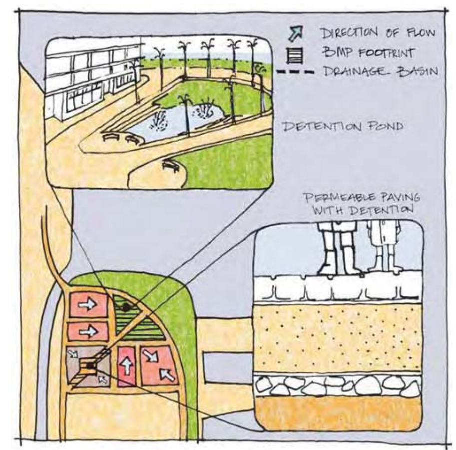
Integrated Pest Management (IPM) is an ecological approach to suppressing pests. IPM uses information on the life cycle of pests, along with multiple pest control techniques, to keep pests at acceptable levels in an economical and environmentally safe way. IPM focuses on monitoring and preventing pests and using low-risk pest control techniques. Because pest problems are often symptomatic of ecological imbalances, the goal is to plan and manage ecosystems to prevent organisms from becoming pests in the first place. This means developing landscape plans that focus on the use of native or Mediterranean plant species suited to San Francisco's climate and soil conditions (Appendix D). IPM principles help to reduce or eliminate the use of pesticides; thereby reducing the risk that stormwater runoff will mobilize pesticides and carry them to collection systems or receiving water bodies.

Step 6

Select and Locate Treatment BMPs

Site design and source control make significant contributions to effective stormwater management. But achieving treatment to the MEP also requires the implementation of treatment control BMPs. The selection of stormwater treatment BMPs is guided by existing site conditions, design and development goals, and the pollutants of concern for the site.

The two-step BMP selection process outlined here will help project applicants to identify a suite of site-specific treatment BMPs. The first step is to use the BMP Decision Tree (see Figure 22), to identify BMPs that are suitable for a given site. The second step is to narrow the list of suitable BMPs to the ones that target the pollutants of concern that have been identified for a given site.



The BMP Decision Tree

The BMP Decision Tree will help project applicants use site-specific information to select the BMPs that are most appropriate given the conditions at their site. BMPs that are not suitable will be eliminated from consideration.

The BMP Decision Tree prompts the project applicant to consider specific site characteristics that affect BMP design. The answers narrow the field of appropriate BMPs. On-site percolation tests and geotechnical investigations must be done during the site analysis to determine whether infiltration-based BMPs are feasible for the site (for instance, is there adequate depth to groundwater, which for most sites will be 10 feet). However, infiltration-

El Monte Sagrado Spa in Taos, New Mexico uses wetlands to treat stormwater so that it can be used to fill spa pools.

Permeable pavement can be integrated into a variety of hardscapes such as roads and sidewalks, plazas, terraces and patios.

based BMPs need not always be eliminated based upon this information. Rather, a modified design solution can make a BMP feasible. Vegetated swales can be used for stormwater treatment in areas with poor infiltration or contaminated soils provided that they are lined with an impermeable liner, underdrained, and constructed with clean import soil. See the BMP Fact Sheets in Appendix A for information on liners and underdrains.

Steep slopes can limit the range of appropriate BMPs for a given site because they can cause high flow rates and instability. Terracing the site is one design solution that could allow the implementation of slope-dependent BMPs on a steep site. Check dams can also be used to mitigate problems caused by steep slopes.

After all of the information has been evaluated, the BMP Decision Tree will indicate one of three outcomes for a given site:

- All BMPs are feasible;
- A subset of BMPs is feasible for unconditional implementation; or
- A subset of BMPs is feasible with conditions.

The resulting list of BMPs can then be evaluated for their effectiveness in treating the pollutants of concern for the project. Project applicants should include the results of the Decision Tree process in their SCP.

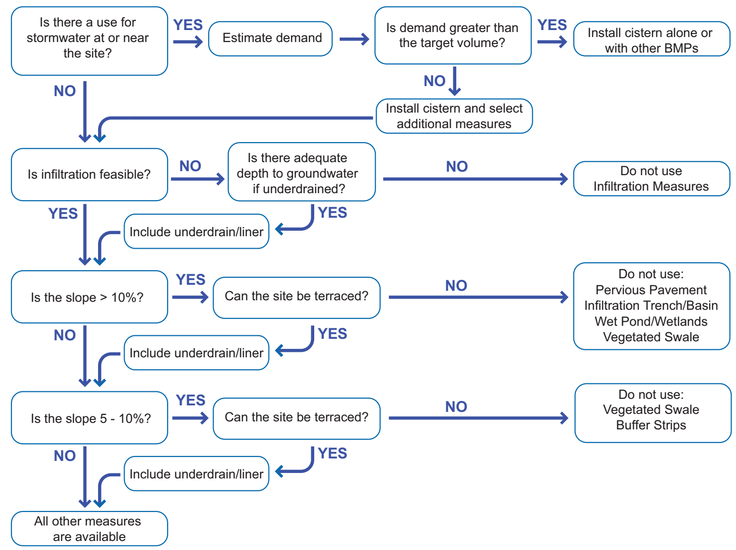


Figure 22. *Stormwater BMP Decision Tree*

Weirs (top) and cascades (bottom) make street-side bioretention possible on steep slopes in Seattle, WA.

Match BMPs with Pollutants of Concern

Table 6 includes a list of pollutants typically found in stormwater runoff and their association with common San Francisco land uses. Project applicants can use the table to screen for likely pollutants of concern, but identifying the specific commercial and industrial activities proposed for a site provides a better indication of which pollutants to target. For example, a restaurant would need to include BMPs to prevent oil and grease from contacting stormwater, and roadways in any project bring up concerns about metals, oil and grease, and sediments.

After project applicants consult Table 6 to anticipate the pollutants of concern for their proposed land uses, they can use Table 7 to identify BMPs that both treat pollutants of concern and are deemed appropriate for the physical site conditions by the BMP Decision Tree. To learn more about each BMP listed in the table, see the BMP Fact Sheets in Appendix A.

Table 7. *BMPs that capture or treat pollutants typically found in stormwater runoff.*

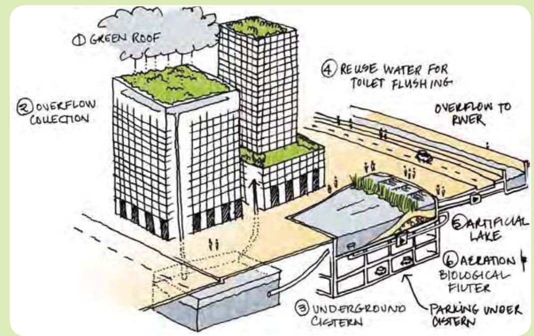
Treatment Trains

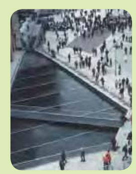
A single treatment BMP may not adequately treat the entire range of pollutants from its contributing watershed, especially in large developments involving diverse activities. For example, some treatment BMPs are designed to remove fine suspended sediment but may not be able to remove dissolved metals. Because of this, a combination of several BMPs in succession may be needed to treat all of the pollutants on a given site.

A combination of BMPs, constructed in a series to target specific pollutants, is called a treatment train. Treatment trains not only improve water quality, they also improve the long-term efficiency and reduce the maintenance requirements for each treatment BMP involved in the train. Heavy sediments and trash can negatively impact BMP performance, thus silt traps and sediment forebays are commonly used as a first step in the treatment process. In the same way that pre-rinsing dirty dishes increases the efficacy and efficiency of a dishwasher, removing sediment prior to infiltration of stormwater will improve the long-term capacity of the underlying soils to infiltrate water by preventing sediment from clogging pore spaces that allow the movement of water through the soil.

Common treatment train configurations include:

- Silt trap → Swale → Wetland
- Cistern → Rain garden
- Retention basin → Sand filter
- Vegetated strip → Infiltration trench



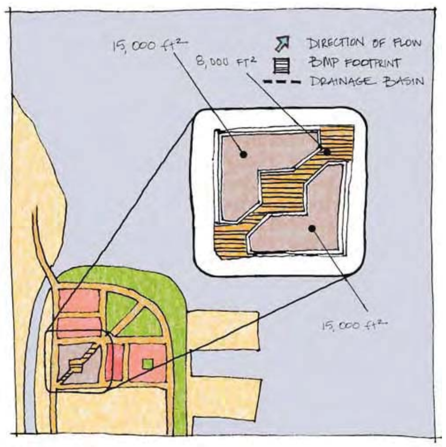


Case Study: Berlin Treatment Train

The design for Potsdamer Platz, one of Berlin's most important public squares, includes a stormwater treatment train that uses multiple stormwater management strategies (indoor use, storage, biofiltration, and outdoor use) to control both the quality and the volume of stormwater on-site. The roofs of the development, some of which are vegetated roofs and some of which are traditional, harvest rainwater to be used in the buildings for toilet flushing and irrigation. During large storm events, five underground cisterns store rainwater and then release it slowly into a series of pools and planted 'biotopes' for filtration. In the summer months, additional filters can be added to remove algae. Treated rainwater then flows through a very popular outdoor waterscape where employees and visitors gather. Like San Francisco, Berlin has an average annual rainfall of 21 inches.

Treatment Train Principles

- Think of each element in a treatment train as a separate functional unit.
- Before adding additional elements to a treatment train, analyze their performance relative to previous BMPs in the train. If the expected water quality benefits are limited, the increase in cost may outweigh the benefits.
- Do not alter or remove design measures used to reduce the size of stormwater treatment measures without a corresponding resizing of associated stormwater treatment BMPs, otherwise the capacity of the BMPs will be exceeded.



Step 7

Size Treatment BMPs

After selecting a suite of treatment BMPs that are appropriate for the site conditions and target the pollutants of concern, project applicants will need to size these BMPs to achieve the required stormwater performance standards. This section explains how to size treatment BMPs, but project applicants can also use the automated electronic sizing spreadsheets provided in Appendix B, which can also be found on the SFPUC and Port websites at www.sfwater.org and www.sfport.com. While the Port and SFPUC do not require the use of the sizing spreadsheets for BMP design, project applicants must complete Table 1 of the electronic sizing spreadsheet in Appendix B to document drainage parcels and design flow rates and volumes. This information is required in the SCP.

The performance measures discussed in this section aim to protect the water quality of receiving water bodies. They meet all regulatory requirements and are the foundation of the BMP sizing spreadsheet. For information about how the performance measures were developed, please see the resources at the end of this section.

A rain garden at Glencoe Elementary in Portland, Oregon reduces stormwater flows to Portland's collection system.

Table 8. *Treatment control measures and sizing methods*

Port Requirements

Stormwater performance measures for areas in the separate sewers operated by the Port require the capture and treatment of:

(a) The flow of stormwater runoff resulting from a rain event equal to at least 0.2 inch per hour intensity; or

(b) Eighty percent or more of the annual stormwater runoff volume, determined from unit basin storage volume capture curves for San Francisco (see Figure 23).

Performance measure (a) should be used for sizing flow-based BMPs, such as vegetated swales or flow-through planters. These are BMPs whose primary mode of pollutant removal depends on the flow rate of runoff through the BMP. Performance measure (b) should be used for sizing volume-based BMPs, such as infiltration basins or detention basins. These are BMPs whose primary mode of pollutant removal depends on the volumetric capacity of the BMP. These performance measures are adapted from the General Permit.

Requirement

The Port's stormwater performance measures for areas served by separate storm sewers require the capture and treatment of:

(a) The **flow** of stormwater runoff resulting from a rain event equal to at least 0.2 inch per hour intensity; **or**

(b) Eighty percent or more of the annual stormwater runoff **volume** determined from design rainfall capture curves for San Francisco. The maximum drawn-down time for stormwater captured during a rain event is 48 hours.

Project applicants should determine which sizing criteria apply to each BMP and size the facility accordingly. Many BMPs can be designed to attain both flow-based and volume-based stormwater management goals, but they are most often categorized as one or the other (see Table 8).

Flow-based Sizing

The recommended method for hydraulically sizing flow-based treatment BMPs is the Uniform Intensity Approach and is used in conjunction with the Rational Method for estimating stormwater flows. It is also described in the CASQA 2003 Stormwater Best Management Practice Handbook New Development and Redevelopment. Automated electronic sizing spreadsheets can be found at www.sfwater.org and www.sfport.com, and are described in Appendix B. The Rational Method is used as follows:

1. **Identify each drainage management area on the site.** A drainage management area is a discrete area or subwatershed. The runoff from each drainage management area will drain its own treatment control BMP(s). The steps below should be applied to each drainage management area.

2. **Determine the area in acres (A)** of the drainage management area that drains to the proposed BMP(s).

3. **Assign a Runoff Coefficient**, or C-factor, to each land surface in the drainage management area. The C-factor describes the percentage of runoff generated by different types of surfaces during rain events. Surfaces that produce higher volumes of runoff, such as concrete, have relatively higher C-factors, while surfaces that produce lower volumes of runoff, such as landscaped areas, have relatively lower C-factors. Table 9 lists established C-factor values for each land surface.

4. **Calculate the Composite C-factor (C)**, a weighted average of all the C-factors for all the surfaces in the drainage management area. Multiply each C-factor by the area of the surface it applies to. Add the results and divide by the total site area.

Flow-Based Sizing

The Rational Method: Q=CiA

Where:

Q = flow in ft^3/second

C = composite runoff coefficient (composite C-factor)

i = rainfall intensity in inch/hour (0.2 inch/hr recommended)

A = drainage area in acres

Type of Surface	Typical Range	Recommended Value
Asphalt	0.7 - 0.95	0.8
Concrete	0.8 - 0.95	0.9
Brick	0.7 - 0.85	0.8
Roofs	0.75 - 0.9	0.85
Pervious Concrete	0.1 - 0.3	0.2
Pervious Asphalt	0.1 - 0.3	0.2
Paving Stones	0.1 - 0.7	0.4
Grass Pavers/Turf Blocks	0.15 - 0.6	0.35
Lawns and Grass:		
sandy soil, slope <2%	0.05 - 0.1	0.08
sandy soil, slope >7%	0.15 - 0.2	0.17
heavy soil, slope <2%	0.13 - 0.17	0.15
heavy soil, slope >7%	0.25 - 0.35	0.3
Landscaping	0.15 - 0.3	0.2
Crushed Aggregate	0.15 - 0.3	0.25

Table 9. *Typical runoff coefficients*

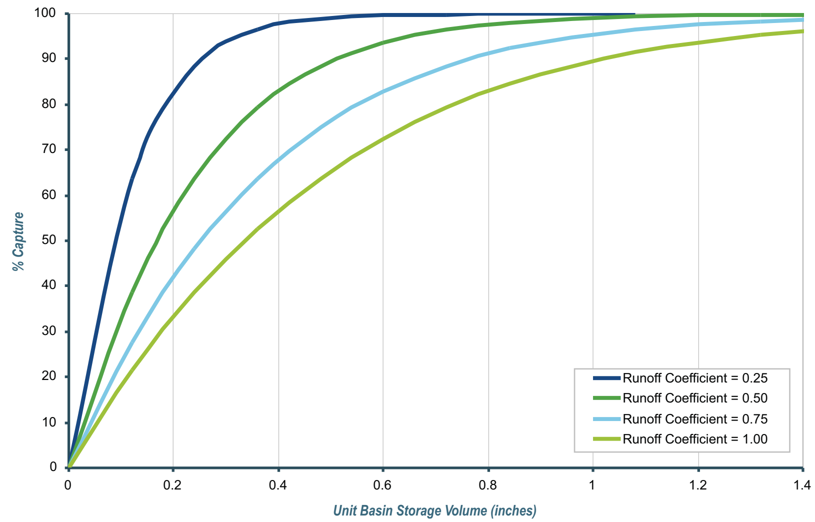

Figure 23. *Composite runoff coefficients and unit basin storage volume for 80 percent capture with 48-hour drawdown*

5. **Use a design rainfall intensity (i) of 0.2 inch per hour**. This intensity represents twice the 85th percentile hourly depth, which can be derived by ranking the hourly depth of rainfall from storms over the period of record. The General Permit specifies that, for water quality protection, the design rainfall intensity be equal to or greater than twice the 85th percentile hourly depth.

Q = CiA yields the design flow rate (**Q**), in cubic feet per second, that a BMP must accommodate to meet the performance measures. For more information on sizing flow-based treatment BMPs, see the Fact Sheets in Appendix A and the sizing spreadsheets in Appendix B.

Volume-based Sizing

The recommended method for hydraulically sizing volume-based stormwater treatment BMPs is based upon a goal of 80% annual stormwater volume capture within a 48-hour draw-down period. This method is further described in CASQA's 2003 Stormwater Best Management Practice Handbook New Development and Redevelopment, which is available at www.cabmphandbooks.com.

The following steps explain how to calculate each variable.

1. **Identify each drainage management area on the site.** A drainage management area is a discrete area or subwatershed. The runoff from each drainage management area will drain its own treatment control BMP(s). The steps below should be applied to each drainage management area.

2. **Determine the area in acres (A)** of the drainage management area that drains to the proposed BMP.

3. **Calculate the Composite C-factor** for the drainage management area using the method described in steps 3 and 4 of the flow-based sizing section.

4. **Use the composite C-factor** to interpolate a Unit Basin Storage Volume value (in inches) from the unit basin storage volume curves in Figure 23. Interpolate between the reference C values as necessary to determine a Unit Basin Storage value. A 48-hour draw-down time is recommended, unless soils at the site are coarse.

Volume-Based Sizing

BMP Capture Volume =
BMP Drainage Area x **Unit Basin Storage Volume**

Where:

BMP Capture Volume = the volume of water that the BMP must capture to achieve compliance with the volume-based performance measures.

BMP Drainage Area = the contributing drainage area for the BMP.

Unit Basin Storage Volume = the depth of rainfall, in inches, that is related to a percentage of annual runoff capture. It is determined for various runoff coefficients from historical rainfall records.

Rainwater harvesting is a volume-based BMP that can be used to collect water for various types of industrial operations, resulting in reduced utility costs.

5. **Calculate the BMP Capture Volume** by multiplying the **BMP Drainage Management Area** by the **Unit Basin Storage Volume**. Convert to cubic feet for easy interpretation.

The BMP Capture Volume is the volume needed to meet regulatory standards for stormwater treatment. This or a larger volume must be used for BMP design. The BMP Capture Volume must be recorded and submitted in the SCP. The BMP Fact Sheets in Appendix A and sizing spreadsheets in Appendix B also contain information pertinent to sizing volume-based treatment BMPs.

SFPUC Requirements

Stormwater performance measures for areas in the separate sewers under the jurisdiction of the SFPUC require the capture and treatment of rainfall from a 0.75-inch design storm, which is equivalent to LEED Sustainable Sites Credit 6.2.

To meet the SFPUC performance measure and earn LEED Credit SS6.2, use the following calculation:

V = CAd, where **V** = Volume of water in cubic feet, **A** = size of the drainage management area in square feet, **C** = runoff coefficient, and **d** = rainfall depth in inches.

1. **Determine the area in square feet (A)** of the drainage management area, also known as a subwatershed, that drains to the proposed BMP.

2. **Calculate the Composite C-factor (C)** for the drainage management area using the method described in steps 3 and 4 of the flow-based sizing section.

3. **Use 0.75 inch as the design rainfall depth (d)** for the facility. This design rainfall depth corresponds to LEED Credit SS6.2 for semi-arid watersheds.

5. **Calculate the Volume** by multiplying **C**, **A**, and **d**. Divide by 12 to convert to cubic feet. The maximum allowable draw-down time is 48 hours.

The BMP must capture a volume of water equal to or greater than the volume calculated using the equation above to meet regulatory standards for stormwater treatment. The volume that the BMP will capture must be recorded and submitted in the SCP. The

BMP Sizing

V=CAd

Where:

V = volume in ft^3

C = composite runoff coefficient (composite C-factor)

A = drainage area in square feet

d = design rainfall depth in inches (use 0.75 inch)

"BMP Fact Sheets" in Appendix A and the sizing spreadsheets in Appendix B also contain information pertinent to sizing volume-based treatment BMPs.

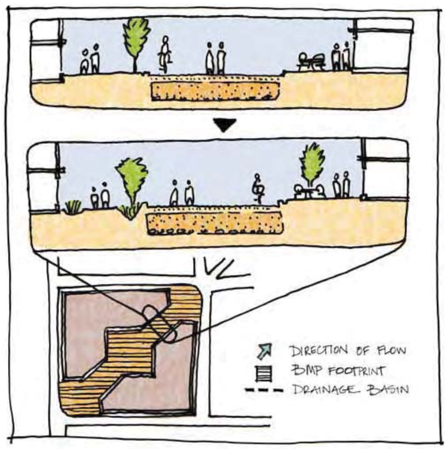
Project applicants in combined sewer areas under SFPUC jurisdiction must achieve LEED SS6.1 to reduce the flow and volume of stormwater into the collection system. SFPUC staff is in the process of creating additional guidance for achieving SS6.1. In the meantime project applicants are encouraged to consult *LEED for New Construction Version 2.2* and contact Urban Watershed Management Program staff if necessary.

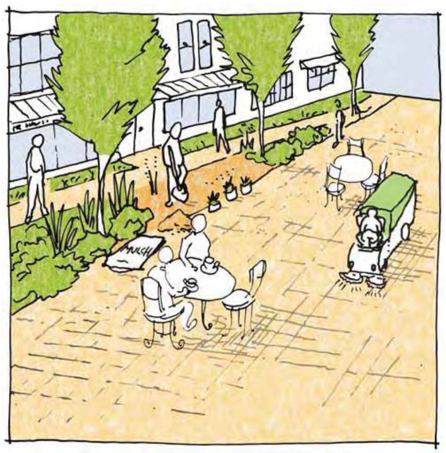
Step 8

Check against Design Goals and Modify if Necessary

After site design, source control, BMP selection, and BMP sizing are completed, project applicants should review the original design goals and evaluate whether they have been achieved. If not, an iterative design process that may include BMP relocation or resizing can ensure that the project achieves its design and development goals and complies with stormwater treatment requirements.

At this stage in the design process, there is a general understanding of how the runoff will move across the site, source control measures have been identified and located, treatment controls have been selected based on site conditions and pollutants of concern, and target water quality volumes and flow rates have been calculated. The next task is to locate and size the actual treatment controls. Sizing tools for each treatment control are





included with the Fact Sheets in Appendix B, and are available electronically at www.sfwater.org and www.sfport.com.

Step 9

Develop an Operations and Maintenance Plan

Treatment and control facilities must be regularly maintained to ensure that they continue to provide effective treatment and do not harbor mosquitoes, cause flooding, or otherwise create a nuisance. Improper maintenance is one of the most common reasons for BMP underperformance and failure.

The General Permit requires that project applicants provide verification of maintenance provisions "through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits." Stormwater facilities installed as part of new development or redevelopment projects will be incorporated into both the Port's and SFPUC's operation and maintenance verification program. An operations and maintenance plan is a required element of the SCP. To develop an operations and maintenance program for new facilities, follow these steps:

1. **Identify who will own or have operational responsibility** for the facility. In the case of Port facilities, operational responsibility will be assigned through lease and development agreements. In the case of privately owned facilities regulated by the SFPUC the property owner will be responsible for operations and maintenance.

2. **Identify applicable maintenance requirements** for each stormwater control at the facility and list the requirements into the SCP. The SCP must identify any title transfers, lease provisions, or maintenance agreements that will be executed before construction is complete.
3. **Develop an Operations and Maintenance Plan** (O&M Plan) for the site incorporating detailed requirements for each treatment and control BMP at the facility. The O&M Plan must be submitted before the building permit is finalized and a certificate of occupancy is issued. Any necessary agreements must be executed concurrent with submittal of the O&M Plan.
4. **Maintain the facilities** from the time of construction until ownership or lease is formally transferred.
5. **Formally transfer** operation and maintenance responsibilities to any new owner, occupant or lessee. **The transfer will require the new owner, occupant, or lessee to maintain facilities in perpetuity and comply with Port and SFPUC self-inspection, reporting, and verification requirements.**

Mulching is an important part of BMP maintenance.

Designing to Minimize Maintenance

Streamlined maintenance and maximized performance can be achieved by considering the following design features:

- Use pretreatment systems to remove coarse sediment and litter, particularly for infiltration systems. Pretreatment systems can also reduce the velocity of flows entering the treatment BMP, reducing wear on the BMP and extending its useful life.
- Use deeper rooted vegetation in conjunction with infiltration BMPs. Good root structure helps to maintain soil porosity and reduces the maintenance needs of the BMP. For a list of recommended vegetation species, see Appendix D.
- Whenever possible, select BMPs that do not require slow-release control structures. Such structures can clog and require periodic inspection and maintenance.
- Stormwater facilities that are above-ground are more likely to be visible and therefore receive maintenance.

Regular inspections are required in order to maintain the effectiveness of treatment control BMPs. Inspection and maintenance activities can be divided into two functions:

1. Scheduled routine inspection and maintenance, and
2. Non-routine repair and maintenance.

Routine inspection can reveal potential problems with BMP operations and help to ensure the highest level of pollutant removal. Routine maintenance refers to activities performed on a regular basis to keep the BMP in good working order. These activities are generally not complicated (sediment removal, landscape work, etc.) and can be performed by most facility maintenance staff. Typical maintenance activities are described in each of the BMP Fact Sheets included in Appendix A.

Step 10

Compile the Stormwater Control Plan

A Stormwater Control Plan (SCP) with exhibits – as described in the SCP template (Appendix C) – must be submitted to the Port or SFPUC as part of the planning approval process. The completed SCP must include the following information:

- Information on Project Owner/Developer and Design Team
- Project location
- Project description
- A site plan showing proposed project
- Any soils or geotechnical reports necessary to complete stormwater design
- Site analysis for locating and sizing BMPs
- A site drainage plan showing direction of stormwater flow to the point where it enters the storm sewer system or receiving waters
- Stormwater sizing calculations
- A post-construction O&M Plan
- Refer to Appendix C for a template of an SCP.

- Steps to Safe Renovation and Abatement of Buildings That Have PCB-Containing Caulk

Overview

In recent years, EPA has learned that caulk containing potentially harmful polychlorinated biphenyls (PCBs) was used in many buildings, including schools, in the 1950s through the 1970s. Most schools and buildings built after 1979 do not contain PCBs in caulk. On September 25, 2009, EPA announced new guidance for school administrators and building managers with important information about managing PCBs in caulk and tools to help minimize possible exposure. Through EPA PCB Regional Coordinators, the Agency will also assist communities in identifying potential problems and, if necessary, developing plans for PCB testing and removal.

For more information:

- PCBs in Caulk Fact Sheet (PDF) (2 pp, 26 KB)
- PCBs In Caulk Frequent Questions (PDF) (14 pp, 101 KB)

The EPA is conducting research to address several unresolved scientific questions that must be better understood to assess the magnitude of the problem of PCBs in caulk and identify the best long-term solutions. For example, the link between the concentrations of PCBs in caulk and PCBs in the air or dust is not well understood. The Agency is doing research to determine the sources and levels of PCBs in schools and to evaluate different strategies to reduce exposures. The results of this research will be used to provide further guidance to schools and building owners as they develop and implement long-term solutions. Read more about Research on PCBs in Caulk.

EPA has calculated prudent public health levels that maintain PCB exposures below the "reference dose" – the amount of PCB exposure that EPA does not believe will cause harm. Read Public Health Levels for PCBs in Indoor School Air || PDF version (2 pp, 14 KB)

Background

Caulk is a flexible material used to seal gaps to make windows, door frames, masonry and joints in buildings and other structures watertight or airtight. At one time caulk was manufactured to contain PCBs because PCBs imparted flexibility.

First Step: Take Steps to Minimize Exposure

Although this is a serious issue, the potential presence of PCBs in schools and buildings should not be a cause for alarm. If your school or building was built or renovated between 1950 and 1979, there are several steps schools can take to reduce potential exposure until it can be determined with certainty if PCBs are present in caulk used in the building and any contaminated caulk can be removed. One of the most important steps is to minimize the potential for PCBs to be present in the indoor air. Indoor air levels of PCBs within a school can be reduced by ensuring that the ventilation system is operating as designed, and to repair or improve the system if it is not.

Many old lighting systems contain ballasts manufactured with PCBs. These PCBs can get into the air if the ballast fails or ruptures. Replacement of old lighting systems with new, energy efficient systems will eliminate a potential source of PCBs.

Other steps include:

- Clean frequently to reduce dust and residue inside buildings.
- Use a wet or damp cloth or mop to clean surfaces.
- Use vacuums with high-efficiency particulate air (HEPA) filters.
- Do not sweep with dry brooms; minimize the use of dusters.
- Wash children's hands with soap and water often, particularly before eating.
- Wash children's toys often.
- Wash hands with soap and water after cleaning, and before eating or drinking.

EPA also has developed an informational brochure to provide the general public with important information on PCBs in building caulk, Preventing Exposure to PCBs in Caulking Material || PDF version (4 pp, 2.7 MB) || en Español (PDF) (4 pp, 2.7 MB), EPA Publication EPA-747-F-09-005.

Testing

Air

If school administrators and building owners are concerned about potential PCBs in the caulk, they should consider testing to determine if PCBs are present in the air. If testing reveals PCB levels above the levels EPA has determined to be safe, schools should attempt to identify any potential sources of PCBs that may be present in the building, including testing samples of caulk and looking for other potential PCB sources (e.g., old transformers, capacitors, or fluorescent light ballasts that might still be present at the school).

If elevated levels of PCBs are found in the air, schools should also have the ventilation system evaluated to determine if it is contaminated with PCBs. Although the ventilation system is unlikely to be an original source of PCB contamination, it may have been contaminated before other sources of PCBs were removed from the school and may contribute to elevated air levels of PCBs. Contaminated ventilation systems should be carefully cleaned. Ideally, such cleaning should be planned in concert with removal of any sources of PCBs that are found to avoid re-contamination of the system.

During the search for potential sources, schools should be especially vigilant in implementing practices to minimize exposures and should retest to determine whether those practices are reducing PCB air levels. It is important to note that interior surfaces and settled dust can absorb PCBs from contaminated air, and these "secondary sources" can emit PCBs after the primary source is removed. Therefore, a remediation plan should consider the potential effects for these secondary sources on indoor air quality.

Other Sources, Including Caulk

Should those practices not reduce exposure, caulk and other known sources of PCBs (e.g., paints, floor and ceiling tiles) should be removed as soon as practicable. Please note that you cannot tell if caulk has PCBs by looking at it. While it is possible that PCBs could be released into the environment through the cracking or flaking of caulk, EPA believes the old caulk that is still flexible or is in visibly good condition could be a significant source of PCBs into the air. The only way to be sure that caulk has PCBs is to have a professional test the caulk.

Where schools or other buildings were constructed or renovated between 1950 and 1979, EPA recommends that PCB-containing caulk be removed during planned renovations and repairs (when replacing windows, doors, roofs, ventilation, etc.).

Based on EPA's Office of Research and Development's (ORD) laboratory research, encapsulation was found to be most effective for interior surfaces that contain low levels of PCBs (i.e. several hundred parts per million). Depending on the PCB reduction goal, the performance of the encapsulant, and the conditions of the building, the upper limit of the PCB concentration for successful encapsulation may vary. Therefore, post-encapsulation monitoring is an essential part of the encapsulation process. Building owners should consult EPA's research on this issue for more specifics. Encapsulation may be useful for the reduction of emissions from secondary sources such as contaminated building materials under and around PCB-containing caulk or paint that has been removed. Encapsulation was not found to be effective in reducing emissions from sources that have a high PCB content (for example caulk) for more than a short period of time. Because each site will present unique circumstances, please consult your EPA PCB Regional Coordinator regarding the application of encapsulation measures on a case by case basis. It is critically important to assure that PCBs are not released to air during replacement or repair of caulk in affected buildings. Assessment of the ventilation system for potential contamination, proper cleaning when required, and isolation of the system to prevent further contamination are also important.

Test Methods

For determining the presence of PCBs in indoor air, EPA has two approved methods:

- Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air - Compendium Method TO-4A (high air volume) (PDF) (53 pp, 665 KB)
- Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air - Compendium Method TO-10A (low air volume) (PDF) (37 pp, 288 KB)

EPA recommends that caulk suspected to contain PCBs be tested directly for the presence of PCBs and removed if PCBs are present at significant levels. The PCB regulations provide appropriate methods for testing. More information on these procedures can be found at:

- Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846
- Wipe Sampling (PDF) (31 pp, 86K)

Contact EPA's Toxic Substances Control Act (TSCA) Hotline at 1-888-835-5372 or the EPA PCB Regional Coordinator for your state for assistance.

Schools Information Kit

A Schools Information Kit provides information for parents, students and staff about PCBs in caulk, including:

- General information on PCBs in older schools and buildings || PDF version (1 pg, 564 KB) || en Español (PDF) (1 pg, 517 KB)
- Schools checklist || PDF version (1 pg, 416 KB) || en Español (PDF) (1 pg, 221 KB)

Information for Contractors Working in Older Buildings

Read Contractors Handling PCBs in Caulk During Renovation, EPA's guidance to contractors and maintenance personnel working in older buildings that may contain PCB-contaminated caulk.

Read EPA's Steps to Safe Renovation and Abatement of Buildings that Have PCB-Containing Caulk.

Additional Information

Additional EPA brochures and fact sheets on best practices for addressing PCBs in caulk:

- Fact Sheet: Testing for PCBs in Buildings
- Fact Sheet: Interim Measures for Reducing Risk and Taking Action to Reduce Exposures
- Fact Sheet: Removal and Clean-Up of PCBs in Caulk and PCB-Contaminated Soil and Building Materials

- Fact Sheet: Disposal Options for PCBs in Caulk and PCB-Contaminated Soil and Building Materials

Where Can I Get More Information?

For more information on how to properly test for and address PCBs in caulk, call the EPA's Toxic Substances Control Act (TSCA) Hotline at 1-888-835-5372 or contact the EPA PCB Regional Coordinator for your state.

EXHIBIT 6

Project Map

PCBs in Caulk Project

PCBs–polychlorinated biphenyls–are a probable human carcinogen and may be causing reproductive failure in birds and affecting immune response in harbor seals in the Estuary. SFEP's PCBs in Caulk Project was created to address potential impacts of polychlorinated biphenyls (PCBs) in caulks and sealants released into stormwater runoff during demolition or remodeling projects in the San Francisco Bay Area. The project is assisting the implementation of the Total Maximum Daily Load (TMDL) for PCBs in San Francisco Bay. The PCBs TMDL includes a plan for reducing PCBs loads that is implemented through permits, including the Municipal Regional National Pollutant Discharge Elimination System (NPDES) Permit for Stormwater (MRP). In the first five-year permit term, starting in 2009, stormwater Permittees are required to investigate the costs, effectiveness, and technical feasibility of several categories of potential PCBs control measures. The PCBs in Caulk Project focused on one such category of potential PCBs controls: measures to minimize the release of PCBs in caulks and sealants to stormwater runoff during demolition or remodeling projects.

The grant-funded PCBs in Caulk Project concluded at the end of 2011.

UPDATE: EPA Proposes Reinterpretation PCBs in Caulk Regulations

Since the SFEP PCBs in Caulk materials were published, EPA issued a notice of proposed rulemaking soliciting comment on how PCBs in caulk were treated under EPA regulations. After consideration of those comments, EPA has proposed a reinterpretation of what materials are considered PCB bulk product waste versus PCB remediation waste. See fuller information at http://www.epa.gov/epawaste/hazard/tsd/pcbs/pubs/caulk/reinterpret.htm

Final Report on PCBs in Bay Area Buildings – Sampling Results and Estimate of Loadings to SF Bay

Institute (SFEI), 2011.

- Supporting documents:

1. Calculations of mass estimates
2. Calculations of demolition and renovation releases

Model Regulatory Program

Disclaimer: To the extent that Permittees will be required in future permits to control PCBs in caulks and sealants released during building demolition or remodeling, these documents are intended to assist in complying with such requirements. **At the time of publication (2011), municipalities are not required to implement the BMPs or Model Implementation Process.**

- Best Management Practices to control PCBs in caulk at demolition or renovation.
- Model Implementation Process to incorporate requirement to use BMPs into municipal demolition permitting process. This document breaks new ground as the first known attempt to create a potential regional regulatory process to manage PCBs in caulks and sealants to protect water quality. It also leaves many issues for potential future implementers to address, compiled in Appendix A of this document on Obstacles, Challenges, and Future Needs.
- Training Strategy to train and deploy municipal staff, such as hazardous material or building inspectors, to ensure proper implementation of the BMPs and compliance with the program. This is a supplement to the MIP.

  - *The BMPs, MIP, and Training Strategy were authored by Larry Walker Associates, Inc., Geosyntec Inc., and TDC Environmental, LLC in November, 2011.*

- Technical Memorandum on existing regulatory controls and policies related to managing wastes and hazardous materials during building demolition and/or remodeling programs.

  - *Please see also the Resources section at the bottom of this page for additional related materials.*

Workshop Held 7/26/11 to Test New Regulatory Process Adding PCB Control to Demolition Permitting

Who: Municipal staff with responsibility for demolition permitting
When: Tuesday, July 26, 1:00pm to 5:00pm
Where: Menlo Parks Arrillaga Family Recreation Center, 700 Alma Street (Juniper Room) Workshop invitation

Requests for Participation in Sampling and Implementation Trial Elements of the Project

Request for Participation – Sampling Element
Request for Participation – Implementation Trials Element (for municipalities)
Request for Participation – Implementation Trials Element (for non-municipal agencies and organizations)

2nd Stakeholder Meeting, October 26, 2010, Oakland

The project's second stakeholder meeting provided an opportunity to review a draft management procedure for PCBs in caulk at demolition/renovation. The authors described and solicited feedback on draft Best Management Practices, an implementation guide, and training materials. Discussion centered on the theme: "how would these documents work for your agency?"

Physical meeting location: 1515 Clay Street in Oakland, Room 1411 with call-in available.
Materials:
Meeting Invite Flyer and Agenda
Presentation 1 (SFEP Overview)
Presentation 2 (LWA and Geosyntec)

1st Stakeholder Meeting, July 15, 2010, Oakland

A team of municipalities, scientists, and stormwater quality managers are developing a process to manage PCBs in caulk. The management process is intended to protect San Francisco Bay from PCBs in caulk released when buildings are demolished or renovated. Developing best management practices (BMPs) and a process to implement those BMPs is required under the new municipal stormwater permit.

This stakeholder meeting introduced the project and identify opportunities to provide feedback into the development of the BMPs and implementation process. We are seeking input from a variety of sectors which may find this project relevant, including: Construction/demolition managers, contractors, building industry associations; Air/water/waste regulators; Public health and safety; Environmental remediation specialists; Municipal permitting, community development, public works departments; and Building managers or facilities managers.

The meeting was held at Joseph P. Bort MetroCenter Auditorium, 101-8th Street, Oakland (Lake Merritt BART) on Thursday, July 15 from 1-4pm.

CLOSED: RFP for PCBs in Caulk BMPs Development

The RFP was posted March 4, 2010, and closed April 2 at 5:00pm. The San Francisco Estuary Partnership (SFEP), a project of the Association of Bay Area Governments (ABAG), a joint powers agency, formed under California Government Code Sections 6500, et seq., invites qualified organizations (such as a consultant or team of consultants) to respond to this Request for Proposals (RFP) for developing Best Management Practices (BMPs) to reduce or prevent discharge of polychlorinated biphenyls (PCBs) from release during building demolition/remodeling, as part of the PCBs in Caulk project managed by SFEP. This project is funded by the State Revolving Fund under the American Recovery and Reinvestment Act of 2009 (ARRA) and is subject to federal stimulus terms and conditions. Proposals were due April 2, 2010 at 5:00pm.

Polychlorinated Biphenyls (PCBs)

What is a PCB Transformer?

Serious Health Concerns

State Contacts

National Information

PCBs in Caulk in Older Buildings

PCBs in Caulk Hotline
For additional information call
1-888-835-5372

PCB Transformers

What is a PCB Transformer?

A PCB Transformer is a transformer that contains PCBs at concentrations greater than 500 parts per million (ppm). Polychlorinated biphenyls (PCBs) were used in electrical transformers because of their useful quality as being a fire retardant. These transformers were manufactured between 1929 and 1977. The majority of these PCB Transformers were installed in apartments, residential and commercial buildings, industrial facilities, campuses, and shopping centers constructed before 1978. If your facility currently uses or plans to dispose of a PCB Transformer you should be aware that the United States Environmental Protection Agency (EPA) regulates the use, storage and disposal of PCB Transformers. PCB-Contaminated Transformers containing between 50 and 499 ppm PCBs are also subject to EPA's regulations.

Do You Own a PCB Transformer?

Generally, a transformer will have a nameplate attached to one side of the unit indicating the trade name of the dielectric fluid, the approximate weight in pounds, and the amount of fluid, usually in gallons.
Since PCBs were marketed under different trade names, the nameplate on a PCB Transformer may not carry the specific term "PCBs". Trade names for PCBs could include:

- Abestol, Aroclor, Askarel, Chlophen
- Chlorextol, DK, EEC-18, Fenclor
- Inerteen, Kennechlor, No-Flamol, Phenoclor
- Pyralene, Pyranol, Saf-T-Kuhl, Solvol
- Non-Flammable Liquid

If the nameplate says "PCBs" or any of the names on the above list, then the transformer most likely contains PCBs in concentrations of between 600,000 and 700,000 ppm. Should your transformer's nameplate not carry any of the above labels, or if the label is missing or illegible, your utility company may be able to tell you if the transformer contains PCBs. Otherwise the only way to be certain is to test the electrical fluid.

PCB Transformer Regulations

Certain requirements have been established to assist the owners or operators in the use of PCB Transformers. These regulations can be found in Title 40 of the Code of Federal Regulations (40 C.F.R.), Part 761. If you are the owner or operator of a commercial building, you have a special responsibility to reduce the potential threat of a fire in or near a PCB Transformer. A commercial building is a non-industrial building - such as an apartment house, school, train station, hospital, or store - which is typically accessible to the general public. These requirements for PCB Transformers currently in use include

Use:

- Certain PCB Transformers must be equipped with enhanced electrical protection or removed from service (40 C.F.R. § 761.30 (a)(1)(iv));
- All PCB Transformers must be registered with fire response personnel (40 C.F.R. § 761.30 (a)(1)(vi));
- PCB Transformers in use in or near commercial buildings must be registered with the building owners (40 C.F.R. § 761.30 (a)(1)(vii));
- Combustible materials must not be stored within a PCB Transformer enclosure or within 5 meters of a PCB Transformer enclosure or PCB Transformer (40 C.F.R. § 761.30 (a)(1)(viii));
- Visual inspections of each PCB Transformer must be conducted quarterly (40 C.F.R. § 761.30 (a)(1)(ix));
- Visual inspections must be conducted daily if the PCB Transformer is leaking and corrective measures must be taken immediately (40 C.F.R. § 761.30 (a)(1)(x)).

Labels:

- Proper PCB identification labels must be affixed to the access to the transformers and also the transformer itself (40 C.F.R. § 761.40 (a)).

Recordkeeping:

- Records of inspections and maintenance must be maintained (40 C.F.R. § 761.30 (a)(1)(xii));
- Annual documents and annual document logs describing the inventory and disposition of PCB Transformers and other PCB Equipment must be kept (40 C.F.R. § 761.180 (a)).
- **All records for inspections and annual documents must be retained for a minimum of three (3) years after the last PCB Item has been disposed of.**

Storage and Disposal

PCB Transformers removed from service can be temporarily stored up to 30 days on pallets while incorporating inspection safeguards. Otherwise, PCB Transformers that are stored for disposal in an area that meets the requirements of 40 C.F.R. § 761.65(b) must be disposed of within a year.

Spills

If a PCB spill occurs in your facility, you should report the spill within 24 hours to the **EPA Region 3 Emergency Response Section (215-814-3255) and the National Response Center (800-424-8802)**. Immediately take control measures for the spread of the spill by damming or libbing the leak, using absorbent materials, and cordon off the area. Once a spill is contained, cleanup must be initiated within 48 hours of the spill. For more information concerning the PCB spill cleanup requirements, see EPA's PCB Spill Cleanup Policy at 40 C.F.R. § 761.120 and the Requirements for PCB Spill Cleanup at 40 C.F.R. § 761.125.

The above information contains only a partial summary of the PCB Regulations. Please refer to the full text of the Code of Federal Regulations (C.F.R.) at 40 C.F.R. Part 761 to determine which requirements apply to your circumstances.

- E-mail to:Kelly Bunker (bunker.kelly@epa.gov) or Craig Yussen (yussen.craig@epa.gov)

Back to top

Serious Health Concerns

There are a number of adverse health effects associated with this chemical. Tests on animals show that PCBs can harm reproduction and growth, and can cause skin lesions and tumors. When PCB fluid is partially burned-as it may be in a transformer fire-the PCB fluid produces by-products, which include polychlorinated dibenzo dioxin and polychlorinated dibenzo furans , that are much more toxic than the PCBs themselves. Tests on rats show that furans can cause anemia and other blood problems. Dioxin is associated with a number of health risks, and has been shown to cause cancer of the liver, mouth, adrenal gland, and lungs in laboratory animals.

For further information regarding the disposal of PCB ballasts, please contact the EPA, Region 3, Land and Chemicals Division at (215)814-2177 or (215) 814-2165.

EXHIBIT 8

Contractors: Handling PCBs in Caulk During Renovation

This brochure is meant to provide contractors, parents, teachers, and school administrators a general overview of the practices a contractor should consider when conducting the renovation of a building that has polychlorinated biphenyl (PCB)-containing caulk. PCBs were not added to caulk after 1979. Therefore, in general, schools built after 1979 do not contain PCBs in caulk.

Contractors play an important role in protecting public health by helping prevent exposure to toxic PCBs. Ordinary renovation and maintenance activities involving the removal of PCB-containing caulk and the surrounding contaminated substrate (brick, masonry, cinder block, wood, etc.) can create dust that contains PCBs which can expose children and adults. PCBs have been demonstrated to cause a variety of adverse health effects, including cancer in animals. PCBs have also been shown to cause a number of serious non-cancer health effects in animals, including effects on the immune system, reproductive system, nervous system, endocrine system, and other health effects.

Consider Testing the Air in Buildings Built Between 1950 and 1979 to Determine Whether Your School or Building May Have PCBs

If school administrators and building owners are concerned about exposure to PCBs and wish to supplement the steps recommended in this brochure, EPA recommends testing to determine if PCB levels in the air exceed EPA's suggested public health levels. If testing reveals levels above the suggested public health levels, school and building operators should be especially vigilant in implementing and monitoring practices to minimize exposures. If PCBs are found in the air, EPA will assist in developing a plan to reduce exposure and manage the caulk. You cannot tell if caulk has PCBs by looking at it. EPA believes the old caulk that is still flexible or is in visibly good condition may be a significant source of PCBs into the air. The only way to be sure that caulk has PCBs is to have a professional test the caulk. Your EPA Regional PCB Coordinator can direct you to a PCB testing lab.

Take Site-Specific Protective Measures

- Be in compliance with occupational protection regulations for contractors (PDF) (2 pp, 286K).
- Protect building occupants and passersby by containing the work area to prevent PCB-containing caulk dust from getting into the surrounding environment.
- Determine disposal options based on concentration and type of material.
- Place an encapsulant underneath the new caulk/sealant (since PCBs in the adjoining material can move into the new caulk/sealant). Use replacement caulk/sealant that is free of environmental hazards.

A pilot renovation project may be warranted to verify whether the renovation goals can be met. It will allow you to compare methods, tools, and protective measures to get specific information about their effectiveness and cost.

Before Starting the Job, Consider the Types of Tools and Machinery for Removing Caulk

- Manual tools are recommended for soft flexible caulk:
  - Advantages: no dust and no heat
  - Disadvantages: labor intensive and slow
- Electromechanical tools are recommended for hardened/brittle caulk:
  - Advantages: faster, less labor intensive
  - Disadvantages: generate heat (which can volatilize the PCBs) and dust, requiring added protective measures. Also must consider the potential abrasive effects on sensitive adjoining structures (e.g., wood and metal).
- EPA recommends removing as much of the old caulk as possible, since any residual caulk left in place can contaminate any new caulk or sealant that is applied.

Notify Interested Parties and Plan for Emergencies

- Communicate the goals, type, and length of projects and specific behavior rules to the affected groups (PTA, school principal, etc.).

- Have an emergency contact list (hospitals, police, etc.).
- Ensure workers are properly trained.
- Prevent unauthorized persons from entering the site.

