Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 – Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the project referenced above. The proposed project, located on an approximate 11-acre site, would construct a multi-purpose event center and a variety of mixed uses including office, retail, open space, and parking within the Mission Bay South Redevelopment Plan Area of San Francisco. The project site is approximately one half mile from the Interstate 280 (I-280) ramps at Mariposa Street, 18th Street, and Pennsylvania Avenue. Our comments seek to promote the State's smart mobility goals that support a vibrant economy and build active communities rather than sprawl. We have reviewed the Draft Subsequent Environmental Impact Report (SEIR) and have the following comments to offer.

Forecasting
Please clarify why there is only minor difference in volumes at Study Intersections 9, 10, 11, 12, and 13 between Cumulative Project-No Event and Cumulative Project-With Basketball Game Conditions, as shown in Figures 13a and 15a (SEIR, Appendix TR, pgs. TR-156, TR-152). Additionally, Study Intersection 12 shows greater southbound and eastbound volumes in Figure 13a than 15a. The volumes of inbound vehicle trips during the weekday 4-6 and 6-8 peak hour periods are estimated 379 & 2,489 respectively and 2,797 outbound vehicle trips during the 9-11 PM peak period (pg. TR-37). This would appear to show significant Cumulative volumes. Please clarify or revise the report. The report should identify traffic turning movements per study intersection under Basketball Game Only, Convention Only Conditions separately.

Parking

- Given the Project is located on AT&T Parking Lots B & E, please clarify if Mitigation Measure M-TR-11c, which provides additional off-site parking from the Project Plus

Overlapping Giants Evening Game Scenario, should be revised from 1,000 to 1,600 spaces to account for AT&T Park's displaced 600 parking spaces. Table 1-1, which presents the Summary of Proposed Project Facilities, shows the arena will have seating capacity of maximum 18,500 patrons. Approximately 950 vehicle parking spaces are proposed from the combined Blocks 29-32 and the existing off-site 450 South Street Parking Garage (SEIR, Vol. 1, pg. 1-7). Mitigation Measure M-TR-11c states the City shall identify one or more off-site parking lots to provide approximately 250 additional parking spaces for all events and up to approximately 750 additional parking spaces for use during dual events of 12,500 or more event center attendees, for a total of 1,000 additional offsite parking spaces (pg. 1-23). The AT&T Park Post-Game Event Traffic Plan, courtesy of the Mission Bay Transportation Management Agency, is available at the following webpage and identifies AT&T Parking Lots B & E:
http://sanfrancisco.giants.mlb.com/sf/downloads/y2015/postgame_map.pdf.

- Please elaborate how the AT&T Park Post-Game Event Traffic Plan is incorporated within the Project's Transportation and Circulation analysis regarding parking impacts on the surrounding neighborhood and roadways. According to the Post-Game Event Traffic Plan and noted in the report, some streets near AT&T Park and its parking lots are closed beginning in the 7th inning to approximately one hour post-event. Given the Project's additional number of vehicles seeking parking, potential safety issues for all road users should be identified and fully mitigated. Project-related queuing impacts on nearby State facilities should be analyzed. The AT&T Park Post-Game Event Traffic Plan is available at the webpage above.

- Please quantify how many additional Parking Control Officers (PCOs) will be utilized when there are overlapping events. Mitigation Measure M-TR-11a, under Conditions With a SF Giants Evening Game at AT&T Park, states the Project's Transportation Management Plan shall be expanded to include additional PCOs that shall be deployed at some specific intersections (pg. 1-22). Mitigation Measure M-TR-2a, under Conditions Without a SF Giants Game at AT&T Park, states "four additional PCOs shall be deployed to intersection where the proposed project would result in significant impacts, as conditions warrant during events (pg. 1-15).

Interstate 280 Mitigation
Please explain the possible interventions on the I-280 Mariposa Street on-ramp, listed under Contraflow Lane Mitigation in Table 2-1 (pg. 2-17).

Transportation Management Plan
We commend the City's Transportation Management Plan (TMP) to encourage sustainable mode shares and reduce single vehicle occupancy trips. The Project's participation in the Waterfront Transportation Assessment reflects comprehensive early planning efforts and on-going coordination between agencies to assess the mobility needs of travelers and provide

additional services within the Mission Bay Area. We agree the TMP should include documentation for monitoring vehicle trip reduction, including annual reports to demonstrate the ongoing reduction of vehicle trips while continuing to survey the travel patterns of residents and employees within the project area. We recommend the TMP elaborate future coordination between nearby proposed large-scale development projects and their associated Transportation Management Agencies and various Transportation Demand Management measures to ensure the TMP is thoughtfully planned.

Transportation Impact Fees

Please identify any transportation impact fees to be used for project mitigation. Consider including information from the City's local and any relevant regional impact fee program and identify if those programs include improvements to alternative modes. Caltrans encourages the City to ensure sufficient allocation of contributions toward regional transit improvements in order to better mitigate and plan for the impact of future cumulative growth on the regional transportation system. We support projects and measures to reduce vehicle miles traveled and to increase sustainable mode shares.

Mitigation Responsibility

As the lead agency, the City and County of San Francisco is responsible for identifying and ensuring the coordinated implementation of all project mitigations. The project's fair share contribution, financing, scheduling, implementation responsibilities associated with planned improvements on Caltrans ROW should be listed, in addition to identifying viable funding sources per General Plan Guidelines.

Should you have any questions regarding this letter or require additional information, please contact Sherie George at (510) 286-5535 or by email at: sherie.george@dot.ca.gov.

Sincerely,

PATRICIA MAURICE

State Clearinghouse
1400 Tenth Street, Room 121
Sacramento, CA 95814

Thank you for the opportunity to review the "Notice of Completion" environmental document from the State Clearinghouse regarding the Golden State Warriors multi-purpose event center project, State Clearinghouse #2014112045. The California Highway Patrol is the primary agency that provides traffic law enforcement, safety and traffic management on Interstate 80, Interstate 280 and US 101 within the city limits of San Francisco, California. The San Francisco Area is responsible for these functions and will be affected by the implications of this project. To that end, we offer the following comment:

Our concerns relate to the final design of the proposed 18,064 seat multi-purpose event center with regard to the potential increase in traffic congestion, changes in traffic congestion patterns and the additional enforcement demands on freeways and transition ramps at and near the proposed event center. A year-round event center of this magnitude could potentially affect emergency response times for Area personnel during peak commute times which may have a negative impact on departmental services. Furthermore, in addition to a potential increase in overall traffic congestion, Area resources may also be negatively affected with a potential increase in the number protective service details associated with this event center. Our recommendation would be to further analyze traffic patterns and schedule events appropriately with other event centers and/or city organizers in order to reduce traffic congestion to the greatest extent possible.

If you have any questions, or wish to discuss this matter further, please contact Lieutenant R. Rios at (415) 557-1094.

Sincerely,

C. SHERRY, Captain
Commander

Subject: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32
SCH#: 2014112045

Dear Brett Bollinger:

The State Clearinghouse submitted the above named Supplemental EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on July 20, 2015, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title Event Center and Mixed-Use Development at Mission Bay Blocks 29-32
Lead Agency San Francisco, City and County of

Type **SIR** Supplemental EIR

Description GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an ~11 acre site (Blocks 29-32) within the Mission Bay South Redevelopment Plan Area of San Francisco. The proposed event center would host the Golden State Warriors basketball team during the NBA season, as well as provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events cultural events, conferences and conventions. GSW has entered into an agreement to purchase the site. The project requires approval of amendments to the Mission Bay Plan Design for Development, among other approvals.

Subject: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32
SCH#: 2014112045

Dear Brett Bollinger:

The enclosed comment (s) on your Supplemental EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on July 20, 2015. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2014112045) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

RE: **Comments on Warriors' San Francisco Event Center Draft Subsequent Environmental Impact Report "DEIR"**
OCII Case No. ER 2014-919-97

Dear Ms. Bohee:

Thank you for the opportunity to review and comment on the Draft Subsequent Environmental Impact Report ("DEIR") for the proposed Golden State Warriors' ("GSW") Event Center and Mixed-Use Development project (the "Event Center" or the "Project") located at Mission Bay Blocks 29-32. UCSF appreciates the City's and the GSW's commitment to creating an Event Center project that is successful for the Mission Bay neighborhood, as well as all of San Francisco. We also appreciate the City's and GSW's commitment to identify and mitigate negative impacts that could result from the Project. After a careful review of the DEIR, UCSF continues to be concerned about the Project's potential impacts on UCSF's Mission Bay campus and Medical Center, the greater Mission Bay area and its environs.

UCSF acknowledges and appreciates the efforts made by the City and GSW to date to address concerns that UCSF has expressed about the impacts of the proposed Event Center on UCSF patients, patient visitors, patient care givers, and emergency vehicles. In the spirit of cooperation that has marked those conversations between UCSF, the City and GSW, UCSF offers the following comments on the DEIR, with the understanding that the City will continue to work with UCSF, GSW, and neighbors to develop more detailed plans to address and mitigate the negative impacts of the Project. We understand that these more detailed plans will be included in the Final EIR and incorporated into the Event Center's conditions of project approval, which will result in a project that will fit well in the neighborhood, be supported by UCSF, and be an asset for the City.

A. Transportation Impacts

Driven by its commitment to patient care and public safety, UCSF's primary goal is to ensure that patients, patient visitors and patient care workers, as well as emergency vehicles, have 24/7 unimpeded access to its Mission Bay hospitals. This goal may be impeded by traffic congestion and parking impacts of the proposed Event Center, especially when there are dual and/or overlapping large events at the Event Center and AT&T Park. The DEIR indicates that there would be an average of nine dual and/or overlapping large events at the Event Center per year, comprised of two basketball games and seven concerts with an average attendance of 12,500 or more (DEIR p. 5.2-171). As such, large dual and/or overlapping events at AT&T Park and the Events Center should be managed judiciously. In addition, the impacts of such events—particularly on traffic flow—should be monitored and the City should have the ability to employ additional mitigation measures to ensure traffic can be maintained at acceptable levels and access to the Mission Bay hospitals is assured. Should the City's efforts to maintain acceptable traffic levels fail and access to the hospitals be impeded, UCSF supports a trigger mechanism giving the City the ability to manage the scheduling of dual and/or overlapping large events until such time that traffic can operate during such events at acceptable levels. Further, UCSF encourages City efforts to ensure funding is secured to manage these impacts and to ensure a robust monitoring program.

Page 5.2-32, Table 5.2-8, and page 5.2-237, Table 5.2-68 of the DEIR assumes that four UCSF lots and garages, totaling 2,590 parking spaces, will be available to event attendees. UCSF has informed the City that it should not include any of UCSF's parking spaces in the baseline parking supply in the DEIR because UCSF's current use and projected demand demonstrate that UCSF needs its parking spaces for its staff, patients and visitors. UCSF's future parking demand is expected to increase over existing demand. We appreciate that the parking supply/demand analysis in the DEIR does include tables showing the parking surplus/shortfall when UCSF's garages are not included in the parking supply.

We support the City's efforts to optimize public transit service to and from the Event Center. Toward that end, we offer the following comments:

Page 5.2-51, funding of incremental event-only Mission Bay shuttles is left to the discretion of GSW. Please consider making it a requirement that GSW fund additional shuttles if the Mission Bay TMA requests such service.

Page 5.2-52, Table 5.2-14, we suggest Mission Bay TMA shuttle hours be expanded to cover post-game as well as pre-game (6-8 pm) hours.

Page 5.2-53, it is unclear whether GSW or the City will pay for the four additional light rail vehicles. The Final EIR should specify.

Page 5.2-56, we would appreciate the City/GSW consulting UCSF when the number and location of PCOs are refined after Year 1.

Page 5.2-57 through 58, the text indicates that the listed transportation management strategies would apply to concerts with more than 12,500 attendees, but Table 5.2-16 (footnote b) says more than 14,000 attendees. UCSF believes that the lower number should be used.