Take General Protective Measures

- Ensure workers are properly trained.
- Choose the method that minimizes the amount of dust generated.
- Choose methods that protect workers, building users, passersby, and the surroundings of the restoration project.
- Use proper containers to hold removed caulk.
- Use gloves and skin protection.
- Use eye goggles.
- Do not smoke, drink, or eat in the work area.
- Wash hands prior to breaks.
- In dusty work areas, have showers available and separate changing areas so that dust on clothing is not brought home.
- If working with solvents, provide respirators.

Interior Areas

- Cover work areas with plastic.
- Use signs to keep residents and pets out of the work area.
- Remove furniture and belongings, or cover them securely with heavy plastic sheeting.
- Use heavy plastic sheeting to cover floors and other fixed surfaces like large appliances in the work area.
- Improve ventilation and add exhaust fans. Close and seal the ventilation system in the work area and, if necessary, turn off forced-air heating and air-conditioning systems.
- Regularly clean the work area with an industrial (HEPA) vacuum and by wet mopping.
- Properly dispose of personal protective equipment and cleaning material.

Exterior Areas

- Mark off the work areas to keep non-workers away.
- Cover the ground.
- Enclose scaffolding.
- Cover the ground and plants with heavy plastic sheeting.
- Close windows and doors near the work area.
- Move or cover play areas near the work area.

Leave the Work Area Clean

On a daily basis you should:

- Put trash and debris in heavy-duty plastic bags.
- Wrap waste building components, such as windows and doors, in heavy plastic sheeting and tape shut.
- Ensure everything, including tools, equipment, and even workers, are free of dust and debris before leaving the work area.
- HEPA vacuum the work area.
- Remember, you do not want to bring PCB dust home and expose your family.
- Remind residents to stay out of the work area. When the job is complete, you should also:
    - Remove the plastic sheeting carefully, mist with water, fold dirty side in, tape shut, and dispose of it.
    - HEPA vacuum all surfaces, including walls.
    - Wash the work area with a general purpose cleaner.
    - Check your work carefully for dust because hazardous amounts may be minute and not easily visible. If you see any dust or debris, then re-clean the area.

Dispose of Renovation Waste Materials that Contain PCBs in Compliance with the Toxic Substances Control Act (TSCA)

- PCB-containing caulk is considered *PCB bulk product waste* if the concentration of PCBs in the caulk is greater than or equal to (=) 50 parts per million (ppm).
- Surrounding building materials to which PCB caulk is still attached may be disposed of as a PCB bulk product waste, if there is no source of PCB contamination other than the caulk. This could apply in situations such as demolition and disposal of entire buildings, walls, etc. (Note: if your abatement plan states that you intend to dispose of the PCB caulk and any contaminated building materials together, you may dispose of all the materials as a PCB bulk product waste, even if the

PCB caulk becomes separated from the adjacent contaminated building materials during remediation. EPA realizes that the PCB caulk may need to be separated during removal from adjacent contaminated building materials due to the presence of other hazardous materials or may accidentally be separated during the removal process.)
- If PCB caulk has been removed from the surrounding building material and disposed of separately, any contaminated surrounding building materials and adjacent soil are considered PCB remediation waste. This could apply in situations where the PCB caulk is removed, but the contaminated substrate is to be remediated.
- The decision on how to manage PCB contaminated substrate may be subject to a variety of site-specific facts. The appropriate EPA regional office and regional PCB coordinator can be consulted as necessary for assistance with making these decisions. For instance, property owners have identified instances where PCB caulk contained high levels of other hazardous constituents such as asbestos. Similarly, there are cases where PCB paint has been found to contain high levels of leachable metals. In these scenarios, care must be taken to fully characterize the waste to determine the appropriate disposal option.

Disposal Options

PCB bulk product waste: The disposal of *PCB bulk product waste* is regulated under 40 CFR § 761.62 of TSCA. Under this provision, PCB bulk product waste must be disposed of in one of two ways: disposal in a permitted solid waste landfill or via risk-based disposal approval process.

Disposal in solid waste landfills: Certain PCB bulk product waste, such as PCB-containing caulk, even if the concentration of PCBs in the caulk is equal to or greater than 50 ppm, may be disposed of in non-hazardous waste landfills permitted by states. Disposal under this option does not require you to obtain approval from EPA. However, EPA recommends that you determine prior to shipment that the landfill is willing and able to accept the PCB waste. Anyone sending PCB bulk product waste to a non-hazardous waste landfill permitted by a state must send written notice to the landfill prior to shipment of the waste stating that the waste contains PCBs at greater than 50 ppm (see 40 CFR 761.72(b)(4)(ii)). This guidance document does not replace or supersede any (sampling) requirements that the receiving facility may deem necessary to determine acceptance of the waste into its facility. Additionally, this guidance does not supersede state requirements which may be more stringent than those mandated by the federal government for management of this debris.

Risk-based option: The risk-based option allows for a site-specific, risk-based evaluation of whether *PCB bulk product waste* may be disposed of in a manner other than under the performance-based disposal option or the solid waste landfill disposal option. Disposal of *PCB bulk product waste* under this option requires you to obtain approval from EPA based on a finding that the disposal will not present an unreasonable risk of injury to health or the environment.

PCB remediation waste: The disposal of PCB remediation waste is regulated under 40 CFR § 761.61 of TSCA. There are three options for management of *PCB remediation waste*:

- ***Self-implementing cleanup and disposal:*** The self-implementing option links cleanup levels with the expected occupancy rates of the area or building where the contaminated materials are present. The disposal requirements for the self-implementing regulatory option vary based on the type of contaminated material and concentration of PCBs in the materials, among other things. Cleanup and disposal under this option requires you to notify your EPA Regional PCB Coordinator.

- ***Performance-based disposal:*** The performance-based option allows for disposal of the contaminated materials in either a TSCA chemical waste landfill or TSCA incinerator, through a TSCA-approved alternate disposal method, under the TSCA-regulated decontamination procedures, or in a facility with a coordinated approval issued under TSCA. Disposal under this option generally does not require you to obtain approval from EPA.

- ***Risk-based cleanup and disposal:*** The risk-based option allows for a site-specific evaluation of whether *PCB remediation waste* may be cleaned up or disposed of in a manner other than the alternatives provided under the self-implementing or the performance-based disposal options. Disposal of PCB remediation waste under this option requires you to obtain an approval from EPA based on a finding that the disposal will not present an unreasonable risk of injury to health or the environment.

Additional Information on EPA's Website

EPA has developed an informational brochure and fact sheets to provide building owners and managers with key information on the current best practices for addressing PCBs in caulk. View these documents here.

EPA is Helping to Address the Issue of PCBs in Caulk

Where Can I Get More Information

EPA has conducted research on how the public is exposed to PCBs in caulk and on the best approaches for reducing exposure and potential risks associated with PCBs in caulk. Where PCBs have been found in the air, soil, or in the caulk and other building materials, EPA is committed to helping schools and communities enact plans to reduce exposure. Please contact your regional PCB coordinator for help with assessing contamination and exposure and developing cleanup plans. Please contact your regional EPA Regional PCB Coordinator help with assessing contamination and exposure and developing cleanup plans.

EXHIBIT 9

CNPS Botanical Survey Guidelines

CALIFORNIA NATIVE PLANT SOCIETY
December 9, 1983
Revised June 2, 2001

The following recommendations are intended to help those who prepare and review environmental documents determine when a botanical survey is needed, who should be considered qualified to conduct such surveys, how surveys should be conducted, and what information should be contained in the survey report. The California Native Plant Society recommends that lead agencies not accept the results of surveys unless they are conducted and reported according to these guidelines.

1. Botanical surveys are conducted in order to determine the environmental effects of proposed projects on all botanical resources, including special status plants (rare, threatened, and endangered plants) and plant (vegetation) communities. Special status plants are not limited to those that have been listed by state and federal agencies but include any plants that, based on all available data, can be shown to be rare, threatened, or endangered under the following definitions:

   A species, subspecies, or variety of plant is “endangered” when the prospects of its survival and reproduction are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, over-exploitation, predation, competition, or disease. A plant is "threatened" when it is likely to become endangered in the foreseeable future in the absence of protection measures. A plant is "rare" when, although not presently threatened with extinction, the species, subspecies, or variety is found in such small numbers throughout its range that it may be endangered if its environment worsens.[1]

   Rare plant (vegetation) communities are those communities that are of highly limited distribution. These communities may or may not contain special status plants. The most current version of the California Natural Diversity Database's *List of California Terrestrial Natural Communities*[2] should be used as a guide to the names and status of communities.

   Consistent with the California Native Plant Society’s goal of preserving plant biodiversity on a regional and local scale, and with California Environmental Quality Act environmental impact assessment criteria[3], surveys should also assess impacts to locally significant plants. Both plants and plant communities can be considered significant if their local occurrence is on the outer limits of known distribution, a range extension, a rediscovery, or rare or uncommon in a local context (such as within a county or region). Lead agencies should address impacts to these locally unique botanical resources regardless of their status elsewhere in the state.

2. Botanical surveys must be conducted to determine if, or to the extent that, special status or locally significant plants and plant communities will be affected by a proposed project when any natural vegetation occurs on the site and the project has the potential for direct or indirect effects on vegetation.

3. Those conducting botanical surveys must possess the following qualifications:
   a. Experience conducting floristic field surveys;
   b. Knowledge of plant taxonomy and plant community ecology and classification;
   c. Familiarity with the plants of the area, including special status and locally significant plants;

[1] California Environmental Quality Act Guidelines, §15065 and §15380.
[2] List of California Terrestrial Natural Communities. California Department of Fish and Game Natural Diversity Database. Sacramento, CA.
[3] California Environmental Quality Act Guidelines, Appendix G (Initial Study Environmental Checklist).

   d. Familiarity with the appropriate state and federal statutes related to plants and plant collecting; and,
   e. Experience with analyzing impacts of a project on native plants and communities.

4. Botanical surveys should be conducted in a manner that will locate any special status or locally significant plants or plant communities that may be present. Specifically, botanical surveys should be:

   a. Conducted in the field at the proper times of year when special status and locally significant plants are both evident and identifiable. When special status plants are known to occur in the type(s) of habitat present in the project area, nearby accessible occurrences of the plants (reference sites) should be observed to determine that the plants are identifiable at the time of survey.

   b. Floristic in nature. A floristic survey requires that every plant observed be identified to species, subspecies, or variety as applicable. In order to properly characterize the site, a complete list of plants observed on the site shall be included in every botanical survey report. In addition, a sufficient number of visits spaced throughout the growing season is necessary to prepare an accurate inventory of all plants that exist on the site. The number of visits and the timing between visits must be determined by geographic location, the plant communities present, and the weather patterns of the year(s) in which the surveys are conducted.

   c. Conducted in a manner that is consistent with conservation ethics and accepted plant collection and documentation techniques[4,5]. Collections (voucher specimens) of special status and locally significant plants should be made, unless such actions would jeopardize the continued existence of the population. A single sheet should be collected and deposited at a recognized public herbarium for future reference. All collections shall be made in accordance with applicable state and federal permit requirements. Photography may be used to document plant identification only when the population cannot withstand collection of voucher specimens.

   d. Conducted using systematic field techniques in all habitats of the site to ensure a thorough coverage of potential impact areas. All habitats within the project site must be surveyed thoroughly in order to properly inventory and document the plants present. The level of effort required per given area and habitat is dependent upon the vegetation and its overall diversity and structural complexity.

   e. Well documented. When a special status plant (or rare plant community) is located, a California Native Species (or Community) Field Survey Form or equivalent written form, accompanied by a copy of the appropriate portion of a 7.5-minute topographic map with the occurrence mapped, shall be completed, included within the survey report, and separately submitted to the California Natural Diversity Database. Population boundaries should be mapped as accurately as possible. The number of individuals in each population should be counted or estimated, as appropriate.

5. Complete reports of botanical surveys shall be included with all environmental assessment documents, including Negative Declarations and Mitigated Negative Declarations, Timber Harvesting Plans, Environmental Impact Reports, and Environmental Impact Statements. Survey reports shall contain the following information:

   a. <u>Project location and description</u>, including:

[4] Collecting Guidelines and Documentation Techniques. California Native Plant Society Policy (adopted March 4, 1995).
[5] Ferren, W.R., Jr., D.L. Magney, and T.A. Sholars. 1995. The Future of California Floristics and Systematics: Collecting Guidelines and Documentation Techniques. *Madroño* 42(2):197-210.

1) A detailed map of the location and footprint of the proposed project.
2) A detailed description of the proposed project, including one-time activities and ongoing activities that may affect botanical resources.
3) A description of the general biological setting of the project area.

b. Methods, including:
1) Survey methods for each of the habitats present, and rationale for the methods used.
2) Description of reference site(s) visited and phenological development of the target special status plants, with an assessment of any conditions differing from the project site that may affect their identification.
3) Dates of surveys and rationale for timing and intervals; names of personnel conducting the surveys; and total hours spent in the field for each surveyor on each date.
4) Location of deposited voucher specimens and herbaria visited.

c. Results, including:
1) A description and map of the vegetation communities on the project site. The current standard for vegetation classification, *A Manual of California Vegetation*[6], should be used as a basis for the habitat descriptions and the vegetation map. If another vegetation classification system is used, the report must reference the system and provide the reason for its use.
2) A description of the phenology of each of the plant communities at the time of each survey date.
3) A list of all plants observed on the project site using accepted scientific nomenclature, along with any special status designation. The reference(s) used for scientific nomenclature shall be cited.
4) Written description and detailed map(s) showing the location of each special status or locally significant plant found, the size of each population, and method used to estimate or census the population.
5) Copies of all California Native Species Field Survey Forms or Natural Community Field Survey Forms and accompanying maps.

d. Discussion, including:
1) Any factors that may have affected the results of the surveys (*e.g.*, drought, human disturbance, recent fire).
2) Discussion of any special local or range-wide significance of any plant population or community on the site.
3) An assessment of potential impacts. This shall include a map showing the distribution of special status and locally significant plants and communities on the site in relation to the proposed activities. Direct, indirect, and cumulative impacts to the plants and communities shall be discussed.
4) Recommended measures to avoid and/or minimize direct, indirect, and cumulative impacts.

e. References cited and persons contacted.

f. Qualifications of field personnel including any special experience with the habitats and special status plants present on the site.

EXHIBIT 10

GENERAL RARE PLANT SURVEY GUIDELINES

Ellen A. Cypher
California State University, Stanislaus
Endangered Species Recovery Program
P.O. Box 9622, Bakersfield, CA 93389-9622
ecypher@esrp.org

Revised July 2002

All surveys for rare plants should be conducted in accordance with the standardized guidelines issued by the regulatory agencies (U.S. Fish and Wildlife Service 1996, California Department of Fish and Game 2000) and the California Native Plant Society (2001). Some of the requirements specified in the standardized guidelines are that surveys must be conducted during the appropriate season and be floristic in nature. Thus, surveys should not target a single species but should aim to identify any and all rare species and rare plant communities in the area. The guidelines also provide information on selecting a qualified botanist and providing appropriate documentation of surveys. Additional considerations for conducting rare plant surveys are described by Nelson (1987). Permission of the landowner or land-management agency is required for both site access and plant collection. In addition, federal and/or state permits are necessary to collect specimens of plants listed as endangered, threatened, or rare.

The species-specific methods presented below are intended as a supplement to the basic guidelines. They describe the conditions under which the potential for discovering each listed plant species in the survey area will be maximized. Multiple visits to a site may be necessary to ensure that survey conditions have been appropriate for all potentially-occurring rare plant species.

Certain methods are common to all of the following species-specific survey guidelines; similar methods may be employed for species not covered herein. In the southern San Joaquin Valley, many of the listed plants are small and easily obscured by dense vegetation. Thus intensive, systematic surveys are recommended to detect rare plant species in this region. Biologists should walk parallel transects spaced 5 to 10 meters (16 to 33 feet) apart throughout the entire site, regardless of subjective habitat evaluations. Transects may be stratified by topography or plant community for convenience. Field survey crews should include at least one member who has seen the target species growing in its natural habitat. Other team members may be trained using photographs and/or herbarium specimens but should be accompanied in the field by the experienced crew member during all surveys. Project-area surveys are valid only for those species that are evident during the survey period. Prior to conducting surveys in a given year, at least one member of the survey crew should visit known populations of the target species that occur in areas similar in elevation, latitude, vegetation, and topography to the survey area. Such visits will determine whether precipitation has been adequate for germination and growth, as well as confirm current phenology of the target species. Survey reports should document the known locations that were visited, the date of the visit, and the observability and phenology of the target

species at that time, plus the date of the survey, the abundance and distribution of all rare species in the survey area, and any other elements required by the agency guidelines. Information on the locations of known populations may be obtained from agency biologists, the California Natural Diversity Data Base, or local chapters of the California Native Plant Society (see below). The current status and abundance of any known populations visited as well as any new populations discovered also should be reported to the California Natural Diversity Data Base.

Surveys can confirm the presence of rare plants on a site, but negative results do not guarantee that rare plant species are absent. However, for practical purposes, surveys that adhere to the attached species-specific guidelines provide reasonable evidence that the specified plant taxa do not occur in the survey area. Surveys that employ methods or timing other than those recommended herein may be used as evidence of the presence (but not absence) of rare plant species.

SUPPLEMENTAL SURVEY METHODS FOR SAN JOAQUIN WOOLLY-THREADS

Ellen A. Cypher
California State University, Stanislaus
Endangered Species Recovery Program
P.O. Box 9622, Bakersfield, CA 93389-9622
ecypher@esrp.org

Revised July 2002

Literature review

San Joaquin woolly-threads [*Monolopia congdonii* (Gray) B.G. Baldwin] is an annual herb of the aster family (Asteraceae). When first described (Gray 1883), this species was included in the genus *Eatonella*; Greene (1897) later transferred it to *Lembertia*. The name *Lembertia congdonii* (Gray) Greene was in use for many years, but a recent revision based on phylogeny (Baldwin 1999) changed the scientific name to *Monolopia congdonii* (Gray) B.G. Baldwin. San Joaquin woolly-threads is federally listed as an endangered species (U.S. Fish and Wildlife Service 1990).

The plant size and habit of San Joaquin woolly-threads are influenced by associated vegetation. On sparsely-vegetated sites, individuals generally are 2 to 7 centimeters (0.8 to 2.8 inches) tall, erect, and single-stemmed, whereas individuals in tall, dense vegetation may have many decumbent stems up to 45 centimeters (17.7 inches) long (Cypher 1994). In years of below-average precipitation, few seeds of San Joaquin woolly-threads germinate (Twisselmann 1967, Taylor 1989), and those that do typically produce tiny plants (E. Cypher personal observation). Phenology also varies with location and weather conditions. Seed germination may begin as early as November (Taylor 1989) but usually occurs in December and January (Lewis 1993, E. Cypher unpublished data). San Joaquin woolly-threads typically flowers between late February and early April (Taylor 1989), but flowering may continue into early May if conditions are optimal (B. Delgado personal communication). Populations in the northern part of the range flower earlier than those on the Carrizo Plain (Mazer and Hendrickson 1993, Cypher 1994). Small, vegetative individuals closely resemble *Eriogonum* species, but flowering individuals are readily distinguishable (E. Cypher personal observation).

The historical range of this species included Fresno, Kern, Kings, San Benito, San Luis Obispo, Santa Barbara, and Tulare Counties (Taylor 1989, Tibor 2001). San Joaquin woolly-threads occurs in a number of the plant communities described by Holland (1986), including Non-native Grassland, Valley Saltbush Scrub, Interior Coast Range Saltbush Scrub, and Upper Sonoran Subshrub Scrub (Cypher 1994). However, this species typically occupies portions of the habitat with less than 10% shrub cover and may occur in association with cryptogamic crust (Taylor 1989, Cypher 1994). Occurrences have been reported at elevations ranging from as low as 60 m (190 feet) on the San Joaquin Valley floor up to 838 meters (2,750 feet) in the Inner Coast Ranges of San Luis Obispo and Santa Barbara counties (Lewis 1993, California Natural Diversity Data Base 2002).

San Joaquin woolly-threads occurs on soils of alluvial origin that are neutral to subalkaline (Taylor 1989, Lewis 1993). On the San Joaquin Valley floor, this species typically is found on sandy or sandy loam soils, particularly those of the Kimberlina series (Taylor 1989, Taylor and Buck 1993), whereas on the Carrizo Plain it occurs on silty soils (Lewis 1993). San Joaquin woolly-threads frequently occurs on sand dunes and sand ridges (Taylor 1989, California Natural Diversity Data Base 2002) as well as along the high-water line of washes and on adjacent terraces (Lewis 1993, E. Cypher personal observation). Populations of this species have been documented in previously cultivated lands, heavily grazed pastures, and remnant habitat in oil fields (Taylor 1989, Lewis 1993, Taylor and Buck 1993).

Survey guidelines

All surveys for rare plants should be conducted in accordance with the standardized guidelines issued by the regulatory agencies (U.S. Fish and Wildlife Service 1996, California Department of Fish and Game 2000) and the Califomia Native Plant Society (2001). The species-specific methods presented below are intended as a supplement to those standardized guidelines.

Systematic surveys are recommended to detect presence and determine distribution of San Joaquin woolly-threads within the survey area. For systematic searches, biologists should walk parallel transects spaced 5 to 10 meters (16 to 33 feet) apart throughout the entire site, regardless of subjective habitat evaluations. However, transects may be stratified by topography or plant community for convenience. Field survey crews should include at least one member who has seen San Joaquin woolly-threads growing in its natural habitat. Other team members may be trained using photographs and/or herbarium specimens but should be accompanied in the field by the experienced crew member during all surveys.

Prior to beginning surveys in a given year, at least one member of the survey crew should visit one or more known locations of San Joaquin woolly-threads to verify that precipitation has been adequate for germination and to determine current phenology. The known locations should be as similar as possible to the survey area in elevation, habitat, and topography. Species-specific surveys should not be attempted if San Joaquin woolly-threads is not seen at known locations, the densities are very low relative to normal years, or the plants are inconspicuous. Survey reports should document the known locations that were visited, the date of the visit, and the observability and phenology of San Joaquin woolly-threads at that time, plus the date of the survey, the abundance and distribution of all rare species in the survey area, and any other elements required by the agency guidelines. The typical survey period for San Joaquin woolly-threads is March and April.

Revised July 2002

Literature review

The taxonomy of Kern mallow (*Eremalche kernensis* C.B. Wolf) is somewhat controversial. At issue are the taxonomic rank and the circumscription of Kern mallow in relation to Parry's mallow [*Eremalche parryi* (Greene) Greene]. Kern mallow was first described as *Eremalche kernensis* (Wolf 1938) but also has been included in the genus *Malvastrum* (Munz and Keck 1959). The most recently-published treatments of this complex (Bates 1992, Bates 1993) assign Kern mallow the name *Eremalche parryi* (Greene) Greene ssp. *kernensis* (Wolf) Bates, and Parry's mallow the name *E. parryi* ssp. *parryi*. Other combinations have been suggested (Leonelli 1986) but have not been validly published. After consultation with species experts, the U.S. Fish and Wildlife Service made the decision to continue using the original name and circumscription for Kern mallow (Medlin in litt. 1995). Kern mallow is federally listed as endangered (U.S. Fish and Wildlife Service 1990). In terms of status, its rank is irrelevant because subspecies also are protected under the federal Endangered Species Act (U.S. Fish and Wildlife Service 1992). Throughout this document, "Kern mallow" refers to *Eremalche kernensis* in the strict sense.

The circumscription debate centers around the gender, size, and color of flowers to be included in each taxon. Certain populations in the Kern/Parry's mallow complex exhibit a condition known as gynodioecy, meaning that some of the plants have only bisexual flowers and other plants in the same population have only pistillate flowers. Bisexual flowers have both male and female parts; these flowers also are known as perfect or hermaphroditic. Pistillate flowers have only female parts; these flowers also are known as male-sterile. Pistillate flowers have shorter petals than bisexual flowers in the same population (Bates 1992, Bates 1993, E. Cypher unpublished data) (Table 1). Experts agree that Kern mallow is gynodioecious. However, any gynodioecious population in the complex keys to *Eremalche parryi* ssp. *kernensis* in Bates (1993), including those that species experts consider to be Parry's mallow (Taylor and Davilla 1986, E. Cypher unpublished data). Other populations in the Kern/Parry's mallow complex consist only of plants with bisexual flowers; these populations key to *Eremalche parryi* ssp. *parryi* (Bates 1993) and are indisputably Parry's mallow. Parry's mallow is generally accepted to have larger flower parts than Kern mallow (Table 1) (Munz and Keck 1959, Bates 1992, Bates 1993, E. Cypher unpublished data).

Gynodioecious populations in the Kern/Parry's mallow complex may have a mixture of flower colors. Kern mallow flowers may be either white or pale lavender, regardless of gender (Wolf

Table 1. Comparison of morphological characters (ranges) of three *Eremalche* species. Compiled from Abrams (1951), Munz and Keck (1959), Bates (1992, 1993), Stebbins et al. (1992), and E. Cypher (unpublished data).

Character	*exilis* (bisexual only)	*kernensis* pistillate flower	*kernensis* bisexual flower	*parryi* [1] pistillate flower	*parryi* [1] bisexual flower
Petal color	white, pinkish, or pale lavender	white or pale lavender	white or pale lavender	mauve, purple, or rose-pink, rarely white or lavender	mauve, purple, or rose-pink, rarely white or lavender

[1] Measurements obtained from plants in Kern, Tulare, and San Luis Obispo counties only.
[2] Not differentiated by flower gender.

1938, Munz and Keck 1959, E. Cypher unpublished data). Parry's mallow typically has mauve to purple flowers (Bates 1992), but white or pale lavender flowers are observed occasionally (Taylor and Davilla 1986, E. Cypher unpublished data).

Another source of confusion is that the closely-related desert mallow (*Eremalche exilis*) co-occurs with Kern and Parry's mallows in western Kern County. Desert mallow plants have only bisexual flowers that are similar in size to the pistillate flowers of Kern mallow (Table 1). Despite the gender difference, the bisexual flowers of desert mallow are easily mistaken for the pistillate flowers of Kern mallow due to their size and the fact that the anthers of the former are not easily distinguished from the stigmas (Andreasen et al. in press). Desert mallow is known to grow sympatrically with Kern mallow in the Lokern area but occupies a much broader range overall (Twisselmann 1956, Twisselmann 1967, Hoover 1970, Bates 1993, Andreasen et al. in press). Although Mojave desert populations of desert mallow typically have trailing stems, those in western Kern County and San Luis Obispo County may have either trailing stems or robust, upright stems. Numerous populations attributed to Kern mallow in the past actually consist of desert mallow (Andreasen et al. in press). Due to their morphological similarity, close inspection is required to differentiate the two species.

Widely varying geographical ranges have been reported for Kern mallow due to the unresolved taxonomic problems and misidentifications of desert mallow. Kern mallow in the strict sense occurs only in the Lokern area of Kern County (Wolf 1938, Munz and Keck 1959, Taylor and Davilla 1986, Tibor 2001, Andreasen et al. in press). Plants reported from elsewhere in Kern County or from San Luis Obispo, Santa Barbara, and Tulare counties (Hoover 1970, Leonelli 1986, Taylor and Davilla 1986, Olson and Magney 1992, Stebbins et al. 1992, California Natural Diversity Data Base 2002, E. Cypher personal observations) are referable either to Parry's mallow or desert mallow (Andreasen et al. in press). These erroneous locations include Buena Vista Valley, Carrizo Plain, Cuyama Valley, Elk Hills, Elkhorn Plain, Fellows, Lost Hills, Maricopa, McKittrick Hills, Panorama Hills, Pixley, Telephone Hills, and the Temblor Range. The distribution map in the recovery plan for Kern mallow (U.S. Fish and Wildlife Service 1998) has been invalidated by the recent research of Andreasen et al. (in press).

As with many desert annuals, the height, habit, density, and phenology of Kern mallow vary greatly depending on precipitation. Kern mallow may not germinate in dry years (Twisselmann 1956, Bates 1992). True Kern mallow typically flowers in March and early April, although flowers may be present in late February or into May if weather conditions are favorable (Taylor and Davilla 1986, E. Cypher unpublished data). The majority of Kern mallow flowers open in late morning (approximately 10:00 am standard time) and wither by late afternoon (approximately 3:00 pm standard time) of the same day. Desert mallow in Lokern begins flowering somewhat earlier in the season and flowers are open only for a few hours at mid-day (E. Cypher personal observation).

Kern mallow occurs primarily in the Valley Saltbush Scrub plant community (cf. Holland 1986) and its ecotones with Valley Sink Scrub and Non-native Grassland (Taylor and Davilla 1986, California Natural Diversity Data Base 2002, E. Cypher unpublished data). This species typically grows in areas where shrub cover is less than 25%. However, much of the Kern mallow habitat in Lokern is shrubless due to repeated fires, which type-converted the areas from shrubland to grassland. Herbaceous cover in occupied habitat is variable depending on rainfall; it has ranged from 48% to 97% between 1993 and 2001, but a lower cover probably would be optimal (Taylor and Davilla 1986, Cypher 1994, Anonymous 1997, Anonymous 1998, Anonymous 1999, Anonymous 2000, Anonymous 2001). Elevations at true Kern mallow locations range from 84 to 275 meters (275 to 900 feet) (California Natural Diversity Data Base 2002). The primary soil type supporting Kern mallow is Kimberlina sandy loam, followed by Kimberlina fine sandy loam and Panoche clay loam (E. Cypher unpublished data). Kern mallow occasionally has reinvaded disturbed sites when existing populations remained in adjacent areas to provide sources of seed (Mitchell 1989, E. Cypher unpublished observation).

Survey guidelines

All surveys for rare plants should be conducted in accordance with the standardized guidelines issued by the regulatory agencies (U.S. Fish and Wildlife Service 1996, California Department of Fish and Game 2000) and the California Native Plant Society (2001). The species-specific methods presented below are intended as a supplement to those standardized guidelines.

Systematic surveys are recommended to detect presence and determine distribution of Kern mallow within the survey area. For systematic searches, biologists should walk parallel transects spaced 5 to 10 meters (16 to 33 feet) apart throughout the entire site, regardless of subjective habitat evaluations. However, transects may be stratified by topography or plant community for convenience. Field survey crews should include at least one member who has seen Kern mallow growing in its natural habitat. Other team members may be trained using photographs and/or herbarium specimens but should be accompanied in the field by the experienced crew member during all surveys. The identity of each population discovered must be confirmed by a botanist familiar with both Kern mallow and desert mallow. Any non-flowering *Eremalche* populations that are observed during surveys must be revisited when the flowers are open to confirm their identity.

Prior to beginning surveys in a given year, at least one member of the survey crew should visit one or more known locations of Kern mallow in the Lokern area to verify that precipitation has been adequate for germination and to determine current phenology. The known locations should be as similar as possible to the survey area in elevation, habitat, and topography. Species-specific surveys should not be attempted if Kern mallow is not seen at known locations, the densities are very low relative to normal years, or the plants are inconspicuous. Survey reports should document the known locations that were visited, the date of the visit, and the observability and phenology of Kern mallow at that time, plus the date of the survey, the diagnostic characteristics of any *Eremalche* populations discovered, the abundance and distribution of all rare species in the survey area, and any other elements required by the agency guidelines. The typical survey period for Kern mallow is March and April.

Until biosystematic studies have been conducted to resolve the taxonomic issues, any gynodioecious or small-flowered *Eremalche* population west of the Sierra crest should be reported to the appropriate agency, regardless of flower color or apparent gender. The identity of populations to be acquired as mitigation for disturbance to known Kern mallow should be confirmed by a species expert.

SUPPLEMENTAL SURVEY METHODS FOR CALIFORNIA JEWELFLOWER

Ellen A. Cypher
California State University, Stanislaus
Endangered Species Recovery Program
P.O. Box 9622, Bakersfield, CA 93389-9622
ecypher@esrp.org

Revised July 2002

Literature review

California jewelflower [*Caulanthus californicus* (S. Watson) Payson] is a showy annual belonging to the mustard family (Brassicaceae). It was included previously in the genera *Stanfordia* (Watson 1880) and *Streptanthus* (Greene 1891). California jewelflower is both federally and state listed as an endangered species (U.S. Fish and Wildlife Service 1990, Tibor 2001).

As is typical of annuals, both the size of California jewelflower plants and population size may vary dramatically, depending on site and weather conditions. California jewelflower is most conspicuous during the flowering period, which can range from February into May (Taylor and Davilla 1986, E. Cypher unpublished data). Heights at flowering can range from less than 10 centimeters (4 inches) to 50 centimeters (20 inches) or more (Munz and Keck 1959, Mazer and Hendrickson 1993, Cypher 1994). Even in optimal years, California jewelflower colonies are very limited in extent due to the clumped distribution of plants (Taylor and Davilla 1986, Mazer and Hendrickson 1993).

Other species of *Caulanthus* resemble California jewelflower superficially. However, California jewelflower has smaller flowers and shorter, flatter fruits than Coulter's jewelflower (*C. coulteri* Watson) and desert candle *(C. inflatus* Watson) (Table 1). Depauperate individuals of desert candle may lack the characteristic inflated stems but can be identified by their lavender stigmas (Buck 1993, E. Cypher personal observation). The rosettes of California jewelflower can be confused with those of several other species in the mustard family and aster family (Asteraceae).

Historically, California jewelflower occurred in the San Joaquin Valley and the inner Coast Ranges from Fresno County south to Santa Barbara and Ventura Counties (Taylor and Davilla 1986). Populations have been reported from elevations ranging from approximately 75 to 945 meters (240 to 3,100 feet) and occur on level to gentle sloping (usually <25% slope) terrain. Soils at known locations are primarily subalkaline, sandy loams (Taylor and Davilla 1986, California Natural Diversity Data Base 2002, R. Lewis personal communication).

Plant communities (cf. Holland 1986) supporting extant California jewelflower populations include Non-native Grassland, Upper Sonoran Subshrub Scrub, and Cismontane Juniper Woodland and Scrub (E. Cypher unpublished data). Historical records suggest that California jewelflower also occurred in the Valley Saltbush Scrub plant community (California Natural

Table 1. Diagnostic characters of three *Caulanthus* species. Data from Buck (1993), Munz and Keck (1959), and E. Cypher (unpublished data).

Character	*C. californicus*	*C. coulteri*	*C. inflatus*
Filaments	distinct or 1 pair fused	1-2 pair fused	1-2 pair fused
Stem	not inflated	not inflated	usually inflated
Cauline leaf shape	ovate to rounded	oblong to ovate	oblong to ovate
Sepal length	4-10 mm	5-18 mm	8-10 mm
Petal length	6-11 mm	8-31 mm	8-14 mm
Stigma color	greenish	?	lavender
Mature fruit length	1-6 cm	4-13 cm	5-11 cm
Fruit cross-section	flattened perpendicular to septum	rounded or flattened parallel to septum	rounded to squarish
Seed shape	spheric	oblong	oblique-oblong

Diversity Data Base 2002). Herbaceous cover is dense at most locations except those in Santa Barbara County, where up to 50% of the surface is barren. Native plant species comprise a high proportion of the vegetation at many of the known locations (Taylor and Davilla 1986, Cypher 1994, R. Lewis personal communication).

Survey guidelines

All surveys for rare plants should be conducted in accordance with the standardized guidelines issued by the regulatory agencies (U.S. Fish and Wildlife Service 1996, California Department of Fish and Game 2000) and the California Native Plant Society (2001). The species-specific methods presented below are intended as a supplement to those standardized guidelines.

Systematic surveys are recommended to detect presence and determine distribution of California jewelflower within the survey area. For systematic searches, biologists should walk parallel transects spaced 5 to 10 meters (16 to 33 feet) apart throughout the entire site, regardless of subjective habitat evaluations. However, transects may be stratified by topography or plant community for convenience. Field survey crews should include at least one member who has seen California jewelflower growing in its natural habitat. Other team members may be trained using photographs and/or herbarium specimens but should be accompanied in the field by the experienced crew member during all surveys.

Prior to beginning surveys in a given year, at least one member of the survey crew should visit one or more known locations of California jewelflower to verify that precipitation has been adequate for germination and to determine current phenology. The known locations should be as similar as possible to the survey area in elevation, habitat, and topography. Species-specific surveys should not be attempted if California jewelflower is not seen at known locations, the densities are very low relative to normal years, or the plants are inconspicuous. Survey reports should document the known locations that were visited, the date of the visit, and the observability and phenology of California jewelflower at that time, plus the date of the survey, the abundance and distribution of all rare species in the survey area, and any other elements required by the agency guidelines. The typical survey period for this species is March and April.

SUPPLEMENTAL SURVEY METHODS FOR BAKERSFIELD CACTUS

Ellen A. Cypher
California State University, Stanislaus
Endangered Species Recovery Program
P.O. Box 9622, Bakersfield, CA 93389-9622
ecypher@esrp.org

Revised July 2002

Literature review

The taxonomy of Bakersfield cactus has not been accepted universally, even though it was named over a century ago. Originally, Bakersfield cactus was treated as a full species, *Opuntia treleasii* Coulter (1896). Shortly thereafter, Toumey (1901) renamed Bakersfield cactus as a variety of the more widespread beavertail cactus (*Opuntia basilaris* Englemann and Bigelow), resulting in the combination *O. basilaris* var. *treleasii* (Coulter) Toumey for Bakersfield cactus. Griffiths and Hare (1906) considered Bakersfield cactus to be a distinct species and further subdivided it into two varieties, *O. treleasii* Coulter var. *treleasii* and *O. treleasii* Coulter var. *kernii* Griffiths and Hare. Britton and Rose (1920) corrected the spelling of the epithet to *treleasei* to be consistent with the name of the original collector, William Trelease. In the most recent treatment (Parfitt and Baker 1993), the scientific name of Bakersfield cactus was given as *Opuntia basilaris* var. *treleasei* (Coulter), which includes both varieties of the former *O. treleasei*. Some experts still consider Bakersfield cactus to be a unique species.

Bakersfield cactus differs from the common beavertail cactus (*O. basilaris* var. *basilaris*) in several key characters (Table 1). Bakersfield cactus is unique among the varieties of *O. basilaris* in that the eye-spots contain spines in addition to the bristles. Bakersfield cactus individuals from the type locality near Caliente in Kern County have spines less than 7 millimeters (0.3 inches) long, which may be shorter than the bristles (ESA 1986, R. van de Hoek personal communication). Most other populations of Bakersfield cactus have longer, more conspicuous spines. If the taxonomy of Griffiths and Hare (1906) is used, *O. treleasii* var. *treleasii* refers to the plants with short spines and *O. treleasii* var. *kernii* refers to the form with longer spines. Bakersfield cactus typically flowers in May (Munz and Keck 1959), and plants are less than 35 centimeters (1 foot) tall (Abrams 1951). It is federally and state listed as an endangered species (U.S. Fish and Wildlife Service 1990, Tibor 2001).

Bakersfield cactus is endemic to a limited area of central Kern County, ranging from Granite Station southeast to the Caliente Hills and south to Wheeler Ridge (Twisselmann 1967, U.S. Fish and Wildlife Service 1998, Tibor 2001). Only isolated remnants of the formerly extensive colonies remain (Twisselmann 1967, U.S. Fish and Wildlife Service 1990). Bakersfield cactus occurs on well-drained sandy, gravelly, or loamy soils on stream banks, ridges, bluffs, and rolling hills (ESA 1986, California Natural Diversity Data Base 2002). Historical records indicate that the majority of Bakersfield cactus occurred at elevations ranging from 88 to 396 meters (290 to 1,300 feet) with a few colonies, including the type locality, up to 550 meters

Table 1. Characters differentiating *Opuntia basilaris* var. *basilaris* from var. *treleasei*. Data from Coulter (1896), Griffiths and Hare (1906), Abrams (1951), and Benson (1969).

Character	var. *basilaris*	var. *treleasei*
Joint (pad) shape	obovate to orbicular	obovate to narrowly elliptic
Joint base	flattened	terete
Areoles (eye-spots)	depressed	not depressed
Spine length	absent	4-38 mm

(1,800 feet) in elevation (California Natural Diversity Data Base 2002). Plant communities in which it grows include Sierra-Tehachapi Saltbush Scrub, Relictual Interior Dune Grassland, and Blue Oak Woodland (ESA 1986, Holland 1986, Griggs et al. 1992, California Natural Diversity Data Base 2002, R. van de Hoek personal communication). Beavertail cactus also is found in Kern County, occurring in the Mojave Desert and the western foothills of the Sierra Nevada and Tehachapi mountains (Twisselmann 1967). The ranges of Bakersfield cactus and beavertail cactus may overlap in the Caliente and Kern Canyon areas (Twisselmann 1967, E. Cypher personal observation). Cultivated prickly-pear cacti (*Opuntia* spp.) also have escaped in the vicinity of Bakersfield (E. Cypher personal observation).

Survey guidelines

All surveys for rare plants should be conducted in accordance with the standardized guidelines issued by the regulatory agencies (U.S. Fish and Wildlife Service 1996, California Department of Fish and Game 2000) and the California Native Plant Society (2001). The species-specific methods presented below are intended as a supplement to those standardized guidelines.

Surveys for Bakersfield cactus are possible year-round because it is a perennial. However, vegetative individuals may be obscured by dense annual grasses, and thus plants are most conspicuous while they are in flower. Systematic surveys are recommended to detect presence and determine distribution of Bakersfield cactus within the survey area. For systematic searches, biologists should walk parallel transects spaced 5 to 15 meters (approximately 15 to 50 feet) apart throughout the entire site, regardless of subjective habitat evaluations. However, transects may be stratified by topography or plant community for convenience. Field survey crews should include at least one member who has seen Bakersfield cactus growing in its natural habitat. Other team members may be trained using photographs and/or herbarium specimens but should be accompanied in the field by the experienced crew member during all surveys.

Visits to one or more known locations of Bakersfield cactus are recommended to determine current phenology and observability. The known locations should be as similar as possible to the survey area in elevation, habitat, and topography. Survey reports should document the known locations that were visited, the date of the visit, and the observability and phenology of Bakersfield cactus at that time, plus the date of the survey, the diagnostic characteristics of any *Opuntia* populations discovered, the abundance and distribution of all rare species in the survey area, and any other elements required by the agency guidelines.

Due to the difficulty of identifying short-spined populations of Bakersfield cactus, any wild *Opuntia* population in Kern County west of the Sierra crest should be reported to the appropriate agency. The identity of any such cactus populations outside of the range reported in the recovery plan (U.S. Fish and Wildlife Service 1998) should be confirmed by a species expert before being disturbed or acquired as mitigation for disturbance to known Bakersfield cactus.

SUPPLEMENTAL SURVEY METHODS FOR HOOVER'S WOOLLY-STAR

Ellen A. Cypher
California State University, Stanislaus
Endangered Species Recovery Program
P.O. Box 9622, Bakersfield, CA 93389-9622
ecypher@esrp.org

Revised July 2002

Literature review

Hoover's woolly-star [*Eriastrum hooveri* (Jepson) Mason] is an inconspicuous annual member of the phlox family (Polemoniaceae). It was named originally by Jepson (1943) as *Huegelia hooveri* Jepson but has been known as *Eriastrum hooveri* since Mason (1945) revised the genus. Hoover's woolly-star has small, white to pale blue flowers that are less than 5 millimeters (0.2 inches) long; the stamens are shorter than the corolla (Abrams 1951, Munz and Keck 1959, Patterson 1993). Many-flowered eriastrum [*Eriastrum pluriflorum* (Heller) Mason] frequently occurs in mixed populations with Hoover's woolly-star (Lewis 1992, Cypher 1994). Many-flowered eriastrum can be distinguished by its dark blue flowers that are 16 millimeters (0.6 inches) or more in length and stamens that protrude from the corolla (Abrams 1951, Munz and Keck 1959, Taylor and Davilla 1986, Patterson 1993). Hoover's woolly-star is federally listed as a threatened species (U.S. Fish and Wildlife Service 1990). It has been proposed for delisting (U.S. Fish and Wildlife Service 2001) but must be treated as a listed species until a final rule is published that officially delists this species.

The flowering period for Hoover's woolly-star occurs between March and June (Munz and Keck 1959, Lewis 1992, Cypher 1994), but phenology varies among sites and years. Unlike many other annual forbs, stems of *Eriastrum* species may persist for many months after the plants die. However, surveys outside of the flowering season are unreliable because dead stems do not always persist and even if they do, the plants are not identifiable to species unless the corollas remain attached (Taylor and Davilla 1986, Lewis 1992).

Differing rainfall and site conditions can affect the size of both individual plants and populations (Cypher 1994). The wiry stems of Hoover's woolly-star may be simple or branching and vary in height from 1 to 17 centimeters (0.4 to 6.7 inches) at flowering; similarly, single plants have been observed with as few as 1 and as many as 82 flowers (E. Cypher unpublished data). Densities may vary greatly within a single population (Cypher 1994).

Hoover's woolly-star is known to be extant from Fresno and San Benito Counties south to Kern and Santa Barbara Counties (U.S. Fish and Wildlife Service 1998, Tibor 2001); recently, two populations were discovered in the Antelope Valley of Los Angeles County (Boyd and Porter 1999). The species occurs in a wide variety of sites, from alkali sinks to ridgetops (Lewis 1992). Populations of Hoover's woolly-star have been reported from approximately 50 to 915 meters

(165 to 3,000 feet) in elevation (Danielson et al. 1994, California Natural Diversity Data Base 1995), but the majority of valley-floor populations have been extirpated due to agricultural conversion (Taylor and Davilla 1986).

A wide variety of plant communities support Hoover's woolly-star. Most are dominated by shrubs such as saltbush (*Atriplex* spp.), Mormon tea (*Ephedra* spp.), and iodinebush (*Allenrolfea occidentalis*), but other shrubs, herbs, or trees may dominate the landscape in some areas (Taylor and Davilla 1986, Danielson et al. 1994, California Natural Diversity Data Base 1995). Shrub cover in occupied habitats typically is less than 20% (Taylor and Davilla 1986, Cypher 1994). Features common to many Hoover's woolly-star sites are stabilized silty to sandy soils, a low cover of competing herbaceous vegetation, and presence of cryptogamic crust (Taylor and Davilla 1986, Lewis 1992). However, dense vegetation, other soil types, and lack of cryptogamic crust do not preclude the occurrence of Hoover's woolly-star (Cypher 1994, California Natural Diversity Data Base 1995). Hoover's woolly-star may reinvade disturbed soil surfaces (*e.g.*, well pads, dirt roads) if seeds remain in the vicinity (Lewis 1992, Danielson et al. 1994, Hinshaw et al. 1998, Holmstead and Anderson 1998).

Survey guidelines

All surveys for rare plants should be conducted in accordance with the standardized guidelines issued by the regulatory agencies (U.S. Fish and Wildlife Service 1996, California Department of Fish and Game 2000) and the California Native Plant Society (2001). The species-specific methods presented below are intended as a supplement to those standardized guidelines.

Systematic surveys are recommended to detect presence and determine distribution of Hoover's woolly-star within the survey area. For systematic searches, biologists should walk parallel transects spaced 5 to 10 meters (16 to 33 feet) apart throughout the entire site, regardless of subjective habitat evaluations. However, transects may be stratified by topography or plant community for convenience. Field survey crews should include at least one member who has seen Hoover's woolly-star growing in its natural habitat. Other team members may be trained using photographs and/or herbarium specimens but should be accompanied in the field by the experienced crew member during all surveys.

Prior to beginning surveys in a given year, at least one member of the survey crew should visit one or more known locations of Hoover's woolly-star to verify that precipitation has been adequate for germination and to determine current phenology. The known locations should be as similar as possible to the survey area in elevation, habitat, and topography. Species-specific surveys should not be attempted if Hoover's woolly-star is not seen at known locations, the densities are very low relative to normal years, or the plants are inconspicuous. Survey reports should document the known locations that were visited, the date of the visit, and the observability and phenology of Hoover’s woolly-star at that time, plus the date of the survey, the abundance and distribution of all rare species in the survey area, and any other elements required by the agency guidelines. If *Eriastrum* stems are observed outside of the flowering season, the site should be treated as if a threatened species was present, and the population should be revisited at the appropriate time to determine the identity of the plants. The typical survey period for Hoover's woolly-star is April and May.