Page 5.2-64 through 68, it is unclear who will decide which TDM measures will be implemented. We recommend that this not be solely at the discretion of GSW. Please describe which City agency will have the authority to order specific additional TDM measures.

Page 5.2-67 through 68, UCSF appreciates the performance standards set forth in the TMP. Please describe how the City would enforce these measures. In addition, we would appreciate receiving copies of the monitoring reports upon their submittal to OCII.

Page 5.2-68, third bullet, in addition to event traffic not blocking access to the UCSF emergency room entrance, please consider deploying PCOs to ensure vehicle queuing does not block access to the UCSF hospital and hospital garage for medical staff, patients and visitors.

Page 5.2-80, the TSP should apply to all large events (+12,500).

Page 5.2-130, we request that marquee events, such as National Hockey League regular season games, not be allowed to be regularly scheduled as overlapping events given the significant traffic impacts posed by such overlapping events and the unknown transportation mode profile of those attending such events.

Page 5.2-146 through 147 and 5.2-185, given the relatively high auto mode share by South Bay and North Bay event attendees, can funding be secured for additional South Bay and North Bay transit service needs? Mitigation Measures M- TR-5a and b require GSW to "work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate" with Caltrain, Golden Gate Transit and WETA to provide additional service; how can this mitigation measure be strengthened?

Page 5.2-167 and page 5.2-181, Table 5.2-50, the fact that the I-280 northbound off-ramp at Mariposa is projected at LOS F during the evening peak hour during overlapping events is significant. This off ramp is an important access path to the UCSF hospitals and to neighboring land uses, and cannot be in a failing condition on a regular basis. We request a mitigation measure requiring the City to investigate the reconfiguration of the I-280 Mariposa Street northbound off-ramp lanes to better segregate Event Center traffic from UCSF and other non-Event Center traffic.

Page 5.2.169, Improvement Measure 1-TR-10b, we request that the traffic engineering study for Mariposa Street be completed prior to, not after, certification of the Final EIR and that it be implemented and included as a condition of project approval, if determined feasible.

Page 5.2-180, Mitigation Measure M-TR-11c, UCSF encourages efforts to avoid scheduling non-Warriors events at the Event Center of 12,500 or more attendees that start within 60 minutes of the start of events at AT&T Park, as stated in this mitigation measure. We suggest that the mitigation measure be modified to limit large overlapping non-GSW events to what was analyzed in the DEIR -- no more than seven large Arena concerts per year. In 2014, the City imposed a numeric limit on large concerts at the Masonic Auditorium, providing a precedent for this type of condition.

Page 5.2-249, we request that the City commit to the additional parking lots south of the Event Center in order to minimize traffic and parking impacts of overlapping events. The total projected shortfall of about 2,000 spaces in the cumulative condition during overlapping events is substantial.

Comments on May 2015 TMP

Section 10.2.8, UCSF surveys need not be limited to only emergency access, but also could include surveys of general patient and staff access to the UCSF campus and Medical Center.

Section 10.4.4, we request that this performance standard be expanded to require that event traffic not block patient, staff and visitor access to the UCSF hospitals, not just emergency room access.

B. Impacts on UCSF Helipad Operations Have Not Been Adequately Addressed

After a review of the DEIR, UCSF remains concerned about the projected impact on UCSF's medical helipad, and about the DEIR's analysis of this matter. UCSF's helipad provides access to critical emergency care for children and pregnant women in distress. UCSF undertook an extensive community process and received helipad and access route approval by various regulatory agencies, including the Federal Aviation Administration, the California Department of Transportation's Aeronautics Division, and the San Francisco Board of Supervisors. Any activities proposed by GSW that would render UCSF's flight paths unusable or that would compromise the safety of air medical access are unacceptable to UCSF.

UCSF understands and appreciates that the City and GSW continue to work on addressing the impacts. Nonetheless, the DEIR identifies the following:

- There would be 5 construction cranes at the Event Center construction site (see DEIR Figure 5.2-28), which would extend over all streets surrounding the project site, Third Street, 16th Street, Terry Francois Boulevard, and South Street.

- One crane would penetrate the airspace of UCSF's primary flight path --the flight path over 16th Street that is most frequently used, which arrives from and departs to the east. The DEIR concluded that this constitutes a potentially significant impact.

- Other cranes could penetrate the airspace of one or more of UCSF's secondary flight paths.

We understand that GSW may have a revised plan that relocates the construction cranes so that no penetration of the UCSF flight path airspace would occur, and we appreciate GSW's efforts on this matter. However, there is no commitment to avoid penetration of the flight path airspace at this time. We would appreciate GSW working toward a commitment to avoid penetration of the UCSF flight path, which we want included in the Final EIR. Also, we have the following concerns about the DEIR analysis:

- Page 5.2-265, the mitigation measure calls for the development of a Crane Safety Plan. The DEIR provides that the safety plan would identify appropriate measures "to reduce, and where possible, avoid, potential conflicts", by, among other things, seeking to "minimize penetrations" or "the duration of penetrations" into helicopter flight airspace. As currently written, the mitigation measure would allow for construction cranes to penetrate the flight path's airspace, which potentially compromises the ability of the helipad to operate 24/7. Accordingly, UCSF does not concur that Mitigation Measure M-TR-9a reduces this impact to less than significant levels. Rather, UCSF requests that the mitigation measure be revised with the objective to ensure safe, 24/7 operation of the UCSF medical helipad by requiring GSW to locate their constructions cranes so that no penetrations of airspace occur during the construction of the Project.

- Page 5.2-263, the discussion of impacts on the alternative flight path over South Street is unclear. The text states that the working radii of the two construction cranes over South Street are not located under any part of UCSF's alternative arrival/departure flight path. However, the text also identifies the minimum amount of vertical clearance anticipated between the cranes and the approach and transitional surfaces of the flight path. It is extremely important that the analysis of impacts be clear.

- Page 5.2-270 through 272, while the DEIR does require GSW to develop an exterior lighting plan, it does not discuss the impact of laser pointers and drones which could present a real danger to helicopter pilots and passengers. Both UCSF's helipad consultant and pilots whom we have consulted agree that this is a real safety issue.

Although incidents are rare, it seems that in an event/crowd atmosphere, especially if there were an outdoor activity at the Third Street Plaza, the likelihood would be increased that an incident could occur. UCSF requests that mitigation measures be identified to reduce or eliminate this potential. Mitigation Measure M–TR–9d does not go far enough. It promises to develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems "would not have an undue impact on helipad operations." Any impact to a helicopter pilot transporting a critically-ill patient should be considered an undue and unacceptable impact, and further mitigation should be imposed.

C. Noise Impacts Have Not Been Adequately Addressed

When UCSF planned and developed a large student housing complex along Third Street in 2002, it relied on the zoning districts in the South Plan, which called for commercial/industrial uses on adjacent blocks such as Blocks 29-32. Those uses would be primarily daytime uses, not uses that would disgorge up to 18,000 people after 10:00 p.m. on more than 100 days per year.

Page 5.3-26, Improvement Measure I-N0–3. UCSF requests that this measure be modified to expand the distance for notification of owners and occupants to include all occupants of the UCSF Medical Center at Mission Bay and the student housing on Third Street.

Pages 5.3–37 through 5.3-38, the DEIR indicates that the excessive noise would occur at the northbound Muni line platform adjacent to the UCSF student housing building on up to 105 evenings following basketball games, concerts and other major event. To address this impact, the DEIR indicates that the project sponsor will urge patrons to respect the quiet of the neighborhood as they leave the area and provide to all interested neighbors a contact agency and phone number that would be prepared to respond to complaints. We respectfully request that GSW and the City devise more effective mitigation measures to address this significant impact.

The land uses most affected are the UCSF Mission Bay Housing units on Block 20 that front onto Third Street and onto Gene Friend Way. These buildings have no air conditioning and rely on a passive ducting system for ventilation when windows are closed for noise control. At the time these structures were built, it was anticipated that adjacent development would consist of biotechnology or office uses. It was not anticipated that an arena and event center with over 200 events per year would be proposed directly across the street, of which up to 150 large events would generate crowd noise that, according to the DEIR, would be significant and unavoidable due to "the increase in noise levels from crowds gathering at the Muni T-line platform during quieter nighttime periods". The significant and unavoidable impact of crowd noise on the UCSF Mission Bay Housing complex would most acutely affect those units in Hearst Tower which contain bedrooms that face Third Street or Gene Friend Way (83 units), those units in the

South Building which contain bedrooms that face Gene Friend Way (63 units), and those units in the North Building which contain bedrooms that face Third Street (18 units). For these reasons, UCSF requests that the following mitigation measure be included in the Final EIR:

> To minimize the effect of crowd noise on nearby sensitive receptors at the UCSF Mission Bay Housing complex, the project sponsor will evaluate and implement feasible noise control measures to limit the significant increase in noise affecting the existing UCSF Mission Bay Housing complex on Block 20. The noise control measures will be submitted to the City for review and approval, and following City approval, will be implemented to reduce the significant and unavoidable noise impacts affecting UCSF Mission Bay Housing on Block 20.

Page 5.3–41, the DEIR provides that construction-related vehicles and equipment will be required to use designated truck routes to travel to and from the project site, as determined in consultation with the SFMTA. UCSF requests that truck routes be designated in consultation and coordination with UCSF and other nearby developers.

Tables 5.3-2 and 5.3-4, the distance from the "project site" to the UCSF Medical Center at Mission Bay is listed as 560 feet, without any explanation of measuring points. Elsewhere in the DEIR it is listed as 300 feet. This distance needs to be confirmed because at page 5.3-14, summarizing Article 1, Section 47.2 of the San Francisco Police Code, the DEIR states that "except as permitted by the Entertainment Commission, [amplified] sound shall not be issued within 450 feet of hospitals." As GSW proposes noise sources and noise generating events in the outdoor plaza areas as well as within the Event Center, the Final EIR should be specific and consistent about the locations from which distances were measured and what those distances are.

D. <u>Inadequate Mitigation Measures</u>

"An EIR shall describe feasible mitigation measures which could minimize significant adverse impacts…" CEQA Guidelines section 15126.4(a)(1). "Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments." CEQA Guidelines sections 15126.4(a)(2).

Many of the Mitigation Measures contained in the DEIR, as summarized in Table 1–2, are conditioned upon language such as "if feasible."

In addition, some Mitigation Measures lack implementation or enforcement mechanisms or performance standards include TR – 2 ("if feasible", "if available", "working in good faith", "make good faith efforts"), TR – 4, TR – 5, TR –9a, TR –11 ("make good faith efforts", "if feasible", "shall exercise commercially reasonable efforts"), NO-4, and WS –1.

We suggest that the significance determination for each of these impacts be reassessed assuming a worst-case scenario in which the proposed mitigation measures are not feasible. Also, the Final EIR should identify whom at OCII or other City agencies will be responsible for determining "feasibility," "availability," "good faith," and "commercially reasonable efforts." We respectfully submit that GSW should not be allowed to make these determinations.

The adoption of an effective mechanism to fully fund the City's operating costs to manage impacts as described above for the life of the Event Center would help to eliminate funding as a criteria for determining the feasibility of the measures that are the responsibility of the City.