EXHIBIT 11

Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities

State of California
CALIFORNIA NATURAL RESOURCES AGENCY
Department of Fish and Game
November 24, 2009[1]

INTRODUCTION AND PURPOSE

The conservation of special status native plants and their habitats, as well as natural communities, is integral to maintaining biological diversity. The purpose of these protocols is to facilitate a consistent and systematic approach to the survey and assessment of special status native plants and natural communities so that reliable information is produced and the potential of locating a special status plant species or natural community is maximized. They may also help those who prepare and review environmental documents determine when a botanical survey is needed, how field surveys may be conducted, what information to include in a survey report, and what qualifications to consider for surveyors. The protocols may help avoid delays caused when inadequate biological information is provided during the environmental review process; assist lead, trustee and responsible reviewing agencies to make an informed decision regarding the direct, indirect, and cumulative effects of a proposed development, activity, or action on special status native plants and natural communities; meet California Environmental Quality Act (CEQA)[2] requirements for adequate disclosure of potential impacts; and conserve public trust resources.

DEPARTMENT OF FISH AND GAME TRUSTEE AND RESPONSIBLE AGENCY MISSION

The mission of the Department of Fish and Game (DFG) is to manage California's diverse wildlife and native plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. DFG has jurisdiction over the conservation, protection, and management of wildlife, native plants, and habitat necessary to maintain biologically sustainable populations (Fish and Game Code §1802). DFG, as trustee agency under CEQA §15386, provides expertise in reviewing and commenting on environmental documents and makes protocols regarding potential negative impacts to those resources held in trust for the people of California.

Certain species are in danger of extinction because their habitats have been severely reduced in acreage, are threatened with destruction or adverse modification, or because of a combination of these and other factors. The California Endangered Species Act (CESA) provides additional protections for such species, including take prohibitions (Fish and Game Code §2050 *et seq.*). As a responsible agency, DFG has the authority to issue permits for the take of species listed under CESA if the take is incidental to an otherwise lawful activity; DFG has determined that the impacts of the take have been minimized and fully mitigated; and, the take would not jeopardize the continued existence of the species (Fish and Game Code §2081). Surveys are one of the preliminary steps to detect a listed or special status plant species or natural community that may be impacted significantly by a project.

DEFINITIONS

Botanical surveys provide information used to determine the potential environmental effects of proposed projects on all special status plants and natural communities as required by law (i.e., CEQA, CESA, and Federal Endangered Species Act (ESA)). Some key terms in this document appear in **bold font** for assistance in use of the document.

For the purposes of this document, **special status plants** include all plant species that meet one or more of the following criteria[3]:

[1] This document replaces the DFG document entitled "Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened and Endangered Plants and Natural Communities."

[2] http://ceres.ca.gov/ceqa/

[3] Adapted from the East Alameda County Conservation Strategy available at http://www.fws.gov/sacramento/EACCS/Documents/080228_Species_Evaluation_EACCS.pdf

- Listed or proposed for listing as threatened or endangered under ESA or candidates for possible future listing as threatened or endangered under the ESA (50 CFR §17.12).

- Listed[4] or candidates for listing by the State of California as threatened or endangered under CESA (Fish and Game Code §2050 *et seq.*). A species, subspecies, or variety of plant is **endangered** when the prospects of its survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, over-exploitation, predation, competition, disease, or other factors (Fish and Game Code §2062). A plant is **threatened** when it is likely to become endangered in the foreseeable future in the absence of special protection and management measures (Fish and Game Code §2067).

- Listed as rare under the California Native Plant Protection Act (Fish and Game Code §1900 *et seq.*). A plant is **rare** when, although not presently threatened with extinction, the species, subspecies, or variety is found in such small numbers throughout its range that it may be endangered if its environment worsens (Fish and Game Code §1901).

- Meet the definition of rare or endangered under CEQA §15380(b) and (d). Species that may meet the definition of rare or endangered include the following:

    - Species considered by the California Native Plant Society (CNPS) to be "rare, threatened or endangered in California" (Lists 1A, 1B and 2);

    - Species that may warrant consideration on the basis of local significance or recent biological information[5];

    - Some species included on the California Natural Diversity Database's (CNDDB) *Special Plants, Bryophytes, and Lichens List* (California Department of Fish and Game 2008)[6].

- Considered a **locally significant species,** that is, a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region (CEQA §15125 (c)) or is so designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include a species at the outer limits of its known range or a species occurring on an uncommon soil type.

Special status natural communities are communities that are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects. These communities may or may not contain special status species or their habitat. The most current version of the Department's *List of California Terrestrial Natural Communities*[7] indicates which natural communities are of special status given the current state of the California classification.

Most types of wetlands and riparian communities are considered special status natural communities due to their limited distribution in California. These natural communities often contain special status plants such as those described above. These protocols may be used in conjunction with protocols formulated by other agencies, for example, those developed by the U.S. Army Corps of Engineers to delineate jurisdictional wetlands[8] or by the U.S. Fish and Wildlife Service to survey for the presence of special status plants[9].

---

4 Refer to current online published lists available at: http://www.dfg.ca.gov/biogeodata.

5 In general, CNPS List 3 plants (plants about which more information is needed) and List 4 plants (plants of limited distribution) may not warrant consideration under CEQA §15380. These plants may be included on special status plant lists such as those developed by counties where they would be addressed under CEQA §15380. List 3 plants may be analyzed under CEQA §15380 if sufficient information is available to assess potential impacts to such plants. Factors such as regional rarity vs. statewide rarity should be considered in determining whether cumulative impacts to a List 4 plant are significant even if individual project impacts are not. List 3 and 4 plants are also included in the California Natural Diversity Database's (CNDDB) *Special Plants, Bryophytes, and Lichens List*. [Refer to the current online published list available at: http://www.dfg.ca.gov/biogeodata.] Data on Lists 3 and 4 plants should be submitted to CNDDB. Such data aids in determining or revising priority ranking.

6 Refer to current online published lists available at: http://www.dfg.ca.gov/biogeodata.

7 http://www.dfg.ca.gov/biogeodata/vegcamp/pdfs/natcomlist.pdf. The rare natural communities are asterisked on this list.

8 http://www.wetlands.com/regs/tlpge02e.htm

9 U.S. Fish and Wildlife Service Survey Guidelines available at http://www.fws.gov/sacramento/es/protocol.htm

BOTANICAL SURVEYS

Conduct botanical surveys prior to the commencement of any activities that may modify vegetation, such as clearing, mowing, or ground-breaking activities. It is appropriate to conduct a botanical field survey when:

- Natural (or naturalized) vegetation occurs on the site, and it is unknown if special status plant species or natural communities occur on the site, and the project has the potential for direct or indirect effects on vegetation; or

- Special status plants or natural communities have historically been identified on the project site; or

- Special status plants or natural communities occur on sites with similar physical and biological properties as the project site.

SURVEY OBJECTIVES

Conduct field surveys in a manner which maximizes the likelihood of locating special status plant species or special status natural communities that may be present. Surveys should be **floristic in nature**, meaning that every plant taxon that occurs on site is identified to the taxonomic level necessary to determine rarity and listing status. "Focused surveys" that are limited to habitats known to support special status species or are restricted to lists of likely potential species are not considered floristic in nature and are not adequate to identify all plant taxa on site to the level necessary to determine rarity and listing status. Include a list of plants and natural communities detected on the site for each botanical survey conducted. More than one field visit may be necessary to adequately capture the floristic diversity of a site. An indication of the prevalence (estimated total numbers, percent cover, density, etc.) of the species and communities on the site is also useful to assess the significance of a particular population.

SURVEY PREPARATION

Before field surveys are conducted, compile relevant botanical information in the general project area to provide a regional context for the investigators. Consult the CNDDB[10] and BIOS[11] for known occurrences of special status plants and natural communities in the project area prior to field surveys. Generally, identify vegetation and habitat types potentially occurring in the project area based on biological and physical properties of the site and surrounding ecoregion[12], unless a larger assessment area is appropriate. Then, develop a list of special status plants with the potential to occur within these vegetation types. This list can serve as a tool for the investigators and facilitate the use of reference sites; however, special status plants on site might not be limited to those on the list. Field surveys and subsequent reporting should be comprehensive and floristic in nature and not restricted to or focused only on this list. Include in the survey report the list of potential special status species and natural communities, and the list of references used to compile the background botanical information for the site.

SURVEY EXTENT

Surveys should be comprehensive over the entire site, including areas that will be directly or indirectly impacted by the project. Adjoining properties should also be surveyed where direct or indirect project effects, such as those from fuel modification or herbicide application, could potentially extend offsite. Pre-project surveys restricted to known CNDDB rare plant locations may not identify all special status plants and communities present and do not provide a sufficient level of information to determine potential impacts.

FIELD SURVEY METHOD

Conduct surveys using **systematic field techniques** in all habitats of the site to ensure thorough coverage of potential impact areas. The level of effort required per given area and habitat is dependent upon the vegetation and its overall diversity and structural complexity, which determines the distance at which plants can be identified. Conduct surveys by walking over the entire site to ensure thorough coverage, noting all plant taxa

12 Ecological Subregions of California, available at http://www.fs.fed.us/r5/projects/ecoregions/toc.htm

observed. The level of effort should be sufficient to provide comprehensive reporting. For example, one person-hour per eight acres per survey date is needed for a comprehensive field survey in grassland with medium diversity and moderate terrain[13], with additional time allocated for species identification.

TIMING AND NUMBER OF VISITS

Conduct surveys in the field at the time of year when species are both evident and identifiable. Usually this is during flowering or fruiting. Space visits throughout the growing season to accurately determine what plants exist on site. Many times this may involve multiple visits to the same site (e.g. in early, mid, and late-season for flowering plants) to capture the floristic diversity at a level necessary to determine if special status plants are present[14]. The timing and number of visits are determined by geographic location, the natural communities present, and the weather patterns of the year(s) in which the surveys are conducted.

REFERENCE SITES

When special status plants are known to occur in the type(s) of habitat present in the project area, observe reference sites (nearby accessible occurrences of the plants) to determine whether those species are identifiable at the time of the survey and to obtain a visual image of the target species, associated habitat, and associated natural community.

USE OF EXISTING SURVEYS

For some sites, floristic inventories or special status plant surveys may already exist. Additional surveys may be necessary for the following reasons:

- Surveys are not current[15]; or
- Surveys were conducted in natural systems that commonly experience year to year fluctuations such as periods of drought or flooding (e.g. vernal pool habitats or riverine systems); or
- Surveys are not comprehensive in nature; or fire history, land use, physical conditions of the site, or climatic conditions have changed since the last survey was conducted[16]; or
- Surveys were conducted in natural systems where special status plants may not be observed if an annual above ground phase is not visible (e.g. flowers from a bulb); or
- Changes in vegetation or species distribution may have occurred since the last survey was conducted, due to habitat alteration, fluctuations in species abundance and/or seed bank dynamics.

NEGATIVE SURVEYS

Adverse conditions may prevent investigators from determining the presence of, or accurately identifying, some species in potential habitat of target species. Disease, drought, predation, or herbivory may preclude the presence or identification of target species in any given year. Discuss such conditions in the report.

The failure to locate a known special status plant occurrence during one field season does not constitute evidence that this plant occurrence no longer exists at this location, particularly if adverse conditions are present. For example, surveys over a number of years may be necessary if the species is an annual plant having a persistent, long-lived seed bank and is known not to germinate every year. Visits to the site in more

[13] Adapted from U.S. Fish and Wildlife Service kit fox survey guidelines available at www.fws.gov/sacramento/es/documents/kitfox_no_protocol.pdf

[14] U.S. Fish and Wildlife Service Survey Guidelines available at http://www.fws.gov/sacramento/es/protocol.htm

[15] Habitats, such as grasslands or desert plant communities that have annual and short-lived perennial plants as major floristic components may require yearly surveys to accurately document baseline conditions for purposes of impact assessment. In forested areas, however, surveys at intervals of five years may adequately represent current conditions. For forested areas, refer to "Guidelines for Conservation of Sensitive Plant Resources Within the Timber Harvest Review Process and During Timber Harvesting Operations", available at https://r1.dfg.ca.gov/portal/Portals/12/THPBotanicalGuidelinesJuly2005.pdf

[16] U.S. Fish and Wildlife Service Survey Guidelines available at http://www.fws.gov/ventura/speciesinfo/protocols_guidelines/docs/botanicalinventories.pdf

than one year increase the likelihood of detection of a special status plant especially if conditions change. To further substantiate negative findings for a known occurrence, a visit to a nearby reference site may ensure that the timing of the survey was appropriate.

REPORTING AND DATA COLLECTION

Adequate information about special status plants and natural communities present in a project area will enable reviewing agencies and the public to effectively assess potential impacts to special status plants or natural communities[17] and will guide the development of minimization and mitigation measures. The next section describes necessary information to assess impacts. For comprehensive, systematic surveys where no special status species or natural communities were found, reporting and data collection responsibilities for investigators remain as described below, excluding specific occurrence information.

SPECIAL STATUS PLANT OR NATURAL COMMUNITY OBSERVATIONS

Record the following information for locations of each special status plant or natural community detected during a field survey of a project site.

- A detailed map (1:24,000 or larger) showing locations and boundaries of each special status species occurrence or natural community found as related to the proposed project. Mark occurrences and boundaries as accurately as possible. Locations documented by use of global positioning system (GPS) coordinates must include the datum[18] in which they were collected;
- The site-specific characteristics of occurrences, such as associated species, habitat and microhabitat, structure of vegetation, topographic features, soil type, texture, and soil parent material. If the species is associated with a wetland, provide a description of the direction of flow and integrity of surface or subsurface hydrology and adjacent off-site hydrological influences as appropriate;
- The number of individuals in each special status plant population as counted (if population is small) or estimated (if population is large);
- If applicable, information about the percentage of individuals in each life stage such as seedlings vs. reproductive individuals;
- The number of individuals of the species per unit area, identifying areas of relatively high, medium and low density of the species over the project site; and
- Digital images of the target species and representative habitats to support information and descriptions.

FIELD SURVEY FORMS

When a special status plant or natural community is located, complete and submit to the CNDDB a California Native Species (or Community) Field Survey Form[19] or equivalent written report, accompanied by a copy of the relevant portion of a 7.5 minute topographic map with the occurrence mapped. Present locations documented by use of GPS coordinates in map and digital form. Data submitted in digital form must include the datum[20] in which it was collected. If a potentially undescribed special status natural community is found on the site, document it with a Rapid Assessment or Relevé form[21] and submit it with the CNDDB form.

VOUCHER COLLECTION

Voucher specimens provide verifiable documentation of species presence and identification as well as a public record of conditions. This information is vital to all conservation efforts. Collection of voucher specimens should

[17] Refer to current online published lists available at: http://www.dfg.ca.gov/biogeodata. For Timber Harvest Plans (THPs) please refer to the "Guidelines for Conservation of Sensitive Plant Resources Within the Timber Harvest Review Process and During Timber Harvesting Operations", available at https://r1.dfg.ca.gov/portal/Portals/12/THPBotanicalGuidelinesJuly2005.pdf

[18] NAD83, NAD27 or WGS84

[19] http://www.dfg.ca.gov/biogeodata

[20] NAD83, NAD27 or WGS84

[21] http://www.dfg.ca.gov/biogeodata/vegcamp/veg_publications_protocols.asp

be conducted in a manner that is consistent with conservation ethics, and is in accordance with applicable state and federal permit requirements (e.g. incidental take permit, scientific collection permit). Voucher collections of special status species (or suspected special status species) should be made only when such actions would not jeopardize the continued existence of the population or species.

Deposit voucher specimens with an indexed regional herbarium[22] no later than 60 days after the collections have been made. Digital imagery can be used to supplement plant identification and document habitat. Record all relevant permittee names and permit numbers on specimen labels. A collecting permit is required prior to the collection of State-listed plant species[23].

BOTANICAL SURVEY REPORTS

Include reports of botanical field surveys containing the following information with project environmental documents:

- **Project and site description**
  - A description of the proposed project;
  - A detailed map of the project location and study area that identifies topographic and landscape features and includes a north arrow and bar scale; and,
  - A written description of the biological setting, including vegetation[24] and structure of the vegetation; geological and hydrological characteristics; and land use or management history.
- **Detailed description of survey methodology and results**
  - Dates of field surveys (indicating which areas were surveyed on which dates), name of field investigator(s), and total person-hours spent on field surveys;
  - A discussion of how the timing of the surveys affects the comprehensiveness of the survey;
  - A list of potential special status species or natural communities;
  - A description of the area surveyed relative to the project area;
  - References cited, persons contacted, and herbaria visited;
  - Description of reference site(s), if visited, and phenological development of special status plant(s);
  - A list of all taxa occurring on the project site. Identify plants to the taxonomic level necessary to determine whether or not they are a special status species;
  - Any use of existing surveys and a discussion of applicability to this project;
  - A discussion of the potential for a false negative survey;
  - Provide detailed data and maps for all special plants detected. Information specified above under the headings "Special Status Plant or Natural Community Observations," and "Field Survey Forms," should be provided for locations of each special status plant detected;
  - Copies of all California Native Species Field Survey Forms or Natural Community Field Survey Forms should be sent to the CNDDB and included in the environmental document as an Appendix. It is not necessary to submit entire environmental documents to the CNDDB; and,
  - The location of voucher specimens, if collected.

[22] For a complete list of indexed herbaria, see: Holmgren, P., N. Holmgren and L. Barnett. 1990. Index Herbariorum, Part 1: Herbaria of the World. New York Botanic Garden, Bronx, New York. 693 pp. Or: http://www.nybg.org/bsci/ih/ih.html

[23] Refer to current online published lists available at: http://www.dfg.ca.gov/biogeodata.

[24] A vegetation map that uses the National Vegetation Classification System (http://biology.usgs.gov/npsveg/nvcs.html), for example *A Manual of California Vegetation*, and highlights any special status natural communities. If another vegetation classification system is used, the report should reference the system, provide the reason for its use, and provide a crosswalk to the National Vegetation Classification System.

- **Assessment of potential impacts**
  - A discussion of the significance of special status plant populations in the project area considering nearby populations and total species distribution;
  - A discussion of the significance of special status natural communities in the project area considering nearby occurrences and natural community distribution;
  - A discussion of direct, indirect, and cumulative impacts to the plants and natural communities;
  - A discussion of threats, including those from invasive species, to the plants and natural communities;
  - A discussion of the degree of impact, if any, of the proposed project on unoccupied, potential habitat of the species;
  - A discussion of the immediacy of potential impacts; and,
  - Recommended measures to avoid, minimize, or mitigate impacts.

QUALIFICATIONS

Botanical consultants should possess the following qualifications:

- Knowledge of plant taxonomy and natural community ecology;
- Familiarity with the plants of the area, including special status species;
- Familiarity with natural communities of the area, including special status natural communities;
- Experience conducting floristic field surveys or experience with floristic surveys conducted under the direction of an experienced surveyor;
- Familiarity with the appropriate state and federal statutes related to plants and plant collecting; and,
- Experience with analyzing impacts of development on native plant species and natural communities.

Toxic and Priority Pollutants

Two lists have special significance to water quality regulatory programs in the Clean Water Act (CWA):

- list of toxic pollutants
- list of priority pollutants

List of Toxic Pollutants

Key Features

1. The Clean Water Act references the list of toxic pollutants at §307(a)(1) (also labelled §1317(a)(1)).
2. The list appears in the Code of Federal Regulations at 40 CFR 401.15
3. The list is an important starting point for EPA to consider, for example, in developing national discharge standards (such as effluent guidelines) or in national permitting programs (such as NPDES).
4. The list contains 65 entries. Many of the entries, such as "haloethers," are for groups of pollutants.

Connection between CWA §307(a)(1) and the List of Toxic Pollutants

1. Section 307(a)(1) says, "…the list of toxic pollutants or combination of pollutants subject to this Act shall consist of those toxic pollutants listed in table 1 of Committee Print Numbered 95-30 of the Committee on Public Works of the House of Representatives…"
2. Committee Print 95-30 (November 1977) is titled "Data Relating to H.R. 3199 (Clean Water Act of 1977)."
3. Table 1 is titled "Section 307—Toxic Pollutants." EPA incorporated Table 1 into the Code of Federal Regulations at §401.15.

History of the List of Toxic Pollutants

1. Source of the list: The list was negotiated among parties to a settlement agreement (NRDC et al. vs Train, 6 ELR 20588, D.D.C. June 9, 1976).
2. That settlement agreement is sometimes referred to as the Toxics Consent Decree, or the Flannery Decision (for presiding U.S. District Court Judge Thomas A. Flannery).
3. Congress subsequently ratified the Settlement Agreement and the list of toxic pollutants when they amended the CWA (Public Law 95-217) in 1977.
4. Note to readers: The Congressional Research Service prepared a paper in 1993 on Toxic Pollutants and Clean Water Act EXIT Disclaimer .
5. The list was first published on January 31, 1978 in the Federal Register (43 FR 4108).
6. In a final rule on July 31, 1979 (44 FR 44501), EPA published the list again and added the list to the CFR at 40 CFR 401.15.

Modifications

1. EPA removed three pollutants from the list in 1981, after determining that their chemical properties did not justify their inclusion:
   - *Dichlorodifluoromethane* and *trichlorofluoromethane* were de-listed on January 8, 1981 (46 FR 2266) at the request of E.I. duPont de Nemours and Co. because of low solubility in water and high volatility combined with low human and mammalian toxicity. *Bis(chloromethyl) ether* was de-listed on February 4, 1981 (46 FR 10723) based on data that indicated a half-life in water of 38 seconds at 20°C.
2. De-listing the three pollutants did not change the 65 entries because the three de-listed pollutants were specific compounds within entries for the groups Halomethanes (list entry 38) and Haloethers (list entry 37).

Priority Pollutants

Key Features

Key features of the list of priority pollutants and its relationship to the list of toxic pollutants:

1. The Priority Pollutants are a set of chemical pollutants EPA regulates, and for which EPA has published analytical test methods.
2. The Priority Pollutant list makes the list of toxic pollutants more usable, in a practical way, for the purposes assigned to EPA by the Clean Water Act. For example, the Priority Pollutant list is more practical for testing and for regulation in that chemicals are described by their individual chemical names. The list of toxic pollutants, in contrast, contains open-ended groups of pollutants, such as "chlorinated benzenes." That group contains hundreds of compounds; there is no test for the group as a whole, nor is it practical to regulate or test for all of these compounds.

Derivation

Starting with the list of toxic pollutants, EPA used four criteria to select and prioritize specific pollutants:

1. We included all pollutants specifically named on the list of toxic pollutants;
2. There had to be a chemical standard available for the pollutant, so that testing for the pollutant could be performed;
3. The pollutant had to have been reported as found in water with a frequency of occurrence of at least 2.5%, and
4. The pollutant had to have been produced in significant quantities, as reported in Stanford Research Institute's 1976 Directory of Chemical Producers, USA.

Number of Entries

Originally, there were 129. When three pollutants were removed from the list of toxic pollutants in 1981 (see above), they were also removed from the Priority Pollutant list.

1. Entry numbers 17, 49, and 50 were removed.
2. The last number on the list is still 129, although there are 126 entries.

Publication

Why is the Priority Pollutant list published at 40 CFR 423, Appendix A, rather than at section 401, or some other, more general section?

1. One of the first industrial categories for which EPA developed effluent regulations was the Steam Electric Power Generating Point Source Category. The Priority Pollutant list was included to support regulations for that category.
2. Although the other sections within part 423 apply only to Steam Electric Power Generating, the Priority Pollutant list in Appendix A is not limited in terms of its relevance to that one industrial category.
3. Some users find it helpful to think of Appendix A to Part 423 as a convenient storage place for the list, or as a matter of convenience for citation.
4. The list of Priority Pollutants can be found here.

RE: Comments on Environmental Review for Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Dear Ms. Bohee:

Our firm, on behalf of Mission Bay Alliance, submitted a letter on July 27, 2015, regarding comments on the environmental review for the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32. In support of our comments, we attached five subject matter expert reports, Exhibits A through E. With regard to Exhibit C (July 21, 2015 letter report authored by geotechnical engineer Lawrence Karp, CE, CEG, regarding Geology and Soils impacts), enclosed is Dr. Karp's summary of qualifications and expertise, which was inadvertently omitted.

Thank you and please do not hesitate to contact our office if you have any questions.

Very truly yours,

Attention: Osha Meserve, Esq.

Dear Ms. Meserve:

The following is a summary resumé of qualifications and expertise that was used recently in an expert disclosure statement:

> "Lawrence B. Karp holds an earned doctorate in civil engineering and other degrees from the University of California, Berkeley (with honors), and is licensed as a civil engineer, geotechnical engineer, and architect in California and as an architect and professional, civil, marine, and structural engineer, and naval architect, in other states. He was awarded a post-doctoral Earthquake Engineering certificate by the University of California, Berkeley (with distinction). He has been issued national certifications in architecture and structural engineering. Dr. Karp taught advanced foundation design and construction at Berkeley for 11 years and at Stanford for 3 years, and he has been a court appointed expert on engineering design and construction at various times over the last 40 years. He has membership in various professional societies, and he has authored numerous technical reports as well as conference and journal papers.
>
> With over 50 years experience in design and construction, Dr. Karp specializes in soil-structure interaction and resistance to lateral forces with applications to foundations for buildings and other structures including all types of ground support systems, underpinning, shoring and demolition, environmental analyses, controlled grading and slope stabilization including landslide repair, investigation of causation and remediation of foundation failures, seismic upgrades of foundation for buildings and other structures, reinforced and prestressed concrete technology, determination of defects in construction and materials, stability evaluation of excavations and earthwork, demolition and construction logistics, coastal engineering, and groundwater hydrology."

I trust this information is responsive to your request.

Yours truly,

RE: Supplemental Comments on Environmental Review for Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 – Clean Water Act 404 and CZMA Consistency

Dear Ms. Bohee:

This firm represents the Mission Bay Alliance ("MBA") with respect to the Warriors Event Center Project ("Project"). These comments supplement MBA's prior comments on the Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("DSEIR").

As described in the July 24, 2015, comment letter submitted by the Law Offices of Thomas Lippe regarding Hydrology, Water Quality and Biological Impacts ("Hydro Comments"), the Project site contains a wetland feature that is likely jurisdictional and will require permits from the U.S. Army Corps of Engineers ("Corps") and/or the State Water Resources Control Board in order to lawfully fill. (See Hydro Comments, pp. 11-15, and Exhibit 2, pp. 2-3.) Specifically, the Project site contains a wetland area consisting of a large, permanent pond created by a narrow channel that seasonally contains surface waters and creates further, seasonal wetland features. (Exhibit 2, p. 2.) The area is replete with shrubs and riparian plants, and it serves as habitat for various species, including nesting and foraging sites for native birds. (*Id*. at pp. 2-3.)

Despite the existence of likely jurisdictional wetlands on the site, the DSEIR does not include the Clean Water Act ("CWA") 404 fill permit that will be needed to fill the wetland in the list of project approvals. (DSEIR, pp. 3-51 to 52.) The need for a 404 fill permit also requires the Corps to prepare a Coastal Zone Management Act ("CZMA") consistency finding, as required by the Bay Conservation Development Commission

("BCDC") Management Program (see 16 U.S.C., § 1456, subd. (c)(3)), which should also be on the list of project approvals. (See CEQA Guidelines, § 15124, subd. (d).)

Under the CZMA, any applicant for a federal permit to conduct an activity, regardless of its location, will be required to certify its consistency if that activity will affect a land use, water use, or natural resource of the coastal zone. (See, e.g., *Amber Res. Co. v. United States* (Fed.Cir. 2008) 538 F.3d. 1358, 1363-1364; *Southern Pacific Transp. Co. v. California Coastal Com.* (N.D.Cal. 1981) 520 F.Supp. 800, 802-803.) Effects on coastal uses and resources need not be direct, but may include "any reasonably foreseeable effect," including "indirect (cumulative and secondary) effects which result from the activity and are later in time or further removed in distance, but are still reasonably foreseeable." (15 C.F.R., § 930.11, subd. (g).) It is likely that this Project will have effects on coastal resources, as the area to be filled is adjacent to the coastal zone. Coastal resources include biological and physical resources, such as vegetation and animals that are found in the state's coastal zone on a regular or cyclical basis. (15 C.F.R., § 930.11, subd. (b).) This Project site provides nesting and foraging habitat for several such species of birds. (See Hydro Comments, Exhibit 2, p. 3.) Thus, a consistency determination is necessary.

In summary, the DSEIR omits necessary project approvals and overlooks impacts associated with the Project's inconsistency with the BCDC Management Program. These omissions from the Project description and lack of analysis must be corrected prior to certification of the EIR. Thank you for considering these supplemental comments. Please feel free to contact my office with any questions.

Very truly yours,

RE: "Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32" OCII File No. ER 2014-919-97; San Francisco Planning Department No. 2014.1441E

PUBLIC COMMENT ON DRAFT SUPPLEMENTAL EIR

This is Public Comment on the Draft Supplemental Environmental Impact Report ("DSEIR") for the "Golden State Warriors Event Center and Mixed Use Development at Mission Bay Blocks 29-32" ("the Project"). The Project proposes placing a championship basketball team drawing capacity crowds of more than 18,000 for every game in a new sports arena and "event space" with drastically inadequate parking and access for vehicles, inadequate public transportation, less than one mile from the AT&T baseball stadium with overlapping events and already-existing severe traffic congestion. The proposed Project location is directly adjacent to the largest medical facility in San Francisco, creating blocked access for both existing staff, visitors, and emergency vehicles.

The Project proposes a sports arena for the Golden State Warriors in San Francisco, relocating that arena and "event center" from its present location in Oakland California to the Mission Bay complex adjacent to new medical centers and residential developments, where the Warriors would then host capacity crowds of 18,000 from all over the Bay Area. (DSEIR, pp.1-8; 5.2-235.) The "events" would be held 225 times per year. (DSEIR p. 1-8.) Even the severely flawed SDEIR admits the Project will generate significant traffic and transit impacts affecting travel throughout the City and the entire region "at multiple intersections and freeway ramps" with "regional transit providers exceeding capacity," "noise and crowd noise affecting sensitive receptors," air quality impacts, wind impacts, and impacts on public utilities, including wastewater facilities with existing already-"inadequate capacity to serve the project's wastewater demand." (SDEIR, p. 1-9.) The SDEIR proposes no effective or publicly enforceable mitigation for those significant impacts.

Instead of improving severely congested traffic and already substandard air quality conditions, the Project proposes to make them worse throughout the Project area, which includes the entire downtown area cumulatively, freeway ingress and egress, and AT&T Ballpark. The Project therefore directly and facially conflicts with the mandates of the California Environmental Quality Act ("CEQA," Pub. Res. Code [PRC] § 21000 *et seq*.) to "enhance the environmental quality of the state," to mitigate the Project's impacts, and to "consider alternatives to proposed actions affecting the environment." (PRC § 21001.) The DSEIR fails propose feasible mitigation measures or alternatives for the admitted impacts of the Project, and therefore violates not only those mandates but the legal requirements of CEQA to inform the public of the Project's impacts and mitigate them. The DSEIR fails propose feasible mitigation measures or alternatives for the admitted impacts of the Project, and therefore violates not only those mandates but the legal requirements of CEQA to inform the public of the Project's impacts and mitigate them.

The SDEIR fails to accurately identify the magnitude of the obvious congestion, transportation and parking impacts of the proposed Project, has no coherent or accurate cumulative impacts analysis, and no accurate direct or cumulative analysis of the Project's impacts on air quality, and fails to meet other requirements of the California Environmental Quality Act ("CEQA"), Public Resources Code ("PRC") §§21000 *et seq.*

The DSEIR does not comply with CEQA's requirements to accurately state existing (baseline) conditions of traffic, thus negating the impacts analysis, the mitigations analysis, and the alternatives analysis on these crucial impacts affecting traffic, transit, air quality, safety, and human health throughout the affected area. The DSEIR contains *no* traffic counts or other traffic indicators and inadequate analysis of operational air quality impacts from the congestion inevitably caused by removing traffic lanes and parking. The DSEIR's disingenuous conclusion that the Project will have no impact on emergency services is false and dangerous. With the gridlock created by bottlenecked traffic, those emergency vehicles will not be able to climb over the backed up cars and buses. The DSEIR also fails comply with CEQA's mandate to mitigate the Project's impacts by proposing in a separate section of the EIR feasible, effective, and enforceable mitigation measures for each impact identified, and to present a full range of alternatives, including off-site alternatives, to the Project to eliminate or reduce the Project's impacts.

These defects make the DSEIR legally inadequate, since it fails to inform the public and decisionmakers of the Project's true impacts and fails to mitigate them. Further, the DSEIR's conclusory statements are in many instances unsupported. The large number of references to other EIR's and documents on other projects make the document user-unfriendly and its conclusions unsupported. The minimal public comment period on the DSEIR from June 5 to July 27, 2015, is inadequate for a Project of this size, regional importance, magnitude, and severity of impact, and a DSEIR of this complexity. The location of the Project area in downtown San Francisco and the large number of affected travelers and residents in the area make this Project of regional and statewide importance. Therefore, this public comment is necessarily incomplete, and other comment may be submitted later on issues not addressed here. The following are some inadequacies of the DSEIR.

1. **Traffic Impacts Are Neither Adequately Analyzed Nor Mitigated.**

Even though it drastically underestimates the vehicle traffic generated by the Project, the DSEIR concludes that the Project will have significant "project-specific" impacts at seven study intersections, including King/Fourth; Fifth/Harrison; I-80 westbound off-ramp; Fifth/Bryant/I-80 eastbound on-ramp; Third/Channel; Seventh/Mission Bay Drive; and seventh/Mississippi/16th. (DSEIR 5.2-128.) The DSEIR then claims that it will not provide proposed mitigation measures for the Project's gridlock-creating mess throughout downtown San Francisco and on major freeways in violation of CEQA's fundamental mandate, claiming that any mitigation of the Project's impacts would have to increase lane capacity, which the DSEIR claims would "generally be infeasible," providing no substantial evidence to support the conclusion of infeasibility. (DSEIR 5.2-128.)

The Project description in the DSEIR fails to include an accurate description of The Project area, since the Project’s impacts extend far beyond the Project site and will affect citywide and regional streets, freeways, and transit lines.

There appears to be no accurate traffic count data supporting the baseline (existing) conditions from which the impacts analysis proceeds. Further, even if only seven of the analyzed intersections streets were impacted by the Project, the backup from those intersections would affect many entire streets and other intersections that the DSEIR claims would not be degraded. An EIR that fails to inform the public and decisionmakers of the Project's impacts is legally defective.

The DSEIR proposes admittedly ineffective "mitigation," such as on-site "PCO's that shall be deployed," without saying where and when they would be "deployed," who would pay for them (the public), and how they would affect the intersections where impacts are identified. (DSEIR 5.2-128.) Instead of proposing effective mitigation measures for the identified impacts, the DSEIR then claims that "strategies to reduce traffic congestion" "could" include more ineffective "outreach" to urge people not to drive, urging the project sponsor to buy up more parking spaces, and other vague "strategies." (DSEIR 5.2-129.) The DSEIR then proposes a "Strategy to Enhance Non-auto Modes," which also would not mitigate the Project's impacts on traffic, including traffic that is not attending a basketball game or a "special event," which is not even considered in the DSEIR. (DSEIR 5.2-129.) The "Non-auto Mode" strategy includes, *e.g.*, a "promotional incentive…for public transit use and/or bicycle valet use at the event center." (*Id.*) The "Non-auto Mode" strategy, however, again fails to address the traffic impacts of the Project, and does nothing to mitigate them.

Regardless of whether the City provides additional Muni "Special Event Transit Service," a central assumption of the DSEIR, the document admits that traffic impacts will affect the entire Project area, freeway ingress/egress, and Bay Bridge travel. (DSEIR 5.2-118 - 129, 5.2-191-207.)

The DSEIR's analysis and the proposed "mitigation" fall far short of the requirements of CEQA to identify significant impacts and mitigate them.

2. The Cumulative Traffic Analysis Is Factually and Legally Defective.

Even though its cumulative analysis is severely flawed, the DSEIR admits that the Project will cause cumulative traffic impacts at 16 "study intersections" including I-80 and I-280 freeway ramps. (DSEIR 5.2-219-221.) The DSEIR then fails to propose any effective mitigation measures for those impacts.

The DSEIR's cumulative traffic impacts analysis legally inadequate and unsupported. The document claims that it assessed cumulative impacts "by calculating the project-generated traffic conditions at intersections that are projected to operate at LOS E or LOS F under 2040 cumulative conditions for the No Event scenario for the weekday p.m. and Saturday evening peak hours." (DSEIR 5.2-212-213.) However, that "methodology" is irrelevant to, and does not meet the legal requirements of, CEQA for assessing cumulative impacts. Rather, the DSEIR was required to identify the Project's impacts in combination with other past, present, and reasonably foreseeable future projects that would also result in traffic impacts. The baseline for assessing cumulative traffic impacts is not conditions existing in 2040 but is conditions existing now. The DSEIR's pointless computer exercise thus does not comply with CEQA. (DSEIR 5.2-212-215.) Further, the DSEIR fails to include in the cumulative analysis many other reasonably foreseeable future projects that will also result in traffic impacts, such as the "Second Street Bicycle Plan project," a major project that will eliminate two traffic lanes, turning facilities, and all parking on Second Street from Market Street to King Street to create raised separated bicycle lanes, and similar bicycle plan "road diet" features proposed by the City in the "Central Soma Plan" on Third, Fourth, and Fifth Streets and the closure of Market Street to vehicles in August, 2015, and large private development projects in the project area, all of which should have been included in the cumulative analysis. In short, the Project's impacts today and in the future will contribute significantly to the creation of severe congestion and gridlock throughout the downtown area, the freeway system, and the Project area. The failure to identify and mitigate these foreseeable cumulative impacts violates CEQA.

3. The Project Will Overwhelm Transit Capacity With No Effective Mitigation.

There is no accurate analysis of transit impacts in the SDEIR. The SDEIR says that "the project sponsor is working with the City to secure funding for the Muni Special Event Transit Service Plan as part of the project improvements." (SDEIR 5-2.191.) That vague promise is not a legally adequate project description or baseline assumption. The SDEIR then engages in an argument to secure that funding, which requires public subsidy in an unstated amount, with a series of claims showing how much *worse* vehicle traffic will be if that funding isn't provided. However, that strong-arm tactic is irrelevant to CEQA's required analysis and mitigation of the Project's transit impacts. (DSEIR 5-2-192 - 194)

The DSEIR fails to properly identify and propose mitigation for the Project's specific impacts on Muni, concluding that "the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to transit impacts." (DSEIR 5.2-224.) That conclusion improperly relies on an EIR that is both outdated and irrelevant to the Project, which was not included in that EIR.

Transit will also be delayed by queuing and gridlock caused by the project, since buses and vehicles will have to share the congested streets resulting from the Project.

The DSEIR admits that the Project will cause significant impacts due to exceeding capacity on other transit services, including BART, proposing no mitigation. (DSEIR 5.2-226.)

The SDEIR also admits that the Project would result in significant cumulative transit impacts on BART, Caltrain, Golden Gate Transit, and WETA, particularly with overlapping events, again proposing no mitigation. (DSEIR 5.2-226.)

4. Direct, Indirect, Secondary, and Cumulative Parking Impacts Are Not Analyzed or Mitigated

The DSEIR claims that it need not analyze or mitigate the Project's direct, indirect, secondary, and cumulative impacts from creating a shortfall of thousands of parking spaces throughout the area, falsely claiming that the Project is either a "residential, mixed-use residential, or employment center project on an infill site within a transit priority area." (DSEIR 5.2-233, citing PRC §21099(d).) The Project fits none of those categories, and the DSEIR must therefore analyze and propose effective mitigation for the Project's significant parking impacts.

The parking analysis understates the drastic parking shortfall created by the Project and misleadingly overstates the number of available parking spaces outside the Project area on which it irresponsibly relies.

Warriors games will always draw peak attendance of 18,000 (DSEIR, pp.1-5 [stadium capacity of 18,064 seats]; 1-8.) with most attendees driving and parking at the arena. The Project admits that it will supply only 1,082 parking spaces, including 950 in the "on-site parking garage" and 132 "within the 450 South Street Parking Garage for which the project sponsor has acquired parking rights to serve the project." (DSEIR 5.2-235.)

Admitting that the Project's proposed on-site parking is grossly inadequate and that there are few metered parking spaces in the Project area, the DSEIR claims to include parking lots within a mile of the Project, and still comes up drastically short of the parking capacity needed for the "events" in the stadium.

The parking availability baseline is outdated and inaccurate, particularly since it incorrectly lists in its offsite parking inventory the "SF Giants Facilities," which are slated for removal and development under the "Mission Rock Project." Therefore, where the DSEIR claims there are "2,530" available parking spaces at "SF Giants facilities," no such spaces will be available under the planned development, and those spaces are not available when Project "events" overlap with "events" at the AT&T stadium. (DSEIR 5.2-236-238.) The baseline (existing conditions) thus grossly overestimates the existing parking supply, disregarding the reality of ongoing development throughout the downtown and Project area.

The baseline also grossly underestimates existing parking demand for its proposed "events," claiming without support that, with 18,000 event attendees, the parking space "demand" would be only 5,937 spaces for midday events, and 9,614 spaces for evening events. (DSEIR 5.2-242.) The DSEIR does not state how those baseline "demand" figures were derived. The failure to set forth either an accurate baseline supported by evidence and an accurate description of the Project demand not surprisingly results in the DSEIR's implausible and irresponsible conclusions that it need not realistically assess and effectively mitigate the Project's significant parking and traffic impacts due to a lack of parking.

Instead, we are told that by creating a parking shortfall, attendees "may instead use transit to arrive at the site because the perceived convenience of driving is lessened by a shortage of parking" (DSEIR 5.2-241) is completely unsupported, and evades the Project's impacts on other travelers who are not attending a Project "event" who must also contend with the secondary impacts of snarled traffic, congestion, delays, and lack of parking throughout the area. That conclusion is even more dubious in view of the DSEIR's admission that existing transit cannot accommodate Project demand. (DSEIR 5.2-140-147.)

The DSEIR concludes that, "By promoting carpooling, providing parking attendant services, providing clear direction to alternative parking locations in advance of events, and adjusting event parking rates (raising them), the parking supply would likely be more efficiently utilized during the event days and the potential parking deficit would be eliminated." (DSEIR 5.2-241.) That absurd conclusion is again completely unsupported.

The same error that flaws all of the cumulative impacts analyses in the DSEIR also applies to the cumulative parking impacts analysis, which again mistakenly begins with a baseline of "existing" conditions in 2040, instead of present existing conditions. (DSEIR 5.2-248.)

5. There Is No Accurate or Legally Adequate Analysis and Mitigation of the Project's Air Quality Impacts or GHG Impacts.

The DSEIR fails to quantify or coherently analyze air quality impacts, complaining, for example, that "it is difficult to predict the magnitude of health effects from the project's exceedance of significance criteria for regional ROG and NOx emissions. (DSEIR 5.4-40.) The DSEIR also admits that its proposed "mitigation" of reducing vehicle trips by not providing adequate parking or transportation capacity "would be difficult to quantify." The DSEIR may not hide behind its failure to gather the necessary data to analyze these and other air quality impacts, because that failure also violates CEQA's requirement to inform the public and decisionmakers of the Project's impacts and to mitigate them.

6. The DSEIR Fails To Propose Effective And Feasible Mitigation Measures For The Project's Impacts.

Under CEQA, "An EIR is an informational document which will inform public agency decisionmakers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project." (14 Cal. Code Regs. ["Guidelines"] §15121(a); PRC §21002.1(a), (b).) CEQA requires specific content in the EIR, including either a separate chapter on mitigation measures proposed to minimize the significant effects or a table showing where that subject is discussed. (Guidelines §15126.) The DSEIR contains *no* chapter on mitigation and no table showing where mitigation, including feasibility analyses, are discussed. (*Id.*)

Proposed mitigation measures include "[a]voiding the impact altogether by not taking a certain action or parts of an action." (Guidelines, §15370(a).) The EIR should propose effective, enforceable mitigation measures for each impact it identifies. The effectiveness of proposed mitigation measures should be supported by substantial evidence.

Claiming a significant impact is "unavoidable" does not excuse the failure to propose effective mitigation, but that is what this DSEIR assumes it may do, including significant transportation and circulation impacts, noise impacts, air quality impacts, wind impacts, and utilities impacts. (DSEIR 6-1 - 6-4.) That does not comply with CEQA.

7. The DSEIR Fails To Adequately Evaluate Alternatives To The Project, Including Offsite Alternatives.

The DSEIR fails to evaluate a "range of reasonable alternatives to the project, or the location of the project, which…would avoid or substantially lessen any of the significant effects." (Guidelines, §15126.6(a).) The DSEIR proposes instead analyzes only three alleged "alternatives": "Alternative A: No Project Alternative," "Alternative B: Reduced Intensity Alternative," and "Alternative C: Off-Site Alternative at Piers 30-32 and Seawall Lot 330."

The "No-Project Alternative" may not be counted as an "alternative," because it will be rejected as not satisfying the "Project-Sponsor's Objectives." The other two alternatives do not substantially lessen any of the significant impacts, and could even make them worse. (SDEIR 7-48, 7-73 - 109. Indeed, "Alternative C" met with such intense public outcry that it resulted in the land deal that moved the proposed Project to the present location. The only proposed alternative that should be considered is the No Project alternative, which is also the environmentally superior alternative.

8. There Is No Accurate Analysis or Mitigation of Impacts on Emergency and Public Services on the Directly Adjacent Major Medical Complex.

The DSEIR's conclusions that the Project will not cause significant impacts for emergency vehicles is false, dangerous, and irresponsible. The false implication that the entire area would not be gridlocked is silly, since the backup from gridlocked intersections would prevent any vehicles from moving anywhere during "events."

9. There Is No Proposed Mitigation Of The Project's Impacts On Wastewater.

10. The SDEIR Fails to Address The Project's Direct and Cumulative Land Use

Impacts.

The DSEIR incorrectly claims that an "Initial Study" can substitute for the analysis and mitigation of the Project's land use impacts, claiming the Project "would not physically divide an established community; conflict with land use plans, policies, or regulation adopted for the purpose of avoiding or mitigating an environmental effect; or have impacts on the existing character of the vicinity." (DSEIR 6-4.) In fact, the Project it plainly incompatible with existing uses in the immediate vicinity, including a major medical center, research and hospital facility, and residential uses. The Project's significant impacts clash with and affect all of those other land uses. Indeed a "subsequent" environmental impact report is inappropriate for this Project, since it drastically departs from existing land uses.

11. The SDEIR Lacks Objectivity.

The DSEIR fails to fulfill CEQA's requirement of objectivity, instead advocating for the Project sponsor. The lack of objective analysis flaws the DSEIR as an informational document and violates CEQA. (See *e.g., Citizens for Ceres v. Superior Court* (2013) 217 Cal.App.4th 889, 918-919.)

For the foregoing and other reasons, the DSEIR is legally inadequate in violation of CEQA.

POTRERO BOOSTERS
NEIGHBORHOOD ASSOCIATION
SERVING THE HILL SINCE 1926

July 27, 2015

Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: Potrero Boosters Comments to Warriors SEIR

Via Email

Dear Mr. Bollinger:

When the Golden State Warriors announced the acquisition of the rights to Mission Bay blocks 29-32, the Potrero Boosters Neighborhood Association was carefully optimistic that the City, with its stated desire to lure the Warriors to San Francisco, would provide additional transportation and transit infrastructure to our neighborhoods.[1] Indeed, we saw the Warriors as a tremendous opportunity, as the City has lagged in developing the infrastructure to accommodate the growth, both residential and commercial, experience by our neighborhoods over the last decade.

However, upon reading the Supplemental Environmental Impact Report (the "SEIR") for the Golden State Warriors Event Center and Mixed Use Development (the "Arena"), we have some significant concerns. We are distressed by the volume of identified impacts on traffic transit and parking identified as "significant and unavoidable." A failure to avoid significant impacts will directly reduce the day-to-day quality of life for the residents living and moving into the Potrero neighborhoods.

As a result, we are compelled to comment on the SEIR. We do so not with an eye to preventing the Arena from being built. We do so based on our belief that the City is capable, with the right measures in place, of making this development an asset to not just the City as a whole, but to its direct neighbors as well.

This letter will consider two sets of impacts, those associated with (i) parking, transit, traffic and emergency vehicles, and (ii) air quality.

[1] The "Boosters" represent the Potrero neighborhoods of Potrero Hill, Showplace Square and Dogpatch, i.e., those neighborhoods directly adjacent to the Mission Bay site in question.