E. <u>Utilities and Service Systems</u>

Page 5.7–2, the DEIR indicates that the Mission Bay FSEIR determined that the projected increases in wastewater generation and storm water flows could be accommodated by the planned infrastructure at Mission Bay, and that the Mission Bay Plan's effects on wastewater and stormwater collection and treatment facilities would be less than significant. The DEIR now states that wastewater capacity will be inadequate when Project flows are added to existing and planned flows. But the DEIR presents no evidence other than a letter to SFPUC from its consultant, Hydroconsultant Engineers, as to current demands on the wastewater and stormwater collection and treatment facilities at Mission Bay and concerning what happened to make the 1998 prediction untrue. The DEIR discussion suggests that UCSF development at Mission Bay is the reason why peak flows would exceed the capacity of the dry weather pump stations, but this contention is contradicted by the analysis recently conducted by UCSF's consultants, as described below. In response to the UCSF's review of the supporting studies listed in the DEIR on page 5.7-7 (SF-DPW / SF-PUC memos "Mariposa Pump Station (MPS) Dry Weather Flow Hydraulic Analysis" dated February 3, 2015, and "Hydraulic Assessment of Mission Bay Sanitary Pump Station" dated February 25, 2015), UCSF undertook sanitary sewer flow monitoring to address questions in those analyses of the actual sewage flow contributions UCSF has to the respective pump stations. This information was provided to the City, however the relevant information from this study does not seem to be incorporated into the DEIR.

Page 5.7-7, the DEIR indicates that the SFPUC is performing interim improvements at the Mariposa Pump Station to accommodate planned and approved peak wastewater flow rates from UCSF that would exceed the Mariposa Pump Station's dry weather capacity. Also, at page 5.7-12, a similar statement is made that the peak flows from UCSF are contributing to peak dry weather flows from the Mariposa subbasin that now exceed the Mariposa Pump Stations dry weather capacity and therefore interim improvements are being made. The interim improvements described in the DEIR include connecting the existing 10-inch dry weather force to the 20-inch wet weather force main as well as upsizing the influent sewer to the pump station.

The February 2015 SF DPW memo did describe the same force main improvements, but the increases in dry weather flows were not attributed to UCSF. UCSF's consultants, Freyer & Laureta, Inc., prepared a May 15, 2015, memorandum presenting results of flow monitoring from Blocks 24a/b, 25a, and Phase I of the UCSF Medical Center. The memorandum concluded that the cumulative measured average and peak sanitary sewer flow rates from these UCSF facilities was generally less than both the Mission Bay Master Plan and 2014 LRDP estimated sanitary sewer flow rates.

Page 5.7-13 through 17, the discussion related to Impact C-UT-2 indicates that the projected peak flow rates from the UCSF planned development of Block 25b, Block 33/34, Block 40, and Phase 2 of the MCMB is 1.2 mgd. However, the 1.2 mgd projected peak flow rate includes both Phase 1 and Phase 2 of the Hospital construction. The correct projected peak wastewater flow rate from Block 25b, Block 33/34, Block 40, and Phase 2 of the Hospital should be 0.95 mgd based on the LRDP.

Page 5. 7–16, the statement that UCSF flows to the Mission Bay Pump Station would be 6.63 mgd with full LRDP development is not accurate. See 2014 LRDP Draft EIR at page 7-99 (indicating that the estimated peak flow increase to the Mission Bay Block P15 pump station from UCSF's proposed growth under the 2014 LRDP would be 0.23 mgd, resulting in a need for P15 pump station capacity of 6.63 mgd.).

Page 5.7-13 through 5.7-17, it is not clear why Impact C–UT–2 does not require mitigation involving a fair share contribution by the project sponsor; rather it states that no mitigation is currently available.

Page 5.7–19, the DEIR indicates again that existing and planned UCSF development at Mission Bay would result in a major contribution to cumulative wastewater flows in the subbasin. (See responses above)

F. <u>Other Issues</u>

1. <u>Project Description</u>

Page 3-36 through 37, UCSF appreciates the City and GSW's commitment to the improvements listed. UCSF requests the DEIR include documentation to confirm these improvements are fully funded.

Page 3-49, as discussed in greater detail in Section B, above, contractor compliance with all codes, rules and regulations is not enough to ensure that tower cranes do not interfere with helicopter flight path.

Again, thank you for the opportunity to comment on the DEIR. We acknowledge the City's and GSW's efforts to address our concerns about the potential impacts of the proposed project. UCSF is supportive of a successful Event Center project, and looks forward to changes to the Project's EIR mitigation measures that will bring about meaningful improvements in projected conditions in the area.

Should you have any questions about these comments, please contact me at (415) 476-8312.

Sincerely,

Lori Yamauchi
Associate Vice Chancellor

BAY AREA
AIR QUALITY
MANAGEMENT
DISTRICT

July 20, 2015

Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 DSEIR

Dear Mr. Bollinger:

Bay Area Air Quality Management District (Air District) staff has reviewed the City and County of San Francisco's (City) Draft Subsequent Environmental Impact Report (DSEIR) prepared for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (Project). The Project applicant proposes to construct a multi-purpose 750,000 square foot event center and 605,000 square feet of office, 125,000 square feet of retail, 475,000 square feet of parking and loading use, and approximately three acres of open space. The Project site is approximately 11 acres. The site is within the Mission Bay South Redevelopment Plan Area of San Francisco. The event center would have a capacity of 18,064 seats and host the Golden State Warriors, and provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences and conventions.

Air District staff greatly appreciates the opportunity to work with the City to address the potentially significant air quality impacts estimated for this Project. Project design features and the mitigation measures identified in the DSEIR will substantially lessen the local and regional air quality impacts from construction and operation of the Project.

However, even with these Project design features and on-site mitigation measures, air quality impacts from the Project still exceed the City's thresholds of significance. Therefore, Mitigation Measure M-AQ-2b Emissions Offsets (M-AQ-2b) commits the Project applicant to providing funds to achieve additional emission reductions to reduce air emissions below the thresholds of significance. To this end, M-AQ-2b states that the Project applicant would provide funding of $321,646 to the Air District to fund emissions reduction projects in the region in order to

offset the remaining criteria pollutant emissions generated by both the construction and operation activities from the Project.

However, as Air District staff previously has discussed with the City, the Project Applicant would need to contribute $620,922 to fully offset the remaining criteria pollutant emissions from this Project through the Air District's grant programs. The Air District recommends that the DSEIR MM-AQ-2b be updated to reflect this funding amount.

Air District staff is available to assist the City to address these comments. If you have any questions, please contact Alison Kirk, Senior Planner, at (415) 749-5169 or akirk@baaqmd.gov.

Sincerely,

Jean Roggenkamp
Deputy Air Pollution Control Officer

Re: BART District Comments on the Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 (OCII Case No. ER 2014-919-97)

Dear Director Bohee,

The San Francisco Bay Area Rapid Transit District (BART) has reviewed the Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development at Mission Bay Blocks 29-32. BART appreciates the coordination with the City and County of San Francisco on this important project, and supports many of the transit-first actions proposed to encourage multi-modal access to the site.

For context, BART's Transbay service began in 1974, and the original planning horizon has been surpassed by more than a decade. Given strong job expansion in San Francisco, BART has experienced unprecedented ridership growth (~25% over the last four years), which creates a number of peak period capacity challenges. BART is in the process of replacing the existing rail car fleet, modernizing the train control system, and expanding train storage, which will allow BART to carry more San Francisco-bound patrons. However, as the Bay Area concentrates more growth around the region's rail systems, BART anticipates substantial ridership increases — beyond what the current system can safely and comfortably accommodate. The Metropolitan Transportation Commission's (MTC's) Plan Bay Area (2013) and Core Capacity Challenge Grant does partially fund several of BART's most important capacity projects serving San Francisco, but BART looks forward to partnering with the City to address cumulative impacts and funding solutions.

We understand that the development proposal is for a mixed-use project that features an 18,500-seat multi-purpose event center, along with open space, parking and retail uses in the Mission Bay South Redevelopment Area. BART submitted Scoping Comments in a letter dated January 23, 2013 based on the Notice of Preparation (NOP) issued by the City of San Francisco for the project (at the former location). We are submitting the following comments based on our review of the DSEIR to the City and County of San Francisco for your consideration in proceeding with the document.

1. System capacity improvements (i.e., rail car fleet expansion, stations, train control modernization, and additional shop & yard facilities) are needed to alleviate peak period constraints from projected ridership, but are unfunded. The BART Fleet Management Plan (FMP) (2010) service levels shared with the City in our January 23, 2013 Scoping Comments on the NOP are based on projected demand. The BART FMP indicates that BART will need to increase base service frequency from 15- to 12-minute headways, and have approximately 1,100 vehicles by 2025 in order to adequately serve the demand generated in San Francisco. BART's current funding, however, leaves us more than 300 rail cars short of this total. The DEIR should take this information into account in analyzing projected transit capacity and crowding.

2. BART should be represented on the Ballpark/Mission Bay Transportation Coordinating Committee. BART looks forward to working with the City to identify appropriate short-term and long-term mitigation strategies and operational actions to address identified transportation shortcomings.

3. The proposed Transportation Management Plan's (TMP) objective is to mitigate surface traffic impacts by shifting trips from personal vehicles to other modes. Given the significant traffic impact of the project under all scenarios analyzed and the subsequent need for a successful implementation of the TMP, the impacts of the target mode shift to transit on BART capacity should be anticipated, quantified and closely monitored.

4. The DSEIR analysis does not sufficiently detail its methodology and assumptions to enable the reader to interpret the analysis and the extent of impact for both BART operations and station capacity. For all scenarios, assumptions should be documented, including numbers of trains, train capacity, transfer (station) locations and directions of travel, average travel times to each station (to better understand passenger arrival times at the stations and their impact on station and operation capacity), etc.

5. Timing of Central Subway Service: Currently, the arena is scheduled to open prior to commencement of Central Subway service. If that sequence holds, Warriors fans taking BART will rely almost solely upon the Embarcadero Station - with nearly 38,000 daily boardings, the most heavily patronized station in the BART system. BART currently experiences heavy congestion at both Embarcadero and Montgomery Stations (and is working with the City to develop capacity improvements to these stations). Embarcadero Station also has the narrowest platform width of the Market Street stations. To ensure that BART can safely deliver patrons to events (in addition to accommodating peak commute loads), the City should work with BART to mitigate the short-term impact to ridership at these stations. BART seeks mitigation measures in the both short and long term to divert trip generation at Montgomery and Embarcadero stations.

6. The project sponsor should work with regional transit providers to encourage inbound event patrons to consider AC Transit Transbay service during the Inbound PM Peak. In general, all transit information should be seamlessly integrated with proposed dissemination of parking information so patrons understand all travel options simultaneously, including transit.

7. BART is concerned about Transbay operating capacity in the eastern direction during the late evenings after events, especially after simultaneous events throughout the city on Friday and Saturday nights. Analysis for this scenario (OUTBOUND from project site) was not included in the DSEIR. Given the timing of the ends of basketball games and large events, and the time required to travel to BART stations, event patrons may be using the last trains of the evening when stations and trains are already crowded. For this scenario, the DSEIR needs a broader definition of "simultaneous events" that are known to significantly increase BART ridership. This includes other events occurring and ending simultaneously throughout the city and along the Market Street Corridor (i.e. concert venues), as well as the "ambient" increase in ridership on weekend late evenings. At a minimum, the project should call for monitoring transit capacity during this condition (late evening OUTBOUND to East Bay on Fridays and Saturdays).

8. Station Capacity: BART's NOP comment letter stated that the City needs to work with BART to analyze the impacts of the proposed Project on peak period travel for station capacity as well as line haul capacity to ensure that BART can safely deliver patrons to and from events. However, there was no station level ridership forecast, or analysis, to determine the impacts to individual stations.

9. 16th Street Station: BART is particularly aware of station loading capacity constraints at the 16th St. station. It is unclear from the analysis how many patrons would need to transfer to Muni service at this station, or what impacts that could have at the station plazas. This station does not have faregates on the concourse level nearest the entrance on the north-east corner of Mission St. and 16th St. To accommodate passengers that will be dropped off at this entrance from either MUNI #22 buses or supplementary shuttles, a new fare area may need to be added, including faregates, station booth and support infrastructure such as CCTV. Staffing needs include a station agent, police and possibly staff to meter passengers at the concourse and platform level.

Thank you for the opportunity to comment on this Draft SEIR. Please call me if you have any questions.