Parking, Transit, Traffic and Emergency Vehicles

General Comments

For the Arena to coexist within its rapidly developing surrounding neighborhoods, the City must maintain dedicated funding of full time transit and transportation solutions and review the parking management programs throughout the adjacent areas. Proper attention must be paid to the travel needs of the populations that live and work (and who will soon live and work) in the area full time, and not be reserved for those few times a year when the confluence of San Francisco Giants and Arena events bring about the largest transportation challenges. New transit should be based on current data and SFMTA should be prepared to move away from more outdated transit planning.

Impact TR-2b: Parking

Parts of northeast Potrero Hill and Dogpatch are currently part of Residential Parking Permit ("RPP") Zone X. RPP enforcement is from Monday to Friday, from 8:00 am to 6:00 pm reflecting the out-of-City commuter concerns RPP was designed to remedy. These hours do not correspond with the weekend and evening operations of the Arena. Due to proximity to the Arena and existing transit options, Zone X is well within the parking shed for the Arena.

Extension of RPP enforcement hours should be considered. Yet mere extension of enforcement may not be enough. RPP areas marked with four-, rather than two-, hour limits, which may serve local businesses well, would not generally provide protection from Arena parking. Areas in our neighborhoods not currently under RPP, but which are otherwise residential in character, cannot be allowed to suffer the pressures of Arena parking. And, of course, enforcement must have the resources behind it to provide appropriate ticketing and towing for violators.

A plan needs to be developed to prevent our neighborhoods from becoming a free parking zone for Arena event attendees. Metering by itself will not provide an adequate solution given the day-to-day mixed uses of the areas in question. A meeting with community stakeholders would ensure the adequacy of a plan and help garner the support necessary to make it a reality.

We also believe that parking for the Arena should be bundled with the tickets sold. No person driving to an event at the Arena should have to guess about where they will be parking. Remote, satellite parking served by shuttles and taking advantage of mobile application technology should be required under the SEIR.

Impact TR-4: Transit

We would celebrate the introduction of ferry service to the Arena site, and would hope that an electrified Caltrain would provide additional service to and from the Peninsula. We consider both improvements to be part of the critical path to the Arena opening—that is, they must be operational prior to the Arena's first tip-off. That parochial interests on the Peninsula have tied-up Caltrain electrification is of great concern. Ridership is already at capacity levels throughout much

of the weekday schedule. Without additional trains on the schedule, we question the extent that Caltrain can be depended on in the Arena rideshare models.

Transit improvements should be funded from dedicated sources, regardless of whether those funds come from the incremental property, sales or ticket taxes arising from the Arena. With a current estimate of $14 million being collected by the City annually, at least half that mount should be funding improvements to our transportation system intended to move people out of cars. Our neighborhood intersections are overburdened as they are, with many graded a "D" or an "F" under level of service standards. We do not have any excess capacity to accommodate more drivers.

Transit funding can go to infrastructure and operations that, when not deployed for the largest of events, can mitigate the day-to-day concerns of the neighborhood. We have identified the following necessary enhancements:

- Connecting the 11 North Point-Mission Bay line through to the commercial districts on 17th, 18th, and 20th streets in Potrero Hill, to the 22nd Street Caltrain Station, and terminating adjacent to the Pier 70 and NRG Power Plant development projects. This line can serve as an outlet for residents and business to move around, rather than through, the greatest Arena impacts.
- Increased running of the 10 Townsend to three times an hour during events.
- Making the E Embarcadero a seven-days-a-week line, turning south from its current 4th and King terminus to serve the Arena, with a terminus at the 25th Street Muni Yard.
- Moving the proposed Muni Turnaround from the congestion inducing 18th and 19th Streets to the 25th Street Muni Yard, where staging could be done more efficiently and more residents to the south of the Arena could be served on a daily basis.
- Keeping the 55 16th Street line as a dedicated connector from 16th Street BART to Mission Bay, and perhaps extending the line to incorporate transfers from the J Church.

This list of improvements is not intended to be exhaustive. But they represent the need for a global transit plan for the area—one with a growing population and growing businesses—and one that has additional transit *decreases* planned, exacerbating cuts made in 2008-2009.

Impact TR-5: Traffic

Traffic is perhaps the Boosters greatest concern; increased traffic drives every other discussion in this letter. The intersection of 7th and 16th Streets is already at an "F" grade for level of service, creating danger to bicycles and pedestrians at all hours of the day. New drivers, not familiar with the area, will only compound the difficulties of an intersection where four modes (Caltrain's tracks run adjacent to 7th Street) of traffic come together. Prior to the Arena's opening, this intersection should be reworked under the City's Vision Zero plan.

Additional bicycle infrastructure may also be appropriate. Both 16th Streets and Mariposa Streets experience significant automobile traffic, and with dedicated bus lanes coming to 16th Street, neither are ideal for bicycles. A pedestrian and bicycle connector at 17th Street, including an overpass over the Caltrain tracks, would extend the bicycle routes already on 17th Street through the Mission and the western part of Potrero Hill. Such improvements should be evaluated so that bicycling can be a safer, more prevalent means of reaching the Arena.

Impact TR-10: Emergency Vehicle Access

The SEIR should provide greater clarity as to how emergency vehicles, patients and hospital staff will access the UCSF medical facilities adjacent to the Arena. Mariposa Street between 101 and 280 has an increasingly residential character and a three-ton vehicle weight limit, and runs adjacent to a school and Jackson Park. It should not be depended upon as a route from the 101 Freeway to UCSF. Emergency traffic along this stretch would be dangerous and inconvenient to residents and patients alike.

Early discussions on UCSF transportation showed Minnesota Street through the Dogpatch Historic District serving the hospital. The SEIR should make clear that this routing has been abandoned, and show an alternative route that allows ease of access to the hospital under the heaviest of traffic conditions.

Air Quality Impacts

Impact AQ-2 and Mitigation M-AQ-2b

The air quality mitigation disbursement plan described in AQ-2 and M-AQ-2b is not adequate to meet the needs of the Potrero neighborhoods and our neighbors to the south. Given our proximity to freeways, industrial activities (including a UPS distribution center and a Recology recycling facility), heavy trucking, and the historical uses of our neighborhoods (including a recently decommissioned power plant), we feel that this represents a significant environmental justice issue.

While the Bay Area Air Quality Management District ("BAAQMD") may be able to use mitigation funding anywhere in the counties of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara and portions of Solano, and the Arena is likely to draw automobile traffic from all of these areas, the bulk of the pollution by vehicles will be within two miles of the Arena. Mitigating pollution sources in Solano County will not go to reduce the impacts in our neighborhoods, which will experience additional car traffic at least 225 times per year.

As pointed out by the San Francisco Department of Environment, "The City's neighborhoods in the Southeast areas are heavily burdened by air pollution-not only from major industrial facilities, but also from the thousands of automobiles and heavy-duty diesel trucks that travel daily on nearby freeways and City streets."

The SEIR forecasts that 53% of Arena attendees on a weekday, and 59% on a weekend, will drive to the Arena. While those mobile sources of pollution will travel through other Bay Area counties, they will all arrive in our neighborhood, the analysis of the BAAQMD seems to equate moving efficiently at freeway speeds to idling on our neighborhood off-ramps and our poor level-of-service intersections.

As Arena traffic is the source of the impact, money should mitigate pollution sources near the Arena. If a stationary source of mitigation cannot be identified near the Arena, then mitigation could take the form of additional hybrid and electric buses for the SFMTA.

As a result, 80% of the funds called for in Mitigation M-AQ-2b should go to reducing the impacts in the area of the Arena itself.

Summary

The Potrero Boosters Neighborhood Association believes that, without mitigation, the Arena would significantly impact our neighborhoods for the worse. The SEIR, with its failure to identify reasonable mitigations to predicted impacts, causes us significant concern. That said, we are still optimistic that, with dedicated funding and enforceable agreements between the City and the Warriors, and with appropriate air quality management, there are opportunities to not only accommodate the Arena, but to address concerns with the context in which it is proposed to be built.

Sincerely,

J.R. Eppler

Dear Mr. Bollinger,

I am a San Francisco resident and I am dismayed that the city would devote substantial resources, obstruct views, and congest an already highly over-used area for the sake of a sports franchise. I happen to be a major sports fan, but this type of municipal support (financial and political) is profoundly inconsistent with the needs of the vast majority of San Franciscans.

Thank you for your time and consideration.

RE: Comments on the Draft Subsequent Environmental Impact Report for Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Dear Ms. Bohee,

Please accept the San Francisco Bicycle Coalition's comments on the Draft Subsequent Environmental Impact Report for Event Center and Mixed-Use Development at Mission Bay Blocks 29-32.

Background

Over the course of nearly a year, GSW Arena LLC, an affiliate of Golden State Warriors, LLC ("Warriors") and the San Francisco Bicycle Coalition ("SFBC") have had on-going discussions, outside of the formal EIR process, to address bicycle access and infrastructure at the proposed arena site. Discussions thus far between SFBC and the Warriors have led to strong plans and support of existing and future bicycle travel to and from the Project, as well as plans to address enhanced bicycle infrastructure in and around the Project site, including publicly accessible bicycle parking, bicycle valet and additional secure bicycle parking for special events, secure commercial bike parking for employees. These discussions have also led to the Warriors and SFBC's commitment to work with appropriate agencies to add public bike share to the project vicinity, intersection management during special events to maximize bicycle and pedestrian safety, ongoing bicycle encouragement for special events, and a commitment to expanding bicycle capacity if/when need increases over the life of the Project.

We would like to commend the Warriors for being receptive and responsive partners that have demonstrated a strong commitment to promoting bicycle trips to the Project site in this Draft Subsequent Environmental Impact Review document (DSEIR) and in their goals beyond this document. Both the Warriors and SFBC acknowledge that bicycle infrastructure and promotion on and near the Event Center site are critical and cost-effective investments for the immediate and long-term success of the project and help to reduce neighborhood congestion, improve local environmental quality, support positive health outcomes, and drive local economic development.

SFBC, working in close partnership with the Warriors, supports the following activities to create better biking at the Project Site. These recommendations, if not already included in the DSEIR, should be addressed under Mitigation Measure M-TR-2b, Impact TR-7, or wherever appropriate in the DSEIR document:

New and Enhanced On-Street Bicycle Facilities
SFBC supports the Warriors' and this DSEIR's inclusion of new and/or enhanced on-street bicycle facilities, to be designed in coordination with SFBC, the San Francisco Municipal Transportation Agency (SFMTA), Port of San Francisco, Office of Community Investment and Infrastructure (OCII), and Mission Bay Development Group (MBDG). These priority streets for bicycle infrastructure include:

- **Terry Francois Boulevard,** two-way protected bikeway on the East side of the roadway from Lefty O'Doul Bridge to Mariposa Street;
- **16th Street between 3rd and Terry Francois Boulevard**: one-way buffered and/or parking-protected bike lanes on North and South side;
- **Enhanced intersection designs around the arena**, with special attention paid to bicycle and pedestrian safety at 16th and Illinois Streets and 16th Street and Terry Francois Boulevard and;
- **Managed intersections around the site during special events**, with special attention paid to 16th and Illinois Streets.

The Warriors should encourage Mission Bay Development Group and public agencies to construct or implement these improvements prior to the opening of the event center.

Bicycle Parking
Adequate bicycle parking is critical to support the mode share goals of the project. SFBC encourages the Warriors to provide ample bicycle parking at the Project for special events, as well as for everyday commercial and neighborhood use. SFBC appreciates the Warriors commitment in on-going discussions to expand bicycle capacity as needed over the life of the development to meet additional capacity requirements that may arise.

Valet Bicycle Parking
The Warriors and this DSEIR indicate a need for enclosed bicycle valet space with a minimum capacity of 300 bikes. SFBC supports and encourages the current allocation of roughly 2,000 square feet for the operation and management of on-site bicycle valet, which would allow proper space for expansion, as noted above. The valet space should be designed to maximize the amount of bike storage available and to be consistent with current and projected neighborhood transportation plans. The bicycle valet should be sited as close to a main entrance to the Event Center as reasonably possible and located along one of the new or enhanced on-street bicycle facilities described above. The bicycle valet space should be completed and fully operational in conjunction with the opening of the Project.

We are pleased that valet bicycle parking will be provided at special events at the Event Center, including concerts and performances throughout the year, and at other events with an expected attendance past a threshold size to be reasonably determined in consultation with the SFBC, and revisited annually, as needed. Bicycle valet services could also be scaled up or down based on expected attendance levels on a per-event basis.

SFBC could plan to promote the availability of bicycle valet parking in communications and in programs to drive use. This could include promotion on the SFBC website, newsletters and social media with a reach of over 30,000 San Franciscans, and through programs and events as outlined below.

Commercial Bicycle Parking
As indicated in the DSEIR, the Warriors should provide secure (Class 1) bicycle parking for commercial office tenants and short-term bike parking (Class 2) for retail tenants, customers and guests at or above the requirements of applicable law including the City of San Francisco Planning Code Section 155.2, which sets standards for the provision of bike parking in new commercial development.

Other Bicycle Parking and As-Needed Expansion
SFBC supports the Warriors' and this DSEIR's proposal for an approximately 100-bike "pop-up" corral in a publicly accessible and highly visible location at the Event Center for special events on an as-needed basis. The pop-up corral should be monitored by event security staff and should be set up no less than one hour before such events.

SFBC also supports the Warriors' intention to identify on-site locations for additional pop-up corrals and/or additional bike parking facilities if/when the need for expanded bicycle parking capacity should arise. This additional bike parking capacity should be provided as additional pop-up corrals, expanded valet, and/or other forms of secure, monitored bicycle parking.

SFBC is encouraged by the Warriors' plan to identify additional future bike parking capacity to achieve a total of up to 900 potential spaces available to the general public during full-capacity special events (the sum of on-site bicycle valet spaces, on-site Class 2 spaces, pop-up corral spaces, and other publicly accessible secure bike parking spaces in the project vicinity). The Warriors should assess the need for expanded event bicycle parking facilities up to this number on a yearly basis and in consultation with SFBC to meet projected growth in bicycle trips. These spaces would be in addition to the permanent bike rooms in each on-site office building, which together with expanded event bicycle parking as described above, may in the future exceed 1,000 total available bike spaces for varied users at the project site.

SFBC is committed to continue working with the Warriors to find secure, public, and appropriate locations and systems to accommodate future bicycle capacity at the Project site.

Bay Area Bike Share Stations
SFBC supports the Warriors and this DSEIR's inclusion of Bay Area Bike Share stations at and/or around the Project site.

Marketing and Bicycle Promotion
We are pleased that the Warriors and this DSEIR acknowledge that increasing the number of bicycle trips to and from the Project will support the Citywide goal of a 8% bicycle mode share by 2023. As such, trends in bicycle trip generation and mode split should be studied and

evaluated on at least a yearly basis, with bicycle parking expansion, marketing, and promotion adjusted, to support this goal.

The Warriors and this DSEIR discuss integrating bicycle transportation into marketing and promotional activities for the Event Center to support the above stated goals. SFBC is supportive and committed to work with the Warriors on an on-going basis to further develop, implement, and promote the programs outlined below.

The Warriors and this DSEIR note that marketing and promotion are possible mitigations under *Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts* for enhancing non-auto modes. As consistent with on-going discussions with the Warriors, SFBC encourages the Warriors to also consider marketing the Event Center as a bicycle-friendly destination in other press and marketing materials that may include but are not limited to:

- Warriors players and employees on bicycles at Warriors events and at SFBC events
- Feature bicycle facilities and programs in sustainability or environmental promotional materials or media
- Encourage bicycle travel information in non-Warriors special event promotions and marketing, such as concerts and performances

Promotions to enhance the bicycle experience should also include a recurring, season-long program that encourages more people to arrive to basketball games by bicycle. Similar promotions could also be used to promote bicycle trips at other events at the Event Center throughout the year.

The Warriors should design a plan prior to the opening of the Project for promoting bicycling to the Event Center that may include but is not limited to:

- Regular “Bike to Game” nights that include group rides from various starting locations in San Francisco and the region, rides with GSW staff prior to the game, and/or special offers for people who bike to the game;
- Bike-related raffles or prizes for people who bike to games. Giveaways could include branded lights, stickers, discount tickets, etc.;
- Special services and programs for people who bike to games. These could include monthly free or discounted tune-ups and minor repairs, and other incentives for people who frequently ride their bikes to games, such as a Bike Fan of the Month/Year program, and;
- Special events leading up to and during NBA “Green Week”, in coordination with the Green Sports Alliance.

SFBC could help organize, implement and promote bicycle-related events and promotions, ensuring strong attendance and participation. SFBC could promote the plan and the Warriors’ commitment through existing email and social media channels, through partners, and on our website.

The Warriors and SFBC, through both the EIR process and on-going discussions, are committed to continued refinement of the plans and roles described in this letter and in the DSEIR.

Thank you for considering these comments as part of a truly collaborative effort to make the proposed Mission Bay Arena and Event Center the most bicycle-friendly sports venue in the country and an addition to the neighborhood that supports current city and neighborhood transportation goals.

Sincerely,

Paolo Cosulich-Schwartz
Business and Community Program Manager

RE: Warriors Arena Draft Environmental Impact Report (DEIR)

Dear Ms. Bohee:

The San Francisco Bay Trail is a 500-mile shoreline walking and bicycling path that will one day encircle the Bay. With over 340 miles complete, it follows the shoreline in nine counties, passes through 47 cities and crosses four-and-a half toll bridges. The Trail provides scenic recreation for hikers, joggers, bicyclists, skaters and wheelchair riders. It offers a setting for wildlife viewing and environmental education, and serves as an important commute alternative for bicyclists.

Several inaccuracies regarding the Bay Trail alignment and bicycle infrastructure were found in the DEIR, and it is our hope they can be corrected in the final.

Page 5.2-3, under "Local Access" states "As part of the Mission Bay Plan, Terry A. Francois Boulevard will be realigned to the west to be adjacent to the east side of Blocks 30 and 32, and a buffered two-way cycle track (Class II)3 will be provided as part of the San Francisco Bay Trail on the east side of the street." The term "Class II" is a Caltrans standard that refers to a striped bicycle lane as opposed to the buffered two-way cycletrack referenced here. Cycletracks do not currently have a Caltrans classification, though it is our understanding that one may be forthcoming. The footnote at the bottom of this page also erroneously defines both a bike lane and a cycletrack as a Class II bikeway.

Page 5.4-4 states that Fourth Street between King and Mission is part of the Bay Trail alignment. It is not. The Bay Trail alignment in this area is on Terry Francois, Lefty O'Doul Bridge, waterside of AT&T Park, and north along the Embarcadero. See attached map.

Page 5.2-28 states "At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, bike lanes, sidewalks or city streets signed as bicycle routes." The vision and goal of the Bay Trail is a Class I, multi-use pathway for cyclists and pedestrians, separated from traffic, as close to the shoreline as possible. While in certain locations, on a case-by-case-basis, the Bay Trail can consist of Class II bike lanes and sidewalks where there is *no possibility* for a multi-use path, city streets signed as bike routes are never proposed or accepted as complete segments of Bay Trail.

On page 5.2-43, the DEIR states that the Bay Trail is a 400-mile pathway, and that 338 miles are complete. Please note the Bay Trail's total length is 500 miles, and we are happy to report that 341 miles are complete.

Signage and Wayfinding

The San Francisco Bay Trail should be included in wayfinding signage on and around the project site. We would be happy to provide either the physical signs or our logo in electronic format for incorporation into the Warriors Arena signage and wayfinding plans.

While the Bay Trail Project was a commenter on the Notice of Preparation for this project, we were not notified regarding the availability of the Draft EIR. Please add us to your list of interested parties so that we will be notified when the Final EIR is available for review.

If you have any questions regarding these comments or about the Bay Trail, please contact me at (510) 464-7909 or by e-mail at maureeng@abag.ca.gov.

Sincerely,

Maureen Gaffney
Bay Trail Planner

Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco CA 94103-2414

Dear Mr. Bollinger:

Please accept the following comments on the Draft Supplemental EIR for the Event Center and Mixed-Use development at Mission Bay, Blocks 29-32.

The Sierra Club does not agree that this project fits the definition of an AB 900 Leadership project. The state legislature passed, and the governor signed, AB 900 as an economic boost during the Great Recession. It was designed to fast track infill projects through any CEQA litigation proceedings if those projects created good permanent jobs while at the same time minimizing environmental impacts, including GHG emissions, as determined by the CARB. We are well past the Great Recession, and California's economy is booming. In this midst of this boom, the project sponsors have proposed constructing a venue to nearly match the current Oracle Arena in capacity.

However, the project sponsors are proposing a project in Mission Bay without proposing adequate transportation infrastructure to match the capacity of BART in Oakland, especially when events are happening simultaneously at AT&T Park and in Mission. (*Volume 1, TR-2 through TR-6*).

The Sierra Club also believes there are other inadequacies in the SEIR. For example, the Warriors currently have about 150 full-time employees (Volume 3, Page 16). Have the project sponsors done an analysis of where these employees live, and to what extent GHG emissions will increase or decrease as a result of their commutes to the new location? Have the sponsors estimated how many FTEs will take advantage of the proposed transportation subsidies described in FSEIR Mitigation Measure E47.c: *Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers*? And will part-time employees who are not actually employees of the Warriors or other event sponsors (but who may work for food and souvenir concessions that have contracts with event sponsors) be eligible for these subsidies?

The SEIR notes that the roughly 1,000 day-of-game/event staff at the Mission Bay site will be assumed to be new hires (*Volume 3, Page 42*). The SEIR is inadequate because of this assumption. Project sponsors have not actually determined the number of events that will still be held at the Oracle Arena or surveyed current part-time employees to determine where they live and how many might transfer to the Mission Bay site in lieu of losing hours, if not their jobs, at the Oracle Arena. If roughly 1,000 part-time day-of-game employees will commute to events at the Mission Bay site from the East Bay, or anywhere else in the Bay Area, what are the GHG impacts?

The Sierra Club notes that project sponsors intend to rely on the availability of livery and TNC vehicles after events to transport people (*Volume 1 – TR-2)*. No analysis, to the knowledge of the Sierra Club, has ever yet been done on the environmental impact of TNCs in San Francisco. No one knows how many additional vehicle miles are being traveled in the City due to the availability of TNCs. No study, to the knowledge of the Sierra Club, has been done on the impact of TNCs on congestion or air quality, including GHG emissions. And yet the project sponsors propose to rely on TNCs for an unspecified portion of transportation needs of people going to and getting from events. Project sponsors should include an analysis of the GHG and other air pollution impacts of the TNCs they intend to rely on for transporting people to and from events.

The SEIR notes that there are many GHG regulations – both state and local – with which the project must comply. It credits these laws with reducing emissions of greenhouse gases in San Francisco. However, the Sierra Club notes that a large part of the reason the City's GHG emissions levels have dropped is because of the closure of the PG&E power plant in the Bayview a few years ago. (*Volume 2, 5-5-11*)

The Sierra Club does not agree that the purchase of carbon credits is an adequate method for reducing greenhouse gases, in this case, or that the purchase of carbon credits, in this case, render the project "GHG neutral." (*Volume 2, 5-5-11: As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits.*) The Sierra Club believes mitigations should be implemented at the point of impact.

The Sierra Club is also concerned that there is no requirement to purchase carbon credits until the site is 90 percent leased and occupied, and, for the arena, until 90 percent of the available booking dates are utilized. (*Volume 2, 5-5-12*). If more than 10 percent of the facility remains vacant and/or more than 10 percent of the available booking dates are never filled, the project sponsors will never have to purchase carbon credits – let alone mitigate for the impacts of all the additional car traffic and transit use on the ground. The Sierra Club believes that the project sponsors should mitigate for all GHG emissions.

Additionally, the Sierra Club thinks that the requirement to mitigate for greenhouse gas emissions should not end after 30 years, as the project sponsors propose, but should continue as long as the facility is in use.

The SC also notes many inadequacies in the 1999 and 2006 testing for hazard substances in the soil at the site, including the fact that the methodology used in 1999 and 2006 is outdated.

The Sierra Club believes that the project sponsors should design a project that remains at the current site in Oakland but proposes conversion of the parking lot for the Oracle Arena into workforce housing – and then compare GHG emissions to current operations.

Sincerely,
Susan Elizabeth Vaughan

Re: Golden State Warriors Arena and Events Center in Mission Bay

Dear Mayor Lee,

We write as faculty members at UCSF who are also members of the US National Academy of Sciences. Many of us either are, or have previously been, leaders on this Campus. We have seen this University rise to true excellence over the course of the past 40 years, and we look forward to an even greater future for UCSF and the exciting private biotech and medical organizations that it has attracted to Mission Bay. But we are seriously concerned that this future is threatened by the plan to construct a very large sports, entertainment, and event arena in our midst.

As you know, the plan for Mission Bay approved by the Board of Supervisors (October 1998) states, as one of the major objectives of this visionary project:

> Facilitating emerging commercial and industrial sectors including those expected to emerge or expand due to the proximity to the new UCSF site, such as research and development, bio-technical research, telecommunications, business service, multi-media services, and related light industrial…

And indeed, Mission Bay has rapidly become one of the most prominent academic-industry biotechnology/medical complexes in the world. But we cannot stop here: we face increasing competition from other rapidly growing complexes of this type, both in the US and abroad. It will be critical to keep moving aggressively forward, if we are to continue to attract the very best talent – both academic and private sector – to San Francisco.

It is absolutely clear to us that the planned new Golden State Warriors Arena and Events Center in Mission Bay would severely degrade the environment for the many thousands of researchers and private sector biomedical scientists who come to work at Mission Bay each day. It would also curtail the beehive-like, daily exchanges of personnel – from the South Bay and elsewhere – on which the success of the Mission Bay biomedical complex depends. Our major fear is that the Mission Bay site will lose its appeal – not only for the new biomedical enterprises that the city would like to attract here, but also for most of its current occupants. The result could critically harm not only UCSF, but also the enormously promising, larger set of biomedical enterprises that currently promises to make San Francisco the envy of the world.

Much attention has been properly focused on how traffic gridlock caused by the new stadium would affect access to the three new UCSF hospitals that are immediately adjacent to the site, one of which houses one of only two Children's Emergency rooms in San Francisco. It is unavoidable that terrible, and possibly even life-threatening, traffic congestion will be associated with the planned complex, given that it is intended to be the site of some 220 events per year, held both in the evening and during the day (*New York Times*, September 6, 2015; business section, pages 1, 4 and 5). Many of us have experienced the hours-long gridlock that paralyzes all Mission Bay streets before and after San Francisco Giants home games. The absolute paralysis that it creates is already a non-trivial problem, which the planned stadium promises to both greatly expand and intensify.

The presence of the 41,000-seat AT&T Park less than a mile (a 15-minute walk) from UCSF Mission Bay has not been sufficiently factored into the plans to build the Warriors' huge new sports/entertainment complex. The ballpark already significantly impacts life and work at Mission Bay, with nearly 50 San Francisco Giants home weekday games per season. Due to these events, it can take cars and UCSF shuttle buses over an hour to exit from the UCSF parking lot onto the streets, and a 20-minute trip may require two hours.

The widespread traffic impact of AT&T Park games is noted on the website for the San Francisco Municipal Transportation Agency (SFMTA):

> "Motorists are advised to avoid the increased congestion in downtown San Francisco related to these special events and advises commuters to use transit, taxis, bicycles or walk and to avoid using the Bay Bridge in the two hours before or after these games. ... As a reminder to fans, in order to reduce congestion on city streets after all events at AT&T Park, the SFMTA will close eastbound King Street between 3rd and 2nd streets from the seventh inning until after the post-game traffic has died down. Additionally, the northbound portion of the 4th Street (Peter R. Maloney) Bridge will be closed to all traffic except streetcars, buses, taxis and bicycles during the post-game period. (https://www.sfmta.com/news/press-releases/sfmta-weekend-transit-and-traffic-advisory)

Adding an 18,500-seat Warriors complex on top of what is already a transportation mess is asking for disaster. We are highly skeptical of any plan that proposes to segment traffic by restricting 4th street and other routes for "UCSF business only," since those of us at Mission Bay have experienced the unruly behavior of frustrated drivers stuck for long times in traffic jams. In fact, there is no believable transportation solution for two very large complexes placed in such close proximity at Mission Bay.

Imagine dropping a 41,000-seat stadium anywhere within a 1-mile radius of San Francisco City Hall, and then tripling the capacity of Bill Graham Civic Auditorium. It would make no sense, for the same reason that it makes no sense to squeeze the planned Warriors facility into the Mission Bay neighborhood. The resulting perfect storm of traffic would make it miserable for both the existing neighborhood and for sports fans – in addition to threatening the entire future of UCSF as the center of a world-class academic/ biotech/medical complex.

In summary, we urge you and the city to reconsider the wisdom of proceeding with current construction plans.

San Francisco CA 94158
Phone 415 647-8093, cell 415 813-7457

Subject: Comments and objections to the Warriors' plans and EIR.

Mission Bay is a planned community with specific businesses allowed in the Master plan.
Mission Bay is subject to strict usage and zoning rules, in particular for type of business, building heights, density, open space. It is a planned community and all buildings must fit within the guidelines of the Master plan.
While the Mission Bay master plan should be respected in its entirety, one can visualize needs for minor modifications. Any requested for variances to the Master plan should be fully justified, and provide offsets.

The EIR clearly shows that the proposed arena and the adjoining developments on blocks 29, 30, 31, 32 ignore this master plan, and will have major negative impacts that are inadequately or not addressed in the EIR.

Many have commented on parking, traffic congestion and the impact on nearby hospitals, UCSF and businesses. I fully concur and will not add to the discussion here, except in voicing my support for the filed objections.

This addresses specific design flaws that are totally ignored in the EIR and are in complete disagreement with the Mission Bay Master plan.
First the height issue: Lots 30 and 32 are zone 90 ft. Lots 29 and 31 are zoned 160 ft and height density is spelled out. Not all the lot surface can be built to 160 ft.
The Warriors could have put the arena that has a peak height of 130 ft on the lots zoned 160 ft max height. Instead they chose to located mostly of it to the east, on the lots zoned maximum 90 feet. This is counter to the Master plan for Mission Bay. Yet they chose to put it on the 90 ft max height lots asking for variances and offering no offsets by lowering the height of buildings on lot 29 and 32.
In order to get conditional approval to the plan, and stay within the Master plan intent for Mission Bay, they should either move the arena to lots 29 & 31(the lots zoned to the proper height for the arena) or offset their request for the height variance (necessitated by placing the arena on lots 30 & 32), by lowering significantly the remaining buildings.
Second the Usage issue: The Mission Bay plan is quite explicit about the type of businesses it allows. An arena and entertainment center are not considered as valid developments in the Master Plan. If an exception is granted, it should be for cause. And the impact on the rest of Mission Bay should be minimized.

But more that just an arena, aspects of the design, not properly addressed in the EIR are of great concern. In particular, the so called "viewing deck" or "sky bar" which it really is.

Usage and reason for the "viewing deck" or "sky bar".
In addition to asking that the height limitations of the Master Plan be raised to 130 ft for the arena on lots zoned 90 ft, (understandable if an arena is to be built, as an arena does require a certain height), the Warriors plan adds a "viewing deck" at 110 ft elevation (on lots zone maximum 90 ft) for the sole purpose of gaining views of the downtown and bridge for their sky bar patrons. This would put the "sky bar", well above the adjacent buildings which are all built within code! Gaining views is an outrageous request for a height variance, one of at least 20 ft, and more like 30 ft! These views are not even guaranteed as the Giants may yet build higher than allowing them to the North! But the impact will not change!
No one gets to climb higher than allowed by code just to get views, especially if it impacts the nearby buildings! And for what? a "sky bar"! Are they also contemplating a restaurant, as it was once described during preliminary meetings? The plans are devoid of any specifics for it, and should be disallowed just for this cause alone. Its impact is not measured. It is being swept under the rug!
The views on the Bay are just as spectacular on the East side. If the Warriors want to add a "viewing deck" or "sky bar", justifying its use which is not allowed in the Mission Bay plan, it should not tower above adjacent buildings, encroaching even more than the arena on the 90 ft maximum height limit of lots 30 & 32.
Furthermore the open deck now looks straight into office and residential buildings windows next to it. These, built specifically within the Mission Bay Master Plan will now have this new invasive intrusion, a few hundred feets away. Above all it is not allowed in the plan.
And its stated usage occupancy of thousands of guests, its hours of occupation (conceivably until 11pm, 365 days per year), its ill-defined and open ended purpose, the bright light pollution impact and the potential noise pollution impact (it is an open deck) on nearby residences is just unjustifiable.
And it is totally ignored in the EIR study. No impact discussed, no offsets, no specifics... a quick underhanded way of trying to slip in this totally unjustifiable aspect of the project!
There are no "sky decks", "sky bars", "sky restaurants" or "sky lounges" allowed in the Mission Bay plan. That aspect of the Arena project should be cut out. Not modified. Just cut out! There are no functional justifications for it, except the Warriors wanting it, at the height they chose!

If the Warriors insist on a "viewing deck" or "sky bar", it should be strictly within the guidelines of the Mission Bay plan, its purpose stated, its limited usage defined and strict use restrictions should be agreed upon. And not subject to future appeal. It should be lower, topping at a maximum height of 90 feet (thus sheltering nearby buildings from its impact). It should face East. Its hours of operation should be pre-agreed upon.
And the EIR should address its specific impact.

Subject: Mission Bay resident concerns
Date: Monday, July 13, 2015 12:40:34 PM

Hi,
I own a unit in the Madrone and have lived here since December, 2012. I'm rather concerned about the traffic implications of the new Warriors stadium. Frankly, it feels like SF doesn't understand traffic flow and density in Mission Bay in general, and I'm concerned that the Warrior's impact is totally unknown/inaccurately-planned. For example:

* I frequently seeing fire trucks driving the wrong way on 3rd St so that they can get to China Basin St.
* Around game times, the traffic on 3rd st backs up so much it's faster to walk downtown and catch a cab than try to drive somewhere.
* The light timing, especially around Berry St and 3rd/4th, makes it very hard to get out of Mission Bay during games. I've had it take me 50 minutes to go from the Madrone to 4th & King because of the light timing.

Right now, during a Giants game, the only way to get out of Mission Bay is to head towards 3rd & 16th, and if the Warriors are there, with 200 events/year at least, we'll basically be trapped. Yes, I know if Salesforce had been there we would've had additional traffic, but I suspect the number of employees would be significant less than the people at a game, and tech busses + people biking to work take even more cars off the road.

I can't imagine the fire department, police departments, and UCSF are terribly happy about having to get through even more traffic to get to an emergency, and in some emergencies, seconds can make the difference between life and death. It seems like a lack of foresight to have built this new station if they can't function at 100% efficiency.

I've also heard the mayor wants to add additional public transit into the area, reducing road space, but I'm sure many people will still drive, and this will just make the roads more congested.

Last, I have additional concerns about parking. We're fortunate enough to have 1 space per unit, but we don't have guest parking and some units have multiple cars. It's quite difficult to find parking during a game, and it's expensive for me to have a driving guest over given how expensive the meters are during games. That hassle will only increase with the Warriors. (Plus guests hate having to drive over here because of the game traffic!)

Thanks,
Josh

Subject: Warriors Arena in Mission Bay--NO!
Date: Friday, July 24, 2015 10:58:15 AM

I think putting a sporting arena that close to a hospital with very sick people is not only bad planning, it is greedy and selfish. The hospital and the UCSF buildings were there first. The traffic, noise, pollution, and general crowding and confusion that this plan would bring should be obvious to everyone concerned. I vote no on the arena in Mission Bay.

Subject: Warriors stadium should remain in Oakland where accessibility to the entirety of the Bay Area is best

From: Jason Barton
To: Warriors, PLN (CPC)
Subject: Warriors Arena
Date: Monday, July 27, 2015 1:54:48 PM

Hello,

I live in the surrounding area, Potrero Hill, of the future Warriors Arena and I am writing this email in support of the new arena. I believe the stadium is the perfect choice for this neighborhood. The Mission Bay has been poorly planned up to this point as outlined in this video clip comparing SF and Vancouver https://vimeo.com/86566866. The Mission Bay has become a sterile business park without any character or life. It needs something that can give it some kind of character and a major NBA sporting arena can help do just that. The arena alone will not give it a character, but the businesses that will sprout up once it is developed to support the people coming and going should reflect more character than another office building that closes down at 5 pm. I am excited for the bars, restaurants, and other small businesses that will come to this area to support the weekend and after 5 pm events (note: I am a parent of two, not a single kid just looking for parties)

The arguments against the stadium do not hold water

-The traffic will be horrible

The traffic is already horrible because of the Giants game. The addition of additional cars are not going to make traffic worse it will just be traffic more frequently something that will happen no matter what is built there. The detractors make it seem like the traffic will be analogous to a flood where cars are going to pile on top of each other and block every nook and cranny preventing any kind of human movement

-The space is for bio science

I'd say there is an ample amount of research space provided for research between the hospital and UCSF campus.

-The original plan did not call for a stadium

While the very original plan did not include a stadium, the Giants have been kicking around the idea of putting a stadium across the ball park since 2001

-Pregnant ladies and sick children will not be able to get to the hospital

If this were true why did they build it so close to the Giants stadium. The Giants traffic definitely reaches the Hospital. Furthermore, if this were true than I am curious if pregnant women are advised not to live in high congestion areas. Do they not like in the towers near the Baybridge on ramps where traffic is often gridlocked

-It will be difficult for employees to drive to work
SFMTA has been employing a policy of making driving worse for years and years.

-The infrastructure is not adequate to support this arena.
I am not aware of SFMTA being proactive in creating infrastructure for a neighborhood. You need to build it first and then use the funds to create the infrastructure

This is private land and it will be developed along with the traffic. Please approve this project so we do not get another borring business park and a neighborhood without character and turns into a ghost town on weekends and evenings.

Best Regards
Jason Barton

Hello,

As someone who has lived on Potrero Hill for over 25 years, I must comment on the proposed Warriors project. Traffic getting in and out of our neighborhood has already increased and slowed to a crawl during rush hour, and is even worse before and after Giant's games. Third to Cesar Chavez is impossible, and the other directions to 80 on 3rd and 5th are a half hour crawl to get on the freeway. All despite the promise of better public transportation that were made before the Giants moved into town.

Can you imagine what it will be like with Warriors games and the events that will certainly be held their off season year round? I think this is absolutely the wrong place for a new stadium and yet another development to be built.
But I am sure that our current city father's will explain these problems away, and we'll no longer be living in what was once the best neighborhood in the city.

Has their been any consideration of putting them in the Candlestick site?

As a second generation San Franciscan, I am writing to voice my opposition to the building of the proposed Golden State Warriors Arena and Events Center at Mission Bay. This is the worst idea and it would not be a welcome addition to the neighborhood.

The area is already congested with traffic and this structure would only add more congestion.

As the most congested city in the US, we have seen what a mess ensues with each game by observing the ball park.
We really do not need a new stadium, especially in an area that impacts the whole bay area.

I for one, and one of many oppose it.

Brett Bollinger:

I'm writing to oppose the construction of the Warriors new stadium at the currently proposed site in Mission Bay. I'm a neighbor in the area, already affected by the great increase in traffic on game days from the Giants Stadium. We often have complete gridlock NOW on home game days. An additional arena for a very popular team (!) would make the area impassable on Warriors game days. I have read the traffic solution currently being considered by the City and the Warriors, and find it laughable. The neighborhood simply doesn't have enough parking to support TWO major stadiums within blocks of each other.

I'm also a nurse, and completely agree with the California Nurses Association's opposition to the new Warriors stadium. The traffic congestion will make it difficult or impossible for patients, families and emergency responders to reach the new UCSF Hospital on game days. Emergency access to the Hospital is critical to the survival of patients. The gridlock produced by the proposed Warriors stadium would result in patient deaths.

Subject: 2014.1441E DSEIR traffic/parking comments

Hello Brett Bollinger

Re: Comments on Warriors Traffic/transportation Management proposal DSEIR
2014.1441E Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Based on the transportation Management Plan presented to Dogpatch Neighborhood Association by the Warriors (Theo Ellington, and MTA Peter Albert) on July 14, 2015, the plan lacks sufficient plans/funding for congestion management.

There is a need for:

1. No added parking at 19th St./Illinois St because it will:
a. add to Dogpatch traffic congestion while not serving the neighborhood in any way.
2. It will draw game and function day Peninsula parkers through Dogpatch via 280 N. 23rd St off/on ramp, and THIRD St., crowd out the official Traffic route for trucks and bikes on Illinois St. and interfere with the planned but also opposed MTA turn-around loop at 19th and Illinois St as well as the proposed and opposed 19th St. extension and egress for 10 wheeler trucks from BAE ship repair business on SFPort land.
3. It will interfere with/cause safety issues for pedestrians, park users of the upcoming Crane Cove Park at 19th St./Illinois and Blue Greenway along Illinois St and Pier 70.

2. Need for more PCO's pre and post game/event located throughout Dogpatch and south to Cezar Chavez to avoid traffic going through neighborhood to/from 23rd St. on/off ramp at 280 N. Traffic should be kept off Tennessee, Minnesota, Indiana, 22nd St and 20th streets as these are mainly residential in nature.

3. Dogpatch Neighborhood mitigation projects/ funds need to be identified and funded by the Warriors:
These could include:

a. 250 parking space garage located on Port land or south of 24th St. Dogpatch (with shuttle buses to the stadium). This lot would also serve workers and shoppers in Dogpatch while not sending traffic through the neighborhood. It could be designed such that it could be a park-like setting or off-leash dog park on non-game days.
b. Ongoing funds for Esprit Park maintenance and capital improvements
c. Ongoing maintenance and upgrading of neighborhood basketball court at the Historic Scott School (1060 Tennessee St) playground area on Minnesota St.
d. Ongoing cleaning/greening funds for public sidewalks and now neighborhood volunteer maintained spaces in and around Dogpatch.
e. Increased funding for more N/S T-Third cars and E/W MTA routes and ongoing funding/maintenance of these expansions
f. Ongoing funding for Blue Greenway
g. Ongoing educational scholarship funds for underprivileged Dogpatch/Potrero neighborhood children to attend Dogpatch and Mission Bay pre-schools, after school programs, and charter schools

Dear OCII and the Golden State Warriors:

I am writing to provide my feedback during the allowed period for the Draft SEIR. I live in Mission Bay with a direct view of the planned venue. Already a neighbor to the SF Giants let me briefly convey my concerns about the planned arena based on my lived experience living down the street from the SF Giants.

Quality of life:

- Noise- Intoxicated people being loud outside after games- after 10 pm and weeknights.
- Public urination and discarded trash/alcohol bottles- fans urinating on our building and landscaping.
- All public parking around the building taken up by sports fans. Try having friends over.
- People driving the wrong way down *one-way* Mission Bay Blvd. North and South.
- Full Muni cars as I am trying to get home from work. I now ride a Vespa because of this.
- Mission Bay shuttles stuck in traffic, mainly due to the next:
- No traffic officers at Mission Bay Blvd N. and S.; cars blocking the intersection in bumper to bumper traffic. Cross traffic not getting through.
- Local traffic diverted off China Basin St. down Mission Bay Blvd. North to accommodate SFPD Southern Station during games.
- People double parked/idling in the "mews" on Bridgeview (our garage entrance).
- Cars idling across our driveway entrance- blocking access to our homes.

And now there will be "traffic lanes" with the new stadium? *Please make sure we can get across 3rd Street to get to our homes*. I strongly recommend/request stickers for our vehicles to make passing through traffic lanes an easier process. Also- anything you can do to route foot traffic away from our homes would be appreciated.

Sincerely,

Re: Comments on Draft EIR for Warriors Mission Bay Project

I have significant concerns that the Draft EIR does not adequately address traffic impacts beyond the defined project area.

Specifically:

1) The additional auto trips generated by this project will have far-reaching impacts across the entire SOMA district, including on the Embarcadero, and the on-ramps to the eastbound lanes of the Bay Bridge from Bryant, Harrison and First Streets.These are already heavily congested freeway access points.

2) Indeed, it will have a regional impacts on highways, including the Bay Bridge/580/880 maze and 101/92 interchanges, much as Giant's games currently do. On dates with overlapping events at AT&T and the proposed project, traffic will likely be negatively impacted for 8+ hours, including the main auto egress points out of the Financial District.

I believe a wider traffic study area needs to be defined for mitigation analysis.

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

I am San Francisco homeowner and a local (4th and Townsend) worker concerned about the impact of the proposed Golden State Warriors stadium on the future of the close-knit, surrounding neighborhood communities and the medical campus at Mission Bay.

I believe that the proposed stadium will unequivocally add unbearable congestion and stress to the current neighborhood environment, besides creating an impossible situation for the local services including Fire Stations, and healthcare providers such as USCF and Kaiser Permanente.

My co-workers, many of whom are also homeowners in the Soma/Mission Bay have already been impacted by the traffic caused just by the SF GIANTS' home games! Many of us have had to adjust our work hours to avoid the traffic gridlock. This congestion has also impacted the health and welfare of our outside environment and has impeded our enjoyment of daily walks and outside lunching— which we deem necessary to keep up our health and sanity. During home games, it is virtually impossible to navigate the sidewalks and cars around 4th and Townsend not to mention the continuous bombardment of pedestrians who have parked in Mission Bay for the game. This creates sidewalk congestion even when walking on the San Francisco Bay Trail (one of our favorite walking trails) that runs along the Bay near Terry A Francois Blvd, RIGHT at the site of the proposed Warriors Stadium and other mixed-use buildings. This stadium project absolutely promises additional traffic logjams and parking nightmares.

This is area no longer a Healthy SF but a STRESS SF. This community is already impacted with very dense structures. This area should be PRESERVED and developed as a GREENSPACE PUBLIC PARK. As far as I have seen from walking this neighborhood for over 3 years, there is definitely not enough OPEN SPACE allotted for the population. Preserving this area should be a priority for the City of San Francisco! I DO NOT HAVE ANY FAITH, that the City Officials will be able to provide any traffic control that will alleviate the hellish congestion created by this proposed project.

I appeal to the Planning Department to step up, turn this proposition around and instead consider funding an OPEN SPACE 'Heritage' Project – one that this world-class city needs and deserves and an oasis to be enjoyed for many years by the surrounding neighborhoods, the guests and children of UCSF, local workers and visitors. I implore you to consider preserving what little is left of our beautiful waterfront by creating a gem to be enjoyed like Golden Gate Park on the western edge of our city.

This project is not a welcome addition and will only burden the city in the years to come; creating an impossibly hellish situation in an environment that is already unlivable and unsustainable! Again, I appeal to you to you please DO NOT place your support behind this project.

Sincerely,
Micki Cunningham

Subject:	My concern with Warriors/Mission Bay Project
Date:	Monday, July 27, 2015 2:09:57 PM

Dear Brett Bollinger,
I wish to comment on the Warriors/Mission Bay project. I was recently informed that Kaiser Permanente medical offices will be moving in the Mission Bay Area early 2016. My doctor and my elderly mother's doctor will be located there. My concern is the traffic especially during game days/special events. Yes, I can plan in advance my appointments but in case of an emergency or urgent care appointment I do not want to be stuck in traffic. I am not a basketball fan and I would not know when game days /special events are. I prefer to drive my mother to her appointments and I would not consider taking an 80 year old woman in a wheelchair on MUNI.
I was born and raised in San Francisco and I respect the development of The City. So I hope the necessary steps will be considered to make automobile traffic flow better in the areas of the UC hospital and Kaiser Permanente Medical offices in the Mission Bay Area most of the time and especially during game days and special events.

Thank you for letting me comment on this and thank you for your attention to this important matter.

Sincerely,
Marian Dalere

Subject:	Comments on Draft EIR for Warriors Arena
Date:	Monday, July 27, 2015 10:03:15 AM

As a long time resident of Potrero Hill that will be impacted by the unmitigated effects of the Warriors stadium and event arena's proposed 205 days a year of activities.

I am disappointed that the City is calling traffic, transit and parking issues “significant and unavoidable”.

First many of our blocks already have Residential Permits. What is the City going to do to keep people hunting for parking in our residential neighborhoods? We already suffer daily commuter parking problems cause by UCSF, Mission Bay and Caltrain that have not been addressed for years.

Second, transit is promised to be improved as a result of the Warriors Event Center. However plans are very fluid and not well described to the neighborhood. The only minor improvement is the 55 line which is an interim measure until the only reliable bus line (22) is removed from 18th St. The 22 is proposed to
be replaced by the unreliable 33.

The concept of a “lock box” for ticket tax revenue is a good idea. However I am waiting for legislative action to make it a reality. Given that the Eastern Neighborhoods Plan called for improved transit 5 years ago. We have seen little progress on that front.

Finally, traffic caused by on going development of thousands of units has not been addressed. How can I believe that the Warriors & City will follow through with their promises?

Potrero Hill is an island with only two east - west streets on the north slope of the Hill that cross the 101. Most of our intersections are gridlocked twice a day during morning and evening commute. Add a Giants game to the mix and we get a third rush hour gridlock.
I am not optimistic that the City is going to be able to implement an effective traffic management plan. The promised traffic officers will disappear during the next economic downturn, never to return unless the ticket tax money is in a “lock box” in the City budget.

If the City and the Warriors are going to build the Arena, traffic, transit and residential parking impacts can not be “significant and unavoidable”. They must be mitigated and addressed before the Arena is built.

Dear group reviewing the EIR for the Mission Bay Warriors stadium:

I am writing to express my concern about the proposed new stadium for the Golden State Warriors in the Mission Bay area. I feel that this new complex will have a huge negative impact upon the UCSF Mission Bay medical center and upon the patients which it serves. The traffic congestion created by this new sports complex will make it very difficult for patients and their families to reach the medical center, which could delay urgent or emergency medical care. It is far more important to be able to provide care for the children and families of San Francisco and the larger Bay Area, than to meet the needs of the Golden State Warriors. The Warriors already have an excellent facility for its games in Oakland. Why compromise the care of children for the sake of a basketball team? The City of San Francisco needs to get its priorities straight. The City needs to be more concerned about children and families, and not the financial goals of the rich owners of the Warriors.

Subject: Comments on Warriors DSEIR
Date: Wednesday, June 24, 2015 4:37:52 PM

To whom it may concern,
I am concerned about the dangerous impact of having the warriors stadium/concert hall across the street from the ucsf childrens hospital. I feel like this part of the city already has issues during the baseball games at ATT park, sometimes hidering staff from getting where they are vitally needed in a timely manner. I also think its a burden stressed parents should not have to deal with. These streets cant handle much more congestion. I hope these concerns are looked at before anything is built because I think it will have a very negative impact on our facility.

I am writing to express my opposition to building a stadium at Mission Bay.

It would cause too much traffic for the area; is too remote and difficult to access;

and is not a good fit with the surrounding medical establishment.

Surely there is a more suitable piece of land available.

Subject: UCSF Employee against Warriors Stadium at Mission Bay
Date: Monday, July 27, 2015 11:29:50 AM

Dear Tiffany Bohee,

I am an employee at UCSF and mother to a small child. I am writing today to share my very serious concerns for the Warriors stadium planned for the Mission Bay area of San Francisco. I commute every day to work along both the Bart and Muni lines (either T or 55). I have literally lost sleep about the commute home on days where the Giants are playing as it makes the commute home absolutely terrible and I am often late to pick my child up from daycare. Commuter trains are packed, late, or they get stuck after on a few stops due to the huge foot and car traffic that results on game days. Busses that were added that can sometimes avoid the Giant's stadium (55, Mission Bay Shuttle, UCSF Shuttles) are no better as cars in the area are desperate to find ways around the traffic and they clog up every side street and major through way for blocks around.

Beyond the commute, imagine being in labor and getting stuck in the traffic or having a child critically ill and needing to get to ER immediately. I have heard of ambulances getting stuck in traffic and have noticed that families are very late to their appointments on days where there are day games. As a mother and patient, I cannot even fathom the anxiety this would produce and would never plan any of my care at UCSF Mission Bay if any additional traffic hazards (like the stadium) were added to an already clogged area.

I feel like the planned stadium would be a huge liability to the City of San Francisco, the Warriors franchise, UCSF, and Kaiser (who is also building in the area) - imagine if the traffic held up an ambulance and a child died? Please consider the patients, employees, and families of San Francisco when considering this proposed development and the true cost it would have to our community.

Kindly refrain from pursuing a plan to build an enormous arena and event center in such close proximity to UCSF Mission Bay. My daughter is a patient at UCSF Mission Bay and I can see that traffic congestion would likely impede patient access to critical care medical services.

Thank you,
Jean Dorrance

I oppose this project for two reasons: (1) height-limit increases and (2) congestion. I am a frequent user of the UCSF Mission Bay campus, by public transportation. The 3rd Street MUNI line and local bus service is already strained. This huge add-on would be very damaging to both my concerns.

Subject: I SUPPORT the stadium :)
Date: Monday, July 13, 2015 1:18:43 PM

…….NOT!

don't do it. Please understand what the effects on our community would be. Specifically the destruction of the environment, and encouraging people to spend money they don't have.

What does the Warriors team, or the basketball league as a whole do for their community? How do they give back? I only see children who have been pummeled by their parents and coaches, happened to be the best of the best, to be paid exorbantly to "entertain" the crowds, only to piddle it away on childish things, go into debt, and be expected to be perfect spouses and parents as well as players. What kind of upside down world do we live in ?

Please see that we really don't need another stadium around. It is unfortunate football and soccer got their stadium around here but please respect where our lives are and our environment.
Please do not turn your cheek to the extremely fragile state the earth is in.
Please understand and choose to be the honorary example of a man who chooses to put the earth he lives on, the great great grandchildren he doesn't know yet, a fighting chance at survival.

Thank you for your consideration

JANESSA

Greetings,

Keep the Warriors in Oakland. This is an incredibly ill conceived plan and will result in traffic beyond belief! You propose a few traffic cops to help with the congestion and a few hundred parking spaces?

Surely you must be insane! Have you been in that neighborhood now with the gridlock? No point in directing traffic in complete gridlock.

DO NOT BUILD IT IN SF!!! Please! Think of the families and the people that live there!

Subject: concerns over proposed Warriors Stadium
Date: Monday, July 27, 2015 1:55:41 PM

Dear Brett Bollinger,

I am writing to express my personal concerns over the planned stadium at Mission Bay. I am a professor and faculty member at the University of California, San Francisco, and my research lab and office are located on the Mission Bay Campus. The traffic in this region of the city is terrible on many days, especially those that have an event at the baseball stadium. A few months ago it took me 2 hours and 40 minutes to drive a car from Mission Bay across the Bay Bridge. This is completely unacceptable, and it highlights that the growth in this region of the city is outpacing the infrastructure for transport into and out of the region. As you know, this traffic problem is only going to get worse if this new proposed stadium is built in Mission Bay. Therefore, I oppose this new stadium, and I believe that the city should oppose this new construction also.

I want to state again that these are my own opinions.

Sincerely,
Michael Grabe

Subject: RE: My Opposition to Move the Warriors to San Francisco
Date: Monday, July 13, 2015 2:39:07 PM

Dear Brett Bollinger,

I am greatly oppose to having the Warriors move to San Francisco. I am opposed to this move for several reasons, but more importantly the Warriors are where they are supposed to be. They are in a city that love them--win or loose, support them, and are very loyal to them, not a city that only want them when they are at there best for financial gains.

In addition, San Francisco is becoming overly crowded with parking being a major problem and the city is becoming a city only for the wealthy. And despite of the wealth in the city, no one wanted to spend the money to repair Candlestick park and keep San Francisco 49ers in San Francisco. So , it's an enigma to me as to why it is okay to spend the money to build a new arena to steal the Warriors from Oakland?

Vehicle manslaughter is on the rise in San Francisco, parking is a nightmare, and traffic is a nightmare so a Warriors Arena is not a welcoming addition.

~Max K. Grant

Subject: No room for arena
Date: Monday, July 27, 2015 6:43:54 PM

3rd street is a parking lot when Giants' games get out. When the two seasons overlap, it will be catastrophic to the locals and those trying to reach the Bay Bridge.

There is hardly room in this tiny city for one sports team. The 49ers move although sentimentally disappointing made sense which is proving to be beneficial for San Francisco, I believe.

Unless a way could be devised to inhibit/divert the majority of extra cars coming into the city with some sort of shuttle service (we know Muni cannot handle it), Mission Bay is going to suffer. Let's also remember there is a hospital with emergency capabilities there. It would be devastating to generate a bunch of gridlock right around a major hospital.

Subject: WARRIORS ARENA
Date: Thursday, July 23, 2015 12:10:45 PM

Do not build a new WARRIORS arena in SF; we have too much traffic, the Giants, and all the glorification SF needs! Oakland needs the Warriors, and it gives their young people role models to look up to. Do not take everything away from Oakland. The proposed arena would be a major contributor to an already overly congested area.

I am a huge Warriors fan, and celebrated every moment of their 2015 CHAMPIONSHIP. I have been a Peninsula and San Francisco resident since 1957.

Sincerely,
Constance Harvey

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR.

Unmanageable Traffic and Incompatible Land Uses

The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities. A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR.

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle up to 18,500 fans at 225 events per year, especially when both stadiums have games. Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions.

The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities.

Health Concerns

The project's traffic new massive gridlock and parking problems will also cause significant and unavoidable impacts on air quality. Increased car and truck emissions in the area will be unhealthy for residents, workers and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents and patients and families who rely on UCSF and other lifesaving services in Mission Bay. The Draft EIR fails to address and mitigate these health impacts, relying on vague plans and purchases of emissions offsets rather than effective mitigation measures as required by CEQA.

The current health care and research center is a hub of care and innovation, the future of this world-class medical center should not be jeopardized by billionaires seeking to double the value of the Warriors as a sports franchise on the backs of San Francisco residents.

* * *

Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements. Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship.

Thus, we ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors. The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project and conduct a new and complete environmental review process before any decisions are made. Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project.

Sincerely,
Alison Heath

Subject: Public Comment: concern about street parking for residents
Date: Monday, June 22, 2015 5:17:50 PM

Hello -

While I'm very excited for the Warriors on their 2015 Championship - I am concerned with the impact that having their new stadium at their proposed SF location.
I live in the neighborhood nearby - Dogpatch - and street parking is already limited by the new hospital, university, private business and Giants fans (why use the paid parking when street is free?).

I would like to see the neighborhood parking restrictions extended later in the day for those without a permit to discourage game goers from using all the street parking before residents get home from work. We see this impact already with the AT&T stadium events and the continuing growth of the neighborhood - it will no doubt occur more with another event center nearby.

Thank you for considering your impact on the residents of the neighborhood

Subject: STADIUM
Date: Monday, July 27, 2015 5:37:56 PM
Importance: High

Please note that I am opposed to the building of a monster stadium in San Francisco's South of Market area. I moved to Potrero Hill in 1987 and, since then, every inch of land has been taken over by the developers and big money interests. Meantime, our quality of living has suffered and it is now impossible to even go to the grocery store without encountering traffic jams. When there is a game at AT&T, traffic is a nightmare and getting worse every day. We were told that measures would be taken to alleviate traffic problems when that stadium was proposed – that has not happened. At the beginning, there were traffic cops to assist with the traffic flow but they disappeared pretty quickly. **My street has become a thoroughfare before and after the games and I take my life in my hands trying to back out with cars racing up and down the hill.** On Sunday, the cars used my street to bypass the runners during the San Francisco Marathon—one after the other coming up the hill from 3rd Street to get onto the 280 south freeway. They are not polite and slide through the stop signs!

We are tired of broken promises!

I have no faith that this is going to be a good move. There is nowhere for the traffic to go. We have run out of land, folks, and also air space and all I see in the area now is one high rise after the other. Those movies now showing San Francisco destroyed are depicting what is going to happen when the next earthquake hits and it is not a pleasurable thing.

Ed Lee and the Board of Supervisors need to get back to taking care of the people who pay the taxes and love San Francisco for its unique qualities. Stop selling our streets to the highest bidder – remember the America's Cup...

I am a dedicated voter and I will not forget who voted for this disaster in the making!

July 20, 2015

Subject: Comments on the Draft Subsequent Environmental Impact Report
(Draft SEIR) Case Number: 2014.1441E – Event Center and Mixed Use
Development Mission Bay Blocks 29-32

Good morning Miss. Sarah Jones,

My name is Dennis Hong, I have been a resident and a private citizen residing in San Francisco all my life – Sixty five plus years and currently retired. Thank you the opportunity to review and comment on this exciting Project. I appreciate all the professional work/efforts made by both the OCII and the Planning Department made on this document. I realize that the original scope of work done on this project had changed several times including; a different site, including a number of positive community meetings with the Planning Department, the City, the sponsor (GSW), UCSF and many other stakeholders. In addition, a number of changes have been made (tweaked out) since the publication of the current Draft SEIR – June 5, 2015. To me this shows that progress is being made. As always; communication, collaboration works.

Below you will find my response and comments to this Draft SEIR - as requested by the Planning Department for consideration by the San Francisco Planning Commission, these comments are my personal views. These comments are based on the above Draft SEIR June 5, 2015 – Comment Period – June 5, 2015 to July 20, 2015 (July 27, 2015 @5pm-recently revised).

1. TRAFFIC- I am writing to express my sincere and significant concern with the impact of the additional traffic to this area; both pedestrians and vehicles; both during and after construction. Especially when the project is completed. I have been tracking this project as best as I could. Both the sponsor (GSW) and UCSF have been doing the best possible and with other involved stake holders to resolve some of these issues. This Draft SEIR captures some of that. However, it did not include some of the recent comments and or concessions that came up since it's publication. The recent concerns are mainly with traffic; during and after the games. The possibilities of these issues seem endless. But it looks like all stakeholders are on the same page and are closer than ever to resolving these issues. Most of these issues have been vented, but a compromised plan still needs to be made, the best part is, we are getting there.

2. My main concern is making sure that the traffic issues with pedestrian, vehicle, public transit (Muni, Cal Trains), are worked out with UCSF's master Plan. If the removal of the 280 freeway happens as proposed, it needs to be part of the EIR/plan. Removing this major link and rerouting it under ground as proposed may have a major impact to the project and this area. As I understand it a tunnel would be under Third street which happens to be land fill.

3. Under Cumulative Projects 5.1.5.2, were the following projects considered? HOPE, possible removal of the 280 freeway, Giants Project-Pier 70, 590 Minnesota-UCSF proposed Student Housing and 600 Minnesota-UCSF proposed Student Housing? Several of these Projects may be identified as another name – specifically the HOPE Project. For clarity purposes, could all of these cumulative projects be shown on a map, similar to fig 5-2-12?

4. I realize that the control of Fugitive Dust and construction work is hard to handle. All to often the "best practices" does not work. But with all this work going on how will it affect/impact the ongoing adjacent projects, UCSF's adjacent facilities and their daily operations? The current project at Union Square, Central Subway Station is doing a better than usual job in controlling the dust from entering these high-end retail shops. This includes the California Pacific Medical Center along the Van Ness Corridor. (Use of semi- closed barriers with mesh screens). This may be an better option than some of the best practices.

5. The Draft SEIR does a good job trying to identify the Traffic issues. However, as I mentioned above, since it's publication additional thoughts from the community, MTA, UCSF and others came up are good, these comments should be part of the RTC / Final EIR. All stakeholders have done a relatively good job here. Most importantly the new Arena Facility needs to work with UCSF's Master Plan.

6. More on traffic:

a. During the Events at the arena, add a MUNI shuttle/service to and from the two BART stations 16th and 24th Mission Street to the arena.
b. Provide additional traffic control officers before and after the events.
c. Possibly use other near by garages for additional parking.
d. Restrict traffic along some of the main streets during the events for a smother flow of traffic.
e. During game/event time, work with Caltrans and the city to use a electronic freeway/street type of sign to help direct the traffic before they get in to the Mission Bay area,
these events. They are doing this now when freeway sections and the bridge/s close and it works fine.
f. Consider closing off some of the streets for emergency only access to the hospitals.

7. Aesthetics of the project, both the sponsor and the architects have done an wonderful job. However, I do disagree with some of the comments made on the describing the Area. The use of color Photo-simulations has done an excellent job in showing what this arena may look like. As the design, color and material could have an impact on the visual skyline. I also realize CEQA does not require this step.

8. The new Arena will be an economic boom to both the city and local business, including UCSF, the Dogpatch area and others in the South Eastern part of town.

9.The proposed location is in an ideal part of town. The Sponsor has already done a diligent job in selecting this new site from the original Pier 30-32 which was voted down.

10. Include any other comments made to the (RTC) Response to Comments made during any of the public Planning Commission meetings, i.e., Planning Commission hearing
held on June 30, 2015.

11. Construction Phase, request that the Final EIR provide time lines of this Project.

a. A construction time line showing all ongoing/current, cumulatively or upcoming projects in the vicinity of this project must be considered.
b. Provide the following for controls, signs and etc., for pedestrians and traffic during the construction; traffic control officers, signs, control barriers, etc.
c.Communicate with the local merchants, residences in the area of the dates, construction schedules. Especially if certain streets will be closed. A contact
i.e., Project Manager to call if needed.
d. Provide provisions for dust controls, safety barriers and control signs.
e.Can the use of dust barriers be used to control the dust from getting in to the restaurants, business and residences and the hospital?
f.Can any of the recent/current legislation under consideration (regarding construction dust) be used here? I believe there was something the Board of Supervisors were looking
at on this matter.

12. Will this plan include some of Muni's "Traffic Calming" measures such as some of the intersections along Market Street? This might be a great project to include some of these concept along Market and the Van Ness Corridor.

13. It would be a true shame if the sponsor should abandon this Project. Lets not loose this opportunity of a life time.

In Conclusion: Based on my comments and evaluation of this Draft SEIR, case 2014.1441E of June 5, 2015; I have concluded there is sufficient information and I fully support this Project and this Draft SEIR. With all that said; a little more work needs to be done with communicating and working on the traffic issues, especially how this will or will not impact the Hospitals operations.

If any additional information could be provided in the final Report (RTC), it would be appreciated by the many stakeholders who are personally interested in this project.

Thanks to you, the Office of Community Investment and Infrastructure (OCII), the Planning Department, the Board of Supervisors, the Planning Commission and the Mayors Office for working so hard on this project. I would like to see the process expedited so that construction can start.

Incidentally, I have also been working, I believe with UCSF's most recent Final-UCSF's Long range plan of – November 2014-State Clearing House Number 2013092047, chapter 5.

Thank you for your consideration of my comments as part of the DEIRIS and the process.
Should you have any questions regarding this email/letter, please do not hesitate to contact me at dennisj.gov88@yahoo.com.

Please: If there are any compelling reasons why you think this project should not continue or be delayed, I would be interested to understand why.

Respectfully Submitted,

Dennis Hong

Subject: Public comment about Warriors June 5 SEIR
Date: Friday, July 10, 2015 9:15:02 AM

Below is a comment about the June 5 Warriors SEIR. I hope you can incorporate it into the public comments section of the next version. Thank you. Stan Horn

A WIN-WIN FOR WARRIORS-UCSF

There's a win-win way around a potential Warriors /UCSF-land-bankers quarrel whose aim is to thwart the basketball team's Third Street arena plans until a distant time when UCSF may need additional space for research -- and then junk the arena altogether.

In this win-win scenario, the **Warriors** would get an arena a year ahead of when they would have if the mysterious non-UCSF-affiliated group sued "until the cows come home," as they've threatened. Plus, the Warriors would have an assured income stream from office leasing, leading to the best financing rate available in the commercial real estate market; **UCSF and biotech firms** would get access to a half-million square feet of research space accommodating 2000 workers, at a timing of the university's or biotech companies' choosing; the **anti-arena crowd** would get to claim a victory plus save at least $228 million in cash in the first year and earn untold millions later in a few years; and **non-basketball-fan San Franciscans** wouldn't have to travel 100 miles to San Jose and back to see a concert.

Here's how the idea would work:

The property upon which the arena and two 250,000 square foot office/research buildings would be built was purchased by Salesforce in 2010 for $278 million, according to Bloomberg Business News. So UCSF's benefactors would presumably have to pay that sum or more to acquire and land-bank the property. But suppose they land-banked it by leasing all 500,000 square feet now and then sub-leased completed, ready-to-occupy space as researchers needed it over the next several years. At the going rate of $60 per square foot for Class A San Francisco office space, the benefactors would have an expense of $30 million a year. That's as opposed to a minimum $278 million cost of buying-and-banking it…a savings of at least a cool $248 million. The cream upon this cake is that the benefactors would almost certainly be able to sublease the space for more than they leased it, thereby making a neat profit on their good deeds.

In such a scenario, the only losers would be the delay-delay lawyers whose salivating over the prospect of years of fees would suddenly dry up.

Below is a comment about the June 5 Warriors SEIR. I hope you can incorporate it into the public comments section of the next version. Thank you. Stan Horn

Because San Francisco couldn't get its act together and build an arena 40 years ago -- the proposed arena site at 4th and Howard was turned into low-cost housing -- the Warriors defaulted to the nearest suitable place, the Oakland Coliseum. Oakland has had a good run. But now the party's over.

There are many good reasons why the Warriors belong in San Francisco.

- San Francisco has twice the population of Oakland. So it should have twice the fan base.

- San Francisco is much wealthier per capita, so it should provide the Warriors with a bigger potential.

- San Francisco's cachet alone will make the team more valuable as it basks in the reflections of one of the world's most popular cities.

- According to FBI statistics, fans visiting the Coliseum must forge through some of the nation's highest-crime zip codes. In San Francisco, the site is bounded by the bay, a world-renowned university, and some of the highest-priced real estate in America…none of which are known as high-crime breeders.

- Before and after games, there are nothing but acres of asphalt parking and concrete freeways and raw gray elevated train stations to greet fans in Oakland. Across the bay the arena would be surrounded by scores of cafes, night-spots, restaurants, bars, bayside parks, and pleasant walks in attractive, lively neighborhoods.

But perhaps the main reason the Warriors belong in the City is that it will finally bring San Francisco a modern events center. San Francisco is the only big city in America that doesn't have one. San Franciscans who want to see a concert, for example, must make a 100-mile round trip to San Jose or a 40-mile round trip to Oakland. No other residents of America's principal cities have to go through that.

Dozens of cultural, entertainment, artistic, educational, and sports experiences that are not now available to San Franciscans would be if there were an arena. In that sense, the events center would be as much a cultural addition to the region as our great museums. And not only San Franciscans would benefit: because of the new Muni-to-BART subway, Caltrain, future high-speed rail, ferry service, and thousands of parking spaces, the arena would be much more accessible to all Northern Californians than the freeway-and-parking-girded Coliseum is.

And don't cry for Oakland. The forever-wannabe has gone after -- and won -- virtually all of San Francisco's port jobs, more than a thousand former San Francisco BART headquarters jobs, more than a thousand former San Francisco Caltrans District IV headquarters jobs, more than a thousand former San Francisco federal government jobs, and more. Some would say that giving a little back is not unreasonable.

Below is a comment about the June 5 Warriors SEIR. I hope you can incorporate it into the public comments section of the next version. Thank you. Stan Horn

A Chronicle letter-writer pointed out that more than a dozen cities have arenas near hospitals and co-exist well.

Perhaps the best such example is right here in San Francisco.

For three generations, the 60,000-seat Kezar Stadium was closer to the main entrance of the UCSF Hospital on Parnassus than the proposed 18,000-seat Warriors arena will be to the main entrance of UCSF Mission Bay. Yet never in those generations -- and thousands of 49er, USF, and high school games and traffic -- were there reported complaints about ambulance access. With 200 events per year scheduled and perhaps an hour or two of heavy traffic at each, that means that **96% of each year will be free of arena traffic that might affect ambulances.**

As for parking, there was none at Kezar. The Warriors will build almost 1000 spaces and the Giants are about to build several thousand spaces virtually adjacent to the new arena. Several thousand spaces already exist in UCSF garages, largely empty at nights and weekends when events will be scheduled.

Draft SEIR - Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Submitted by: **Christopher Hrones, AICP**

Date: **June 30, 2015**

Good afternoon and thank you for the opportunity to comment on this draft SEIR. I am a new resident to San Francisco who has followed this project with interest. Prior to this year I lived and worked in Brooklyn, New York, where I had the opportunity to participate professionally in the planning and public discussion of the Barclays Center arena and associated Atlantic Yards development, which saw the relocation of the Nets basketball team from New Jersey to Brooklyn. Although there are obviously differences between that development and this proposal, there are also some interesting parallels, namely, the creation of a new 18,000 seat multiuse arena at an urban infill site accessible by transit, with major concerns initially expressed by some about traffic and parking impacts.

I would like to offer some observations on my experience in Brooklyn that can be instructive as we think about how to plan for the Warriors arena development.

First, the traffic congestion impact feared by many at the Barclays Center site for the most part did not materialize. As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fear of congestion generated by the arena so greatly exceeded the actual impact that when the facility opened traffic congestion was more or less a non-story. This was due to a number of factors, but the two most important were that transit utilization did meet the project goals, and that vehicle arrivals to the arena were more spread out than projected, as many people who drove came early to the area to go to nearby restaurants, bars, etc. Given this, I am happy to see that this EIR does focus on transit investments. Also, developing retail at the site as proposed will encourage some people to arrive early and eat or drink before an event. This should among, other potential benefits, disperse traffic impacts

A second observation from Brooklyn is that off-street parking supply provided by the project, combined with existing nearby off-street parking, far exceeded demand, and parking availability was therefore not an issue. The 541 parking spaces provided on site were never at full capacity and the lot was typically less than half full for major events such as basketball games. This was due, in addition to high transit mode share, to the availability of many nearby parking lots and garages that had capacity after the workday was over, as well as free and low cost on street parking. Many of the same conditions are present at the

Warriors site and therefore I do not believe parking availability will be an issue here either. I will mention one negative impact associated with parking in Brooklyn -- there has been some concern from residents about parking becoming more difficult in surrounding neighborhoods as a result of arena patrons parking on street. The investigation into Residential Permit Parking zone expansion referenced in the EIR will be important if this type of impact is to be minimized in Mission Bay.

Third, inappropriate staging and idling by for-hire vehicles was a major community quality of life concern that the Barclays Arena plan did not in my opinion adequately address. Subsequent to the arena opening, a curbside area was designated for staging in response to this concern and efforts were made to reach out to the for hire vehicle industry. However, limousines and other vehicles idling in bus stops, no standing zones, etc. continues to remain an issue well after the arena opening. With this in mind, I was pleased to see that the SDEIR calls for a specific plan to stage these types of vehicles. Early and thorough communication with the for-hire vehicle industry will be important to ensure that utilization of the designated staging areas actually occurs.

Fourth, emergency vehicle access, which has been raised as a potential concern by some with this project, was effectively accommodated in Brooklyn, where police and fire stations are located immediately adjacent to Barclay's Center. There were no significant issues that I am aware of with fire or police vehicle response. However, close coordination between these agencies and the project owner was necessary to ensure things went smoothly.

Fifth, management of pedestrian flows, especially immediately after events, can be challenging. Barclay's Center has an excellent pedestrian safety record; however, there was a need to make adjustments after the opening, which in addition to pedestrian management by operational personnel, included creating more effective sidewalk space, adding crosswalks, and installing barriers to prevent midblock crossing. The SDEIR is correct to propose solutions to prevent mid-block crossings to the southbound light rail platform at 3rd Street, and to acknowledge that the intersection of 3rd Street and South Street requires active operational management. I would suggest in addition to this that permanent physical infrastructure to adequately accommodate pedestrian flows, especially at 3rd Street and South Street, be included in the project. It is much easier to implement measures such as pedestrian bulbouts and additional crosswalks as part of the project than trying to create retrofits after the arena has opened.

Finally, the phased nature of the buildout of the Atlantic Yards/Barclays Arena project led to prolonged and repeated construction impacts that overlapped with arena events. This including suboptimal temporary conditions for pedestrians, cyclists, and motorists. I was therefore pleased to see that the plan here is to complete all construction on the site including the office towers prior to the opening of the arena, and I would urge that course of action be maintained.

Having recently lived through the planning, construction, and operation of an urban arena, I hope these observations and lessons learned are instructive. Thanks again for the opportunity to provide comments and best of luck with the project.

Aren't things bad enough already? How can you consciously decide to add yet one more traffic creating, system clogging stadium to an area already mired by traffic jams. It should not take us 1.5 hours to get to the east bay during game time, or an hour and a half to get to the embarcadero from the Bayview if there is a game at any point that day, but it does and we endure. Now you're going to add to the infrastructural nightmare? And for what? We already know that the residents of the Bayview neighborhood factor the least in all city planning decisions, but to essentially ensure gridlock along the only pathway from it to the main segment of the city, and along the least efficient public transit line to boot (the T?) When do the concerns of the constituents finally stack up against the dollar signs? Where is the city planner who has chosen to do this to our city? Have they been to the neighborhood during game time? Have they commuted to and from the Bayview during a 6:00 Giants let-out? Only 2 months ago it took me two and a half hours to make it from the Bayview to the Exploratorium for a presentation, attempted arrival time 5pm. The game had let out at 3! If this city does not have the wherewithal to make it stop and improve our already laughable traffic conditions, can we not at least stop actively making it worse? Please, don't shut down transit for all. Find another location!

Brett Bollinger

City of San Francisco

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR.

I have lived on Potrero Hill for a long time, and while it is perhaps a better place to live now than it was 50 years ago, recent development has drastically increased traffic and threatens to make parking impossible for residents. Building the Warriors Arena in this neighborhood will only exacerbate these problems. We already have serious gridlock at certain times of the day at the bottom of Mississippi Street where 7th and 16th Street come together. Soon we will become prisoners in our own neighborhood.

Overall, I am disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements. Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship.

Thus, I ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors. The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project and conduct a new and complete environmental review process before any decisions are made. Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project.

Sincerely,

Richard Hutson

Dear Mr. Bollinger-

I am a long time resident of San Francisco and I have worked in the Mission Bay/ Dogpatch area over the course of 7 years.

To be brief and to the point, I am totally opposed to the Warriors Stadium being located in San Francisco for these reasons:

OAKLAND
Oakland needs the Warriors and the jobs.
BART goes to Oakland, it is efficient and has long term sustainability
The City of Oakland and the Warriors can easily enhance the stadium with activities, shops, museums, and other businesses.

SAN FRANCISCO
SF does not need more congestion and traffic problems
Parking lots and a new bus line will not solve the problem
Do not build on landfill
The traffic has changed dramatically for the worse at Mission Bay
Regular events at the stadium will have a negative impact for the neighborhood, businesses and UCSF hospitals in the area.
We do not need more sports and events in that area of the city.

If for some reason you are not able to keep the Warriors in Oakland, I encourage to build the stadium at the former Candlestick Park site. That neighborhood is growing and changing, they need jobs, activities, more businesses and the T - Line trains can be increased. The Warriors would receive recognition for improving the schools, sports activities in the area, and they could add museums and local light manufacturing businesses near the site.

Thank you,

Kathryn Hyde

"An arena can not comply with the public trust doctrine governing waterfront development in the state, which requires public benefits and maritime use, and San Francisco has far better inland locations, opponents say."

Has an EIS been reviewed?

environmental impact report

n. a study of all the factors which a land development or construction project would have on the environment in the area, including population, traffic, schools, fire protection, endangered species, archeological artifacts, and community beauty. Many states require such reports be submitted to local governments before the development or project can be approved, unless the governmental body finds there is no possible impact, which finding is called a "negative declaration." (See: EIR, negative declaration)

http://www.sfgate.com/warriors/article/A-look-at-alternative-locations-for-Warriors-arena-5099137.php

Another persistent issue with the arena proposal is how to deal with **traffic on the Embarcadero**. Although the site is in close proximity to BART and Muni, a planned 500-space parking lot on-site would be for VIPs only. The arena could bring an additional 18,000 people to the waterfront on game days.

I think the Warriors need a new home outside of SF...it wasn't okay to over-develop at the waterfront/ exceeding height limits, and it's not okay to bring huge crowds into an area that is rapidly becoming overcrowded and already houses a major new hospital, the access to which could easily become compromised when traffic backs up. I'm a native San Franciscan and a big fan but enough! The City needs to function as more than a playground. Sincerely, L. Jensen

Dear Brett Bollinger - Here's the copy of my letter tp you.

Dear Planning Department - My comments in regard to the proposed Warriors stadium, and the UCSF Hospital.
This is an incompatible combination and should be allowed to proceed. The UCSF Medical Center is there already. Adding a sports stadium next to it would be detrimental to UCSF. It would be wiser to seek another location for the Stadium, not nextdoor to UCSF Medical center hospital. Sports games tend to attract a loud and rowdy crowd, which can be aggressive and sometimes violent. Also it monopolizes the waterfront. I object to this choice of location. It would best be put somewhere else. Let's stop it now before the trouble begins.
Please record me as being against the Warriors Stadium at the Mission Bay location. Thank You.

Re: Comments on Warriors Entertainment Center draft Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the traffic flow projections for the proposed Warriors Arena, which appear to not have been adequately analyzed in the draft Environmental Impact Report (dEIR).

Unmanageable Traffic Flow
Based on the dEIR, I have significant concerns about how the traffic will be monitored, handled, and directed around the proposed stadium. The idea that busses will transport people from more distant parking structures ignores the immediate problem of the complete gridlock in the area that blocks all movement in and around Mission Bay for 2-3 hours after Giants games. In looking at another recent stadium example that was also executed poorly, the busses that transport people to the train station from the 49ers Levi's stadium are overcrowded, infrequent and delayed by gridlock, making the trip between Santa Clara and San Francisco a four-hour journey after events. I fear that the proposed Warriors stadium will devolve into a similar unmanageable outcome.

I believe that two dedicated traffic lanes will be insufficient to handle the surge of traffic to this small, landlocked site. I recall all too well that the traffic lanes at Candlestick Park that were specifically directed and reconfigured to handle pre- and post-game traffic did not solve the problem of gridlock and congestion. And Candlestick had direct access to the freeway with no traffic contributing other than game traffic. In contrast, traffic along 3rd Street is already a problem. There is a major traffic flow every afternoon through the area along 3rd Street toward the Giants stadium that contributes significantly to the gridlock that follows every afternoon Giants games. Traffic congestion in the Mission Bay area is certain to continue to worsen as other already approved construction projects are completed and is likely to be devastating to our environment if the Warriors project is approved. I am aware of businesses that have already moved from the area to escape the existing traffic problems, and it is certainly not wise public policy to contribute further to them.

The dEIR appears to assume that scheduling events in the evening will avoid traffic issues, but this seems unlikely if projections of traffic flow have not considered the contributions of all the approved projects that bring new residents and new businesses to the area, or the many occasions when there are coincident events at both the Giants and Warriors stadiums. Does the planning anticipate that attendees will arrive earlier and earlier as traffic and parking problems increase, so that the traffic to night games will inevitably encounter afternoon rush hour traffic? Does the planning address whether TV networks will be able to require earlier than normal Warriors game times? Will there be a stipulation that no event can be scheduled earlier than a certain night hour?

Other major cities with stadiums and sports arenas in urban centers have infrastructure to handle traffic. Madison Square Garden in New York City is serviced almost entirely by public transport. Cincinnati, which has adjacent football and baseball stadiums in its downtown, has adjacent ample parking lots with direct freeway access. By contrast, Mission Bay has no infrastructure to support the increased traffic. The claim recently made on the Michael Krasny forum that the number of attendees to Warriors games is 20% of Giants games does not compute—18,500 is closer to 50% of 42,000. The notion that Warriors' games would only overlap with Giants games on rare occasions ignores the larger number of other events the facility will host – and the combination of other events happening in the City in large spaces such as the Moscone Center that draw traffic through this area. It is not just the Giants games that impact the area and must be considered.

It must be understood as a given that traffic and parking issues will reduce access for emergency and urgent care for patients seeking health care services and will add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The dEIR ignores the health and safety impacts of interfering with access to essential medical facilities.

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle a surge of up to 18,500 fans, especially when both stadiums have games. Parking will be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions.

I am disappointed by the City's failure to realistically consider the inevitable traffic problems and the compatibility of the project with the homes, businesses and hospitals already located in the area. There is already a major problem with traffic that the City has not addressed and the modest improvements to public transport and efficiency of existing traffic lanes that have been proposed solution seem to be woefully insufficient. Certainly, the claim that there is already ample infrastructure and public transport to handle traffic is false, and the problem will only be exacerbated by the growth that is already approved.

No new major projects should be approved unless and until a solution to the existing problem is solved.

I ask that the City of San Francisco recognize the health and welfare of patients, families, employees and neighbors of the Mission Bay area and avoid the disastrous impacts of the proposed entertainment center. The prudent course would be for the City to consider alternative sites other than Mission Bay for this quality of life damaging project, and conduct a new and complete review process before any decisions are made. Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project.

Sincerely,

T Kornberg

Subject: Keep mission bay clean

To Brett Bollinger of the San Francisco planning department,

The Golden State Warriors have given new inspiration to sports fans this year.

This inspiration will be even more appreciated when the team decides to build their arena elsewhere, rather than at Mission Bay.
That is an unwelcome addition and will supersede the needed protection of the bay.
Please ask the warriors to choose another site and leave Mission Bay alone.
Thank you,
Michelle

Date: Monday, July 27, 2015 2:55:21 PM

Hi there,

I fully agree with John deCastro's position on the Warriors project (I've pasted a copy of his letter below). I am already concerned with the level of traffic and congestion in our neighborhood and on the highway exits that bring us home. The city has not presented solutions to our current problems, and so I have no confidence in any action in the future. Also, these traffic and parking troubles won't only affect the residents here, they will affect the potential ticketholders and event-goers. If the arena develops a reputation of being difficult to get to and relentlessly hard and expensive to park at the attendance numbers will be affected. I currently oppose the new arena because of the lack of planning for transit.

Thank you for taking my concerns into account.

Amy

To Whom it May Concern,

I am writing you today to express my concerns regarding the proposed Warriors stadium on 3rd Street in San Francisco.

I am a Registered Nurse at UCSF Benioff Children's Hospital, and I love the Warriors. I do, however, value the safety and well-being of my patients, and their families more than a new sports arena directly across from the hospital.

The infrastructure is not in place to accomodate the immense increase in traffic to the area, if a new stadium is built in the proposed location. I am concerned that staff, patients and families will have an undue amount of stress and increased travel time to and from the hospital on game days (already experienced on Giant's home game days). It took more than an hour to go 2 miles on the last Giant's home game day, and I would expect this issue to occur routinely if the proposed stadium is built.

Having a sick child is stressful enough, I would hope that adding this extra burden to families and staff caring for them, is something you would consider as a serious negative impact that the stadium would have in its current proposed location.

I hope that the children and their families would hold a higher priority than a "nice to have" new stadium.

Thank you for your time, and thoughtful consideration of the impact of this proposal.

Sincerely,
Rachel Leavitt, RN
UCSF Benioff Children's Hospital
San Francisco

P.S. Go Warriors!!

Subject: Another stadium will make Mission Bay unliveable

I lived in Mission Bay for two years at the Radiance Building on Mission Bay Blvd and recently moved out of the neighborhood. I left Mission Bay primarily because AT&T Park and its crowds wrecked havoc on the burgeoning neighborhood. Anytime there was a Giants game, it became impossible to get home using the inbound T line. Fans would transfer to the T line starting at Civic Center and fill it beyond capacity. Working in SoMa, it became impossible to board a train home.

Driving was also impaired. Just trying to leave my home or return to it during a game sometimes meant planning an additional half hour to get through the few blocks of traffic.

After games, the neighborhood sidewalks were covered in trash, vomit, and urine of drunken fans.

Adding a basketball stadium to Mission Bay would make this nightmare a year round nuisance. Stadiums don't belong in urban centers. Don't let the Warriors ruin the neighborhood with the most potential in San Francisco.

Sincerely,
Jeremiah Lee

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

California Nurses Association has serious concerns regarding the environmental impacts on patient access, safety and health of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR, and show a fundamental incompatibility between the project and Benioff Women and Children's Medical Center located across the street.

Unmanageable Traffic and Incompatible Land Uses

The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities. A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR.

Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions. For the nurses who work at the Medical Center, parking access looms as a major concern, unsatisfied by the parking provisions of the project and the implementation of the Muni transit plan or the timing of the event start times.

The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities.

Health Concerns

The project's traffic new massive gridlock and parking problems will also cause significant and unavoidable impacts on air quality. Increased car and truck emissions in the area will be unhealthy for residents, workers and hospital patients. This will have a severe impact on the health and welfare of Mission Bay residents and patients and families who rely on UCSF and other lifesaving services in Mission Bay. The Draft EIR fails to address and mitigate these health impacts, relying on vague plans and purchases of emissions offsets rather than effective mitigation measures as required by CEQA. This concern includes the construction phase, which though temporary, occurs next to a health care facility that has large numbers of sensitive receptors.

Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR.

For example, the assertion that there will be no significant impact on access to Emergency Services during events at the project lacks plausibility given the traffic volume and restricted road network. Traffic patrol officers will not be sufficient to identify non-ambulance patients coming to the Medical Center with an emergency, including women in labor. The ambulances themselves may be delayed, which is of course a matter of life and death.

Given these impacts, which the SEIR fails to identify and/or mitigate, and which may not be possible to mitigate, point to the incompatibility of locating the project across the street from a hospital serving some of the most sensitive patients in the region.

Sincerely,

Michael Lighty
Director of Public Policy
California Nurses Association

To Whom This May Concern,

Wow, What a season for the Warriors! and for Oakland, the Bay Area, and Warriors fans everywhere. I was born and raised in San Francisco, recently moved to Oakland, and working at UCSF Benioff Children's Hospital where the proposed Warriors stadium sits across. Part time, i work as a real estate agent at Climb SF in Potrero Hill.

While i am happy that San Francisco has grown and flourished so much since i was a kid, i am also troubled at the rate and way in which it is all happening. I am seeing my co-workers, great nurses and doctors, leave the Bay Area because they just can't afford to live here anymore. Most recently, a nurse on our unit who has been vital to our Neuro Neonatal ICU program and her husband who works as a special ed teacher. Portland now gets to benefit from their hard work and dedication in their fields of work.

Having the Stadium built across from the medical center will surely impact the quality of life for all the employees in how they get to and from work. I commute across the Bay Bridge, which isn't bad now (30min average commute), but am very afraid that the numerous game days will extend this. Public transportation is not efficient enough to get me to work in the same amount of time or less. I work 12-hour night shifts from 7pm to 7:30am the next morning and when i get off work, i just want to be home and in bed.

While the Medical Center has a heli-pad, we are limited in the hours we are allowed to use it because of the noise it would create for our resident neighbors. Therefore, we need to rely on efficient ambulance transfers of sick patients in order to get them care. When you are THAT sick, EVERY MINUTE COUNTS.

And what about Oakland? Sure, we can think about all the benefits this has for Oakland, but taking 20 steps back and looking at the bigger picture, we are taking away a positive force from Oakland. A city that needs more positivity in the community. San Francisco has the Giants, we have the techies, we have the city that everyone wants to be in, why not allow Oakland to keep the Warriors and provide them with a new stadium? Because after all, they are our neighbors and as San Francisco continues to grow and spill over, our communities will be shared. Let's allow the Bay Area to grow and flourish together so people have more incentive to stay close and not feel like SF is the ONLY option. Because THAT is what makes people move to other states.

Thank you for giving me this opportunity to speak my mind. I trust that the decision made will be one that sees not only monetary value, but the value of all humans living in this area.

I appreciate your time and consideration.

<3 tina.

Office of Community Investment and Infrastructure Case No. 20114-919-97
San Francisco Planning Department Case No. 2014.144IE

Draft SEIR Public Comment Period: June 5, 2015 – July 27, 2015

Dear Ms. Bohee and Mr. Bollinger,

I am writing to share my thoughts and comments in response to this Draft Subsequent Environmental Impact Report regarding the Warriors Arena & Event Center proposed to be built in San Francisco's Mission Bay neighborhood in relation to the following issues.

Please study and respond to my following comments addressing the potential impacts that the construction of a Warriors Arena & Event Center can have for San Francisco and Mission Bay.

****

Chapter 7 – Alternatives
Page 7-20

7.3.1 – Alternative A: No Project

As required by CEQA Guidelines Section 15126.6(e), the No Project Alternative is evaluated to allow decision-makers to compare the environmental effects of approving the proposed project with the effects of not approving the project. The No Project Alternative represents what would reasonably be expected to occur in the foreseeable future if the project is not approved.

7.3.1.1 - Description of the No Project Alternative

Under the No Project Alternative, the Golden State Warriors organization would not relocate to San Francisco, and Blocks 29-32 in the Mission Bay South Plan area would not be developed with the proposed event center and mixed-use development described in Chapter 3 of the SEIR. Instead, it is assumed that in the short term, the Warriors organization would exercise its option to stay in Oakland, and accordingly, the team would continue to play its home games at Oracle Arena and lease their management offices and practice facility at the Oakland Convention Center in Oakland. Oracle Arena, built in 1966 and remodeled in 1996, is the oldest facility still in use by the NBA. Therefore, under this alternative, it is likely that the Warriors organization would either build a new arena at its current location or relocate and build a new facility in the long term in the Bay Area or elsewhere.

7.3.1.3 - Impacts of the No Project Alternative
Page 7-23

The No Project Alternative would result in similar impacts to those disclosed in the Mission Bay FSEIR and would be subject to all mitigation measures identified in the Mission Bay FSEIR applicable to Blocks 29-32. Impacts of the No Project Alternative would also be similar to those of the proposed project. This is because many of the impacts would result from the conversion of a vacant parcel at this same location to a fully developed City block, regardless of the size of the development, and the same or similar mitigation or improvement measures identified for the proposed project would apply to the No Project Alternative. The impacts of the No Project Alternative as compared to those of the proposed project are summarized below by resource topic. The reader is referred to Initial Study (Appendix NOP-IS) and Chapter 5 of this SEIR for the full analysis of impacts similar to those of the proposed project.

The environmental impact analysis of the No Project Alternative considers only the hypothetical development scenario on Blocks 29-32 described above and does not consider any effects associated with building a new arena for the Warriors basketball team at another location. However, it should be noted that in March 2015, the City of Oakland certified a Final EIR on the Coliseum Area Specific Plan 3 which discloses the environmental impacts of a new sports venue at the current location of Oracle Arena and the surrounding area.

****
My comments and perspectives in relation to these above Chapter 7 items:

One of many potential impacts that a "No Project Alternative" would have if the construction of the proposed Warrior's San Francisco Arena & Event Center is not built at this Mission Bay location, is a fact that has become crystal clear; that is, the Warriors would not be able to return to San Francisco in order to build a new state-of-the-art Arena & Event Center. This option would also prevent the opportunity to offer an indoor multi-purpose facility that would provide not only Warriors professional NBA basketball games, concerts and a variety of sports tournaments and games for numerous college, high schools and other youth programs, but it would also prevent the potential creation of an innovative Model indoor Education & Career Development Classroom within this facility capable of offering a wide range of social-economic benefits including education, career development programs and new businesses for an untold amount of public and private sector organizations, students and youth, young adults, families and our entire San Francisco-Oakland Bay Area Community as a whole.

This is a unique opportunity to build an Event Center and Mixed-Use Development at Mission Bay on Blocks 29-32, that can offer unique and invaluable incentives, inspiration and real-world career guidance and skills development and leadership training opportunities for our youth that would disappear if this Warriors Arena project does not get built. This project can also inspire and create new jobs and careers, as well as build education and career development programs that will not be possible in any other central location in San Francisco, Oakland or other Bay Area cities. I believe it would be an unfortunate failure of our collective responsibilities if we do not cooperate as a city and community and demonstrate the successful leadership necessary to construct an NBA Arena in San Francisco at the Mission Bay location. This is a once in a life time opportunity for San Francisco leaders to collaborate effectively in order to build a professional sports facility integrated with a model visionary, innovative and strategically located indoor Classroom facility capable of enhancing and expanding our capacity to establish effective wide-ranging and healthy socio-economic growth and opportunities for our entire diverse, cross-cultural San Francisco community. At the same time, I believe our public and private sector agencies, corporate leaders and Non-Profit Foundations and officials can work together in collaboration with the Warriors in order to benefit, support and share their professional knowledge and experience inside this Arena & Event Center environment for all our San Francisco, Oakland and our Bay Area schools, youth, teachers, families and communities all year-round.

****
Chapter 6
Other CEQA Issues

6.1 - Growth Inducing Impacts

6.3 - Effects Found Not to Be Significant
Page 6.3 – 6.4

Public Services -The project would not create impacts associated with the need for new or altered schools, parks, or other services.

7.3.1.3 Impacts of the No Project Alternative
Public Services / Page 7-41

Schools, Public Health, Childcare, Library, and Street Maintenance Services. Like the proposed project, the No Project Alternative would not result in increased demand for schools because it would not include residential uses. Other public services, such as demand for public health, childcare, library, street maintenance, and emergency medical would be within the assumptions provided for in the overall Mission Bay Redevelopment Plan and analyzed in the Mission Bay FSEIR. These impacts would be less than significant and no mitigation would be required.