Sincerely,

Val Joseph Menotti

Caltrain

July 27, 2015

Ms. Tiffany Bohee
OCII Executive Director
c/o Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Ms. Bohee:

Subject: Comments on the Draft Subsequent Environmental Impact Report for the Event Center & Mixed Use Development at Mission Bay

On behalf of the Peninsula Joint Powers Board (JPB) Caltrain is submitting the following comments on the Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (the Project). Caltrain provides commuter rail service between San Francisco, San Jose and Gilroy, operating a mix of express, local and limited service. Today, Caltrain operates 92 trains per weekday, 36 trains on Saturday and 32 trains on Sunday. Caltrain also operates supplemental service for a variety of special events including extra trains after San Francisco Giants games.

The Project site is located 0.8 miles south of the Caltrain terminal at Fourth/King and 0.9 miles northeast of Caltrain's station at 22nd Street and the analysis in the DSEIR indicates that travel demand generated by the project on event days will result in a substantial addition of riders to the Caltrain system. Specifically Caltrain notes that Impacts TR-5 and TR-14 identify Caltrain service as being significantly capacity-impacted to and from the South Bay during the weekday evening, weekday late evening, and Saturday evening peak hours during both the "Basketball Game Scenario" (Impact TR-5) and the "Basketball Game with Overlapping SF Giants Game at AT&T Park Scenario" (Impact TR-14) evaluated in the DSEIR.

In response to the above impacts the DSEIR identifies mitigation measure M-TR-5a "Additional Caltrain Service," noting that implementation of this measure would reduce or minimize the severity of the capacity utilization exceedances for Caltrain and would not result in secondary transportation impacts. The DSEIR also notes, however, that the provision of additional Caltrain service is uncertain and full funding for the service has not yet been identified. Implementation of the mitigation measure thus remains uncertain and impacts TR-5 and TR-14 are found to be Significant and Unavoidable with mitigation.

PENINSULA CORRIDOR JOINT POWERS BOARD
1250 San Carlos Ave. – P.O. Box 3006
San Carlos, CA 94070-1306 650.508.6269

Caltrain agrees with the DSEIR's analysis of capacity impacts to our service, the conclusion that additional service has the potential to mitigate a portion of these impacts, and the statement that additional Caltrain service has not yet been defined, funded or agreed to. Caltrain understands the importance of the regional transportation services we provide and we look forward to working collaboratively with the City and County of San Francisco and the project sponsors to address the transportation challenges and opportunities presented by this unique project. As the project advances through the environmental process we encourage the City and the project sponsors to engage with us directly to more formally define, analyze and identify funding for any contemplated increase in Caltrain service.

Sincerely,

Stacy L. Cocke

Hi Brett,

It was nice talking to you this afternoon! Per our conversation, could you provide information on the following?

- Who at Caltrain (or Samtrans) was the notice of availability sent to?
- Did the EIR analyze capacity impacts to Caltrain inbound service during the PM (pre-event) condition?

Thanks!

re: Draft SEIR for case number: OCII: ER 2014-919-97; Planning Dept: 2014.1441E

Dear Sirs and Ladies:

I am writing on behalf of the Golden Gate Audubon Society in response to the Draft SEIR for the Event Center and Mixed-use Development project at Mission Bay Blocks 29-32. We were pleased to see that this SEIR included planned mitigations for possible impact to resident and migratory birds. Two specific areas are addressed: Mitigation Measure M-BI-4a: Pre-construction surveys for nesting birds; and Mitigation Measure M-BI-4b: Bird-Safe Building Practices (refer to details in table 1-2, biological resources, initial study section E13; vol 1 pages 1-58, 1-59). Also the project description in section 3 (page 3-28) mentions Bird-Safe Design: *"The project sponsor proposes to incorporate bird-safe design measures that would reduce the potential effects of the proposed buildings, signage and lighting on birds."* The bird-safe building codes are important regulations that San Francisco has adopted – making our city a national leader in environmental stewardship. **We hope that you will do your utmost to meet and even exceed the bird-safe building design codes.**

There are some open questions regarding the planned open space near the project (Bayfront Park, and Agua Vista Park). It is not clear if the scope of this SEIR includes those spaces. These are additional areas of possible impact to bird populations on the shoreline. For example, the old piers off the Bayfront Park area served as the last remaining sites in San Francisco where Caspian Terns had nested collectvely. Replacement nesting platforms were proposed to be built by the Port of SF as required mitigation for America's Cup (and hasn't been done as promised yet). The shoreline beach area is also used by birds on migration, so further development of this area could have deleterious impact on wildlife use. Part of the beauty and attraction of these areas is the waterfront, so to the extent that you can incorporate natural waterline and structures that sustain the presence of charismatic wildlife (such as birds), you are serving both the people and the health of the San Francisco Bay. We encourage you to consider native plantings and features that support native wildlife. To the extent that these natural resources are negatively impacted, it will be necessary to mitigate for those impacts.

Thank you for your consideration of comments on this project. We encourage project leaders to be familiar with the biological report which both Golden Gate Audubon had submitted a few years back pertaining to this general area. It is called, *A Summary Report of Avian Surveys Conducted in 2008 at Dilapidated Piers and Other Structures along the Port of San Francisco's Southern Waterfront Properties* which was provided to the Port of San Francisco.

GOLDEN GATE AUDUBON SOCIETY
2530 San Pablo Avenue, Suite G, Berkeley, CA 94702
phone 510.843.2222 *web* www.goldengateaudubon.org *email* ggas@goldengateaudubon.org

As the project proceeds, GGAS would like to be kept informed about the results of the surveys, and proposed construction plans to reduce instances of collisions with birds. We can be reached at (510) 843-2222.

Very sincerely yours,

Cindy Margulis

Re: Comments On Golden State Warriors Arena Draft SEIR

Dear Ms. Bohee:

The undersigned small business owner/operators of trucks locally based in Bayview-Hunters Point want to thank you and OCII for giving us the opportunity to comment on the Draft SEIR for the proposed Golden State Warriors Arena at Mission Bay. Our group of highly qualified hazardous-certified truckers are made up of local minority truck owners who reside in and/or hire our drivers and other employees from the local community. We park our vehicles at the Port of San Francisco railyard off Third Street, which also hires exclusively from the local community. Our member truckers transport contaminated and hazardous waste to the railyard from remediation projects all over San Francisco and the Bay Area. The local truck-to-rail system offers the following benefits to projects like the Warriors Arena project:

- Railyard is just a few blocks from arena site compared to 250 miles one-way for long-haul truck trip to Southern California landfills;
- Excavation phase impacts can be reduced months by using truck-to-rail option;
- Reduced fuel consumption by hundreds of thousands of gallons and reduced toxic air emissions (CO_2) by millions of pounds per project;
- Reduced liability of hazardous waste at high speeds down public highways;
- Economic development dollars stay in our neighborhood.

With that in mind, here are our comments on the Draft SEIR:

1. We found no mention in the EIR documents about the geology or toxic containimation at the proposed site. Our group of truckers hauled more than 100,000 tons of toxic soils from the Shorenstein office buildings site (formerly Union Oil tank farm owned by Chevron-Texaco) immediately adjacent to the south side of the proposed arena site. Our understanding is that the arena site has similar contamination, which should be discussed in the EIR.

2. The project plans show the arena building being sunken down into the site, which means the soils currently there will need to be excavated and removed. Since the arena site is at least as big as the adjacent Shorenstein site, and since the fill material is likely similar, in excess of 100,000 tons of soils will likely need to be removed. The traffic, air and other impacts from this soil removal activity during the construction period should be discussed in the EIR. We believe using the same very successful approach as used on the Shorenstein project, mass excavation and 1-mile haul down Illinois Street to the railyard – would result in the least environmental impacts of all options.

3. We would like to see the direct excavation of all Class 1 toxic soils and use of our local truck-to-rail as the preferred remediation option because:

   (a) any *on-site treatment* of toxic soils means double or triple-handling of the waste and airborne toxics spread into nearby neighborhoods and the Bay;

   (b) *long-haul trucking* has the ability to remove from the site only 500 tons daily maximum, and due to a shortage of hazardous trucks in the State, possibly far less. This means the excavation phase of the site preparation could take months more than the local rail option; would generate many times the amount of CO_2 and other toxic air emissions as the rail option; and would have far greater risk of impacts on the driving public due to millions of high speed truck miles with toxic waste from the project.

   (c) *local truck-to-rail* option can remove 3,000 tons daily and reduce the period of construction (and impacts from construction) by months; offers a 1-mile one-way truck haul versus a 250-mile one-way truck haul to Southern California; offers significantly reduced fuel use and toxic emissions; offers the ability to use 100% local-based minority and women-owned truckers.

Other projects that our team of local truckers have successfully hauled hazardous and contaminated soils to the railyard at the Port, in addition to the adjacent Shorenstein project, include: UCSF Medial Center at Mission Bay; Kaiser Medical Center @ Mission Bay; Transbay Terminal; Pac Bell Park; The Gap Headquarters; SFMTA Third Street Light Rail; Hunters Point Naval Shipyard; Equity Potrero –16th Street; Embarcadero Waterfront Improvement; Avalon Bay Communities; SFMTA Central Subway; and hundreds more that have chosen the local truck-to-rail option as the best option.

We would like that our community truckers be able to take part in this exciting and historic project using our successful truck-to-rail approach. And again, we appreciate the opportunity to comment on the EIR.

Subject: RE: Mission Bay CAC Agenda - July 9th Meeting
Importance: High

Hilde, good morning. We are reading through the Warrior's DEIR and encountering major heartburn with the noise and vibration analysis and mitigation. First, we see continuing reference to the MB Good Neighbor Policy and the SFEIR for MB completed in 1998. None of us in the MB life science community have seen those documents much less participated in the development of same. Life science and specifically sophistication of instrumentation and evolution of preclinical work has changed dramatically since 1998.

Could you please forward a copies of at least the Good Neighbor Policy as soon as is possible.

Best regards

Catherine

June 18, 2015

San Francisco Chronicle

Dear Sir or Madam:

Professor Richard Zitrin is absolutely correct in his June 18th op ed that the Warriors need to stay in Oakland. What he did not address is what one of my law professors said you always need to examine: "cui bono", to whose benefit. Moving the Warriors to San Francisco is all about getting more money for the out-of-state owner of the Warriors. Think luxury boxes and increased ticket prices. Just like Larry Ellison after extracting concessions for the America's Cup abandoned San Francisco and chose to go to San Diego for the next Cup, do you think the Warrior's owners are acting in the best interest of the Bay Area. The ads they have placed in the Chronicle using sports figures like Joe Montana to promote their scheme is pure hypocrisy. Where was Joe when the 49ers moved, looking to invest in real estate in Santa Clara. Remember how San Francisco felt when the Yorks moved the 49ners. Let's put a stop to such behavior. Maybe we should be talking about with public ownership of sports teams such as in Green Bay and demand the owners provide that as a condition of locating in a city. Over the 40 years between championships, the arena in Oakland has been sold out regardless of the Warrior's record. There is no reason to move the Warriors from Oakland. The Coliseum site has much better access, particularly to public transportation than the proposed Mission Bay site adjacent to a new hospital. One only needs to go to ATT Park and recognize the traffic problems when the Giants are playing. Hopefully, you do not need to see a doctor when the Warrior's are playing. Its about time that we see professional sports teams as a benefit to the entire Bay Area and that we plan for multiple venues so all cities can share the benefit and burdens. This is the true "sharing" economy.

Re: **Request for extension of comment period.** Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms. Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance, an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project").

I write to request a 45-day extension, to September 3, 2015, of the public comment period on the Draft Subsequent Environmental Impact Report ("DSEIR"), currently set to expire on July 20, 2015. This extension is necessary for the public, including my client, to meaningfully comment on the DSEIR.

The Project is a large, multifaceted sports, entertainment, and office complex situated in a densely populated metropolitan area. The Project vicinity is expected to experience large increases in traffic even without this Project. (See San Francisco Transportation Plan, 2040.) Also, the Project setting has a long history of industrial and chemical pollution, yet retains a wide diversity of environmental resources and amenities that are threatened by further development.