****

My comments and perspectives in relation to these above Chapter 6 and Chapter 7 items regarding Schools:

Once again, the failure to build this Arena & Event Center - including the loss of socio-economic growth, enhanced and newly created business opportunities and a wide range of educational and career development programs, jobs, internships, practical real-world experience, leadership training and comprehensive support for our San Francisco, Oakland and Bay Area high school and college age students, non-profit youth and community organizations that can all be served year-round through visiting an indoor Warriors Arena Classroom - would be a huge loss for all sectors of our San Francisco, Oakland and the Bay Area Community; as well as the loss of creating an educational Model for our nations professional sports organizations and teams that would be worthy of emulation for future construction of Arenas and Stadiums throughout our country – and beyond.

The potential loss of building this San Francisco Warriors professional NBA Basketball Arena & Event Center, would also include the lost opportunity to create a model facility with the visionary capacity to initiate and develop an Education and Career Development Classroom in collaboration with San Francisco government, public and private sector officials and business leaders, the San Francisco Unified School District, non-profit youth and community organizations; while at the same time, create effective partnerships with public-private Non-Profit Foundations and philanthropists for financial support and matching funds as well.

The loss of this unique opportunity would also prevent enhancing and expanding much needed opportunities for our San Francisco-Oakland and Bay Area high schools and college students. This Mission Bay location also has the opportunity to inspire new businesses, and offer our public-private sectors and government leaders and agencies to work together in order to enhance and expand long-term, comprehensive socio-economic initiatives and cross-cultural, international sports and education exchange programs as well; if not, this will be instead - a huge and irreplaceable missed opportunity for our interdependent communities of San Francisco, Oakland and the entire Bay Area.

****

7.3.1.3 Impacts of the No Project Alternative
Public Services / Page 7-23

Public Services / Page 7-41
Schools, Public Health, Childcare, Library, and Street Maintenance Services. Like the proposed project, the No Project Alternative would not result in increased demand for schools because it would not include residential uses. Other public services, such as demand for public health, childcare, library, street maintenance, and emergency medical would be within the assumptions provided for in the overall Mission Bay Redevelopment Plan and analyzed in the Mission Bay FSEIR. These impacts would be less than significant and no mitigation would be required.

****

My comments and perspectives below address these above items contained within the SEIR, and the 'less than significant' impact, which will not require any additional schools to be built for our San Francisco Unified School District and family needs. With this in mind, I ask that our collective efforts envision this opportunity to build a Warriors Arena & Event Center in Mission Bay to be considered an invaluable opportunity for the Warriors, City and County of San Francisco's public and private sector officials, the SF Chamber of Commerce, Non-Profit Foundations and organizations – as well as business and community leaders to support the inclusion of an indoor Classroom to be built within this Warriors facility that can be accessible to all of our San Francisco Unified School District's high schools, students and teachers in order to initiate, create and establish an Educational Methodology Model 'Magnet Education & Career Development Classroom' within this Warriors Arena & Event Center in Mission Bay:

I believe the proposal I have shared with the Warriors and all San Francisco public and private sector officials, agencies and leaders can create a "Model Magnet Sports Management & Facilities Operations Pathway" studies, including the numerous multi-media, journalism, business and other curriculums I've shared with you, the Warriors, all San Francisco Unified School District leaders and San Francisco officials that can contribute to our current challenge to attract parents and families to raise their children in San Francisco, and attend our San Francisco public schools. The numerous jobs and careers associated with any professional Basketball Arena and NBA team, ownership and organization, could initiate tremendously inspiring incentives for high school age students to listen to and learn from all the professionals presenting their knowledge, experience and guidance within this proposed state-of-the-art Warriors Arena and Event Center High School-College Career Pathway & Field Study Classroom. I trust there would be tremendous interest throughout our San Francisco and Bay Area communities and schools to participate and become involved in an education system that included real-world experience and training within this Warriors Arena in San Francisco's Mission Bay.

This indoor Warriors Arena Classroom would have the capacity to create first-of-its-kind Model programs; including the ability to serve as a model for building future NBA Arenas throughout the country, and the Americas - as well as a unique opportunity to serve our community, city, state and country by establishing and building a National Model for other professional sports organizations and teams across the country for generations to come.

In addition to my comments above addressing these issues contained within the SEIR, I respectfully ask that you and your OCII and Planning Department staff and city officials take into consideration the details of the comprehensive programs and positive influential impacts of this Arena that I have shared with you through my previous communications and materials in writing and in public comments at both the OCII and Planning Commission hearings regarding this Arena & Event Center, my proposal to include a high school classroom within this Arena, and this Environmental Impact Report.

I respectfully ask that my proposal requesting the Warriors and SF city officials and leaders collaborate in order to include the far-reaching positive impact the construction of a High School-College Career Pathway & Field Study Classroom© within this SF-Warriors Multi-Use Arena & Event Center can have for San Francisco and this proposed project to be built on Blocks 29-32 in Mission Bay. I also ask that this Environmental Impact Report consider - and comment on - the immense potential loss that not building this Arena & Event Center would have; including the lost socio-economic benefits and educational programs and options lost through the failure to build this project would have without initiating a national Model Education and Career Development Classroom for the benefit of supporting our students, youth, young adults, families, communities and newly created business opportunities in the present - and for generations to come.

Thank you for your time, and the immense effort you and your staffs have dedicated in order to study and assess these numerous environmental and community issues and impacts that the construction of this proposed Warriors Arena & Event Center in Mission Bay will have for our entire San Francisco community – for generations to come.

Sincerely,

Dennis MacKenzie

Hello,

I am a nurse at UCSF BCH. I have major concerns regarding the warriors stadium location proposal in San Francisco.

I have heard the debates both for and against the proposal. However, having two stadiums so close to the hospital would be detrimental to our patients, families, and employees.

I am less concerned with my personal commuting problems. More so, I am concnerned with the fact that critically ill patients will not receive the care and attention they deserve and are now able to receive. I have spoken with several AMR employees as well who have major concern regarding the transportation of patients to the hospital when there are events. I am also a transport nurse that works closely with AMR and I have seen first hand how badly traffic can impact our patient care.

Often patients are in a Code III situation, where lights and sirens are permitted. Most often, however, our patients are getting transported because they are very very ill and are near code status. It is imperative that we not sit in heavy traffic and get in and out of the hospital very quickly. Our resources are limited on the ambulance and we simply need to get back in a safe manner of time.

I am afraid that our paitent's safety will be compromised and also that patient and family satisfaction will dramatically decrease and therefore the hospital will eventually lose the funding we need to continue to be one of the top hospitals.

Please consider my deep concerns.

Thank you

Subject: Public Comment on Warriors Arena
Date: Monday, July 27, 2015 7:45:15 AM

Re: Case No.: OCII: ER 2014-919-97
Planning Dept.: 2014.1441E

Thank you for the opportunity to comment on the proposed Warriors Arena project and related office buildings in Mission Bay. As a local resident (I live by the Ballpark at 2nd and King) I strongly support the proposed development as a sport and entertainment destination for our neighborhood. Please see my thoughts below:

1. Traffic. The original proposal to locate the Warriors Arena at Pier 32/34 was far preferable from a traffic perspective as it would have permitted visitors to the Arena to use the multiple public transit lines that pass within a few blocks of that location. However, in view of the significant politics and expense associated with that proposal, I feel the current proposal is the "next best thing" while still providing our neighborhood the benefits of the vibrancy and activity that will be generated by the Arena. I call on Muni and Caltrans, in particular, to take whatever steps they can to enhance service in and around the proposed arena and understand that the Arena would use extra traffic-control officers during events in the same way that Giants games do.

2. Aesthetics. The Arena, with its round, gleaming design, will be a striking presence on the waterfront and in the neighborhood. The Mission Bay neighborhood has been built, for better or worse, with a very standardized, stucco-box and concrete aesthetic, and the proposed arena will shake that up quite a bit. When the building is empty, which will be most of the time, it will be an enhancement to have a modern building in our midst. Also, the landscaping of the waterfront park will help extend the beautiful jogging/bike trail that's been started further north.

3. Neighborhood benefits. Just as with the Giants ballpark, the presence of the Arena in Mission Bay will attract and encourage the development of restaurants, bars, and other entertainment facilities, more than would be drawn to the simple residential and office neighborhood that's been built around UCSF. As in the South Beach neighborhood, those bars and restaurants will attract more residents to the area and will generate taxes and activities even when the Arena is dark.

Thank you,

Bruce McDougal

From: KimOsborn2
To: Warriors, PLN (CPC)
Subject: Strongly Opposed to New Arena in Mission Bay
Date: Monday, July 27, 2015 12:18:58 PM

Dear Arena Planners,

We who work in Mission Bay already face many days a year in which a normally 35 minute commute home takes 60 minutes or more due to traffic congestion from Giants' games. Even if we like baseball, it makes us glad whenever the Giants are away or baseball season is over. For those away or off season days we actually get a sensible commute time.

The original city plan for the area included more EVENING entertainment space, not a massive new stadium with hundreds of events at all times of day, all year long. If the traffic were more congested after dark, that would probably be fine. During the day time, however, the Giants' stadium congestion is already enough of a challenge.

I signed UCSF's WinWin petition because it is better than total surrender, but I would really vastly prefer that you put the new stadium somewhere else entirely.

It really isn"t fair to take a neighborhood already seriously damaged by the congested traffic around AT&T ballpark events to endure a doubling of the traffic with the Warriors' stadium.

We could use a lot more retail establishments around here, and smaller restaurants would do well. The thousands of us working out here don't have a lot of choices to walk to at lunch time. That would be a welcome addition. And that is the type of thing that was on the original plan I believe.

Ah well,
I hope the project goes somewhere else,

Kim

Date: Thursday, July 23, 2015 7:08:19 PM

New York City went through the same process when a stadium was proposed for Manhattan .
It was defeated, sensibly, as incompatible with Manhattan.
Same logic-different city, it doesn't belong in the Mission .

From: Mary Pezzuto
To: Warriors, PLN (CPC)
Subject: don"t gut the Warrior"s base!!
Date: Monday, July 13, 2015 2:16:36 PM

Dear Mr. Bollinger,

I'm writing to offer my perspective on the proposed Golden State Warriors Arena and Events Center at Mission Bay.

The Warriors have been Oakland's team for decades, and they belong here. This is where the heart is. You will lose a significant portion of your regular ticketholders with the move, and derail the (current and ongoing) accessibility of East Bay youth and community to continue to afford and gain access to the team we love.

Moving to SF may seem strategically great from a financial/investment perspective, but that's not everything. It's not that I dislike change, it's that if you saw the turnout that came to the parade, or the energy in the playoffs and the finals, you know that Oakland doesn't just support, Oakland needs and loves this team. And Oakland needs a team to love.

I was born in SF, and my family has been here for 5 generations. I love the city. It's not about that. San Francisco has plenty of reason to party and celebrate, with all the attractions and civic and community pride. I'm thinking Pride Parade, BatKid, St. Paddy's day parade, not to mention the Giants and the 49ers (Okay, so they've left or may leave. You'll still have their parades in SF, and ATT park will continue to be a hip destination and tourist destination.) SF doesn't need more congestion to already overstressed transit, street parking, and street and ramp traffic. It also doesn't need the kind of regentrification that displaces hundreds or thousands of hardworking San Franciscans who keep the lights on and do much of the heavy lifting in the local economy. It needs to fine-tune the garden it's growing, by helping the homeless, supporting underserved neighborhoods, cleaning up the urine-soaked streets and entryways, and providing more grassroots community events to engage the public and energize neighborhood continuity.

Oakland deserves to keep the Warriors. The spirit of connection and civic pride that's evolved from this championship is beyond compare. People here are talking to each other in supermarkets, gas stations, banks, cafes. It's such a happy vibe, and it's pulling Oakland together. Don't hijack one of the most significant bright spots this east bay community has seen in years.

Sincerely,
Mary Pezzuto

To whom it may concern,

I am a nurse practitioner at UCSF Benioff Children's Hospital, and I am strongly opposed to building a new Warriors stadium at Mission Bay.

It is already very difficult to commute in and out of the area, so much so that some co-workers have resigned their positions since we left the Parnassus campus. I will also likely resign if this stadium is built. I work in an Intensive Care Unit, and cannot withstand the additional stress of negotiating gridlock at the end of my workday.

The report that traffic can be managed in the area when the new stadium is built is not realistic, and leads me to suspect financial motives/bias in the 'experts' generating this report.

I also cannot imagine adding to the stress of parents with sick children, who already find it difficult to travel to the new Benioff campus.

Ill children matter more than money.

Sincerely,
Kay Ramsdell, RN, NNP, MSN

Subject: Concerns about Warriors Arena & 5M Development
Date: Monday, July 27, 2015 4:13:08 PM

Dear Ms. Kim,

I've never taken the time to contact anyone at City Hall but two huge developments currently under consideration demand responses.

I work at UCSF Mission Bay and am convinced that the proposed arena development is a huge mistake. I am fortunate to be able to walk to work, but for my colleagues game days at AT&T Park already involve forward planning, changes to schedules, or work from home. Traffic is awful and the already glacial Muni cars are further slowed. The arena development is completely ill-suited to a university campus and medical center location--not to mention a prime waterfront site. The scale is ill judged and and it just does not fit with a world class research institution. The site is poorly served by public transport, just two routes--it only functions now because of extensive private shuttle links.

Secondly I recently learned of the so-called 5M development two blocks from my home (Russ St). I am horrified by the inappropriate scale of the plans. Retail and service businesses are already being squeezed out of Soma, extending the FiDi westward will not help. The plan strikes me as intentionally vague, with promises of retail and art space, that just don't add up financially. Retail even in the Westfield is struggling to survive, and arts organizations don't stand a chance. Witness the Mint building which has sat closed--when that project for a museum (or a gallery, something?) should have been a city priority.

While I'm taking the time to write I'm curious to know what is being done about the vacant lot that used to be a car park on 7th St at Minna. It's been ripped up and become a eyesore, at night it's positively apocalyptic. I can only imagine what the tourists in the 3 nearby hotels make of it. Surely the owner has a responsibility to maintain even a vacant lot?

I could continue, but I won't.

Yours Gavin Rynne

Subject: Vibration sensitive equipment at Mission Bay
Date: Monday, July 27, 2015 2:44:03 PM
Attachments: Vibrationexamples.pptx
ATT00001.htm

Dear Ms Bohee:

The following statement is provided in addition and as complementary information to the comments provided to you by Tom Lippe (Law Offices of Thomas N. Lippe APC, 201 Mission St., 12th Floor, San Francisco, CA 94105) on behalf of the Mission Bay Alliance regarding the Warriors Arena Project.

Surveying the vibration-sensitive equipments that are mostly used at the UCSF Mission Bay (MB) by members of the Neuroscience research community, there appear to be two groups of equipment that fall under different criteria when considering vibration design/tolerance features for buildings (according to the ASHRAE Handbook).

The main category (VC-B) relevant for MB includes: Microsurgery, eye surgery, neurosurgery; bench microscopes greater than 400x magnification; optical equipment on isolation tables such as two-photon microscopes. Tolerance vibration velocities (in microns/sec) are indicated as the yellow line in the two attached figures from a study in another building (not at MB but relevant as general reference for vibration-sensitive equipment used here). Acceptable values for vibration velocities above 8Hz vibration frequencies are 25 microns/sec (max) and up to 50 microns/sec for lower frequencies, especially those in the range of walking-induced vibrations (~2Hz). Actual values of measurements should fall below those lines (as in the example measurement in the second slide; again not made at MB) for equipment to work error free.

The next category (VC-C) deals with ultrahigh vibration requirements (< 6 microns/sec Max.) for electron microscopes (TEMs, SEMs). However, I did not hear from any of the Neuroscience faculty whether those currently are in use.

The EIR considers vibration-sensitive equipment not to be ‘sensitive receptors’ but we would disagree with that since those pieces of equipment are indispensable for performing our research, largely supported by the National Institute of Healths. The EIR indicates that, during construction, research buildings may experience vibration velocities that exceed 0.008 in/s (or 203.2 microns/s), 5 to10-fold the values considered acceptable for operating the equipment (although the affected vibration frequency range is not indicated). Additionally, the EIR does not indicate by how much those velocities may be exceeded. Without a more thorough assessment of the potential vibration levels and spectra to be expected during construction and usage of the facility the impact on vibration-sensitive equipment is not possible. Even from the few points mentioned in the EIR it appears that vibration levels would be significantly above the VC-B criteria and, thus, may constitute intolerable interference with ongoing research or medical practice.

Sincerely,

Christoph Schreiner, PhD, MD

Examples of vibration measurements and standards in a research building

Floor Vibration Criteria

The 2007 ASHRE Hand Book (Section 47.39, table 46) provides a set of floor vibration criteria (VC) as a function of vibration frequency that are often used when the actual tool sensitivity has not been quantified. The frequency axis is broken in to bands each of which is 1/3 of an octave wide called a 1/3 octave band plot. The curves are plotted in floor vibration velocity units of microns/sec.

The yellow line across the 1/3 octave band plot of the vertical floor vibration corresponds to the ASHRE VC-B criterion.

VC-B – Microsurgery, eye surgery, neurosurgery; bench microscopes greater than 400x magnification; optical equipment on isolation tables; microelectronic manufacturing equipment such as inspection and lithography equipment (including steppers) to 3 um line widths.

From section 47.39 table 46 of the 2007 ASHRAE Handbook.

Subject: The water front is a national treasure. Put the stadium some place else!!!
Date: Tuesday, July 14, 2015 11:25:23 AM

The San Francisco water front is a national treasure. We don't need an ugly visually polluting stadium or the cluster of bars and fan excesses that go along with the highly commercialized and hyped up nature of professional sports today.

Stadiums can go anywhere. There is only one San Francisco Bay. It should be a place where anyone can walk, enjoy sweeping views and feel the power and healing nature of the ocean and tides. Do not ruin this national treasure by giving into crass commercial interests who what to take this treasure from all of us, to put up a massive building that cannot but be ugly, polluting, noisy and the equivalent of trading paradise for a parking lot.

Save the water front for all. Put the stadium someplace else.

Subject: Traffic Mitigation in Dogpatch
Date: Tuesday, July 14, 2015 10:08:03 PM

I am VP and founder of the Dogpatch Neighborhood Assc. We have been living at 917 Minnesota St.since 1986. We are supportive of the Warriors development if proper steps are taken to guarantee parking and traffic will be mitigated in the Dogpatch neighborhood.
We are concerned about the negative impact the new stadium will have on our already over taxed neighborhood parking.
Hospital workers and patients at the newly opened UCSF Hospital are currently parking on Minnesota and Tennessee streets further taxing street parking already at capacity. This is happening in spite of UCSF promising to provide traffic mitigation for 5 years prior to the hospital opening. In addition to the hospital, Giants fans are also parking in the neighborhood during games both day and night.
The addition of the Warriors stadium and other events planned at the site will only worsen an already untenable situation.
The Warriors and the City must take the necessary steps to limit further street parking in Dogpatch. Muni and Caltrain and the City must commit in writing upgrading existing public transport to accommodate increased traffic and pressure on Dogpatch parking.
Sincerely,
David Siegel
917 Minnesota St.

Subject: Feedback on EIR

Hi,

I am a (concerned) resident of the Radiance (corner of Terry A Francois and Mission Bay Blvd North). I have raised this with several stakeholders, without any response yet.

Here is my concern. I would appreciate your feedback asap.

- The post-game traffic planning involves shutting down 3rd Street to northbound traffic. This is justified to allow pedestrian traffic to get onto Muni.
- Therefore, all northbound traffic will go on TAF northbound.
- The Giants development plan calls for closing TAF north of Mission Rock Street. TAF is currently often closed at the north intersection with 3rd.
- The Police and Fire station limits cross traffic on Mission Rock and China Basin Streets. They limit traffic when there are ball games; it is reasonable to expect that they will do likewise during arena events.
- Thus, **all northbound TAF traffic will need to funnel through Mission Bay Blvd North.**
- Mission Bay Blvd North is a single lane road adjacent to residences and a park. It is the only reasonable ingress/egress point for residents of the Radiance and the Madrone.

My question: Has this untenable situation been discussed, and accepted as the correct approach? Or, has this not yet been fully considered? If the later, I hope to raise awareness and effect a change to this plan.

How can I raise the priority of this issue?

Regards,
Todd Simpson
415-676-1682

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

SPEAKER'S CARD

Subject: Comments on Warriors DSEIR
Date: Friday, June 19, 2015 11:08:38 AM

To whom it may concern,
I am a Neonatal Nurse Practitioner, specializing in emergency newborn care that includes transport of these complicated, high acuity, critically ill infants. My job involves helicopter, airplane and ambulance transport of medically fragile infants. My greatest concern regarding the proposed development of an arena in such close proximity to the hospital is that is would prevent the ambulances/personal cars transporting patients from reaching the hospital in a timely matter, potentially creating life threatening situations for a mother or child that is in urgent need of medical care. The importance of this cannot be understated.

I have personally witnessed the traffic jams from an afternoon game getting out from SF Giants Stadium, which is actually further away than the proposed stadium would be. I was outside the UCSF Benioff CHildrens Hospital after a day of work at approximately 430 pm, waiting for muni. There was complete gridlock, no T train was able to easily move and people in their independent cars were stuck, people were acting aggressively, honking, yelling, and actually driving up on the designated muni sectioned off train path to break out of the gridlock. UCSF Shuttle buses downloaded their passengers to get on the T train towards downtown since they were unable to move for at least 30 minutes. Although I was frustrated to not to be able to get home from work, I was feeling relieved that I wasn't in the back of an ambulance providing life sustaining care to a child that needed further care that I cannot provide in the back of an ambulance. To say that we have a helipad, transports will fly in, is an inaccurate statement. Contact our transport team and you will see that the majority of our tranports are ambulance based, some from even here within our own city. Children often need life sustaining treatments that only UCSF can provide, such as ECMO. In fact, there are limitations on the number of helicopter landings we can do per month per the community board. I remember also thinking, I hope there is not a laboring mother in any of these cars, because I certainly wouldn't want to be in her shoes. Now what if there was an event at this new proposed arena and an event at Giants stadium? It is already so bad as it is! Not to mention there was not one security or police presence in the entire area near UCSF. It is literally an accident and lawsuit waiting to happen!

I am from NY City, I realize change happens, areas get rejuvenated! There needs to be thorough and realistic approach to any considerations of any further developments. Quite frankly, lives are at stake. The area already has enough congestion and lack of insightfulness around how to alleviate the already cramped roadways in the Mision Bay area. The impact of such a large stadium in this hospital area would be multifold. I am writing this letter in hopes for more to gain insight into actually what we are doing here everyday at UCSF, this isn't about money, getting stuck in traffic on the way to /from work, this is about providing efficient, reliable, state of the art healthcare. The city of SF needs to reevaluate what its primary goals are and be thoughtful about how major decisions such as an arena could single handedly increase the mortality and morbidity of its citizens. Is this really worth it?

Please feel free to contact me with any further questions

Subject: comments on Warriors arena draft SEIR

Dear Ms. Bohee,

I would like to submit the following comments regarding the DSEIR for the Warriors arena in Mission Bay. For disclosure, I am a Mission Bay resident, I am on the Board of the South Beach / Rincon / Mission Bay Neighborhood Association, and I am a UCSF professor. My comments do not necessarily reflect the views of the Neighborhood Association nor UCSF; they are my own.

1) Use of third-party parking structures: In Figure 5-2 in the Transportation Management Plan, it appears that several UCSF or residential parking structures are being provided as examples of where fans might park. A note in accompanying text states that the figure does not reflect actual third-party agreements, but residential parking garages should not be used for fan parking, and while perhaps the UCSF parking garage closest to the arena could potentially be incorporated into a deal of some sort with the university, the parking structure on the other side of campus in the Rutter Center should not be used as a preferred fan parking structure because that would result in a horde of fans, sometimes drunken fans, pouring through the campus. This is not acceptable at any time of day, as the research mission of the university is not confined to business hours.

2) Page 5.2-68 states that preferred performance standards include that "event traffic does not block access to the UCSF emergency room entrance for emergency vehicles or patients on Mariposa Street between I-280 and Third Street" and says "In the event that ongoing monitoring shows at any time that the performance standards outlines above are not being met,..." It is crucial that lack of blocking of patient access to the UCSF hospital will never be a performance standard that isn't being met. That is, monitoring of the blocking of access to the hospital to identify a problem is not sufficient; rather, monitoring should be in place to prevent that from ever occurring and to actively control event traffic to allow patient access at all times.

3) The funding must be guaranteed for the mitigations outlined in the SEIR. Whether it comes from the City or the Warriors, the mitigations must not be reliant on there being sufficient funds; those funds should be identified and secured before the project is approved, or else the EIR is irrelevant.

4) Egress from Mission Bay South to the west occurs via the traffic circle and via 16th/Mariposa corridors. The arena attendees will be encouraged to use the 16th and Mariposa corridors or to exit to the north, but I suggest that they be actively diverted away from Mission Bay Blvd. MB Blvd doesn't show up as a preferred route but it is hard to interpret from the maps whether the traffic will be kept away from it. The residents of Mission Bay South, and those of Mission Bay North via the west end of Berry St, will rely on the traffic circle to be able to get in and out of their homes during pre- and post-event times. If arena traffic is pouring westward through the traffic circle, the residents will be trapped in Mission Bay or prevented from reaching it, especially as the Caltrains come through. The traffic circle should be reserved for non-event traffic. Please note that from my experience on Berry St before the west end was completed through Mission Bay Drive to 7th St, we were trapped on Berry whenever there was pre- or post-AT&T Park traffic, and we had to plan to not leave home or come home during those times via car or transit. If the traffic circle becomes held hostage to event traffic as well, then everyone in Mission Bay will experience unacceptable access limitations to their homes.

Respectfully submitted,

Re: Comments on Warriors Entertainment Center Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

As a professor at UCSF-Mission Bay, I believe that the proposed Warriors Arena will have a devastating impact on the faculty and students of UCSF and on the health care professionals and patients in our hospital. The impact of this project on traffic and transportation is not appropriately analyzed in the portions of the Draft EIR that I have read.

We who work at UCSF Mission Bay and use public transportation (the T line and the Golden Gate ferry) know that the transportation system frequently fails during Giants games, extending commute times unreliably often by hours as a result of missed connections in the intermodal travel. The overall impact of the Giants home games on public transportation (and on alternatives like Uber and taxis) are such that I personally, along with many others, choose to drive a car back and forth to Marin when there are events at AT&T Park during the times I would travel. The failure of public transportation can not be remedied when the Muni shares right of way with cars and the intersections are blocked. The proposed Warriors Arena would exacerbate this situation beyond measure.

The idea that there would be more than 225 traffic-generating events per year at the proposed Warriors Arena, which is much closer to our campus and hospital than AT&T Park, is a nightmare that can not be alleviated by having policemen direct traffic. The fact that events at AT&T Park and the proposed Warriors Arena would coincide more than than 30 time a year is truly horrible. No one will be able to go to or from work on those days, or get to our hospital, without delays that are completely unreasonable.

Access to the Bay Bridge and to the south, as well as to the hospitals, will also be tremendously compromised by the gridlock that will ensue when fans come to the stadium. Bay Bridge commuters have to go north, and 3rd and 4th streets will be impassible or perhaps closed to cars in order to allow the Muni to run. The Mariposa freeway entrance and exit can take only very low traffic flows, nothing like the freeway entrances and exits at the present Warriors arena in Oakland.

The proposed parking restriction, with 200 spaces for 18,000 fans at the proposed Warriors Arena, is also ludicrous, and will result in further gridlock and air pollution as fans cruise the neighborhoods in search of a place to park.

Finally, the traffic situation will surely impair ambulance access to our hospitals. I have seen this happen during occasional Giants game gridlock, as ambulances get stuck on 3rd Street for more than 5 minutes through 3 lights. This problem will be unimaginably worse with the addition of the proposed arena. The Draft EIR ignores the health and safety impacts of interfering with access to essential medical facilities.

None of the assessments of traffic take account of the huge increase in the residential population of the Mission Bay community that will take place when the many apartment blocks under construction are occupied. The transit-first philosophy of the City assumes, I suppose, that the public transit system that is already overburdened and frequently dysfunctional can accommodate the thousands of additional patrons without further deterioration. Given features like the transit constriction at the 4th street bridge, such a view is unreasonable. The transit system and traffic will surely become worse even before the proposed Warriors Arena is in place. No reasonable assessment of the traffic impact of the proposed Arena can be made without measuring that of the new residential developments, something that will be possible only in a year or two.

I ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, neighbors, and university students and employees including faculty members like me. The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project and conduct a new and complete environmental review process before any decisions are made. Finally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City concerning this project.

Sincerely,

Subject: Comments on Draft SEIR
Date: Thursday, July 09, 2015 9:24:05 PM

I have three comments:

1) The planned event center will hold less than half of AT&T Park's capacity and by far the majority of events at the new arena will be held on days/times when the Giants will not be playing.

2) As at AT&T Park, the arrival times of attendees will be occur over a longer period than at other venues in the country because of the various attractions and amenities (food and otherwise) that will exist around the arena site. Traffic of all types (autos, public, walking) will not all occur right before the start of the events easing the various traffic flows.

3) I believe that this event center will be a very positive addition to San Francisco.

Thank you for your consideration of these items.

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR. I do not believe that the most recent announcement from UCSF (WinWinSF) would adequately address the following points:

Unmanageable Traffic and Incompatible Land Uses
The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities. A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR.

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle up to 18,500 fans at 225 events per year, especially when both stadiums have games. Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions.

The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities.

Health Concerns
The project's traffic new massive gridlock and parking problems will also cause significant and unavoidable impacts on air quality. Increased car and truck emissions in the area will be unhealthy for residents, workers and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents and patients and families who rely on UCSF and other lifesaving services in Mission Bay. The Draft EIR fails to address and mitigate these health impacts, relying on vague plans and purchases of emissions offsets rather than effective mitigation measures as required by CEQA.

The current health care and research center is a hub of care and innovation, the future of this world-class medical center should not be jeopardized by billionaires seeking to double the value of the Warriors as a sports franchise on the backs of San Francisco residents.

* * *

Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements. Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship.

Thus, we ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors. The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project and conduct a new and complete environmental review process before any decisions are made. Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project.

Subject: concerns for new warriors stadium
Date: Thursday, July 23, 2015 2:58:36 PM

Hello,

I am a physician at UCSF Mission Bay (research buildings, not the recently opened hospital) and am concerned about the impact to traffic a new Warriors stadium will bring to the area. I commute daily to Mission Bay by car and have already noted a significant increase in traffic since the hospital opened. On days with Giant's games or other events, traffic is pretty much a stand still.

There are currently only really 4 options into and out of Mission Bay for the vast majority of people coming from the city, or bay bridge. When one consults a map, you can see that you need to take either 16th street west, Mariposa West, or you can take 3rd or 4th street north. The entire Portrero Hill area cannot exit west unless at 16th, 17th street or all the west south to Cesar Chavez. This creates huge bottle necks at 16th and Mariposa, which are at times only single lanes due to construction or people making left turns.

7th street or Owens street to 7th street will NOT be a viable option. The intersection of Owens to 7th Street is very complicated, spanning 2 lights and a busy Cal Train crossing. People who want to turn onto 7th from Owen often cannot because during rush hours, 7th street is a parking lot and the Cal train is frequently passing by.

Let's not even try using 3rd and 4th street to exit/enter Mission Bay during a Giant's game, let alone a Giant's game and/or other events at the proposed Warriors stadium.

The ability for patients and healthcare givers to access Mission Bay in a timely manner is of paramount importance, and another giant, busy public venue such as the Warrior's stadium will certainly impede that.

Thank you,
Richard Tsai

Subject: proposed Golden State Warriors' Arena and Events Center at Mission Bay.
Date: Tuesday, July 14, 2015 10:49:38 AM

Hello,

Mission bay is a beautiful area where I go on a regular basis to take loved ones to medical appointments and visits. The arena being built here is going to be a huge inconvenience to many residents, commuters, and especially hospital visitors and staff in general. More than that, I feel it poses a safety issue to the community's children.

I demand that the powers that be understand and truly consider the implications of building an arena in this area. The new children's hospital and its EMERGENCY ROOM are located there. The traffic that this arena will bring to the area will devastate any chances of parents, in a true emergency, being able to get to the hospital in time. By building this arena here, you are putting the lives of children unnecessarily at risk all so you can have one more sports team in the city.

Entertaining this idea is reckless and irresponsible. As the local SF government you have a responsibility to the health and public safety of the community and that MUST come first!

Blessings,

R. Tuialu'ulu'u

Considering the new UCSF hospital and current traffic jams in the Mission Bay Area locating the Warrior Stadium in the area if absurd and should not be allowed by city. Certainly, the owners of the 12 acre parcel have a profit motive with utter disregard for the crowded development around the area. Hope that the civic minded authorities in the city hall will prevent this from happening.

Subject: New Arena
Date: Monday, July 13, 2015 3:09:59 PM

An arena is not a welcome addition to the neighborhood in which it is proposed to be located. It does not fit well into an areea where families reside and should be placed in a more business dedicated locale.

Subject: Public Comment: concern about street parking for residents

I live 2 blocks away from the proposed site (18th and Tennessee). Street parking is already limited by the new hospital (why use the paid parking when street is free?).

I would like to see the restrictions extended later in the day for those without a permit to discourage game goers from using all the street parking before residents get home from work. (Some already happens with ATT, even though not as close.). Or maybe restricted sections on each street for only permit holders. Or some other solution.

People are not going to pay for parking in those "many" available spots if they can park on street. And that will cause untold problems for residents.

To: Planning Department
Please do not allow a stadium to be built next to the hospital. This is a crazy plan. The MTA says it will have solutions for traffic. Does anyone who lives in this city believe the MTA about anything? Just look at the job they are doing now with traffic 'solutions'. I am a native San Franciscan and enough is enough!!!
Priscilla Wheeler

July 24. 2015

RECEIVED
CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
MEA

Dear Mr. Bollinger,

As a native San Franciscan, a homeowner and a tax payer I am writing to request that you do not approve a stadium to be built in Mission Bay right next to a busy hospital.

We are already experiencing gridlock on our streets and constant disruption from construction sites everywhere.

The idea that the MTA will come up with traffic solutions is laughable on the face of it.

Please consider that our city is small and already bursting at the seams.

Respectfully, Priscilla Wheeler

Subject: Warriors Stadium at Mission Bay
Date: Thursday, July 23, 2015 12:13:58 PM

Dear Mr. Bollinger,

I am a San Francisco native, a UCSF employee of 10 years at the UCSF Mission Bay campus and a Warriors fan. I am concerned about how traffic will be directed during Warriors games if the stadium is built at Mission Bay. We already have severe traffic congestion during SF Giants game time. How will the patients get access to the new medical center, especially in an emergency? What will happen when there is a Giants and a Warriors game during rush hour? I can't see how this will work, especially for the UCSF patients.

Thank you,
JoAnne Williams

Re: GSW Event Center DSEIR OCII Case No. ER2014-919-97
Planning Department Case No. 2014.1441E

Dear Tiffany,

I have questions about the adequacy and accuracy of the DSEIR for the Golden State Warriors Arena project in Mission Bay South Blocks 29-32.

Transportation and Circulation, SEIR Section 5.2

Impact TR-1. While the SEIR states that the project would not result in construction-related ground transportation impacts because of their temporary and limited duration, the use of Terry Francois Boulevard for construction staging will have a significant impact on traffic flow to and from AT&T ballpark parking lots. Improvement Measure 1-TR-1 needs to be stronger. Where suggested mitigations "could" be required, the word should be changed to "shall", and enforcement must be incorporated in the plans. When there are events at AT&T Park, Terry Francois Boulevard needs to be vacated by construction staging and equipment to allow clear traffic flow, as is done by Mission Bay infrastructure developers to clear roads on event days to allow free traffic flow.

Impact TR-2 and TR-3. While parking in and of itself is not considered a significant environmental impact (based on SB743), the traffic caused by searching for (acknowledged inadequate) parking, or drop-off/pick-ups around the Arena, will create a significant and unavoidable impact, even with mitigation. If this neighborhood is to survive the impact of the arena in addition to the already unacceptable conditions that result from ballpark events, there needs to be effective mitigation of the unavoidable impacts. The SEIR suggests mitigation strategies that "could" be implemented "if feasible", but there are no teeth in the recommendations. Mitigation measures must be specific and enforceable through permits, conditions, agreements or other measures. Mitigations contingent upon further (required) discretionary approvals may not be enforceable, and cannot be deferred. The SEIR mitigation strategies need to be tightened up so that "could" becomes "shall", and the necessary mitigations are stated as conditions of project approval.

Creation of a Transportation Management Plan and coordination and implementation of the TMP demand oversight and authority to enforce and if necessary, amend the plans to respond to "lessons learned", conflicts and changing conditions. While the Ballpark/Mission Bay Transportation Coordinating Committee (see Mitigation Measure M-TR-11b) has been helpful in both interagency coordination of traffic and transportation impacts of the ballpark and expression of neighborhood issues, the BMBTCC has no official authority or standing to enforce or amend plans, or ensure adequate funding for required mitigations. The OCII is in no position to become an enforcing agency, and leaving implementation to “the City” is too vague – there’s no authority or accountability. The SEIR should clearly designate a responsible authority to enforce, amend and access funding for mitigations.

It has been our experience that adequate funding and oversight of mitigations, and flexibility to amend the plan, is the key to success. While the project sponsors are supposed to be drafting a Special Reserve Account to set aside the operational costs of the impacts of the arena, there needs to be a specific and enforceable reference in the SEIR that funding of mitigations will be dedicated for the life of the plan and not subject to the vagaries of City General Fund budget cycles.

Impact TR-6, TR-21, TR-22 While the SEIR addresses active management of pedestrian flows, it needs to be tied to priority for transit. Pedestrians need to be controlled so that transit vehicles have priority over vehicles exiting garages and pedestrian movement.

The most important mitigation for traffic congestion is to reduce the number of private passenger vehicles attempting to access the arena through Mission Bay’s limited and congested street network. It is important that the SEIR require off-site parking, shuttle access to off-site parking, link ticket sales to off-site parking or transportation alternatives, create smart phone or other electronic links to available parking (including reactivation of SFPark), and actively discourage private passenger vehicle access to the Mission Bay neighborhood by providing better transit service. The assumption that UCSF or Alexandria (ARE) parking garages or private parking lots in Mission Bay will be available for Arena patrons is faulty. This incorrect assumption, which inaccurately overstates available parking in the neighborhood, makes it even more critical to discourage “at will” attempts by arena patrons to drive and hope to find parking or the congestion caused by ride-hailing services (TNC’s).

As an active participant in the development of Mission Bay, Chair of the Mission Bay Citizens Advisory Committee, 30 year resident of the neighborhood, and MBCAC representative to the B/MBTCC, I am very concerned that resources for mitigations are overestimated, enforcement and funding are underestimated, and authority and responsibility for implementation of mitigations is vague and unenforceable as expressed in the SEIR. Some of the proposed mitigations in the Mission Bay SEIR still haven’t been implemented, and without specific designated authority and responsibility for implementation, there is no assurance that important mitigations for the impacts of the GSW Arena will actually occur or be maintained.

Sincerely yours,

Corinne W. Woods

NO WAY!!! Look at the logistics!! Suppose there is a Warriors game and a Giants game going on at the same time!!
Uhhh.....think about the traffic and think about the parking nonsense......THERE IS NO MORE PARKING - ANYWHERE!!!!

ARE YOU KIDDING?

There is NO room to put up an arena for the Warriors! There are NO PARKING SPACES AVAILABLE!!! How would you expect an ambulance to transport a patient facing death to get to the UCSF Emergency Room at the Hospital there?

The Warriors, as spoiled as they are right now, are perfectly accommodated in Oakland right now! I don't care how much these rich, little whiners piss and moan about it - screw 'em! They are doing well enough, right where they are!!

DO NOT BRING THEM TO SAN FRANCISCO!! THEY DON'T BELONG TO SAN FRANCISCO!! THEY BELONG TO THE ENTIRE STATE! KEEP THEM PLAYING IN OAKLAND (in a fine, modern venue)! THEY ARE DOING VERY WELL, RIGHT WHERE THEY ARE.........

Hello,

I am a current resident of Mission Bay and am submitting the attached letter to voice my concerns and opposition to the planned Warriors Arena Project in my neighborhood.

Please acknowledge receiving this email and the attachment.

Regards,

James Zboralske

July 25, 2015

Ms. Tiffany Bohee
c/o Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Ms. Bohee:

I am writing and submitting this letter to voice my concerns and objections to the proposed building of the Golden State Warriors Arena in Mission Bay.

I am a longtime San Francisco resident and have lived in several different neighborhoods over a period that exceeds 25 years. I have lived in the Mission Bay area for the past three and one-half years. I moved to the area in December 2011 and lived in the Strata Apartments located at Fourth Street and China Basin. At that time, there was very little completed development in the area and little in the way of on-going construction projects. In August 2012, I moved into a newly constructed condominium building located on Mission Bay Boulevard North. I still reside there.

I am retired and have keenly followed the growth and development in the area. I walk between four to six miles about five times a week. These walks take me all around Dogpatch, Mission Bay, Lower Potrero Hill, Showplace Square, SOMA and the Embarcadero. I walk at various times in both the morning and afternoon hours. I walk before, during and after events at AT&T Park.

During these walks I am constantly evaluating vehicular traffic flow, pedestrian and bicycle traffic patterns, signal light timing, traffic signage effectiveness, the impacts of on-going construction projects and observing, when possible, traffic control and mitigation efforts by police officers, parking control officers and employees of construction companies.

Why do I take such a detailed and keen interest in these matters? Simply put, I'm a retired law enforcement officer with well over 30 years of municipal law enforcement experience and this stuff just fascinates me. I have extensive experience in all aspects of municipal policing. With respect to the development of the Mission Bay area my extensive experience with uniformed patrol duties, traffic enforcement strategies, traffic control measures, noise issues, parking enforcement, community policing and crime prevention, addressing quality of life issues and special event management is relevant. In fact, I would be considered a subject matter expert (SME) in these areas.

In addition to walking extensively, I also regularly take the Muni T-line and the new 55 bus. This allows me to adequately evaluate those services as well.

Over the past years things have changed significantly in Mission Bay and throughout a large portion of San Francisco. Specifically, in Mission Bay many large residential buildings have been completed and occupied. Others are in various states of construction. The new UCSF Children's Hospital project has been built and opened in early 2015. The new Public Safety Building has been completed and occupied. The San Francisco Giants' plan for significant development on Lot A is working its way through a process and has yet to be finalized. It does call for significant proposed changes on that parcel. Proposed changes to Pier 48 are in the works. High-profile businesses plan to build and locate their corporate offices in the area. A significant amount of newly planned residential developments are in the proverbial "pipeline" in Mission Bay, Dogpatch, Potrero Hill and Showplace Square.

Virtually all of these projects impact local residents by causing traffic congestion, noise pollution, taxing public transit and affecting important quality of life issues in the area. As the projects are completed, the influx of new residents living in the area has increased significantly and at a rapid rate. The influx of new workers (in significant numbers) also impacts traffic and public transportation ridership. This will only be accelerated over the next couple of years as thousands of new residential units and many large-scale new retail and commercial buildings will be built and occupied. The scope and pace of development in Mission Bay and its surrounding areas is astonishing.

New local residents use many services that draw additional traffic to our neighborhood. Many of these services use or even require the use of vehicles such as: taxis and ride share companies, delivery services (UPS, FedEx), moving services, pet walkers, house cleaners, nannies, home repair and remodel services and meal delivery companies. In my building alone there are 50-70 of these occurrences on most days. Many of the local businesses also receive deliveries and they face the same problem.

Few of the streets have any commercial loading zones or parking spaces for these vehicles and as a result vehicles frequently circle the area looking for parking, double-park, park in front of fire hydrants, block driveways, and illegally park in turn lanes and the like. This is a regular and predictable practice that is only going to get worse. Although most of these indiscretions last for short periods of time, there is a cumulative effect on the neighborhood and its residents.

Parking in the area is very restrictive. Some of the area is controlled by the Port Authority and metered on a sliding pricing model. Other streets have abusive (in my view) parking restrictions which include two-hour parking zones from 7 a.m. – 10 p.m. daily. On many weekdays (non SF Giant game days) after 6 p.m. and most weekend days, the immediate area around my building is a virtual ghost town. It is not uncommon to have dozens upon dozens of vacant parking spaces on nearby streets throughout the day. Terry Francois Street often has 50 – 75, if not more, open spaces alone. Yet restrictive parking restrictions are in place. The Port Authority does not make it a practice to offer residential parking permits in our area. Residents understand the need for parking restrictions, but in our area the two-hour parking hours should be relaxed to a more realistic timeframe of perhaps between 8 a.m. – 7 p.m. on non-event days.

The new Public Safety Building recently opened and already residents are experiencing problems as police vehicles park illegally, drive too fast and have been observed committing a variety of California Vehicle Code violations. I recently attended a community meeting with police officials where these issues (among others) were brought up and discussed. The meeting went well and the police department will be looking for ways to mitigate these issues.

City officials and the public have long recognized that the City's public transportation system is not as efficient, effective and robust as it needs to be. Complaints about the system have been occurring for decades. Former Mayor Willie Brown vowed to fix Muni within his first 100 days in office and we all know how that turned out.

Ironically, in a July 22, 2015, article published in the San Francisco Chronicle titled, "Housing boom fee could boost Muni," written by J.K. Dineen and Michael Cabanatuan, Mayor Lee is quoted as saying, "As our city grows, we must ensure that our transportation network grows along with it." The article further states San Francisco has added over 100,000 jobs since 2010 and is growing by 10,000 residents a year. It references the hot-bed issue about the proliferation of high-end residential towers in areas that have not been accompanied by adequate improvements in open space, transit and affordable housing.

The article did not mention the proliferation of commercial and retail developments and their significant impacts on San Francisco over the last five years. It is the cumulative impacts of all of these changes that affect our daily lives, our health and our outlook on the City.

I choose not to belabor the historical problems and proposed fixes to our public transportation system. I choose to not focus on the increased advocacy for bicycle riders and pedestrians. I choose to not focus on homelessness and the mentally ill. I choose to not take up the issue of affordable housing and open space. I choose not to evaluate future proposed changes that may never be funded or built. I truly understand these issues and the interests of various advocacy groups.

I choose to look at the project(s) and simply evaluate it based on my extensive professional experiences. Can a project be developed and ultimately function in an efficient, effective, cost-effective and safe manner without causing significant disruptions and degrading the quality of life for nearby residents, workers and visitors? Can it be developed and be successful in the present? Can it work now?

As a longtime San Francisco resident, I understand the interests of many of the City's residents. Having worked in law enforcement has given me a unique perspective and insight into many issues that truly matter to residents, workers and visitors alike.

Residents want to live in a clean, safe and well-maintained environment that offers exceptional public services and infrastructure; a city in which both our elected officials and city staff are responsive and willing to focus on quality of life issues; a city that plans for, and manages, change in a thoughtful, orderly and well-conceived manner; a city that is open and transparent. Simply put, we want to work in a city "that works well at a high level." The expectations are high, but very straightforward.

With regard to quality of life issues, they are of great importance and can be described as:

Those issues which affect the residents, businesses and visitors to the area by creating fear or adversely impacting their health, safety, and welfare.

Some typical quality of life issues in Mission Bay and our surrounding areas include, but are not limited to:

- Aggressive panhandling
- Ticket scalpers hassling people and/or stepping into traffic
- Chronic public intoxication
- Drinking in Public and open containers
- Litter, graffiti and public nuisances such as urinating and defecating in public
- Incidents that involve the mentally ill
- Illegal encampments
- Illegal dumping
- Chronic noise complaints
- Illegally parked vehicles
- Dust and grime associated with on-going construction projects
- Significant numbers of California Vehicle Code violations being committed by motor vehicles, bicycles and pedestrians.
- Constant and often poorly designed and implemented road and/or lane closures and traffic modifications disrupt all modes of both public and private transportation with regularity.

In order to make an assessment of the project I did extensive research, conducted site visits, spoke with local residents, local employees, delivery drivers, a variety of City workers who work special events and several construction workers.

I also spent significant time directly observing traffic flow (all modes) both during Giants games (pre and post-game) and on non-Giants game days at many intersections. I walked and observed over a period of several months.

I have reviewed many sections of the proposed Environmental Impact Report, Planning Department Case No. 2014.1441E for an Events Center and Mixed Use Development at Mission Bay Blocks 29-32.

Based on my direct observations, review of the EIR and my prior experience, I have many concerns and do not believe the City should allow this development to proceed as designed.

The construction of the Warriors arena is only one piece of the local puzzle. Multiple major projects are in various states of planning and/or development. These include:

- Expanding UCSF – Several projects
- Developing Pier 50 – Anchor Steam
- Building a hotel in Mission Bay
- Developing Seawall Lot 337 – Lot A – A massive project
- Pier 70 – A large mixed use development
- The Eastern Neighborhood Program
- The Uber Headquarters Project
- Realignment of Terry A. Francois Boulevard and Mission Bay Park
- The construction of many new residential complexes that will contain several thousand new units in Mission Bay, Dogpatch, Potrero and Showplace Square

In congested urban areas like San Francisco, no new development can be evaluated in isolation. For that reason you need to consider the total cumulative impacts these projects will have. The Warriors Arena was never originally intended to be built in Mission Bay. It was never included in any previous plan for Mission Bay. It would, however, be arguably the biggest and most impactful project ever built in the area. It was thrust and forced on San Francisco when the owners of the Warriors went into contract to buy parcels of land in Mission Bay. This was after the failed attempt to build the arena along the Embarcadero.

The report fails to adequately address many of the actual event usage plans. The Warriors intend to have up to an additional 200+ events at the site. In total, the arena may easily host more than 250+ events a year. This is only an estimate. This number of events is excessive. The area cannot handle these events without significant negative impacts affecting local residents and other people that work in the area.

The plan focuses on the Warriors games and potential overlap with some San Francisco Giants home games. It refers vaguely to other events, but offers no specificity on the types of events, the days or hours of the events and/or any realistic estimate of

the number of people expected to attend. Possible events seem to have a classified threshold of whether they expect to attract over 12,500 attendees or not. This is pure guesswork.

The Warriors, to my knowledge, have never publicly released any demographic information about their season ticket holder base. It would be easy for them to acknowledge, for instance, how many of their season ticket holders reside or work in various postal codes in the Bay Area. This measure, would at least offer a starting point to evaluate the efficiency and effectiveness of current public transportation options for their large base to use as many presumably would need to travel to San Francisco from other communities. The following issues could, at least, preliminarily be looked into:

- Are viable public transportation options currently available?
- How would the scheduling work for transferring between agencies?
- Would it be convenient for those individuals to take public transit?
- How many transfers would the average rider to need make?
- What would the average cost for a round-trip fare likely be?
- How long would a sampling of journeys take each way on average?
- Would the transit options run late enough for attendees staying in the area after a game to still use public transportation to get home?

Vagueness is not my friend.

The Warriors have a huge financial incentive to use the site extensively in order to generate revenue and help pay for the project and ultimately make more profits.

The City should be a staunch steward of City resources and funds, taking appropriate measures to ensure we do not over-commit limited resources or over-spend for service delivery.

Section 5.8 – Public Services

This section evaluates if the project would require new or physically altered governmental facilities to maintain adequate public safety. This is a misleading measure. We should really be assessing the issues associated with providing the broad range of public services to the geographic area impacted by the project.

For example Table 5.8-2 addresses San Francisco Fire Department (SFFD) responses in the project area over a 12-month period. Staff at four fire stations responded to 10,702 medical responses and 4,968 fire calls. In total, SFFD responded to 15,670 incidents. For urban municipal fire departments, medical aid calls typically outnumber all other types of calls for service. Indeed, nearly 70% of the calls at the four stations were medical in nature. Should all the projects in the pipeline be constructed and occupied, the number of total calls will increase dramatically in the target area. With the increase of traffic congestion and associated factors of event management, SFFD response times under current staffing levels are likely to increase.

There is no way to evaluate if there are more or fewer calls on special event days compared to non-event days. There is no way to determine which days of the week and hours of the day are peak response times. Simple raw data does not give us the information we need to determine if the proposed arena project, along with all the other projects, will cause service delays or disruptions.

The San Francisco Police Department (SFPD) is currently understaffed by as many as 300 officers. Although they plan to aggressively hire recruits and increase staffing, this process is arduous and slow. SFPD intends to offer up to three (3) new academy classes with as many as 50 recruits per class over the next several years. Unfortunately, during the next three years they will lose other staff members to retirement, lateral transfer, disability leave and others who choose to transition into other career fields.

The process of recruiting, hiring and training an individual to become a fully functioning and solo officer can easily take up to 18 months. This means that even if you have staff "on paper" there are likely many officers in various stages of the employment and training process. Individuals, who are not yet fully trained and have not completed the FTO program and are not qualified to perform solo officer duties. A police department's current staffing level is merely a number. The more important number is how many physically able and qualified officers can actually be deployed to staff events and/or handle calls for service. These numbers are usually quite different.

Furthermore, if SFPD is successful in sponsoring an academy class with 50 recruits, it is unlikely that all new hires will pass the police academy. Others will fail to complete the rigorous Field Training Program and some will fail to complete their probationary period. This is the nature of police hiring and training programs. It is a predictable outcome that occurs in all local law enforcement agencies.

It is therefore highly unlikely that SFPD can achieve full staffing levels by mid-2018. Any new officers would be inexperienced. It can easily take several years or more for new hires to become truly skilled and competent in handling the broad range of police calls that occur in municipal jurisdictions after achieving solo officer status.

Because SFPD will not, in my view, ever reach its authorized staffing level it may be stretched to safely, professionally and adequately staff another 250+ special events each year. They may be required, at times, to have staff pull double shifts (working patrol and then stay over to work an event), require some form of mandatory overtime and utilize creative scheduling practices.

With respect to staffing levels at special events, the document indicates:

- Staffing levels are determined by SFPD's Event Commander in coordination with the event sponsor in advance of the event as well as by levels established in event security/operations plans. The Department of Parking and Traffic typically provides traffic control services for special events.

Without more specificity, I am not able to determine if adequate resources and being utilized for on-site security by sworn members of SFPD and parking control officers (PCOs).

I can tell you from my own personal experience that sponsors have a financial incentive for fewer personnel usage because they often pay for these services. Sponsors often try to supplant the use of sworn officers and trained PCOs with far less expensive "private security" personnel. Unfortunately, when things go bad – and they will at some point, the ultimate burden to respond and resolve an incident will rest with the sworn police officers and PCOs.

Private security guards can be a deterrent and provide valuable services, particularly inside venues, but for the most part they will not be arresting, citing or physically ejecting people from an event site. They will not be writing a detailed crime report, but rather are usually treated as "witnesses." They will observe, report on conditions and request assistance from uniformed sworn officers or PCOs in enforcement-related incidents or in any circumstance in which the personal safety of a patron or themselves is involved.

In Table 5.8-3 the Summary of Annual Crimes in Mission Bay Area does not specify how many of the crimes occurred on special event dates versus non-special event dates. It is not possible to make an accurate evaluation and/or comparison from the raw numbers supplied.

The numbers reported appear to be crimes that require reporting under the FBI's Uniform Crime Reporting Program. These are crimes that all police departments report annually. They serve as a basis to compare crime rates between jurisdictions in an "apples to apples" approach or crimes that occur year over year for comparison purposes.

While interesting you'll notice that there is no mention of any of the following:

- Actual police calls for service (CFS) in the area
- CFS types and frequencies on event days versus non-event days
- Number of self-initiated detentions, stops, citations issued and arrests made by SFPD
- Number of parking citations issued and vehicles tows by PCOs
- Statistics relating to the many **quality of life issues – previously listed**

- Vehicle collisions
- Disturbance calls
- Disorderly conduct calls
- Alcohol or drug-related calls and crimes
- Total number of crime reports taken
- Response times to crimes in the event area.
- Alarm calls
- Incidents occurring at public transportation facilities
- Incidents occurring on public transportation vehicles of all types
- Number of private person arrests made

Having accurate statistics relating to these types of incidents (in addition to the FBI UCR) gives you significantly more information to evaluate and determine accurate levels of overall police activity in any given area.

Critical information is not provided for analysis in the report. Simply put, utilizing the FBI Uniformed Crime Reporting for SFPD alone is a very ineffective way to gauge the actual level of police, parking and traffic related incidents in a given geographical area or associated with special events.

Given the location of the proposed project it would be prudent to obtain the more comprehensive crime statistics and information from the following agencies:

- University of California Police Department
- The California Highway Patrol
- Port of San Francisco Police Office
- Bay Area Rapid Transit Police Department (BART)

Once the appropriate information is gathered from all relevant sources a detailed analysis of the actual impacts to public safety could be evaluated.

With respect to emergency vehicle access (5.2.3.6) and parking conditions (5.2.3.7) the report is woefully lacking.

The report indicates the primary access for emergency vehicles would be 3rd Street because it has two lanes of traffic in each direction. Although 3rd Street has two lanes in each direction, they are separated by raised curbs and Municipal rail tracks. The lanes on 3rd Street are standard width and there are no shoulders, delineated bike lanes, loading zones, parking spots or any place to pull out of traffic between intersections.

Subsequently, should any disruption occur mid-block that impedes any lane of traffic, all vehicles behind it will be negatively affected and congestion will begin occurring almost immediately. In essence a “bottleneck” will occur. There are many scenarios in which

this could happen; a traffic collision, a stalled vehicle, or any type of police, fire or medical response to a fixed location along the corridor – to name only a few of the likely possibilities.

If a traffic collision occurred where an individual needed immediate medical assistance and transport to a hospital and/or have their disabled vehicle towed, it could easily take an hour or longer to clear the scene. The traffic back-up associated with this type of incident and closure would be stifling. Emergency responders, in vehicles, would have a difficult time getting to the incident. Police on motorcycles and bicycles would be able to get there, but they don’t have the ability to transport injured parties or move and tow disabled vehicles.

The existing parking was looked at in the parking study area. That area was defined to include off-street parking facilities located within a reasonable walking distance from the project site – one-half (.5) mile with easy access to major street corridors that provide access to Mission Bay.

Geographical constraints make access to the area problematic already. To the east is the Bay. To the north there are only two access routes, namely 3rd and 4th Streets.

To the west, the Mission Bay Boulevard extension to 7th Street has not been completed. Sixteenth Street also runs east/west. It crosses the railroad tracks at 7th Street and dead ends at Illinois. Much of the local traffic uses 16th Street to access retail establishments in Potrero, the Mission and beyond. Access to the new UCSF Medical facilities is accomplished by taking 16th Street. Seventh Street extends south, crossing 16th Street and becomes Mississippi Street. This is taken to access southbound Highway 280 from Mariposa Street.

Mariposa Street also runs east/west. It is a primary entrance and exit point for traffic using Highway 280. The ramp northbound frequently gets backed up for up to one-half mile during normal commute times. The ramp to southbound 280 is heavily used and traffic on Mariposa during normal days can be brutal during the afternoon commute. From the south, 3rd Street and Illinois Street allow access to César Chavez and Pennsylvania to access Highway 280 south.

In reality, there are limited points of ingress and egress to the project area. The streets are either one or two lanes in each direction. Many are controlled by signalized intersections and the freeway entrance and exit ramps are poorly designed to handle significant traffic. These ramps were built decades ago and have not been modernized to reflect current demands.

To make modifications would be costly and is in conflict with the City’s transit first policy. The old adage, “you can’t have it both ways” comes to mind. The City would resist making improvements and modifications that might actually increase vehicle traffic efficiency and effectiveness because it contradicts established policy.

The City would also have to coordinate with other local and state agencies to accomplish any improvements to freeway on and off ramps. It is unknown what funding sources would exist to do this type of work. Local community groups would surely oppose such measures. In short, this appears to be a non-starter, which bodes poorly for the proposed arena attendees, local residents in the area and other merchants or businesses that are reliant on the use of these public roadways.

In my opinion, the proposed number of parking control officers (PCOs) slated for deployment is not nearly sufficient.

The report identifies PCO controlled intersections during the various scenarios. Table 5.2-10 gives an example in which only six of 22 locations are staffed. There is no mention of how many PCOs are assigned to each location and no indication of what traffic control measures they will utilize to expedite the safe flow of all modes of traffic. My observations tell me that much PCO intervention focuses on monitoring traffic from a distance and/or controlling the signals via the override function. I do not see a lot of engagement and interaction. Pedestrians and bicyclists regularly do what they want on many of the local streets. The intersections of King Street and 3rd Street, King Street and 4th Street and King Street and 2nd Street are staffed with more personnel. The staff working those intersections appears to be much more engaged and interactive in their efforts to safely control the various modes of traffic. If you do not facilitate the flow of traffic all the way to freeway on-ramps and other major exit routes, traffic will always “bottleneck upstream” and clog its way back toward the event site.

Over the past three years, I’ve often observed one and sometimes two PCOs at intersections who were simply controlling the traffic signals (manual override) to facilitate vehicular traffic. They were not adequately engaging with pedestrians to prevent jaywalking, pedestrians crossing against red lights and people crowding into the roadway. They also weren’t able to control bicyclists that were weaving through traffic. The focus was on cycling the lights rather than a comprehensive effort to facilitate all modes of traffic. PCOs must engage with people to control the intersection and make it clear how the manual traffic flow cycle will be handled and monitored. Each mode of transportation must be addressed independently, but within the context of a master plan, during times of heavy congestion to promote safe traffic movement for all modes.

Traffic control duties can be quite difficult and require significant resources and constant engagement. Simply standing at a signal light control box and manually controlling the light cycle at signalized intersections is not sufficient to ensure the safe movement of vehicles, bicyclists and pedestrians. Active engagement and proper use of traffic control devices (cones, barricades, signs, flares, reflective sleeves and message boards) is also required. Many of the intersections listed in the report indicate “a PCO” will be used. In my opinion, most of these intersections would require between two-three PCOs to safely facilitate the movement of vehicles, bicyclists and pedestrians.

Remember, many attendees may not be familiar with the area. Many events will conclude at night when it is dark. Some people leaving the venue will have consumed alcohol. Existing lighting at some of the critical intersections is not robust. There may be inclement weather. It is likely that with the ongoing construction of other projects that roadway modifications may need to be navigated, which only makes facilitating traffic more difficult. I view the plan as significantly understaffing the traffic control aspect.

According to the plan during overlapping events, due to restricted access on the 3rd Street and 4th Street bridges, it is assumed that no vehicles will travel north on either street during overlapping events. This will be a self-induced “double bottleneck” that will force traffic south and west. The plan calls for “a PCO to be stationed at the intersection of 4th and 16th Streets to “discourage the use of this street except for local access.” Good luck with that!

The intersection would require minimally two and maybe three PCOs to safely facilitate all modes of traffic and respond to inquiries made by individuals on congested days. People will stop and ask PCOs questions. When they do stop or at least slow down, traffic disruption occurs. This is predictable and inevitable to some degree.

The parking lot assessment in section 5.2.3.7 is flawed in my opinion. It claims the 15 off-street parking facilities are located in areas “with easy access from the major street corridors that provide access to the Mission Bay Area.” Unfortunately, given the geographical constraints in the area, and the limited points of ingress and egress, everybody that needs to access Mission Bay for any reason will be on the same few roads. There is no such thing as “easy access” in this area today. To claim “easy access to the major street corridors” is a blatant misrepresentation. Existing conditions do not warrant that description. In theory, by looking at a map, one would expect simple access. In practice this is simply not true.

Twice this last week, for example, between 2:00 – 2:30 p.m. I observed northbound 3rd Street backed up (bumper to bumper) from South Street all the way to King Street and beyond. In both instances it took vehicles over 35 minutes to traverse this short distance. Yes, I stayed, watched and timed a truck. Terry Francois Boulevard was no better, being backed up around the bend all the way to Pier 50. It was an absolute mess and the drivers were frustrated.

Oftentimes when the traffic lights at the signalized intersections turned green no more than a dozen or so cars could get through. This is because the signal light cycles are not long enough and may not be synchronized. The “bottleneck upstream” that was causing the congestion clearly wasn’t being handled properly. The “bottleneck upstream” in this instance was the temporary closure of King Street between 3rd and 4th Streets. One closure (or other incident that blocks a road) had the cumulative ripple effect of bringing an entire section of town to a virtual grind for a period of hours. I have gone out to this location on five occasions and spent an hour or two watching traffic, watching the efforts of traffic control personnel and have been unimpressed. It’s not uncommon for the traffic control staff to simply stand on the sidewalk and watch the gridlock. They only seem to intervene when somebody tries to do something unsafe.

At the intersection of 3rd Street and Townsend I found two PCOs manually overriding the signal in an effort to facilitate traffic flow. Unfortunately, neither was engaging and controlling the pedestrians and bicyclists in the area. At that location, 3rd Street has four lanes of traffic (one way) heading north. There were so many pedestrians in the area crossing the street that vehicles wanting to make left or right hand turns onto Townsend, Brannan or Bryant could not turn and had to wait. This means two of the four lanes did not flow. No efforts were being made to stop all pedestrians, at some point, and allow vehicles to proceed and turn. The City's effort to mitigate this street closure (planned for about a month during weekday hours) is pretty dismal.

All it takes is one incident to bottleneck and clog any of these arteries for hours. It is blatantly irresponsible and defies logic to believe that hundreds if not thousands of cars will descend on the Mission Bay, Dogpatch and Potrero areas over 260+ times a year without a level of congestion and disruption

To reiterate, traffic control duties can be quite difficult and require significant resources and constant engagement. Simply standing at a signal light control box and manually controlling the light cycle at signalized intersections is not sufficient to ensure the safe movement of vehicles, bicyclists and pedestrians. Active engagement and proper use of traffic control devices (cones, barricades, signs, flares, reflective sleeves and message boards) is also required.

With respect to the timeframes used to evaluate parking and occupancy rates, the evening hours used in the study were from 7:00 – 8:30 p.m. This timeframe is flawed. I have seen, with the San Francisco Giants games, fans are often arriving very early to the area. In fact, people come several hours early regardless of transportation mode; hang out, walk the waterfront, and frequent local eating establishments.

If this trend holds, the people looking to park in these 15 facilities will be arriving hours before the 7:00 p.m. threshold. Spots will not be available because day workers will not have vacated them yet. These people will circle the area looking for other options or decide to park further away in residential areas.

I do volunteer work several days a week between 3:00 – 4:30 p.m. at Market Street and 2nd Street. I regularly walk to and from this location. I walk along the Embarcadero to Market Street or walk up 2nd, 3rd, or 4th Streets. I return using one of the same four routes. I do this walk between 2:00 – 3:00 p.m. and 4:30 – 5:30 p.m. These frequent walks give me the great opportunity to observe all modes of traffic in the area.

I am amazed at the congestion and traffic gridlock trying to access the Bay Bridge. I also see Giants fans parking in lots and on the streets along the way. Once again, on a normal non-game day, the traffic gridlock on these streets is often remarkable. On

game days it can be worse. I see people in their Giants garb driving, parking and wandering the area hours before the opening pitch. There is no reason to believe Warriors fans and other event attendees will not come to the area hours before an event. When "newbies" to the area discover how bad navigating the City can be they will likely: adjust schedules to arrive even earlier, decide not to come as often or look at public transportation options.

At any rate, limiting the survey hours in the evening from 7:00 – 8:30 p.m. is flawed. The survey should look at parking supply and occupancy rates in the 15 lots beginning as early as 4:30 p.m. and starting no later than 5:30 p.m. to accurately assess parking availability.

The report indicates in section 5.2.3.7 that bicycle conditions were observed to be operating acceptably, with no conflicts, between bicyclists, pedestrians and vehicles. I dispute this.

It is actually fairly common for bicyclists to ride their bikes on the sidewalk northbound on 3rd Street from South Street up to AT&T Park. They choose to do this because the pavement is wide and 3rd Street has no delineated bike lane in the roadway. Apparently, shifting over to Terry Francois Boulevard or 4th Street, which both have established bike lanes is cumbersome.

As I continue to read through the report page by page, I'm amazed at how frequently problem areas are identified.

For example, the report openly acknowledged that many intersections would have significant traffic impacts that would remain "**significant and unavoidable with mitigation,**" under specified scenarios. Accordingly, the report says the City and the project sponsor should work together to seek feasible mitigation measures to reduce transportation impacts.

One strategy being considered is to use additional off-site parking lots south of the project (not within walking distance) and providing a free shuttle service to patrons.

The report says location sites (yet to be identified) that could provide up to 250 parking spaces for events drawing less than 12,500 patrons and up to 1,000 total spaces on days with overlapping events would be used to accomplish this. Working details regarding to this traffic mitigation option have yet to be specified and defined. Unfortunately, no sites have been identified as possibilities to date. There is no guarantee the sponsor and City could negotiate acceptable terms that would be feasible in the long term.

The report says the sponsor would need to provide, as needed, up to six (6) shuttle trips per hour both before and after the events. There is no mention of the types of shuttles being considered or their capacity. These shuttles would be required to navigate to and from drop-off and pick-up points and be subject to traffic disruptions like other vehicles. If, in the extreme, the maximum 1,000 cars were to use this service it is likely a minimum of 2,000 people (two people per vehicle average) would be shuttled to and from.

Most shuttles (airport rental car and hotel type) probably hold a maximum of 25 people. Doing that math, it could take up to 80 shuttle trips to accommodate the patrons. At six shuttle trips per hour there would be a significant capacity shortfall to move patrons in a timely fashion. Using a lower number of only 500 cars and 1,000 patrons would require up to 40 shuttle trips (given full capacity for each trip) and would also result in capacity shortages, delays and disruptions.

Given the lack of specifics and details about this option, I believe patrons using this mode of transportation will incur significant delays both before and after games.

As the report continues other notable references to traffic problems are aptly addressed. Some of these include:

Page 5.2-178 of the report addresses other factors that affect traffic mitigation efforts. These include physical limitations of the City's street grid and the City's Transit First policies and goals that seek to limit private vehicle usage.

Page 5.2-182 of the report specifically and clearly states, "for conditions without an overlapping SF Giants evening game, no feasible mitigations are available for the freeway ramp impacts because there is insufficient physical space for additional capacity without redesign of the I-80 and I-280 ramps and mainline structures, and which may require acquisition of additional right-of-way, and other potential measures would not adequately address the short term peak travel patterns associated with special events." Later it states, "Thus, for these reasons, the proposed project's impacts related to freeway ramp operations would be significant and unavoidable with mitigation."

It would require significantly more time and effort to for me to continue to cite other report sections that highlight problems with the plan and/or point out other deficiencies. I think my efforts thus far have been sufficient to highlight the many problems I see with the plan.

I sincerely hope that you and other members of San Francisco City Government will read the report in its entirety and in detail. If you do, you'll read about many other aspects that the report indicates would be problematic.

Interestingly, I have gone to great lengths to speak with many people who live, work and visit the area. I engaged them in conversation about the current state of life in Mission Bay, the rapid and substantial increase in development, the on-going disruptions

associated with construction, the reliability of public transportation and, of course, their thoughts about the proposed Warriors Arena complex.

These individuals included a broad spectrum of: local delivery drivers, US Postal employees, local technology sector workers, construction workers, employees of Impark, Mission Bay Shuttle employees, UCSF employees, dog walkers, cleaning service workers, San Francisco police officers, San Francisco parking control officers, Muni employees, food delivery services and random visitors to the area as they recreate and enjoy local food establishments.

The overwhelming majority of responses cite great concern about too much growth in Mission Bay. They raised concerns about inadequate public transportation and infrastructure, the immense scope and scale of the arena and all the other developments that are underway or planned. Specific objections usually involved: traffic congestion, noise and nuisance problems and some mention of one of the quality of life issues I referenced earlier.

The City's current infrastructure can't efficiently and effectively handle the large influx of people to an estimated 250+ yearly events in our neighborhood. The police and fire departments did not adequately address relevant issues in their sections of the report. The City's Public Works Department admittedly struggles now to deal with keeping our streets, sidewalks and neighborhoods clean.

Traffic mitigation options that include concepts like private shuttles, identifying and using new parking lots and increasing public transportation services lack details, specificity, funding sources and could take many years to build.

People living, working or visiting the area would be exposed to a tremendous increase in the number of quality of life incidents and upsurge in crimes. These increases would degrade our personal quality of life. Local residents and local workers often bear the unpleasant burden of over-development, poor infrastructure and the increases in crime, nuisances and disruptions that it brings.

The City may have admirable intentions by implementing a transit first policy. The City cannot, however, impose this policy on the region. There are about 26 different public transportation entities in the Bay Area. Oftentimes, their systems do not operate on schedule and delays occur. Any glitch on one system will negatively affect an individual's ability to make transfers. Until the entire public transportation system in the region is improved and integrated more cohesively, traveling throughout the region by linking multiple systems can be problematic.

Trying to force a transit first policy on people throughout the region is problematic. To try and impose your will, and policy, on people throughout the region will not be successful. In my view, the City is mistaken if it believes the transit first policy and existing public transportation system will be able to alleviate traffic congestion and disruptions in Mission Bay.

Many patrons attending events at the proposed arena will come from cities throughout the greater Bay Area. Most will want to see events with friends and family. People want to go together so they can socialize, hang out and perhaps dine before or after events. Many people have friends and coworkers that live in different cities, have different work hours and may not have robust public transportation options immediately available to them. In the end, much of what we choose to do or not do really involves details, logistics and convenience.

So what inevitably happens? Often groups of attendees make a decision to carpool and drive to the event together. This allows them to share costs. They can decide if they want to leave early or stay late without the constraints of an unpredictable transit schedule. They keep their options open. This is modern day life. This is what happens. This is predictable.

Although not related to the arena project, take a look at recent incidents at Dolores Park. Recently, newspaper articles have reported the park has been besieged by people on weekends, vandalized multiple times and is a filthy mess. Garbage has been strewn about and an inadequate number of trash receptacles were installed. Apparently, the City thought if they didn't put a significant number of trash receptacles in the park that park goers would responsibly haul their trash out and pick up their own mess. How did that work out?

The City is also grappling with measures to curb people urinating and defecating on City streets. So far that effort has not been successful. These issues are the types of quality of life issues that are so important to residents.

We need to focus on, and remedy, the current pressing problems that we face before embarking on additional major projects that will only exacerbate the situation.

In summary, I urge you to prohibit the Warriors Arena project in Mission Bay. The area simply cannot handle a project of this magnitude, especially given all the other major developments currently underway or on the drawing board. The over-all negative impact to the local residents, and ultimately the City, is very concerning. There are far too many unknowns, uncertainties and ambiguities in the report.

Sincerely,

James F. Zboralske

TUESDAY, JUNE 30, 2015 1:22 P.M.

AGENDA ITEM No. 5(b)

EXECUTIVE ASST. GUERRA: The next order of business is Regular Agenda 5(b), Public Hearing on the Draft Subsequent Environmental Impact Report for the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay South Blocks 29 through 32, Discussion.

Agenda Item 5(b) is a Public Hearing on the Draft Subsequent Environmental Impact Report for the Golden State Warriors Event Center and Mixed-Use Development Project at Mission Bay.

The purpose of this hearing is to receive comments on the adequacy and accuracy of the Draft SEIR in identifying the potential impacts of the project -- proposed project on the environment.

Members of the public wishing to make comments are asked to please limit your oral comments to two minutes and try not to repeat points already made by other speakers. More detailed comments may be submitted

in writing until July 20th, 2015.

Please be advised for safety reasons standing is not allowed due to room capacity. We have open overflow rooms in Room 400, 408, and in the event that fills up, Room 421 will also be available.

Once you have made your public comment, please make your way to the overflow rooms to allow other individuals to make their public comment. Thank you.

Madam Director.

EXECUTIVE DIRECTOR BOHEE: Thank you, Madam Secretary.

Good afternoon, Commissioners and good afternoon to the members of the public. Thank you so very much for joining us.

Commissioners, this is a public hearing. There is no proposed action on the proposed Golden State Warriors mixed-use project. Today, again, the sole purpose is to receive comments on the EIR.

So, with that brief introduction, I'd like Sally Oerth, OCII Deputy Director, to provide context and outline a process and procedures. Then the Commission will receive public comment.

DEPUTY DIRECTOR OERTH: Thank you, Director Bohee.

Good afternoon, Commissioners. Again,

Sally Oerth, Deputy Director.

So, this item before you is to -- is a hearing to receive comments on the Draft Subsequent Environmental Impact Report, or SEIR, for the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay South Blocks 29 to 32.

The Draft SEIR was published on June 10th, and the comment period runs through July 20th, 2015. Written comments may also be sent via E-mail to warriors@sfgov.org or to the Planning Department, which is assisting OCII with the Draft SEIR, and the specific mailing address for submitting written comments to the Planning Department is listed on page 2-9 of the SEIR.

Comments provided will be transcribed and responded to in a Responses to Comment document, which will respond to all verbal and written comments received and make revisions to the Draft SEIR as appropriate.

This is not a hearing to consider approval or disapproval of the project, therefore staff is not here to respond to comments today. That hearing will accompany the final certification of the SEIR later this fall.

Comments today should be directed to the adequacy and accuracy of information contained in the Draft SEIR. Commenters are asked to state their name

and to speak slowly and clearly so that the Court Reporter can produce an accurate transcript.

After hearing comments from the general public, we will also take comments on the Draft SEIR by members of the Commission.

And with that, that concludes my presentation. I'm available for any questions. Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Members of the public, please come to the podium in the following order and state your name for the record: Anna Fernandez, Neal Ushman, Ray Nyden, Esther Stearns, and Matt Prieshoff.

CHAIRPERSON ROSALES: Can you repeat those names?

EXECUTIVE ASST. GUERRA: Esther Sterns, Ray Nyden, Neal Ushman, Anna Fernandez, and Matt Prieshoff.

RAY NYDEN: Hello, Commissioners. My name is Ray Nyden. I have lived in Potrero Hill and South Beach for the past 15 years. I also have two businesses nearby, and I'm a board member for the South Beach Mission Bay Merchants Association.

The Warriors have shown an impressive commitment to collaboration and community input in planning the arena, in my opinion. They regularly brief community stakeholders, present updates to the Mission Bay Advisory Committee meetings, and gather feedback from small businesses such as myself in the neighborhood.

One of the many reasons I support the project is because it's -- it is so pedestrian friendly. I will be able to actually walk to the arena events from my home, as well as be able to take dogs the new green area that's going to be developed because of this arena.

I also like the fact that they're gonna have year-round retail as well as restaurants for local residents. So, it's going to be a new meeting place and a place for us to enjoy.

With that short set, I would like to just thank you for your time today, and the City, for taking the time to do the Environmental Impact Report. Thank you.

CHAIRPERSON ROSALES: Thank you.

NEAL USHMAN: Good afternoon, Commissioners. My name is Neal Ushman, and I'm a resident of Mission Bay.

I was originally going to address how impressed I have been with the way the Warriors have been working with the community in addressing our

concerns regarding the new arena. At the many community meetings I have attended, concerns by residents were voiced, and potential solutions to these concerns were explained in great detail. However, after reading this morning's Chronicle, I would like to address another topic.

Thus far, the major opposition has come from the Mission Bay Alliance, and while most of the membership is anonymous, none of those publicly-named members even live close to Mission Bay, and as most thinking-people realize, this group is made up of U.C.S.F. donors and biotech executives who are upset that the land is not going to be used for biotech. After all, they know what's best for San Francisco.

Now, the California Nurses Association comes out against the arena with concerns about access to U.C.S.F. Mission Bay. Have any of these representatives attended any of the CAC meetings where these items were discussed? No.

And according to the Chronicle, when asked about the Warriors' plans, all of the speakers admitted they were unfamiliar with the EIR. And while they claim to have no affiliation with the Mission Bay Alliance, their news conference, conveniently timed for coverage on the same day as this meeting, was organized by the same public relations company that represents the Alliance.

I'm an educator, and as I remind my students about the duck test, if it looks like a duck and quacks like a duck, it probably is a duck. I would give much more credence to the nurses' concerns if they were brought up earlier, and even if one the speakers yesterday had taken the time to actually read the relevant sections of the EIR.

As a grandparent, my granddaughter was a patient in the U.C.S.F. neonatal unit at Parnassus. Access and parking at that location was a challenge. I find it difficult to believe that the Nurses Association believes that the City, U.C.S.F., and the Warriors have turned a blind eye to the legitimate traffic concerns surrounding the new arena and have not taken steps to deal with this issue. After all, we are talking about approximately 200 events per year.

Salesforce would have brought in at least that number of people into the area five days a week, 52 weeks a year.

Let's not use traffic concerns that have been or are being addressed as a foil for other people's agendas.

Thank you.

ESTHER STEARNS: Good afternoon. My name is Esther Sterns. I am a resident of Mission Bay, where I've been a homeowner since 2010.

I'm very excited about the arena's bike and pedestrian access, which I hope will really encourage people to get out of their cars and walk more in our neighborhood, which is something I would like to see.

My wife and I are raising three teenage children in Mission Bay. Until recently, I think they were the only teenagers in Mission Bay. But -- so, when we moved to Mission Bay, when we crossed the creek and moved South, we knew there would be more development, more traffic, more density. And so, we're not surprised that there's new development on this lot. We don't expect there to be empty lots anyplace in a valuable part of San Francisco.

We think the arena is an unexpected bonus for our neighborhood, with the bike paths, with the new parks, with the holiday ice arena as a possibility. All of these things are things that we think enhance our neighborhood for families in a way that few alternatives really could achieve.

So, in that sense, we are excited about the arena. Of course, we support the Warriors, but we're also excited about what the arena can mean for our neighborhood, and particularly, children in our neighborhood. And there are now 250 new children in our neighborhood. We're very excited for them to have access to all of this.

So, that's the basis for our support. I thank you for your attention today, and I hope you'll take into consideration these neighborhood needs as you make your decision.

Thank you.

CHAIRPERSON ROSALES: Thank you.

MATT PRIESHOFF: Good afternoon. My name is Matt Prieshoff. I'm the chief operating officer for Live Nation in the State of California.

As many of you know, Live Nation is one of the world's largest entertainment companies, putting concerts on all across the world.

We're strong supporters of the proposed arena in the Mission Bay area, in large part because there's no major arena in San Francisco, and this great city deserves a great arena, and we know the Warriors have planned for one.

As San Francisco's first ever multipurpose arena, the Warriors will attract people from around the Bay Area, from around the state, and around the world for major events.

As a city, we should be pushing transit first, and we believe that the Warriors EIR plan does that. We believe that this is a transit-rich area and -- that they've done a phenomenal job studying all the potential parking areas around the arena as well.

We want to go on record to you to voice our enthusiastic support of this arena plan, and we hope you will consider our recommendation throughout this process.

Thank you very much.

EXECUTIVE ASST. GUERRA: Anna Fernandez, Alyssa Kies, Alejandro Madi, Alex -- and I'll spell the last name -- it's D-O-N-I-A-C-H -- Damion Scott, Andrew Battàt, please come to the podium.

ALYSSA KIES: My name is as Alyssa Kies, and I'm here representing SPUR.

We've been involved with planning in Mission Bay for many decades, and while we understand that the idea of putting an arena in Mission Bay is a change, we think it's going to be very positive overall for the neighborhood. It's how cities work.

Over the years, different people bring you ideas, and places evolve through the layering process of each generation contributing something different. It's going to make Mission Bay a more interesting place than have it all being one thing.

And on the issue involving transportation impacts, we believe the Warriors are doing pretty much everything we could hope for. Between the transit investments, the existing transit infrastructure, and the fact that some people will be able to walk from Caltrans or from their neighborhood, the impacts are going to be manageable. The City is making the proper investments in transportation infrastructure to support the project.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

ANNA FERNANDEZ: Good afternoon. My name is Anna Fernandez, and I work at the Pediatric Emergency Department in Mission Bay.

I care for very sick children who need continual monitoring and devoted, hands-on care. I am here today to convey my concerns and the concerns of my colleagues, the 3,000 registered nurses represented by the California Nurses Association at U.C.S.F., including the 900 registered nurses who work at U.C.S.F. Mission Bay.

We are not here today to protest the Golden State Warriors. We are here today for one reason: To advocate for our patients and their family members.

As you know, the area around the hospital and clinic facilities at Mission Bay is almost like a small island unto itself, with a very narrow corridor between the Bay and the highways. It is an increasingly dense community with little public transportation that can become easily congested.

A major additional project such as this will undoubtedly increase congestion during the events it is intended to house. We know that the games or other special events -- in those narrow corridors, the traffic can result in gridlock and can limit access for everyone, and that is our major concern.

What will the City do to ensure the patients who need the highly specialized care that we provide, and other patients coming to Mission Bay -- will they have access in a timely manner when they need it -- 24 hours a day, every day of the year, including during games, concerts, or other special events?

What will the City do to ensure the parents of the children I care for and members of other patients -- will they be able to get to the hospital to be by the side of the -- of their loved ones?

What will the City do to ensure that nurses like myself and doctors and other healthcare professionals and personnel will be able to get to the hospital and clinics at Mission Bay to care for our patients?

In a small, densely-packed city such as ours, congestion that affects public health and safety must always be addressed, and the needs of the whole community, not just the wealthy developers, must always be addressed.

Many of us raised similar concerns during the review process for the California Pacific Medical Center facility --

CHAIRPERSON ROSALES: I'm sorry, but your two minutes is up.

ANNA FERNANDEZ: Thank you for your time.

CHAIRPERSON ROSALES: Thank you.

ALEJANDRO MADI: Hello. My name is Alejandro Madi, and I'm a research analyst for Unite Here Local 2. We are the union that represents more than 14,000 hotel and food workers in San Francisco.

I'm here today to express our union's strong support for the Warriors project. From the prospective of creating good, quality, working-class jobs, the proposed arena is probably the most important development we have seen in San Francisco in the last 15 years.

At a time when working-class families are

being squeezed out of our City through a combination of stagnant incomes and rising rents, we should be doing everything we can to promote projects like this one.

As you may know, our union represents 800 concession workers at the AT&T park. While we struggle hard to raise wages and benefits at the ballpark, those remain very part-time jobs because of the nature of the baseball season.

The prospect of a basketball and event center close by holds out the possibility that food service workers could string jobs at these facilities together to something that gives them a real pathway to middle-class jobs. That would be a game changer for food service workers in San Francisco.

The Warriors reached out to our union early on to ensure that workers who currently staff their concessions are guaranteed a place at the new arena, and that the addition of positions created here will be the kind of jobs that raise the bar in San Francisco. That's exactly the kind of development that our City should be investing in.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the next person please come up?

ALEX DONIACH: Good afternoon. Thank you. My name is Alex Doniach, and I am speaking on behalf of the Mission Bay Alliance, the coalition of U.C.S.F. staff, stakeholders, and residents concerned about the proposed stadium in Mission Bay.

Since we've launched our efforts, we've been out talking to employees and residents in the Mission Bay neighborhood. We've heard from hundreds, if not thousands, of people who are concerned about this project and its significant impacts on traffic, parking, access, and quality of life in Mission Bay.

We've also launched a petition, calling for the City to reject this project. In the past few weeks alone, we've collected more than 4,600 signatures from residents, U.C.S.F. healthcare workers, employees, and neighbors who are concerned about the impact of this 18,500-seat arena.

I am submitting that petition today. We have received letters, too, which we're also submitting, from neighbors who are concerned about the impacts of this project on parking, access to hospitals, traffic, and air quality -- letters that ask the City of San Francisco to consider alternative sites other than Mission Bay for this environmentally-damaging project.

Just yesterday, the California Nurses

Association expressed their concerns about this project. In the weeks and months to come, more people will be joining the growing numbers who are coming to understand just how bad this will be for the neighborhood, U.C.S.F. access to emergency care, and traffic throughout the entire east side of the City.

We hope you'll take these residents and their strong opinions into consideration when reviewing this project.

Thank you.

EXECUTIVE ASST. GUERRA: Please come to the podium.

DAMION SCOTT: Good afternoon. Thank you very much for this opportunity. I am speaking on behalf of Allison Heath, who could not make it here today.

She writes:

> "I have serious concerns regarding the environmental impacts of the proposed Warriors arena which are not fully disclosed or fully analyzed in the Draft EIR.
>
> "The Draft EIR shows that the project would cause severe traffic gridlock, noise, and air pollution in Mission Bay, right next to the U.C.S.F. and other medical facilities, yet the Draft EIR does not even

discuss the land-use impacts of the project. They were not analyzed in the mission of the planned EIR.

"Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements proposed by the City, Mission Bay cannot handle up to 18,500 fans and 225 events per year, especially when both stadiums have games.

"While restricting the number of parking spaces may be considered a means of traffic management under the City's regulation, the practical effects will be yet more gridlocked and unhealthy air emissions, and traffic and parking impacts will reduce access for emergency and urgent care for patients and add to the existing commute challenges for the nurses, doctors, and medical staffs who work at the Mission Bay medical campus.

"The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities.

"Increased car and truck emissions in

the area will be unhealthy for residents, workers, and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents.

"Overall, we are disappointed with the City's approach to the environmental review of the project, which fails to fully access the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR.

"Thus, we ask the City of San Francisco, avoid the disastrous impacts of the proposed entertainment center at the Mission Bay community, including the health and welfare of patients, families, employees and neighbors."

Thank you very much.

EXECUTIVE ASST. GUERRA: Sir, would you please state your name?

DAMION SCOTT: Oh, I'm sorry. My name is Damion Scott.

EXECUTIVE ASST. GUERRA: Would the following people please come to the podium: Blaise Gisslow, Annabel Ortiz, Vanessa Aquino, Curt Yagi, Alex -- and I'll spell the last name -- it's G-A-N-O-W-S-I-H-I.

ANDREW BATTÀT: Hello. My name is Andrew Battàt, and I'll be reading a letter on behalf of J. Huerta (phonetic), who was not able to attend this meeting.

"I am very concerned about the negative impact of traffic and parking in the neighborhood by the proposed stadium at 3rd and 16th Streets.

"Currently, when there is an event at the Giants Stadium, my commute to the Financial District is doubled, be it by car, T-train, or bicycle, due to the influx of people to the neighborhood. Furthermore, parking in the neighborhood is filled with fans, and makes it difficult for residents returning from work.

"While I appreciate these fans supporting our local Giants, I do not appreciate the out-of-town, In-N-Out Burger trash, nor the empty containers left in the streets. This speaks to the way that crowds rush into the games and are often not supporting the local" -- excuse me -- "and how the crowds are not supporting the local community since the games are already so

expensive.

"Adding basketball season to the event calendar for this neighborhood will definitely have a negative impact on the traffic and parking in the surrounding neighborhoods, and residents will be hurt, along with business development and growth.

"I am in favor of neighborhood growth, but unfortunately, I think this stadium will only profit the developer, and I would rather have long-term business growth that this neighborhood is already invested in."

Thank you again. That was J. Huerta, a San Francisco resident.

CHAIRPERSON ROSALES: Thank you.

BLAISE GISSLOW: Thank you to the board for putting on this meeting. I'm very happy to have an opportunity to voice my opinion.

My name is Blaise Gisslow. I'm a concerned citizen of San Francisco, and I'm pretty familiar with the EIR. And I know we've all heard a lot of statistics about parking and stuff, so I'm going to start with a quote I read from an SF Gate article. The quote was from a City official. It said:

"Will there be traffic?"

"Yes."
"Will we be able to handle it?"
"Yes."

Well, I look around the City, and I don't think it's been handled at all. I don't see the credibility in an official who says they know how to handle traffic in a city that's been overrun with traffic for years now.

A problem, I think, with the EIR and the public's opinion is, people are very uninformed about what's actually going on with the costs going into this arena.

Yes, the arena is publicly -- I mean, privately financed, but one thing they haven't talked about is the resulting public transportation improvements that will come along with this project.

So, Caltrans had a proposed and approved line going through King Station, but the Mayor wants to change that line going to the new arena he's proposing, and that would cost $2.5 billion.

That is not privately funded. That would be taxpayer money. And I think that's a huge problem that's not addressed in the EIR. That's a huge amount of money not accounted for, let alone the $40 million of proposed improvements to the public transportation, as

well as $6.6 million in annual upkeep fees to the public transportation.

These are all costs that are not addressed at all in the EIR. These are all under the radar that no one talks about or knows about, and I think that's a huge problem with this project.

Thank you.

CHAIRPERSON ROSALES: Thank you.

VANESSA AQUINO: Good afternoon, Commissioners. My name is Vanessa Aquino. I'm a native San Franciscan and have lived in Dogpatch for almost 12 years. I'm also on the board of the neighborhood Dogpatch Association, and I have witnessed firsthand how our community has grown and changed a lot.

I proudly support the Warriors mixed-used development, because it will serve as a community hub for performing arts, retail space, restaurants, and a wide range of community events, and the Warriors have outreached to us and communicate within our community.

Even better, the Warriors are privately financing it with no money coming from the City or the public, and no new taxes would be involved.

This is a huge win for our community and for all of San Francisco. Having the Warriors in our neighborhood and community will create and bring new needed businesses within Mission Bay, Dogpatch, and beyond, which would be Bayview, for me speaking.

Thank you for your time, and I hope you will take my support in consideration. Have a good afternoon.

CHAIRPERSON ROSALES: Thank you.

ANNABEL ORTIZ: Hi. Good afternoon. My name is Annabel Ortiz, and I am here to talk about the opposition, because we do not want the stadium to be built at the Mission Bay.

So, over the past two weeks, I have been canvassing the Mission Bay area, and I've been speaking with residents and employees, and I've been speaking to the relatives who are visiting patients at the hospital, and I've been asking them, What are your views on building the stadium in such a closed unit?

And overwhelmingly, the response that I received frequently was, Do not build it. I do not want the stadium here. We do not need the traffic. We do not have enough parking.

Again, you know, the BART station doesn't go in that direction, so more people are going to be driving in. So, number one, the concern is to definitely avoid the traffic congestion.

One employee said that when he's driving out

of the parking area to go home, and if there's a Giant's game, it takes him about 30 minutes just to drive one block, and it takes about two hours or two-and-a-half hours just to get out of the area and to catch the freeway. So, in thinking about that, the infrastructure is not suited for a stadium. It's not suited to bring 18,000 fans into this area.

A nurse also mentioned her concerns, which are, How are the emergency vehicles going to access? How can they come in and out of the area?

Well, there's really no plan, and if there is, it hasn't been communicated, and that's a problem.

And, lastly, I want to just leave you with a question about, What would responsible development look like in San Francisco?

You know, it's not just a problem with the stadium, but in San Francisco in general. What does that really look like for the council members? And, you know, we can't deny that traffic is a problem in the quality of life for all of San Francisco.

Thank you.

CHAIRPERSON ROSALES: Thank you.

CURT YAGI: Hello, Commissioners. My name is Curt Yagi. I'm the executive director of ROCK, Real Options For City Kids. We're a non-profit in

San Francisco's Visitacion Valley for over 28 years, serving children and youth there. I'm also a long-term Potrero Hill resident.

I'm a big supporter of the Warriors and their move to Mission Bay. I know the team and the City have worked really hard to take feedback from the community, address their needs, and put this into a plan. I think this is great for that community.

In addition, through my work at ROCK -- we have been working with them in partnership for well over about 10 years, probably even longer -- they're the one rare sports team in the Bay Area that really takes to heart what they want to do, gives back to the community, like organizations like us, does a host of things without the need for -- and expectations for PR. They're doing it for the right reasons.

I have no doubt they're going to look out for the community organizations such as ours, as well as the general community.

Thank you.

CHAIRPERSON ROSALES: Thank you.

ALEXANDER GRANOWSKI: Good afternoon. My name is Alexander Granowski. I'll be speaking on behalf of Harold M. Hoogasian, who could not make it today.

"Although I support the quest for an event arena that might serve as the Warriors' home in San Francisco, the site proposed to cross the U.C.S.F. Mission Bay is not appropriate.

"The lack of parking, coupled with the proximity to both the Medical Center and AT&T park is a recipe for congestion and a potential disturbance for the quiet care of patients at the Medical Center.

"I understand there's an alternative site available for consideration which has comparable transportation infrastructure support and is removed by some distance from the Medical Center and the ballpark."

Thank you for your time.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come up: Sebastian Conn, Kevin Carroll, Scott Van Horn, Pat Valentino, and Esther Stearns.

SEBASTIAN CONN: Good afternoon, Commissioners and Madame Chairman. My name is Sebastian Conn, and I'm here to speak in support of the project.

I'm a student here in San Francisco, and like so many San Franciscans, I rely on riding my bicycle everywhere.

I'm excited for the Warriors to move to Mission Bay, because I think this venue will have tremendous bicycle access, with the abundant bike parking as outlined in the EIR.

It has over 300 valet spots, over 100 secure bike parking spots in the office buildings, and dozens more around the site. Plus, this project will bring new bike lines on Terry Francois and 16th Street, making it simple and safe to get to.

Thank you for your time.

CHAIRPERSON ROSALES: Thank you.

SCOTT VAN HORN: Hi. I'm Scott Van Horn. Thank you for the opportunity to have me speak today on the Draft EIR.