As a result, this DSEIR has a long and complex environmental review history under CEQA, including the 1990 FEIR for the Mission Bay Plan, the 1998 FSEIR for the Mission Bay North Redevelopment Plan and the Mission Bay South Redevelopment Plan, and nine addenda to the 1998 Mission Bay FSEIR (completed between 2000 and 2013) for specific developments within Mission Bay that required additional environmental review beyond the 1998 FSEIR. (See DSEIR, p. 2-4 - 2-

5.)

Consequently, 45-days is simply not enough time to meaningfully review and comment on the DSEIR. Indeed, in recognition of the depth and complexity of the environmental review needed for the Project, the City recently obtained a one year extension (from January 1, 2016, to January 1, 2017),[1] from the state legislature of the deadline by which the City must certify the Project's Final SEIR in order to qualify for the "super fast track" litigation schedule provided in AB 900 (codified at Public Resources Code section 21178 et seq.).

The City has been engaged in the environmental review of development in Mission Bay for over 25 years. The City has also been engaged in the environmental review of the Warriors Arena Project for over a year, since April 29, 2014,[2] or at least since preparing the June 24, 2015, Administrative Draft of the DSEIR. Further, with the comment period ending on July 20, 2015, the City will have almost a year and a half to respond to public comments and issue the Final SEIR, and process any appeal of the FSEIR certification to the Board of Supervisors and still take advantage of AB 900's "super fast track" litigation schedule.[3]

These facts reveal an EIR preparation schedule that confers a vast advantage on the City over members of the public who do not share the City's strong desire to locate the Warriors arena in Mission Bay. In the interests of fairness and meaningful public participation in the EIR process, the City should extend the comment period on the DSEIR for at least 45 additional days, to September 3, 2015. Indeed, public participation in the EIR process is fundamental state policy:

> An EIR is an "environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." [citations omitted] The EIR is also intended "to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." [citations omitted] Because the EIR must be certified or rejected by public officials, it is a document of accountability. If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant

---

[1]See Public Resources Code section 21189.1.

[2]See April 29, 2014, CCII Agenda, Item # *.

[3]The deadline for filing the EIR appeal is 30-days after OCII certifies it. The clerk is required to schedule the hearing on the appeal no earlier than 21-days and no later than 45-days after the 30-day appeal period expires. (San Francisco Administrative Code § 31.16.)

> action, and the public, being duly informed, can respond accordingly to action with which it disagrees. [citation omitted] The EIR process protects not only the environment but also informed self-government.

Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 392.)

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

RE: Notice Regarding Incomplete Record for Warriors Event Center Environmental Review

Dear Ms. Bohee and Mr. Bollinger:

This firm represents the Mission Bay Alliance with respect to the Warriors Event Center project. Under Public Resources Code section 21186, which pertains to preparation of the administrative record for projects under the AB 900 "Environmental Leadership" process:

> (a) The lead agency for the project shall prepare the administrative record pursuant to this division concurrently with the administrative process.
> (b) All documents and other materials placed in the administrative record shall be posted on, and be downloadable from, an Internet Web site maintained by the lead agency commencing with the date of the release of the draft environmental impact report.
> (c) The lead agency shall make available to the public in a readily accessible electronic format the draft environmental impact report and all other documents submitted to, or relied on by, the lead agency in the preparation of the draft environmental impact report.

Upon review of the records posted at www.gsweventcenter.com it is apparent that all of the available documents that would be part of the record as defined by Public Resources Code section 21167.6, subdivision (e) are not included. For instance, references cited in the 2015 DSEIR, 2014 NOP/Initial Study, the 1998 Mission Bay SEIR and the 1990 Mission Bay EIR are not included. These references would fall under both Public Resources Code section 21186, subdivision (c) (documents relied upon by lead agency) as well as Public Resources Code section 21167.7, subdivision (e)(10) (materials relevant to compliance with CEQA). (See also CEQA Guidelines, § 15150, subd. (b)

("Where part of another document is incorporated by reference, such other document shall be made available to the public . . . .).)

As just one example, a cultural resources evaluation that was prepared for the 1990 Mission Bay EIR and referenced in the 2014 NOP/Initial Study that is the basis of the entire cultural resources section is also missing.[1] Since the 2015 DSEIR completely relies on analyses found in prior environmental review documents for analysis of cultural impacts (and several other resources), it is essential that the public have access to all of the documents that form the basis for this analysis. Additionally, some references in the 2015 DSEIR are not yet included on the website. For instance, the 2015 DSEIR cites to "54 Federal Register 38044, September 14, 1989." (DSEIR, p. 5.4-13, fn. 21.) This office has also already requested several reference documents cited in the NOP/Initial Study and other reference documents that are critical to analysis of seismic hazards for the site and appreciates your attempts to locate those documents. (See email attached as Exhibit A.)

Moreover, we believe that not all of the correspondence regarding the project has been posted. (See Pub. Resources Code, §§ 21167.6, subd. (e)(7), (10), 21186, subd. (c).) Specifically, all of the documents responsive to Mr. Spaulding's May 18, 2015 Sunshine Act/Public Records Act request would properly be included in the record and appear to not yet be posted on the record website.

AB 900 expressly mandates that a complete record be posted online at the time of release of the DSEIR in order to receive streamlining benefits. (Pub. Resources Code, § 21167.6, subd. (b).) As those documents already in existence that comprise the record have not yet been posted, the 45-day comment period has not properly commenced, and may only commence when all of the documents now in the City/OCII's possession that constitute the record are posted. The current comment deadline of July 20, 2015, will need to be extended accordingly. Until there is compliance with the record posting requirements of Public Resources Code section 21086, this project cannot proceed under the AB 900 process.

[1] "Cultural Resources Evaluation for the Mission Bay Project, San Francisco, CA" Dec. 1987, prepared by David Chavez & Associates. This report is cited at page VI.J.30 of the 1990 EIR and referenced on page 46 of the November 19, 2014 NOP/Initial Study. There is also a 1997 Archaeological resources review, also prepared by David Chavez & Associates, and referenced in the Initial Study that is not included in the online record.

Please feel free to call me to discuss proper resolution of the issue of the posting of a complete record as required under the AB 900 process. I also request immediate confirmation that the 45-day DEIR comment period will not commence until the necessary documents, as set forth above, are posted in compliance with AB 900. We look forward to your prompt response.

Very truly yours,

Subject: RE: Request for EIR Reference Documents

Hi Brett,
Thank you for your call. The date of the report linked below is March 28, 2008, whereas the date of the document referenced on p. 3 of the April 11, 2014 Updated Phase I Assessment is March 7, 2008. The document title appears to be the same, but if there was a prior draft, we would request that as well.

Here are the additional source documents citations to references that my consultant has identified as essential to his review of the DSEIR:

1. The September 17, 1998 SEIR, Section V.H.5 cites a 1995 geotechnical investigation by Treadwell & Rollo, Inc. The reference listed "/15/" for that report cites to "The results of earlier geotechnical investigations are discussed in the 1990 FEIR, Volume One, pp. II.76-II.77, and Volume Two, pp. VI.K. 1-VI.K. 11, VI.K.24-VI.K.30.*"

   The 1995 Treadwell & Rollo report is needed for review.

2. Reference "/16/" cites to the following:
   Treadwell & Rollo, Inc., Environmental and Geotechnical Consultants, Lori A. Simpson, PE, and Frank L. Rollo, PE, Proposed UCSF Site, Mission Bay, San Francisco, CA, letter report to Kerstin Magary, Catellus Development Corporation, 31 October 1994, 2 pages accompanied by 38 figures; Treadwell & Rollo, Inc., Environmental and Geotechnical Consultants, Loft A. Simpson, PE, letter to EIP Associates, March 12, 1997, 1 page accompanied by 6 figures.

   The 1994 Treadwell & Rollo report letter report and 1997 letter report are needed for review.

3. Recent Geotechnical Reports: The only geotechnical report that is listed on the http://www.gsweventcenter.com/ site is a March 28, 2014 Preliminary Geotechnical Evaluation by Langan Treadwell Rollo. This letter report is lacking any site data or analysis. The report presents conclusions and recommendations based on unidentified previous site investigations. The supporting data/reports/analysis should be identified and presented for review.

4. According to the June 2015 Phase II ESA by Langan Treadwell Rollo, the following geotechnical reports have been completed for the site:

   Langan, 2011. Geotechnical Investigation, Blocks 29-32, Mission Bay, San Francisco, California. 21 December.

5. According to the April 11, 2014, Update Phase I, ESA by Langan Treadwell Rollo, the following geotechnical reports have been completed for the site:

   Treadwell & Rollo (T&R), 2007. Geotechnical Investigation, Block 30, Mission Bay, San Francisco, California. 17 October.
   T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 29-32, Mission Bay, San Francisco, California. 7 March.

T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 33-34, Mission Bay, San Francisco, California. 29 May.

I look forward to receiving the documents previously requested on July 3rd, as well as those listed above, as soon as possible as they are needed for our review and comment on the DSEIR.

Best regards,
Osha

Subject: Request for EIR Reference Documents

Dear Mr. Bollinger and Ms. Bohee,

We are trying to locate the references listed below from pp. 3-4 the Phase I Environmental Site Assessment dates April 11, 2014 that was prepared by Langan Treadwell Rollo that is posted at the Record website (http://www.gsweventcenter.com/). The direct link to the document is: http://www.gsweventcenter.com/Draft_SEIR_References/2014_0411_Updated_Phase_1_ESA.pdf.

Treadwell & Rollo (T&R), 2007. Geotechnical Investigation, Block 30, Mission Bay, San Francisco, California. 17 October.

T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 29-32, Mission Bay, San Francisco, California. 7 March.

T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 33-34, Mission Bay, San Francisco, California. 29 May.

Would you please provide these documents to me?

Thanks,
Osha

Re: Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045: **EIR Tiering**

Dear Director Bohee and Mr. Bollinger:

The undersigned counsel for the Mission Bay Alliance write on the Alliance's behalf regarding a threshold procedural issue affecting the Draft Subsequent EIR ("DSEIR") for the Warriors Event Center & Mixed Use Development (the "Project"). The DSEIR unlawfully tiers to prior CEQA documents.

The Mission Bay Alliance objects to the improper use of "tiering" to avoid analysis of important environmental issues in the DSEIR. Both the NOP/IS and the DSEIR announce that they "tier" to the 1998 Mission Bay EIR pursuant to CEQA Guideline 15168(c). (NOP/IS, pp. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR exclude resource topics from the DSEIR based on standards CEQA provides to determine when a subsequent EIR is required under Public Resources Code ("CEQA") section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.)

Based on these predicates, the City prepared a focused EIR and conducted no environmental review regarding Biological Resources, Aesthetics, Land Use, Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. The exclusion of those topics from the DSEIR is erroneous as a matter of law and precludes informed public review.

"Tiering" under CEQA is not permitted where the later project is a separate project from the earlier project, where the EIR for the earlier project did not include an analysis of the environmental impacts of the later project, or where the later project is inconsistent with the "program, plan, policy, or ordinance for which an environmental impact report has been prepared and certified" or is inconsistent with "applicable local land use plans and zoning of the city, county, or city and county in which the later project would be located." (*Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156, 1173 (*Sierra Nevada Conservation*); *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318; CEQA, § 21094(b).)

Here, as shown in the "Land Use" section of the July 26, 2015, letter from the Brandt-Hawley Law Group, the Project is not consistent with the Mission Bay Redevelopment Plan or with the land use plans and zoning controls that are subordinate to the Mission Bay Redevelopment Plan. None of them include, anticipate, or allow a 750,000 square foot Event Center! The 2015 DSEIR also states that the Project requires "amendments to the Mission Bay South Design for Development, and modifications to the Mission Bay South Signage Master Plan and Mission Bay South Streetscape Plan, and conditions of approval," among other changes, in the list of approvals required for the Project. (DSEIR, p. 3-51.)

These major differences between the project described in the 1998 FSEIR (that evaluated the effects of developing the Mission Bay plan area as described in 1998 [see DSEIR Figure 3-7]) and the Warriors Event Center and Mixed Use Development now being proposed, preclude tiering under CEQA section 21094. Therefore, the City cannot use a "tiered" EIR and the DSEIR must be reissued in "non-tiered" form.

Further, the exclusion of resource topics from the DSEIR is not, as the NOP/IS and DSEIR presume, governed by CEQA section 21166 and Guideline section 15162 or their standards. Pursuant to section 21151, the DSEIR must analyze the Project's impacts on any environmental resource for which substantial evidence supports a fair argument of significant impact. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099 ["EIRs must "consider and resolve every fair argument that can be made about the possible significant effects of a project."]; see also, *Sierra Nevada Conservation, supra*, 202 Cal.App.4th 1156, 1173 ["If a proposed new activity is a separate project, the "fair argument" test should apply to an agency's decision whether to require a tiered EIR.] Sierra Nevada Conservation cited the holding of *Sierra Club v. County of Sonoma, supra*, 6 Cal.App.4th 1307, 1318, that under the fair argument test, "deference to the agency's determination is not appropriate and its decision not to require an EIR can be upheld only when there is no credible evidence to the contrary." (Ibid.) *Sierra Club* applied the fair argument standard to a proposed project that was not "either the same as or within the scope of" the program described in the EIR. (*Sierra Club, supra*, 6 Cal.App.4th 1307, 1321.)

As discussed in comment letters submitted on behalf of the Mission Bay Alliance, evidence relating to these excluded resource topics meets the "fair argument" standard. Although CEQA section 21166 does not apply here, its standards are also met. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all Project-related environmental impacts. (Since this is a stand-alone EIR, the title 'Subsequent' is a misnomer.)

To the extent the City chooses to use data from the 1990 or 1998 Mission Bay EIRs, that information must be restated in the Revised Draft EIR in a manner that results in a single, cohesive, understandable document meeting CEQA's mandates for adequacy, completeness, and a good faith effort at full disclosure. (Guideline § 15151.)

Thank you for your attention to this matter.

Sincerely,

Thomas N. Lippe   Susan Brandt-Hawley   Osha Meserve   Patrick Soluri

Re: Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045: **AB 900 and Litigation Streamlining**

Dear Director Bohee and Mr. Bollinger:

The undersigned counsel for the Mission Bay Alliance write on the Alliance's behalf regarding the Draft Subsequent EIR ("DSEIR") for the Warriors Event Center & Mixed Use Development (the "Project"). The City's failure to post online administrative record documents before starting the DSEIR comment period renders the Project ineligible for the litigation streamlining provisions of AB 900.

On July 9, 2015, the Mission Bay Alliance advised the City that it had failed to post available portions of the administrative record online as required by CEQA section 21186, subdivision (b), and as a result, the 45-day comment period on the DSEIR could not commence. The City responded on July 16, 2015, stating that the record was complete and that the documents alleged to be missing were not considered by the City in preparing the DSEIR. The City also extended the public comment period by a mere seven days, a decision it explained elsewhere was to "account for any time off that the public may have enjoyed over the Independence Day holiday." (July 15, 2015, Letter from OCII to Tom Lippe.)

The City's position ignores CEQA's statutory language regarding the required content of the record. Under CEQA section 21186, subdivision (a), preparing the "administrative record pursuant to this division" means that the record posted must include all of the available documents that are part of the record as defined by section 21167.6, subdivision (e).[1] The 45-day public comment period cannot begin until all existing administrative record documents are posted to the City's record website.

Regarding specific documents the City has omitted from its record website, the City has taken the position that references cited in the 2015 DSEIR, 2014 NOP/Initial Study, the 1998 Mission Bay SEIR and the 1990 Mission Bay EIR are not part of the record and that the online record is complete. But this position is entirely at odds with the City's reliance on a tiered SEIR. Since the 2015 DSEIR relies completely on analyses found in prior environmental review documents to avoid analysis in the DSEIR of at least half the CEQA mandated resource areas, it is essential that the public have access to all of the documents that form the basis for these analyses.

Additionally, the online record is missing additional categories of documents. For example, the City has failed to post correspondence among City employees and with consultants regarding the project. The Mission Bay Alliance understands that several different consultants and City agencies are involved in the project, yet there is not even a category on the record website for this correspondence. These materials are part of the record. (CEQA §

[1]The City cannot argue AB 900 implicitly repealed section 21167.6 because the Legislature is presumed aware of existing law when it acts (see, e.g., *Voters for Responsible Retirement v. Board of Supervisors* (1994) 8 Cal.4th 765, 779, fn. 3). This is especially true here, where the relevant definition is within the same statute the Legislature amended.

21167.6, subd. (e)(2).) The City has also failed to post agendas and staff notes from ongoing weekly City meetings regarding this Project and its environmental review.[2]

There has also been staff correspondence regarding the procedures applicable to the online record, such as a June 10, 2015, ESA memorandum entitled: AB 900 Administrative Record Update Procedures for the Golden State Warriors Event Center and Mixed Use Development at Mission Bay Blocks 29-32.

These are just a few examples of how the City has not carried out its obligation to post all available record documents online before commencing the 45-day comment period. Contrary to the position taken in the City's July 16, 2015, letter, which implies the public must identify the missing documents, it is the City's duty to locate, index, and post the documents comprising the record.

AB 900 requires the City to post all available record documents online when the DSEIR is issued in order to receive its litigation streamlining benefits. For this purpose, "record documents" is defined in CEQA section 21167.6, subdivision (e). The City cannot have it both ways. It cannot violate AB 900's record posting requirements and at the same time enjoy the benefits of AB 900's litigation streamlining provisions. Therefore, in order to take advantage of AB 900's litigation streamlining provisions, the City must post all existing record documents before commencing the 45-day comment period. Otherwise, the Project is ineligible for the streamlining provisions of AB 900.

[2] To the extent these documents are posted, they are not individually indexed as required. (See Cal. Rules Court, rule 3.2205.)

Thank you for your attention to this matter.

Sincerely,

Thomas N. Lippe   Susan Brandt-Hawley   Osha Meserve   Patrick Soluri

Re: Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

I am writing on behalf of the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

The Alliance opposes this Project because it will change the Mission Bay community and environment in ways never envisioned when the Mission Bay Redevelopment Plan was adopted in 1998, and because the City's Draft Subsequent Environmental Impact Report ("DSEIR") for the project does not present a good faith, adequate analysis of these impacts.

The Alliance has retained several experienced CEQA attorneys to review and comment on the DSEIR, including Tom Lippe of the Law Offices of Thomas N. Lippe, Susan Brandt-Hawley

of the Brandt-Hawley Law Group, and Patrick Soluri and Osha Meserve of Soluri Meserve. Counsels' comments letters, and their retained consultants' reports, are being submitted to the City under separate cover. A complete inventory of these letters to date is presented at the end of this letter.

The DSEIR is noteworthy because it concedes the Project will cause numerous significant impacts on the Mission Bay community and environment (e.g., traffic, air pollution, noise pollution, and many others). Nevertheless, the Alliance's counsel have discovered many deep flaws in the DSEIR that obscure the true scope and severity of the Project's impacts.

For example, based on the incorrect premise that the DSEIR is permitted to "tier" to a seventeen year old prior EIR, the DSEIR fails to even discuss half of the environmental topics that an EIR would ordinarily include. One of these excluded topics is "land use." This is truly remarkable considering that the 1998 Redevelopment Plan to which this DSEIR attempts to tier never contemplated a major sports and entertainment center of this type and scale. Instead, the Arena will divert land and civic resources away from the land uses, i.e., health sciences and biotechnology, that the 1998 Redevelopment Plan was intended to promote.

In another example, the DSEIR's analysis of the Arena's severe traffic impacts is artificially and arbitrarily limited to the Mission Bay area plus a handful of additional intersections and freeway ramps. The Alliance's traffic engineers demonstrate, in a more objective analysis, that the Arena's traffic snarling influence will extend much farther into SOMA, Downtown, and Dogpatch areas. The DSEIR also ducks revealing more bad news about the Arena's cumulative impact on traffic in the years following its construction. Instead of projecting cumulative traffic effects 5 to 10 years out, the DSEIR offers up a virtually meaningless projection for the year 2040, fully 25 years in the future.

The DSEIR also offers no data to support its conclusion that Arena events will not interfere with emergency access to UCSF Hospital. Instead, it offers weak rationalizations, such as the idea that drivers are supposed to get out of the way of emergency vehicles. But it is common knowledge that in special event situations, and even on normal days in SOMA, vehicles are often queued bumper-to-bumper and pedestrians are swarming the crosswalks. In these situations, drivers often cannot clear the way for emergency vehicles. Regardless of the DSEIR's prevarications to the contrary, this scenario *will* occur during basketball games and ambulances *will* be delayed.

Even the DSEIR's assumptions made about the available parking supply present a stark departure from the reality of parking conditions at Mission Bay and underscore the high level of wishful thinking involved in selling a project wholly incompatible with this region. The project itself only includes 200 onsite parking spaces specifically dedicated for the arena's use. Yet, rather than concede the limited onsite parking, the DSEIR suggests that ample parking will be available to serve the arena's needs by listing all 9,135 possible parking spaces in the Mission Bay region, including street parking. Unfortunately, the vast majority of those spots are currently reserved by UCSF hospitals, UCSF facilities, the Giant's stadium and neighboring businesses, and the DSEIR lacks any evidence to support the assumption that any of these spaces - let alone the majority - will be available for use by arena patrons. It also fails to explore the impact on neighboring communities in the Dogpatch and Potrero Hill areas that will bear the burden of accommodating the thousands of additional cars seeking, but unable, to park in Mission Bay.

These are but a few of dozens of legal defects the Alliance's counsel found in the DSEIR. The volume, scope, and depth of the DSEIR's legal flaws demand, and suggest, an explanation. It appears the Warriors and the City have been in such a rush to get this Project approved and built that they have ignored elementary principles of environmental analysis and CEQA law in the process. The sources of this haste are presumably the previous January 1, 2016, deadline, now extended to January 1, 2017, to certify the EIR in order to obtain the litigation streamlining benefits of AB 900, and the expiration, in late September of 2015, of the Warriors option to purchase the site from Salesforce.com.

Given the Arena's many severe environmental and community impacts, and the DSEIR's attempt to sweep many of these issues under the rug, the Alliance urges the City to slow down

and carefully consider both the legality of siting the Arena in Mission Bay as well as the lack of wisdom in doing so.

A list of the Alliance's counsels' and consultants' comment letters follow.

Thomas Lippe, Susan Brandt-Hawley, Patrick Soluri, and Osha Meserve have jointly submitted the following comment letters on Alliance letterhead:

1. July 26, 2015, letter regarding EIR tiering; and

2. July 26, 2015, letter regarding litigation streamlining under AB 900.

Thomas Lippe has submitted the following comment letters and consultant reports:

3. July 24, 2015, letter regarding impacts on Hydrology, Water Quality, and Biological Resources, including:

   a. July 21, 2015, letter report authored by Matt Hageman, P.G., C.Hg., QSD, QSP; and

   b. July 21, 2015, letter report authored by Erik Ringelberg, B.Sc., M.Sc., Ph.D candidate; and Kurt Balasek, PG, CHg, QSD.

4. July 25, 2015, letter regarding impacts on Noise and Vibration, including:

   a. July 24, 2015, letter report authored by acoustic engineer Frank Hubach.

5. July 26, 2015, letter regarding impacts on Air Quality, including:

   a. July 19, 2015, letter report authored by Greg Gilbert; and

   b. July 20, 2015, letter report authored by Paul Rosenfeld, Ph.D, and Jessie Jaeger.