I live in Dogpatch, just a couple of blocks from the site. I'm actually one of the very few that is going to get my view of the Bay Bridge blocked from my apartment by the project, however I'm not a NIMBY.

As others have talked about this document, this document is incredibly thorough, and I applaud the City for looking at all the issues so carefully and demonstrating attention to the impacts to my neighborhood.

I'm especially pleased about the new businesses and parks that will go in within walking

distance.

As you know, the Warriors and the City have been working very closely with neighbors like myself, listening to our feedback and incorporating the community suggestions into their plan. As a result, they've come up with a project that perfectly fits into the Mission Bay, Dogpatch, and other surrounding communities.

Most of the neighbors that I've talked about [sic] are extremely excited about it. I'd like to go on record that I am personally in support of the new arena.

Thank you.

EXECUTIVE ASST. GUERRA: Cathy Searby, Ace Washington, D.J. Brookter, and Nick Belloini, please come to the podium.

PATRICK VALENTINO: Good afternoon. My name is Patrick Valentino. I'm the vice president of the South Beach Mission Bay Merchants Association. I also live in the neighborhood, close to where the new event center will be.

I've taken some time to look at the Traffic Management Plan and the Draft EIR, and a couple of things, I think, are very important to point out.

Number one, if you start to compare traffic management plans of arenas that have been constructed in the recent decade, you'd see that this is probably one of the most in-depth and forward-looking plans, moving to a transit-first plan, as opposed to prioritizing the automobile, which I think is extremely important. This one talks about having the most bike parking spaces that we'll ever see for an arena.

Also, in discussions, as I understand it from attending a lot of the public meetings, is that there's talk about having direct right-of-way for hospital workers and emergency vehicles. And I think that's extremely important to consider.

It is not the case that the hospital and the emergency issues have been taken off the table. That is very much part of the discussions, and we should pay deference to that.

As far as quality of life goes, you know, we're evolving and finding out that cities are some of the greenest places that we can be, and this is where we have a chance to put housing next to work, next to play.

And the event center is a sense of place that can happen in Mission Bay. It can create a very new and exciting place for us that is environmentally very aware and sensitive to our surroundings.

It's going to be a LEED gold-certified construction -- that's significantly important -- with

offers to mitigate 100 percent of any greenhouse gas emissions.

Again, we shouldn't look through the lense of the automobile and what might have been construction in the 1950's, but look forward to what we're doing today.

I very much support this project, and so does our association.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

CATHY SEARBY: Thank you, Commissioners. My name is Cathy Searby, and I live in Mission Bay with my husband and daughter, and I live next door to the proposed arena site.

We're very excited as a family, not only to watch the championship Warriors basketball team in the arena, but we feel strongly that San Francisco needs this entertainment destination, with the family shows such as "Disney on Ice," the Globetrotters, and concerts we can attend together.

I'm also excited about the waterfront park as there's nothing like this currently in the south neighborhoods, and it provides a place for kids and families to enjoy the beautiful views, have fun in a safe environment.

The Warriors and the City have gone through thorough analysis of the project, including extensive meetings -- the Mission Bay CAC, U.C.S.F., and our neighborhood -- to address our concerns. They have made good progress with all of us, especially U.C.S.F., in coordinating their respective operations so both can function productively in our neighborhood.

As a result, the Warriors team have come up with a project that fits well in the community and that we, as neighbors, are very excited about, if you would put us down for three.

Thank you.

CHAIRPERSON ROSALES: Thank you.

D.J. BROOKTER: Good afternoon, Commissioners, Madam Chair, Director Bohee. My name is D.J. Brookter, and I'm the president of Bayview-Hunters Point, and I'm also the deputy director of Young Community Developers, which is in Bayview-Hunters Point, and I'm here to express my strong support for the Warriors and the arena at Mission Bay.

Pat actually stated -- I was extremely impressed on how green the project itself is based off the EIR. The arena emission rate will be LEED gold certified and will truly set a standard for sustainable building design, I think, here in the City.

And the Warriors are more than just a

basketball team, as we've seen, especially with the championship that we just had. And what the team will actually do is be a partner in the community.

I know just that Young Community Developers alone, within the past two seasons, we've been able to employ well over 200 individuals from Bayview-Hunters Point that we actually transported from Bayview-Hunters Point to Oakland to work in the arena. So, just imagine how many more folks, from an economic standpoint, that will be able to work once those guys are here in Mission Bay.

I just want to thank you all for the opportunity to speak on behalf of the EIR and for your time today in my support for the Warriors stadium.

Thank you.

ACE WASHINGTON: Good afternoon.

I apologize to the younger generation in the back here, but, you know, this is what happens down here at City Hall. I mean, this is something light.

But let me just go on. Ace on the Case. Who is gonna replace Ace is the Case, Community Assistance Service Enterprise?

See, what we do is analyze things -- think about the theme, the scheme, and the team. We analyze the team, find out what the scheme is, and we come back and analyze it.

Think about it, ladies and gentlemen. I'm not new to this; I'm true to this. Okay.

Let me just also go on and say, I don't need the permission, because I'm on a mission. You know, I've been doing this for 25 years, youngsters back there, so you all need to take note. My name is Ace, and I'll give you my numbers later.

But right now, let's talk about the players we've got here. The players. This is all about dollar bills. You know, you talk about the EIR. This is about dollar bills.

Right here. Let's talk about the players, the bases. Let's talk about who is representing who. One side is an ex-member of the Mayor's, and then you got a next side that's a -- what -- he's a community or -- he works for consultants for the big Lennar out there. So, you've got big two big consultants. We're talking about money now. We don't mention that in the EIR, but I'm here to tell you, that A-C-E has been studying it.

So, we're going got put all these things together and we're gonna up with a solution, Mr. Warrior. It's called "community reform," to get -- you know, flip-flop and drop all this other stuff.

We, as community people, must be involved with

the growth of this city for the next 10 years for the generation in the back. So, therefore, I've got a method to all this pollution.

You need to have some kind of conversations about how we're going to put things together. And the only way to do that is you've got to collectively deal with our legislators out here, with our supervisors -- London Breed and Cohen.

That's the only way, youngsters in the back, we're gonna change, so you, in 10 years, will be able to have some part of it.

My name is Ace, and I'm on the case.

Also, about the Warriors down at Mission Bay, my request is a simple one: For the blacks to note that we were part of the Mission Bay through Jim Jefferson.

My name is Ace, and I'm on the case.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: John Caine, Jon Ballesteros, Dianne Hartnett, and Kim Kobasil [sic], please come to the podium.

KIM KOBASIC: Good afternoon, Commissioners. My name is Kim Kobasic. I am a Potrero Hill resident and small business owner in the South Beach.

I'm also the copresident of the South Beach Mission Bay Business Association, and I am here to express my support for the Warrior's arena in Mission Bay.

After taking some time to review the EIR, I am excited about the open pedestrian accessibility in the arena. The walk is going to be flat. It's going to be easy and beautiful along the waterfront.

The venue's proximity to public transportation means that anyone who lives near BART, Muni, or a Caltrain line can walk to a stop or station and arrive at the arena's doorstep within minutes.

The new arena also triggers the construction of the new bayfront park, which will make Mission Bay more hospitable for runners, families, and allow people to enjoy the waterfront. Right now, that is not currently possible.

Thank you for your time today, and I hope you will take my feedback into consideration.

TIM PAULSON: Commissioners, good afternoon. my name is Tim Paulson.

I'm the executive director of the San Francisco Labor Council. We represent over 100 unions here in town, many of members who do live in the District 10 and 6 in the areas that have been revitalized over the last 30 years.

I can remember when there was an old shipyard

out there -- I should say an old train station -- out in that area, and there were many different plans that were put together to build a hospital, build new businesses and parks. There's so many different, exciting things that are going there. And I've been on record as saying that the Labor Council supports this arena to come to San Francisco.

The first thing that the Warriors did -- one of the first things they did when they first announced their intentions to come to San Francisco is to call the Labor Council, and there have been many, many meetings and discussions with the unions here in town, and that's where we moved.

And I'll tell you, even last night when I was coming back on the plane from New York City and I noticed that the California Nurses Association, which is a very wonderful union that's part of our Labor Council -- even before I saw that they had a press conference yesterday, there still were concerns that people had about traffic mitigation next to a hospital.

And we take that very seriously, and we take the nurses very seriously. But I've been assured by the Warriors and the City as we go through this ongoing process that those mitigations will take place.

Again, this is an evolving neighborhood, and it's a wonderful neighborhood, and it's exciting that the Warriors are coming here, and I think that we will get to the right place at the right time to make sure that this happens.

Thank you very much.

JOHN CAINE: Hello, Commissioners. My name is John Caine, and I'm a small business owner in Mission Bay and in South Beach.

I support the Warriors arena project in San Francisco, knowing that it will have a positive impact on our Mission Bay Community. I've reviewed the arena plan, and what really stands out to me is the steps that the architects have taken to minimize the impact that this project has on our environment.

Thank you for the opportunity to weigh in today.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Please come to the podium: Paul -- and I'll spell the last name -- it's O-B-I-D-S-M-O-N; Stefano -- and I'll spell the last name -- C-A-S-S-O-L-A-T-O; Ben Bleiman. Please come to the podium, Adam Gould and Curt Yagi.

JON BALLESTEROS: Good afternoon, Commissioners. Jon Ballesteros, San Francisco Travel Association, and I'm here today to express our strong

support for the Warriors arena in Mission Bay.

Throughout the EIR process, the City has done a thorough analysis of the project and every conceivable impact it could have on the city. The team has been above board and maintained complete transparency in their plans since they've been talking about this project many, many years ago.

We have confidence in the City's assessment that traffic be manageable, and we believe that the benefits of having a multipurpose arena that will serve all of San Francisco will far outweigh any potential impacts.

So, with that, I want to thank you for opportunity to weigh in today.

DIANNE HARTNETT: Thank you for your time. I'm Dianne Hartnett, and I'm here because I'm a real estate professional that's been working in the South Beach Mission Bay area since 1989.

I have been specializing in South Beach Mission Bay since 2005. I have worked with hundreds of people renting, purchasing, developing in the area, and I am here to support the progress.

I know change is difficult, and I believe, witnessing, attending meetings, talking to people that I have worked with, for the most part they're supportive of a responsible vote.

There is no place in the City that does not have a traffic headache at this moment in time, that I, too, have witnessed. I, too, live in a neighborhood with retail. That comes with some pros and cons, but the majority of the people with this vision for this neighborhood moved here knowing this change was inevitable. And I think that the outcome, if people will collaborate, could be very, very positive for the entire City, not just Mission Bay.

We thank you for taking so much time to really thoughtfully think and listen to everybody and all their opinions.

Thank you.

CHAIRPERSON ROSALES: Thank you.

STEFANO CASSOLATO: Good afternoon, Commission. My name is Stefano Cassolato. I'm a registered lobbyist in the City, but I'm here on a pro-bono basis.

I'm coming as a long-term resident. I'm 50 years old, and I was 10 years old when the Warriors won the championship. That really made me happy as a young child and really got me interested in the Warriors. And I'm 50 now, and I'm still very excited about what they brought to the Bay Area.

I would like to say this: When the Giants came, you know, to talk about putting a stadium on the water, there was opposition. There was many of the same opposing dis- -- opposing arguments that we're hearing today. However, this is a very thorough group, project sponsor, from the top down -- Mr. Wells, Lacob, Gruber. They pay attention to detail. They dot their I's. They cross their T's. They hire very, very skilled people, and they're very well prepared.

This City is going to have something that they've needed desperately for years. We have a big venue, we have many small venues, but we don't have a an arena. If we want to call ourselves a world-class city, we're going to need a venue that they're proposing today. More than just basketball. Concerts. Events.

I remember, in 2001, I worked with Bob Arum of Top Rank to bring Mayweather-Chavez before Mayweather was money. And we had that event at the Civic. And I remember how important that was. We can attract more venues like this.

This EIR is very thorough, well thought out, and this arena will be nestled in Mission Bay, which many people will embrace.

I think what's going to happen here is, we're going to make sure that all the steps are taken so that all these concerns are addressed.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come to the podium: Kevin Carroll, Cathy Searby, Andrew Goldstein [sic], and Nick Belloini.

BENJAMIN BLEIMAN: Hello, Commissioners. Thank you from having me. My name is Benjamin Bleiman.

I am the founder and owner of Tonic Nightlife Group, which has seven bars in San Francisco, as well as an event company. We employ over 75 people.

I'm also the founder and manager of the San Francisco Bar Owner Alliance. We have 220 elite bar owners in that group.

I'm also the chairman of the board of the California Music and Culture Association, which is the trade group called CMAC for short, that represents bars, nightclubs, music festivals, and music venues in San Francisco.

I want to talk today about the impact that this stadium, this arena, will have on San Francisco's nightlife.

It is -- all those groups that I spoke of, it's our job to support vibrant, world-class nightlife in San Francisco, and we feel that this arena will

contribute in a very meaningful way to bringing San Francisco up to a world-class city in terms of nightlife, not just from the events that will be there, from sporting events to A-list concerts and music events such as the Red Hot Chili Peppers or Beyoncé, which now have a chance of actually playing in our city, but also in all the people that it'll draw from the outside areas, who will then stay in the city, some of them, and go in the City and spend their time and their money and their joyous smiles at our nightlife venues. So, we're very excited about that.

They've outlined the existing parking near the venue and the extensive of public transportation that will serve the site, and the traffic management plan that I've looked at is very thoughtful and thoroughly done, and it gives us no reason for concern.

So, we want to go on record to support the arena in the strongest possible terms.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

NICK BELLOINI: Good afternoon, Commissioners. My name is Nick Belloini. I'm going to weigh in on this proposal.

I think that's it's a wonderful idea to have an arena here in the San Francisco. The area has gone through an extensive EIR early on, when it became the Mission Bay.

I remember hearing my dad's stories -- who used to be a part of customs, going through the warehouses that used to be there. And, trust me, there's some things you never want to hear that happened down that way.

But the issue is, it had that EIR that made it the great possible [sic] that it is now. And now we're doing a second EIR that is turning into making it so that the Warriors can have the arena here, which is a true gem for San Francisco.

It will complement the hospital, it will complement everything there, and it will be a great thing for San Francisco. So, I fully want to say I support this project and I support the arena with all of my existence.

Thanks, guys.

EXECUTIVE ASST. GUERRA: Please come to the podium: Sheryl Davis; Henry -- and I'll spell the last name -- it's K-A-R-H-O-L-O-W-I-T-Z [sic]; Jim Lazarus; Abe Evans, and Elizabeth Kirk.

ADAM GREENSTEIN: Good afternoon, Commissioners. My name is Adam Greenstein, and I'm a resident of San Francisco and business owner, and I'm

here to support the Warriors arena in Mission Bay.

I reviewed the plans, and what really stands out to me is the steps that the architects have taken to minimize the impact this project has on our environment.

They made a promise to offset 100 percent of the arena's greenhouse gas emissions by paying to the state's Carl Moyer program, which funds the upgrade of vehicles such as dirty school buses, in terms of getting clean, fuel-burning buses. This focus on climate-change mitigation is the future of responsible building, and I'm proud that the Golden State Warriors are leading the way.

I'd also like to point out there were similar concerns when the San Francisco Giants built their stadium, but I've witnessed how that stadium has revitalized the SOMA area. And as a future homeowner in Mission Bay, because I plan to buy a place this year, I'd like to see that same transformation happen in Mission Bay.

Thank you very much for your time.

CHAIRPERSON ROSALES: Thank you.

KEVIN CARROLL: Good afternoon, Commissioners. My name is Kevin Carroll. I'm the executive director of the Hotel Council of San Francisco.

I have the pleasure of working for an industry that employs 24,000 people, the majority of whom live and work it San Francisco. And I'm here to fully support the Warriors arena in Mission Bay.

We do believe that by having the arena there, we will continue to attract more events and other activities to the City that will help not only those who are participating in the events, but those who are working in industries like the hotel industry that will get extra hours and be able to work to be able to support the events as well.

The public space that's part of it, I know, is equivalent to the size of Union Square, and it's something that's adding public space to the project. And working with the project as well as it's done is something that would be important to both us and to our hotel guests as well.

Guests who stay at our hotels spend more money outside our hotels as they do inside. So, if we can attract more people to come in for the events that are part of the arena, they'll spend more money, which will benefit all those who not only work in the hotels, but those who have businesses around them and many small businesses that rely on the visitors as well.

So, again, I'm here to fully support the arena, and I really thank you for your time today.

CHAIRPERSON ROSALES: Thank you.

JIM LAZARUS: Good afternoon. Jim Lazarus, San Francisco Chamber of Commerce.

The Chamber of Commerce represents over 1,500 businesses of all sizes throughout the City, employing over 200,000 people, including the City's hospitals, including the Warriors, including many businesses in Mission Bay.

If the issue is traffic congestion, it can be managed. Hospitals throughout San Francisco are in locations that deal with access issues every day.

How many of us have driven by Saint Mary's Hospital on Fulton and Stanyan on an afternoon or when JFK Drive is closed? Or C.P.M.C. building a new hospital at Van Ness and Post? Or U.C.S.F. Parnassus, which for decades was a neighbor of Kezar Stadium, with 70,000 people going to 49er games, college and high school sports in that facility for decades before it was reduced in size about 30 years ago?

I took a look at the March 1996 voter handbook in San Francisco when the voters were asked to approve the ballpark. Some unnamed group called San Franciscans for Planning Priorities '96 had the ballot argument against the ballpark.

They opposed Prop B because, Millions of additional cars and no parking will drive jobs and businesses out of China Basin, will create gridlock over 200 days a year. Well, we all know within weeks of that ballpark opening in 2000 it was a gem on the waterfront that is supported by San Franciscans throughout the City.

The Draft EIR outlines a mitigation plan for traffic and congestion management that will work for U.C.S.F., it will work for the residents, and it will work for the businesses in Mission Bay, and we urge this Commission to support that EIR and to move this project forward as quickly as possible.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

HENRY KARNILOWICZ: Good afternoon, Commissioners. Henry Karnilowicz, and I am the president of the Council of District Merchants, which represents some -- over 2,000 businesses in the City.

I am in full support of the Warriors arena project in San Francisco, knowing it will have a positive impact not only on Mission Bay, but also on our gem of a city. I want to thank the City for taking the time and energy to create a world-class project that is deserving of a world-class city.

Thank you for the opportunity to weigh in

today. I hope you will take my support to consideration.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Please come to the podium: Matt Prieshoff, Drake [sic] Donaldson, Bruce Agid, and Celestino Ellington.

ABE EVANS: Hi, Commissioners. My name is Abe Evans. I'm a student here, and I live in Potrero Hill, and I'm really excited about this stadium and arena, because it's really bike-friendly, and I bike everywhere in the City.

I love that it is in line with the City's Bike Plan and the Transit-First policies.

I'm excited because it's going to add to the Blue Greenway, and it will be great to have a lot more of that bike path, especially somewhere where I can drop off and grab a bite to eat at some of the retail that's going to be open on the bike path.

Thank you so much for your time.

CHAIRPERSON ROSALES: Thank you.

ELIZABETH KIRK: Hello, and thank you, Commissioners. My name is Elizabeth Kirk. I'm also a student here and a Warriors fan.

I've come today to fully support the Warriors' plan to move to Mission Bay.

I'd like to express my support, mostly because of some of the environmental plans that have been made for this project. In reviewing those plans and by looking at many of the renditions, I'm impressed with the emphasis on landscaping and green space, as well as the incorporation of the natural environment with the site.

From trees and grass lawns and all of the green rooftops that have been designed, I think that this project will have a big impact on making our City more green.

Thank you.

CHAIRPERSON ROSALES: Thank you.

SHERYL DAVIS: Hello, Commissioners. My name is Sheryl Davis. I run a non-profit here in San Francisco.

And, first and foremost, I just wanted to thank you for the time and deliberation that you have already taken into looking at the EIR, and then also to express just gratitude for the way that the Warriors and the City have worked together to address some of the issues identified.

I know that we're talking about the Environmental Impact Report, and I just wanted to say

that for us, for me, specifically, in working with young people, really looking at the social impact and the possibility and potential of what the Warriors have already demonstrated as a great partnership, we actually brought young people out here today to be able to see the process.

They've been talking about the role of science and technology and engineering and mathematics, and all the different fields, and this has really afforded them to be able to look deeper.

But also looking at sports as more than just sports and the workforce development opportunities that the Warriors have provided -- the community development, the collaboration, the partnerships -- I think that those are all things to be highlighted and supported.

They have been amazing community partners for us, and I can only imagine how much more so that can happen with them here in the City -- the opportunity to actually visit the building and to see that it's more than just a sports arena, but to also see the people that are behind the scenes, even in things like this today, to understand that the Warriors is an organization and that there's a commitment for community giving and support and giving back and being able to learn that process.

So, I think, for me, it's much bigger than just the idea of the team, but it's really about the organization itself, and what they represent, and what they're doing for community, and allowing young people to be able to see that firsthand and see that happening in the City for a team that, right now, is being celebrated for the championship, but I think should be celebrated for work that they've already done with the community.

Thank you.

CHAIRPERSON ROSALES: Thank you.

BRUCE AGID: Good afternoon, Commissioners. My name is Bruce Agid. I'm the transportation rep and a board member of the South Beach/Rincon Hill/Mission Bay Neighborhood Association. However, today, I'm speaking on behalf of myself as a resident of Mission Bay.

I'm a supporter of the arena project and look forward to the Warriors coming home to San Francisco.

My comments today are focused on the transportation aspect of the EIR and the associated mitigation plans.

A review of the Draft EIR clearly indicates a detailed account regarding the traffic and transit impacts on Mission Bay. There is no sugarcoating of the assumptions, and all the impacts of the traffic and

traffic congestion appear to have been identified.

Those of us who live in the area understand the congestion that exists today, can anticipate the impacts of events at the arena, and the assumptions outlined in the EIR seem to align with my intuitive perspective on the subject.

With that said, I've attended public meetings and have reviewed the mitigation measures outlined in the Event Management Plan. Some of those included transit improvements, supplemental service, a robust Traffic Management Plan, and the bike and ped improvements, again, just to name a few -- and have confidence that with the appropriate event coordination, resource availability, and effective implementation of these mitigation measures, the traffic and transit congestion can be managed effectively.

Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come to the podium: Michael Sesich, David Siegel, Dennis MacKenzie, Jac Taliaferro, and Christopher Hrones.

DRAKARI DONALDSON: Good afternoon, Commissioners. My name is Drakari Donaldson.

I'm a student, I'm a bicycle advocate, and I'm very impressed by how bike friendly this venue will be.

Furthermore, the project promises to bring new bike lanes to Terry Francois Boulevard and 16th Street, making it simple and easy to get in and out of the area. By making the venue so accessible to bicyclists, they are reducing carbon emissions in cars and traffic congestion in the area as well.

Thank you for your time and consideration.

CHAIRPERSON ROSALES: Thank you.

CELESTINO ELLINGTON: Good afternoon, Commission. My name is Celestino Ellington.

Not only am I a San Francisco resident, but I'm also the sports and recreation director for the YMCA of San Francisco Bayview-Hunters Point branch. And we've been community partners with the Warriors. I started the program in 2006, and I can remember being a part of the Warriors ever since then. And they've been more than just a sports team to me and the families of our YMCA.

Through the years, we've been able to experience the whole Warriors organization, from inside out, outside of just the game of basketball. And, believe me, those are opportunities that people dream to be a part of, and they were in Oakland this whole time.

They've been amazing community partners who have proven that they will work to address the needs and

challenges, and implement strategies that are best for everybody. You know, the Warriors and the City have worked hard to address the concerns and listening to feedback and incorporating the community's suggestions into their plans, and as a result, they've come up with a project that fits very well in the Mission Bay community, and the community and the whole City is excited.

I'd just like to acknowledge my support on record that I do support this project, and if we'd been able to do this with a relationship across the Bay, imagine how many more organizations that the Warriors can affect right here in the City.

And I really do believe that the Warriors' mission, outside of basketball, is community. We've been a direct result and have been privileged to experience those things, and we're looking forward to those in the future as well.

Thank you.

CHAIRPERSON ROSALES: Thank you.

MICHAEL SESICH: Good afternoon. My name is Michael Sesich. I'm a native San Franciscan. I've lived in Mission Bay for the last three years.

I find the Warriors a good attraction to San Francisco. I'm not opposed to the team moving back to San Francisco or even a new arena in Oakland, but I do have concerns about the placement of the new arena in the Mission Bay neighborhood.

The proximity to the hospital, which the nurses' association is pointing out, makes it difficult to get to that location. And I know from living two blocks away from the proposed site how bad the traffic is now with just the AT&T traffic in that area.

One time, I was coming home with my wife in the car, and the traffic was so bad on Third Street, I got out and walked and got home before she did in the car. And I think that a woman, pregnant and going to a woman's hospital in Mission Bay, being stuck in traffic -- the problems that can create.

So, I'm deeply concerned. I've voiced these at local community meetings before.

And I must praise the organization of the Warriors too. I think they've done a good job of reaching out. But when I read the Environmental Report, I came across terms like "provide adequate," "various management strategies," "encourage," "should not," "commercially reasonable efforts." All that could be sidestepped and not get what you want.

When the AT&T park went in, we were told that people would take the train and people would take public

transportation, yet the parking lots of that park are overflowing, and they're looking for new space now that there's a building going in.

So, I'm very concerned about the project's impact on the neighborhood parking and traffic, but not opposed to the Warriors.

Thank you.

CHAIRPERSON ROSALES: Thank you.

DAVID SIEGEL: Good afternoon. David Siegel. 25-year resident of the Dogpatch and vice president of the Dogpatch Neighborhood Association.

The D.N.A. is not opposed to the stadium. However, the development will have direct and lasting impact on our neighborhood, and of course, is of grave concern to the Dogpatch Neighborhood Association and residents of the community.

Our small, beleaguered neighborhood is being severely impacted by the relentless encroachment of U.C.S.F., housing developers, and now, Warriors.

Today, specifically, I want to direct my remarks to the proposed parking lot at Crane Cove. There are a number of issues that we're concerned about regarding this parking lot location.

First of all, Illinois Street is the official route for trucks and bikes as part of the Transportation

Plan of the City. This street would be the nearest street to the proposed parking lot. The Port is also planning on having a 19^{th} Street extension serve as a BAE heavy large-truck route, and Muni is also planing a turnaround loop, as well, directly in that area. Further, Crane Cove is a small patch of green space on the waterfront that serves the community and needs to be protected.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Joe Boss, Jennifer Davis, Rudy Corpus, John Cornwell, and Silvia Johnson, please make your way to the podium.

DENNIS MACKENZIE: Thank you, Commissioners. I'm Dennis MacKenzie. I'm work in consulting and education, and I teach in the San Francisco public high schools, including at the Juvenile Hall.

I have made a proposal and shared with everyone, requesting the Warriors and all the City departments and leaders, including high school classroom, put a golf program inside the arena.

At the last meeting on May 19^{th}, I shared with the Committee and the other leaders in the City and the Warriors that one the things that I've been asking -- and first of all, I am wholeheartedly in

support of this arena and believe all City family leaders can get together and find solutions to this traffic part.

I introduced the idea of the Warriors collaborating with Juvenile Hall on what's referred to as Log Haven Ranch, which has the opportunity -- they have a small gymnasium. I just introduced that to the Warriors and the City, that that is an opportunity for this small gym to provide what I mentioned about golf-course training programs in Philadelphia, Pennsylvania -- I'd like to share this with you (Indicating). But the history of using the sports facilities can be a tremendous influence for kids at risk and all students.

So, in the minutes, I just wanted that to be corrected. I meant to say this earlier -- that there's a statement that I -- I admit I was a Giant -- I mean, the Warriors -- I had proposed to them -- have already done tremendous work in this entire Bay Area promoting education, and then the basketball and the community foundation.

So, in the minutes, it states that I was asking the Warriors to do something with the golf course. That was the not my intent. It was to use this golf-course training program as a model, which my proposal in the classroom is a model to use for future NBA professional or indoor arenas, which I believe is very tremendously valuable for our country.

Thank you very much.

CHRISTOPHER HRONES: Good afternoon, Commissioners, and thank you for the opportunity to comment on this Draft SEIR.

I'm a new resident of San Francisco, who has followed this project with interest. Prior to this year, I lived in Brooklyn, New York, where I had the opportunity to participate professionally in the planning and public discussion of the Barclays Center Arena and associated Atlantic Yards development. This saw the relocation of the Nets basketball team from New Jersey to Brooklyn.

Although there are obviously some differences between that development and this proposal, there are also some interesting parallels, namely the creation of an 18,000-seat multi-use arena in an urban infill site accessible by transit, but also, there are major concerns in both cases initially expressed by some about traffic and parking impacts. So, I have a number of observations I think are relevant.

In the interest of time, I'm going to focus on three things which seem to come up the most today, which

are traffic congestion, parking, and emergency vehicle access.

As far as traffic congestion goes, the impact feared by many of the Barclays Center site, for the most part, did not materialize.

As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fears of congestion greatly -- were greatly -- were exceeded by -- greatly exceeded the actual impact, so that when the facility opened, traffic congestion was more or less a nonstory.

This was due to a number of factors, but the two most important were that transit utilization did not meet the project goals, and that vehicle arrivals to the arena were more spread out than projected.

In terms of parking, the main observation is that off-street parking supply provided by the project, combined with existing nearby off-street parking, far exceeded demands. And so, parking availability was not an issue there either.

And finally, for emergency vehicle access, which has been raised as a potential concern here, this was effectively accommodated in Brooklyn, where police and fire stations are located immediately adjacent to Barclays Center, and there are no significant issues that I'm aware of.

CHAIRPERSON ROSALES: Your time is up.

CHRISTOPHER HRONES: Thank you.

EXECUTIVE ASST. GUERRA: Sir, can you please provide your name for the record?

CHRISTOPHER HRONES: Yes. My name is Christopher Hrones.

JAC TALIAFERRO: Good afternoon, ladies and gentlemen. My name is Jac Taliaferro, and I own La Hitz Digital Media. I'm a San Francisco native, and I own a business here.

The tradition of building stadiums here in San Francisco is -- dates back to the first century -- or, two centuries ago, turn of the century. Robert Taylor, who you may not know, in the Polo Fields, was a gold medalist and also the world champion, and he was an attraction for the Polo Fields when it was built at the turn of the last century.

We know that tourism is the number one industry, and that's fueled by entertainment. So, right now we have one the best entertainers in the world, Bobby Ware, back there. He's helping the fight to get the Yoshi's back into our control.

But my main concern here is the business that the Warriors are or are not doing with black-owned

businesses, which is different than non-profits.

I haven't seen one black business come up here, except for myself, and I was born here. So, of course, when the Warriors won, I was here. And it was a great delight.

This time it was bittersweet, because before the Warriors season started, I was told by a Warriors staff person that he was going to keep my business, which is connected to other black businesses, from doing business with the Warriors. I honestly didn't like that.

So, I wrote this article about that and got a call from that person later, but the opportunity was gone for us to start at the beginning of the season and see them all the way through to the championship.

And I know this well because I'm in entertainment. I've been with groups that's went from obscurity to number one, winning Grammies, et cetera, et cetera, and dealing with people who were there before us to when, now, it is different.

So, my company has lost out on maybe from $700,000 to 1.5, an analyst said. This is a question of "Black Lives Matter." "Black Lives Matter" is not about crisis situation. It's about us flourishing, and we need to flourish with the Warriors.

They're welcome to come here, but you know, if there's an issue about planning, put them out at Candlestick.

EXECUTIVE ASST. GUERRA: Sir, your time is up.

JAC TALIAFERRO: Thank you.

This is -- this is the article that I wrote, and I would love the Commission to see that (Indicating).

CHAIRPERSON ROSALES: Thank you.

JAC TALIAFERRO: You're welcome.

Thank you.

JOHN CORNWELL: Hello, Commissioners. My name is John Cornwell, C-O-R-N-W-E-L-L.

I'm actually a third-generation San Franciscan. I have two young kids who will hopefully be long-term, fourth-generation residents. I've been a resident in the area for 20 years.

And, you know, I worked -- was around when the Giants negotiated with community impacts. The traffic density was a lot different back then.

I respect the Warriors. They're a good organization, but they're not this non-profit organization that should be exempt from smart urban planning; right?

If we had a bank headquarters that was going

to go in that spot with that traffic density as it now exists, and you're going to have 20,000-some-odd visitors, you would write that off immediately. That's awful urban planning.

They're not a non-profit. They're a multibillion-dollar asset and a very profitable organization. And it does not make sense for a company that is going to put that kind of burden on the community and the region; right?

I only ask that you guys go out to that area during commutes and see how bad the traffic is now. The Third Street corridor already is saturated.

And, you know, this isn't about the surface streets in the that area. That's bad enough. But you're talking about the Bay Bridge. We all know that the Bay Bridge rush hour starts at 2:30 and goes to 8:30. So, now are we ready to basically have there be no non-rush hour, for the morning rush hour to run into the afternoon rush hour?

Even if you have 80 percent traffic utilization, already traffic is at a breaking point in San Francisco. I think we all know that from everyday experience. It's not smart urban planning.

These EIR statements about, There will be adequate -- yeah, there may be transparency, but that still doesn't change the fact that it is a huge impact, and it's not a proper use. And you can do all the mitigation you want, but there's not the ability to add bandwidth and traffic capabilities around there. That's common sense.

So, you can offset carbon utilization and all the rest, but the bottom line is this is a really bad regional project.

CHAIRPERSON ROSALES: Thank you.

SILVIA JOHNSON: My name is Silvia Johnson and (Unintelligible) a lot of people would be jealous of me playing the guitar and be rich and famous right now.

I'm just (Unintelligible) you know, my priorities were -- over there in the mountains they don't have no (Unintelligible). You know, I think that's where we should be putting places where you can park. (Unintelligible) put the BART system to where it can go to the stadium, and that way, we would have a lot impact with our plans than when we go to see the Warriors.

And I think there's more solutions to those problems -- is that we need to agree with the Warriors, which would eliminate a lot of these impacts. Maybe put that in thought, that -- to build a BART over there behind the mountains there. You see on this picture

right there.

And I think that this is one of our main problems -- is that -- of course, jealousy is really bad out there. And this is one of the reasons why I haven't been able to build up my career with my guitar playing. And I had already 18 guitars already stolen from me. I went to Washington, D.C., played down there. They stole that too.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come to the podium: John deCastro, John Caine, Mr. Al Norman, Mr. Oscar James, Osha Meserve, and Paul Osmundson.

JOE BOSS: Good afternoon, Commissioners. And good to see you, Tiffany.

The -- I am not for or against the Warriors. They're doing a fairly adequate job with their EIR, but the thing is, what will happen with -- I live in Dogpatch. I've been here for 32 years, worked here since I was 16, so I hate to tell you how old I am. But at the end of the day, if the City wants to get something done, it just moves mountains.

They were trying to get a legacy here for someone -- I can't remember who -- keeping the Warriors in San Francisco, not on the pier, but it is in

San Francisco.

The Warriors actually are a very wonderful team and I love to follow them, and I would love to have them in the City.

We also have, right down the road, the Giants and the Giants attempting to build a rather large development. And being in Dogpatch and -- we've always been up with what's going on, and helped the Port and helped redevelopment in Mission Bay and so forth.

So, I just want to express the opinion that if we really, as a community at San Francisco, wanted to get something done, you would probably crack a whip and have the Warriors have to work with the Giants all on Lot A and B.

And, you know, maybe I'm whistling "Dixie," but you do not have a method of taking care of the traffic. You can say MTA is going to take care of it. MTA couldn't even, in a ten-year period, get a turnaround movement planned and executed. Very, very terrible.

Thank you.

EXECUTIVE ASST. GUERRA: Sir, can you please provide your name?

JOE BOSS: Joe Boss.

EXECUTIVE ASST. GUERRA: Thank you.

RUDY CORPUS: How you doing, Commissioners? My name is Rudy Corpus. I'm born and raised in District 6, South of Market, currently live there.

I run a youth program, United Players Violence Prevention Youth Program, with over a 150 kids run over the summer.

I'm here just in support for the Warriors to be here in our neighborhood and in San Francisco. It would create an enormous amount of opportunity for our people in the community.

South of Market, particularly while I've lived in District 6, has probably the lowest income-paid families in the whole city. I just -- you know, I just want the opportunity -- it would be good for the economy. It would be good for the community, and also, I think it would be good for the City.

I know originally the Warriors was in San Francisco back in the '70's. I think it was the San Francisco Warriors. Then they moved to Oakland, and that's why they called them "Golden State." And so, this gets rightfully their right place where they supposed to be, back here in San Francisco, the San Francisco Warriors.

Thank you.

CHAIRPERSON ROSALES: Thank you.

AL NORMAN: Madam Chair, Madam Director, Commissioners, Al Norman, Bayview Merchants Association, and we're here in support of the EIR for the Warriors, and we think it would be one big jewel of an anchor tenant for all small businesses in and out of the area, and we support it wholeheartedly and support the other associations who are in favor of you passing this EIR so we can go ahead and go to work and establish a relationship that will benefit everyone economically associated with this project.

Thank you.

CHAIRPERSON ROSALES: Thank you.

JOHN deCASTRO: Good afternoon, Commissioners. John deCastro from -- past president of Potrero Boosters Neighborhood Association back about 15 years ago. I'm a 37-year resident of Potrero Hill.

And my biggest concerns are, as I look at 6.2, "significant unavoidable impacts, specifically transportation and transit." Those are a mess today.

And I echo the other speaker that suggested that you might want to come down there between 4:00 and 6:00 in the evening and take a look at that 280 and Mariposa interchange -- Mariposa and Pennsylvania Street, 16th and 7th Street. It is a disaster four nights out of five, especially Thursday night. Every

time the Giants have a day game, the traffic starts backing up at 2:00 -- 1:30 or two o'clock and never quits.

We talk about a "Transportation Management Plan" in 6.5. Where is it? I don't trust the City or the MTA to come forward with a decent Transportation Management Plan when my wife and I tried to go to a Giants game on Sunday, and we waited -- we checked the next Muni -- 58 minutes to the 10. My wife is disabled. I had to call a taxi so we could make our ballgame. That was the only way we could get there, because she couldn't walk down to the T. It was way too far.

6.2 calls traffic "an unavoidable impact." Today, without a game, the traffic is backed up every night and almost every morning at the 280. I have learned ways around the neighborhood and some way to do that.

The transit doesn't work today. We need better plans in that area if the Warriors are going to come to Mission Bay.

I agree with the nurses. It is going to be a serious problem. And you're trying to route traffic, I believe, through the Minnesota Street area and through the Dogpatch neighborhood, to get people -- emergency vehicles to the hospital, or people that are in trouble that need to get to the hospital. That is not an acceptable alternative.

Thank you.

CHAIRPERSON ROSALES: Thank you.

OSCAR JAMES: Good afternoon, Commissioners. My name is Oscar James. I'm a native resident of Bayview-Hunters Point and a former Model Cities Commissioner, which this area covered.

The area that you have today, you're talking about doing development, we have a Memorandum of Understanding. Whichever comes into this area hires 50 percent community residents, 35 percent contractors -- minority contractors as a whole.

But I want to just thank the Warriors for doing what they have done. Prior to coming into our community, they've hired peoples in our community, and we hope and we really believe that they will hire minority contractors, 50 percent out of Bayview-Hunters Point, 100 percent citywide, following our Memorandum of Understanding we wrote in 1970, which had a grandfather clause in our community.

I support them 100 percent. I would like the U.C., since the nurses are talking about all they're talking about -- traffic and what have you -- is to come up with some scholarships that they should have done

getting that free property -- for scholarships in our community to train peoples in our community for nursing, being doctors, and what have you. Do the same thing that the Golden State Warriors are doing.

I was living and I was -- I once went to the games at Kezar Pavilion when the Warriors were there a long time ago, and I'm saying today welcome back to the San Francisco Warriors, and I support this 100 percent.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

PAUL OSMUNDSON: Good afternoon, Chair Rosales, Commissioners, Executive Director Bohee, Deputy City Attorney Bryan. My name is Paul Osmundson.

I am a partner in the East Street Ventures Restaurant, which is located at 295 Terry Francois Boulevard, with John Caine, one of the previous speakers.

I'm also the former Director of Planning and Development for the Port of San Francisco. I've worked with the San Francisco Giants and the Mayor's Office on the AT&T ballpark and on the Transportation Plan.

I've reviewed the EIR, and I can tell you that the -- when the City and MTA has made commitments to manage the traffic to and from the waterfront, these special-event venues, the Giants system works the way they said it would -- the way the Giants said it would, the way the City said it would. That system works. It has worked day in and day out, all 81 home games and the playoff games. It works.

The project is a perfect fit for this neighborhood. Mission Bay was envisioned as a mixed-use development project. The Port worked -- we worked on it for many years in the late '80's and early '90's. It's a mixed-use development project. It's not just a life science center. So, this is use fits into the City's plan for this area.

There's definitely going to be impacts that have to be mitigated or can't be dealt with -- unavoidable impacts. That's always the situation.

This a great use for this location. I urge you to approve the project, certify the EIR, and move forward.

It's a great -- we're very lucky to have an organization like the Golden State Warriors willing to come to this City and invest in our City.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: I have Ms. Susan Vaughan.

SUSAN VAUGHAN: Good afternoon, Commissioners.

My name is Susan Vaughan, and I am the current chair of the San Francisco group of the Sierra Club.

We will be submitting more detailed comments later. For now, I'm just going to be speaking for myself.

I'm very concerned that a piece of State legislation, AB 900, was extended purely for the reason just to get this project -- and apparently one in L.A. -- through the fast-track process so that there are fewer hearings, maybe, for the public. And I'm very concerned about that.

We don't know, additionally, in terms of the greenhouse gas emissions. It's my understanding that the project sponsors intend to purchase carbon offsets. We don't know what those offsets are, and we need to see that in the EIR.

To my knowledge, no greenhouse gas comparison has been done between this proposed project and just keeping the project in Oakland.

And on that line, I want to add that I think that probably most of the people who work that venue in Oakland right now work -- don't live in San Francisco. So, I'm wondering about the impact to BART, and I'm wondering about increased greenhouse gas emissions, because employees might be taking the bridge across the river -- or, not the river -- the Bay.

And I would add that I don't think a lot of public transit enhancements are happening in this project, and that really does need to happen. We're not interested in seeing more parking. It's got to be -- we're really serious about dealing with climate change. It's got to be public transportation.

Thank you.

OSHA MESERVE: Good afternoon, Commissioners. My name is Osha Meserve and I represent the Mission Bay Alliance.

The Alliance believes the proposed entertainment center will not work for the site and does not warrant the massive public investment planned by the State.

In particular, we're concerned about the compatibility of the center with the existing health and research facilities in Mission Bay, and while health and related biosciences was planned to expand under the Mission Bay Redevelopment Plan, this project takes this area in a completely new and incompatible direction.

In our review of the Draft EIR so far, we have found that the traffic, parking, and associated health impacts of the facility will be even more devastating than disclosed in the EIR, and there's inadequate

mitigation.

The project is also being mis-advertised as greenhouse gas neutral. Purchasing unverified assets from a broker for 4,000 tons per year of carbon dioxide is not mitigation and doesn't do anything to help the localized air pollution that will become so much worse under the gridlocked conditions.

With analysis scattered throughout the EIR and other documents prepared over the course of 25 years, the fast-tracking of this project's environmental review process is precluding meaningful public participation.

And the document is not -- because it is not thorough, in that people have said it's thorough, but there are important issues that are relegated to these other 1998 and 1990 documents that the public must also review in order to understand the project. Land use, geology, soils, recreation, and hazardous materials are some of those topics.

For this reason, we have requested an extension of the public review period to better match the complexity of this project, and we look forward to further informing the Commission to review this important project.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Are there any others that want to speak?

DAVID PAN: Yes. Hi. My name is David Pan, and I'm here on behalf of a lot of people that really do not have a voice.

I live in an SRO. I live on S.S.I. Disability on 6th and Market Street right now. There are a lot of people that are in hardship in this City. We all know that. There is a very divisive line in the economics of the wealthy and the poor.

I have a dream of working on creating a non-profit that can create paid jobs for people coming out of hardship. The idea is to open a café, eatery, and meeting spaces, community spaces where people can use for meet-up groups, conferences, study groups, and have them adjoining a café so it's free, just buy some food and some drinks.

Making it a non-profit would allow people to have a reintegration into the workforce, would allow the community a place to gather.

And the idea of doing something like this would be hugely tremendous, because there aren't a lot of 9- or 10,000-square-foot plates that are available to be custom-built out in San Francisco. We all know the retail spaces aren't available.

So, I'm working on trying to propose this with the Warriors, and I've had some very good feedback from members of the community, from Urban Solutions to Cafe La Vie, to Hayes Valley Bakeworks, Delancey Street Crossroads Café, some of the non-profits that have succeeded on a business model similar to this, and others.

I've spoken with Jane Kim, District Supervisor, District 6. I'd like to say thank you very much for your time.

I very much support the Warriors coming to San Francisco. I think it would help a lot of people in a lot of different ways.

Thank you.

I'd like to leave this with you, if I may (Indicating).

CHAIRPERSON ROSALES: Yes.

EXECUTIVE ASST. GUERRA: Are there any others that would like to speak?

(No response)

CHAIRPERSON ROSALES: No.

Okay. Thank you, everyone, for giving us your comments. This is not an action item, but the Commissioners are allowed to also provide comment.

Do I have any comments from the Commissioners?

COMMISIONER MONDEJAR: No.

CHAIRPERSON ROSALES: The only comment I'd like to make is consistent with all the comments I have made in the prior workshops regarding this project, and it deals with two things: Primarily, the traffic impacts and the neighborhood impacts, which are related.

And we've heard a lot of concerns, and I will continue to read the document, but I want to make sure that the comments here regarding those impacts and the mitigation measures are kind of looked at in depth and to the extent of exploring funding mechanisms or recommended or suggested mechanisms, so that they don't go into the document -- that the Commission be told of potential funding mechanisms that we might be able to recommend to ensure that those mitigations are essentially guaranteed and those impacts are mitigated.

I think I can't say more on the record than just a comment. This matter will return to the Commission later this fall.

Should we repeat the opportunity for folks to submit written comments?

DEPUTY DIRECTOR OERTH: Thank you, Chair Rosales. I'll just repeat that if people would like to submit written comments, they can submit them via E-mail to warriors@sfgov.org or they may address them to the

Planning Department. The address of the person to contact at the Planning Department is on page 2-9 of the SEIR.

Thank you.

CHAIRPERSON ROSALES: Thank you.

I think Commissioner Mondejar would like to make a comment.

COMMISIONER MONDEJAR: Sally, can you just explain what the process is after you have -- after the office has received further comment, and also the process of all the public comments that we have received this afternoon?

DEPUTY DIRECTOR OERTH: Yes.

All of the comments provided today, as well as all of the comments provided in writing, will be gathered and responded to in a document called the "Response to Comments," which will be brought back before the Commission later this fall.

And so, we'll be reviewing those and working with the various members of the team to provide the responses, and look at any adjustments that need to be made to the Draft SEIR as appropriate.

COMMISIONER MONDEJAR: And all of these will be made public?

DEPUTY DIRECTOR OERTH: Yes.

COMMISIONER MONDEJAR: So, I just wanted to say that I hope that all of the comments will be taken into consideration and carefully examined. I know I have reviewed the documents that have been presented to us as Commissioners.

And one other thing that just occurred to me -- that the purchasing of carbon offsets is something that was new to me this afternoon. That, I didn't get out of -- I need a little bit more of an understanding of that, but I'm sure that you could respond to that.

I don't know if you can respond now, since we're not on a -- this is simply informational this afternoon, but it's certainly something that I think we should be communicating -- all of these issues and concerns and the responses to these issues and concerns -- to the public.

DEPUTY DIRECTOR OERTH: Thank you.

COMMISIONER MONDEJAR: Thank you.

CHAIRPERSON ROSALES: So, thank you, everyone.

With that, I think that closes this item. It will be again before us later in the year.

(Whereupon, at 3:02 p.m., Agenda Item 5(b) of the Special Meeting of the San Francisco Commission on Community Investment and Infrastructure was concluded.)

CERTIFICATE OF REPORTER

I, KATY LEONARD, a Certified Shorthand Reporter, hereby certify that the foregoing proceedings were taken in shorthand by me at the time and place therein stated, and that the said proceedings were thereafter reduced to typewriting, by computer, under my direction and supervision;

And I further certify that I am not of counsel or attorney for either or any of the parties to said matter, nor in any way interested in the outcome of the cause named herein.

DATED: July 5, 2015