6. July 27, 2015, letter regarding impacts on Transportation, including:

a. July 23, 2015, letter report authored by traffic engineer Dan Smith; and

b. July 21, 2015, letter report authored by traffic engineer Larry Wymer.

7. June 29, 2015, letter requesting an extension of the public comment period on the DSEIR.

Susan Brandt-Hawley has submitted the following comment letter:

8. July 26, 2015, letter regarding impacts on Land Use, Aesthetics, Cultural Resources, and Project Alternatives.

Patrick Soluri and Osha Meserve have submitted the following comment letters and consultant reports:

9. July 26, 2015, letter regarding impacts on Geology and Soils, Recreation, Hazardous Materials, , Greenhouse Gases, Wind and Shadow, Utilities and Service Systems, Public Services, Energy and Urban Decay, including:

a. July 22, 2015, letter report authored by air quality professionals Patrick Sullivan, CPP, REPA, and Joh Henkelman, regarding Greenhouse Gas Emissions;

b. July 22, 2015, letter report authored by geotechnical engineer Lawrence Karp, CE, CEG, regarding Geology and Soils impacts;

c. July 22, 2015, letter report authored by engineering geologist Marin Cline, CEG, and hydrogeologist Kurt Balasek, PG, CHg, QSD, regarding Geology and Soils impacts);

d. July 22, 2015, letter report authored by geotechnical engineer Martin Cline, GEG and Kurt Balasek, PG, CHg, QSD, regarding Hazardous Materials; and

e. July 22, 2015, letter report authored by economist Philip King, Ph.D., regarding Urban Decay.

10. June 29, 2015, letter regarding the City's failure to comply with AB 900 record keeping procedures and the resultant ineligibility of the Project for AB 900's litigation fast track procedures.

The Board of Directors of the Mission Bay Alliance fully supports and endorses the comment letters and reports listed above, and respectfully urges the City to remedy the DSEIR's informational deficiencies and circulate a Revised DSEIR for a 45 day public comment period.

Thank you for your attention to this matter.

Sincerely,

Bruce Spaulding

Subject: Comments on the Draft Subsequent EIR
Warriors Event Center & Mixed Use Development
Mission Bay Blocks 29-32
OCII: ER 2014-919-97 Planning Dept.: 2014.1441E

Dear Director Bohee and Mr. Bollinger:

On behalf of the Mission Bay Alliance ("the Alliance"), please respond to these enumerated comments on the Draft Subsequent EIR vis-à-vis project alternatives as well as the analysis and mitigation of aesthetics, land use, and cultural resources impacts. Substantial omissions in these topic areas require revision and recirculation of the EIR to inform the discretion of the City and to apprise the concerned public.

1. The Mission Bay EIRs Did Not Consider an Event Center

EIRs, including the Draft Subsequent EIR ("the DSEIR"), are measured for "adequacy, completeness, and a good faith effort at full disclosure." (CEQA Guidelines, § 15151.) Whether the Event Center EIR analysis meets that measure presents a question of law. (*E.g., Vineyard Area Citizens v. City of Rancho Cordova* (2007) 40 Cal.4th 412, p. 435.)

An overarching problem with the DSEIR is its misapplication of CEQA via a conclusory reliance on earlier CEQA documents — the 1990 Mission Bay EIR and 1998 Mission Bay Subsequent EIR — prepared for the Redevelopment Plan for the Mission Bay South Redevelopment Project and its related Design for Development. The City cannot now rely on those EIRs because both the Redevelopment Plan and the Design for Development contemplated no uses comparable to the Event Center. Its environmental effects were *not* "adequately examined by an earlier EIR." (Pub. Resources Code, § 21094; Guidelines, § 15063.)

Every environmental issue that has potentially significant impacts must be addressed in a project-specific EIR for the Event Center, and feasible mitigations and alternatives must be identified. The City instead improperly "tiered" the DSEIR from the prior Mission Bay EIRs to evade full environmental analysis, as counsel for the Alliance have explained in a separate letter. Consequently, the DSEIR fails to analyze many of the potentially significant project-specific environmental impacts of the Event Center. As in *Center for Sierra Nevada Conservation v. County of El Dorado* (2013) 202 Cal.App.4th 1156, a revised stand-alone EIR must do so.

This letter will address the DSEIR's omitted analyses of critical project-specific impacts relative to land use, aesthetics, and cultural resources.

2. The Draft Subsequent EIR Must Address Land Use

The Notice of Preparation and Initial Study ("NOP/IS" or "Initial Study") acknowledges that, per the 1998 Mission Bay EIR, "the Mission Bay Redevelopment Plans and Design for Development documents … constitute the regulatory land use framework for the Mission Bay plan area." (NOP/IS, p. 30.) The Initial Study finds no need to address land use issues in the DSEIR, contending that the Event Center would not conflict with land use policy, divide a community, or substantially impact area character. (NOP/IS, p. 27). Without additional discussion, the DSEIR agrees, reiterating that project land use impacts are insignificant and that no environmental analysis is required. (DSEIR, pp. 1-49, 5.1.1.)

While clearly aware that CEQA requires revision of the DSEIR to address the project's conflicts with Mission Bay land use policies and significant adverse impacts to community character, the City simply kicks the can down the road:

> As part of the project approval process, OCII, the San Francisco Planning Commission, and other relevant regulatory agencies *would determine* whether the proposed project is consistent with their respective plans as applicable to the proposed project. Thus, the proposed project would have a less-than-significant impact with regard to conflicts with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.

(NOP/IS, p. 31, italics added.) This statement implicitly acknowledges the requirements of

Appendix G of the CEQA Guidelines. Under Appendix G, Section X, a project's potentially-significant conflicts with land use plans that were adopted for environmental protection or mitigation must receive environmental review in an EIR. A rote finding by a lead agency that simply assumes that a project will comply with such land use plans via future action by involved regulatory agencies cannot substitute for the analysis contemplated by Appendix G. (*The Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903.)

The Event Center's Draft Subsequent EIR does just that; unlawfully deferring the analysis and enforcement of land use plan consistency. The DSEIR must be revised and recirculated to provide environmental analysis and mitigation. EIRs must "consider and resolve every fair argument that can be made about the possible significant effects of a project." (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099.) Here, the record illustrates many inconsistencies with land use plans and policies that have potentially significant environmental impacts:

a. *The Event Center is not 'Nighttime Entertainment' as Defined in the Mission Bay South Redevelopment Plan*. The primary objective of the Warriors Event Center is to "[c]onstruct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities […]" (DSEIR, p. 1-3.) The Mission Bay South Redevelopment Plan designates Blocks 29-32 as Commercial Industrial/Retail. While the mixed-use commercial/retail development portion of the project is an allowed primary use, the Event Center itself would have to qualify as "Assembly and Entertainment: Nighttime Entertainment" in order to be approved as an allowed "secondary use" under the Plan.

The Initial Study pronounces that the Event Center — the *primary* project use — is encompassed within the *secondary* "nighttime entertainment" use analyzed in the Mission Bay EIR and is thus allowed on the Commercial Industrial/Retail site. The City contends that the Event Center is a nighttime entertainment use per the 1998 EIR, although "the size and intensity of the event center use was not previously analyzed." (NOP/IS, p. 33.)

This is not based on fact. Aside from being a "secondary" use of the site, the Warriors Event Center does not meet the plain language of the "nighttime entertainment" designation that anticipates and encompasses small-scale clubs, restaurants, and bars. (Mission Bay South Redevelopment Plan, p. 50.) At the time of the 1998 EIR, several small neighborhood bars occasionally offered nighttime entertainment. This minor "secondary" use that existed in the area thus appeared to be compatible with the 3rd Street Corridor and the waterfront. Nothing in the definition of "nighttime entertainment" anticipates or

allows a venue of the type or at the scale now proposed for the Event Center.

The 1998 Mission Bay EIR focused on entertainment-oriented commercial development in Mission Bay North, "intended to complement" the San Francisco Giants Ballpark. The 1998 EIR anticipated almost 400,000 square feet of related entertainment-oriented retail ancillary to the ballpark, including a theater complex of up to 25 screens. If a regional event venue had been anticipated in Mission Bay South, the 1998 EIR would have called it out. It is also telling that "entertainment-oriented retail" in Mission Bay South was projected at only 56,000 square feet, 15% of the size anticipated in Mission Bay North. (1998 Mission Bay EIR, pp. III.2, 10-11; *see also* 1998 CEQA Findings, Mission Bay Plan [projecting only 50,000 square feet of entertainment-oriented retail].)

And while professional basketball games are nighttime events, the Event Center also anticipates 31 annual events "related to conventions, conferences, civic events, corporate events and other gatherings," with an estimated attendance of between 9,000 and 18,500 patrons. (NOP/IS, p. 15.) "[T]he majority of events are expected to occur during day time hours." (*Ibid.*) The definition of "nighttime entertainment" cannot reasonably stretch to consider over a month of daytime events never contemplated or considered by the 1990 and 1998 Mission Bay EIRs.

In these many respects, the Event Center is inconsistent with the adopted land use plan and has potentially significant impacts that require revision of the EIR.

***b. The Event Center Conflicts with Mission Bay South Design Criteria*.** Despite the Initial Study's contention that the Event Center would be consistent with adopted area land use policies established by the Mission Bay South Redevelopment Plan and the Design for Development, it concedes that the project sponsors seek material changes. The DSEIR anticipates amendments to the Mission Bay South Design for Development, the Mission Bay South Signage Master Plan, and the Mission Bay South Streetscape Plan. The Initial Study notes that the "unique nature of the proposed event center would require the sponsor to receive [City] approval of variations or amendments to some of these standards." (NOP/IS, p. 31.)

The Mission Bay South Redevelopment Plan codifies objectives and policies for urban design that must be applied to the Event Center, including:

> **Objective 3**: Emphasize in Mission Bay South the characteristic

San Francisco development patterns …

Policy 2: Design in consideration of protecting major views of the Bay, the Bay Bridge and the Downtown skyline from Mission Bay South … using street view corridors, open space, the careful placement of building forms and building massing.

Policy 3: Create a visual and physical access to San Francisco Bay and the channel of China Basin.

Policy 4: Recognize that buildings, open spaces and view corridors, seen together, will create the character of Mission Bay South.

Objective 4: Create a building form for the Mission Bay South area such that the scale of new development relates to the adjacent waterfront and to adjacent buildings.

Policy 1: Building heights should decrease as they approach water's edge.

The Event Center proposal creates at least 16 inconsistencies with the Design for Development (D4D), and its Appendix A recites amendments for:

- Raising maximum arena height limits from 90 to 135 feet
- Construction of a 160+ foot tower[1] close to another tower
- Increasing the bulk of the arena
- Changing arena setbacks, street wall heights, view corridors, public rights of way, and parking standards

The addition of large signage, electronic advertising, and nighttime light and searchlight effects that accompany basketball games and other large events also conflicts with design review standards and further impacts aesthetics/view corridors. The Commercial Industrial/Retail zone prohibits flashing signs, moving signs, and roof signs as well as business signs "above 1/2 of the base height of the building." (D4D, p.45.)

[1] The tower heights exceed 160 feet with the 16-foot mechanical parapet.

Even if amendments to the Design for Development could avoid legal inconsistencies, the proposed removal of codified urban design protections significantly impacts the design of the Mission Bay community and aesthetic environment and requires EIR analysis and mitigation.

The Design for Development also delineates urban design concepts that protect the community character of Mission Bay South via view corridors and a planned street grid that extends "San Francisco's historic urban pattern of Spanish measure Vara blocks." (D4D, p. 39.) "A Vara is an early Spanish unit of measure equal to 2.75 feet." (D4D, p.16.)

> First is an urban street grid which builds off of the primary existing streets and a traditional San Francisco pattern of Vara blocks, to allow for the transformation of an industrial pattern to one which welcomes the buildings and open spaces of a living/working/shopping neighborhood. In the tradition of cities by the water, this same framework of streets serves as view corridors that visually connect Mission Bay to the Bay and the City's downtown.
>
> View corridors are based on the following principles: to preserve the orientation and visual linkages to the Bay and Channel; as well as vistas to hills, the Bay Bridge and the downtown skyline; to preserve orientation and visual linkages that provide a sense of place within Mission Bay.

(D4D, pp. 39, 47.) The Design for Development specifies that "no building or portion thereof shall block a view corridor." (D4D, p. 39.)

As explained in the statewide planning publication *California Planning & Development Report* in a 1998 article praising the Mission Bay South Redevelopment Plan, "a 'vara block' is the same dimension as the first 10 blocks of San Francisco laid out by Vioget in 1839." (*CP&DR*, 1 September 1998, *attached*.) The vara block is not only of historic importance but "has near-ideal dimensions for an urban block" and "helps clarify, if clarity were needed, what precisely makes San Francisco the most walkable city in America: the dimensions of the grid …" "This new plan … promises to extend the pedestrian experience of San Francisco to the newest part of the city."

CP&DR marvels that the Redevelopment Plan takes a "giant canvas of largely undeveloped waterfront acreage" and uses vara blocks "to integrate this former railyard into the cultural and business life of the larger city." And "what is most remarkable about this scheme is how thoroughly the [UCSF] campus has been integrated into the grid … likened [] to residential blocks in Paris."

The Warriors Event Center proposes to eliminate four blocks, including two vara blocks and two smaller blocks, creating one large single block for the Event Center with structures that obscure both a north-south and east-west view corridor. The DSEIR must be revised to analyze and mitigate the environmental impacts of required amendments to adopted land use plans and policies, addressing the destruction of vara blocks and the related adverse impacts to aesthetics, view corridors, and pedestrian amenities.

While the Initial Study and the DSEIR rely upon Public Resources Code section 21099 to excuse the lack of analysis of aesthetics, claiming that such impacts of a mixed-use project on an infill site within a transit priority area are not subject to CEQA review, the DSEIR acknowledges that the Mission Bay South urban design standards apply to the Event Center project. The DSEIR must still consider aesthetic impacts that are addressed and protected by the City's design review ordinances.

These impacts are significant. The height and bulk of the project, sited directly on the waterfront, will disrupt views and alter the aesthetics and community character carefully planned for Mission Bay South for many years. The City's fundamental vision for Mission Bay would be forever compromised by dropping a tall, bulky sports arena at the water's edge, destroying planned vara blocks and historic view corridors.

The EIR must be revised to analyze and mitigate the project's inconsistencies with plans and policies in Mission Bay South adopted for environmental protection.

c. The Event Center Will Destroy Planned Community Character.
Development of Mission Bay South has been the subject of intensive planning for 25 years, as reflected in the 1990 EIR, the 1998 EIR, and the Mission Bay Redevelopment Plans. The character of the community revolves around medical and biotechnology development. "Because a major UCSF site would likely be a magnet for biotechnology research, an emphasis on biotechnology is anticipated." (1998 Mission Bay EIR, p. IA.89.)

The Warriors Event Center proposes a signature disruption in the long-planned development of Mission Bay South as a biotechnology and medical hub, and EIR analysis of that planned land use change is required. In comments on the Initial Study, research-based biotechnology company FibroGen, located adjacent to the project site, raised concerns about the Event Center's likely disturbance of the company's "operations, sensitive instrumentation, laboratories, and chemicals," all highly sensitive to noise and vibration. "… [G]iven the Project's significant scope coupled with the sensitivity of FibroGen's use and ongoing operations, … it is critical that the EIR thoroughly disclose and evaluate any potential land use incompatibilities with surrounding land uses."

This major planning detour requires EIR revision and recirculation.

3. The DSEIR's Analysis of Alternatives is Inadequate

Because the Event Center has significant impacts, it *cannot be approved* if feasible alternatives could reduce impacts and still accomplish most project objectives. (Pub. Resources Code, §§ 21002, 21081.) Our Supreme Court reiterated this substantive mandate of CEQA in *Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, pp. 123-134. The Court held that "[u]nder CEQA, a public agency must also consider measures that might mitigate a project's adverse environmental impact, and adopt them if feasible," due to "CEQA's substantive mandate that public agencies refrain from approving projects for which there are feasible alternatives or mitigation measures …"

Appropriately, EIRs explore ways for a project to meet as many applicant goals as possible while protecting the environment to the extent feasible. EIRs must evaluate project alternatives that accomplish most basic project objectives. (Guidelines, § 15126.6 (a).) The courts and the Guidelines require that EIRs analyze a "range of reasonable alternatives to the project, *or to the location of the project*" sufficient "to permit a reasoned choice" of alternatives "that would avoid or substantially lessen" any of the project's environmental impacts. (Guidelines, § 15126.6 (a), (c), (f), italics added.)

The Event Center EIR primarily focuses on three alternatives:

Alternative A: No Project
Alternate B: Reduced Intensity
Alternate C: Off-site at Piers 30-32 and Seawall 330

The EIR identifies significant project impacts relating to "traffic; wastewater treatment capacity impacts; crowd and amplified noise; UCSF hospital helipad safety; wind hazards; construction; water quality and hazardous materials; and bird collisions." (EIR, pp. 7-9). As already noted and as will be discussed further, there are other likely areas of significant impact as well.

a. *The No-Project Alternative Must Comply with Land Use Plans.* The point of an EIR's analysis of a No Project alternative is "to allow decisionmakers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." (Guidelines, § 15126.6 (e)(1).) The DSEIR presents Alternative A as its No Project alternative, positing that the Warriors will temporarily remain at Oracle Arena in Oakland and will then likely rebuild or find another site. The EIR fairly assumes that Development at Blocks 29-32 would then occur according to the Mission Bay South Redevelopment Plan and the related Design for Development, without an arena.

However, the DSEIR's depiction of the No Project alternative assumes that without the Event Center the City would allocate most of the remaining development potential anticipated by the Mission Beach South Redevelopment Plan and Design for Development to this site at Blocks 29-32, thus prioritizing its development over other undeveloped sites in the same zone. The unsupported assumption that the site will host a second tower, among other things, overstates the No Project's environmental impacts.

The Design for Development dictates that three 160-foot towers can be permitted in Height Zone 5, where blocks 29 and 31 are located. (D4D, p. 23.) The No Project alternative assumes that construction of the final tower will be on Block 29. However, UCSF-owned Block 33 is also eligible. Even if the tower is appropriately-assumed to be sited on Block 29, the Design for Development requires that it not exceed 7% of developed area; to wit, 65,954 square feet. The No Project alternative assumes a tower of 208,000 square feet. Overstating impacts does not provide an adequate basis for comparing alternatives.

The No Project size is also inconsistent with other Design for Development requirements. Height Zone 5 permits a total developable area of 942,200 square feet. (D4D, p. 23.) The DSEIR assumes that the no project alternative would encompass 1,087,700 square feet. The DSEIR concedes in a footnote that its estimate of parking stalls exceeds the minimum required; another overstatement:

> Based on the requirements of the South Plan and the Design for Development, a minimum of 1,061 and maximum of 1,081 spaces would be needed for a proposed development of this size. With the inclusion of the 132 spaces at the South Street garage, the requirements for on-site parking would range from 929 to 949 spaces. Thus, the parking estimates used for the No Project Alternative exceed the requirements, though would likely be adjusted should an actual development proposal be submitted.

(DSEIR, p. 7-21 n.2.)

By overstating its size and scope, the No Project alternative defeats the purpose of providing the public and decisionmakers with comparisons to the proposed project and other alternatives. The DSEIR must be revised to analyze a No Project alternative that complies with adopted land use plans and does not overstate the scope of development: a low-rise development using vara blocks and that does not include a new tower, does not block the views of UCSF patients, and complies with Mission Bay's development plans.

b. *The DSEIR Must Analyze a Potentially-Feasible Alternate Site.* In considering whether an EIR's range of project alternatives complies with the "rule of reason," CEQA anticipates consideration of an off-site alternative:

> The key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR.

(Guidelines, § 15126.6 (f)(2)(A).) In light of the admitted and wide-ranging significant impacts of the proposed Event Center, it is particularly critical that the DSEIR consider a potentially-feasible alternate site or sites "… capable of avoiding or substantially lessening significant impacts of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. …" (Guidelines, § 15126.6 (b).) Indeed considering an alternate location is one of the most important tasks for this DSEIR.

Instead, the DSEIR proposes just one off-site alternative, Alternative C, at Piers 30-32 and Seawall Lot 330 — a site already proven infeasible. The Warriors pursued and after considerable investment abandoned a plan to site the Event Center at this very location. The reason no doubt related to major City-wide public opposition based on significant traffic impacts, environmental harm to the San Francisco Bay during construction, blocked views of the Bay Bridge, and inappropriate use of publicly-owned waterfront property. The required vote of the San Francisco electorate that would be required for the project's excessive height was also problematic as increased heights on the northeast waterfront have been decidedly disfavored by City voters in multiple recent elections.

The project site also triggered extensive regulatory approvals from state and federal agencies, including the State Lands Commission, the San Francisco Bay Conservation and Development Commission, the Army Corp of Engineers, the U.S. Fish and Wildlife Service, and others. (DSEIR, pp. 7-17-18). And the project costs were substantially more than initially-projected, by many many millions of dollars, due to the need to replace crumbling piers and other unanticipated costs.

CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (Pub. Resources Code, § 21061.1.) The City knows that Piers 30-32 do not provide a feasible site and its selection as the sole off-site alternative fails to meet the rule of reason required for EIR alternatives. CEQA is not a game; the DSEIR must select and study another location for the Event Center to fulfill its mandate to provide good-faith analysis of a range of potentially-feasible alternatives, including an alternate location.

4. The EIR must assess Cultural Resources

The Initial Study and DSEIR contend that cultural resources were sufficiently addressed in the 1990 and 1998 Mission Bay EIRs. The Alliance disagrees. The DSEIR should be revised to provide project-specific analysis and mitigation as well as an updated investigation of resources as part of the environmental setting. The DSEIR description of the environmental setting is critical to provide a baseline of physical conditions from which to measure the significance of project impacts. (Guidelines, § 15125.)[2]

[2] Inadequacies in the EIR environmental setting and baseline led to inadequate analysis of environmental issues that will be addressed in other Alliance comment letters, including the jurisdictional wetlands identified on the project site.

To address impacts to paleontological and archaeological resources, the DSEIR proposes adoption of the mitigation measures recommended in the 1998 Mission Bay EIR, and concludes that environmental impacts will thereby be mitigated via standard archaeological testing, monitoring, and data recovery. (DSEIR, pp. 1-51, 1-57.)

The 1998 Mission Bay EIR relied on the 1990 Mission Bay EIR that in turn consulted a *Cultural Resources Evaluation for the Mission Bay Project* prepared in 1987 by David Chavez & Associates. (1990 EIR, p. VI.J.30, NOP/IS, p. 46.) As reflected in the prior EIRs, the shallows of Mission Bay were filled beginning in the 1860s and the Event Center site at Blocks 29-32 is on that filled land. The Initial Study references the Chavez report as stating that the filled land in Mission Bay had "no substantial potential for archaeological resources." (NOP/IS, p. 46; 1990 EIR, pp. II.64, VI.J.1-30.) However, the 1990 EIR nonetheless concluded that development could cause "significant impacts to subsurface prehistoric or historic archaeological resources … within the vicinity of Blocks 29-32," and identified mitigation measures. (*Ibid.*)

David Chavez and historian Jan Hupman subsequently prepared an *Archaeological Resources Review* report in 1997 for the 1998 Mission Bay EIR, concluding that "[t]he entire Mission Bay project area has at least some sensitivity for the presences of unknown archeological remains. Prehistoric cultural deposits could be encountered in three identified areas and *unknown historical features, artifact caches and debris areas could be located anywhere in the project area*." (Chavez & Hupman, *Archaeological Resources Review for the Mission Bay Project Subsequent EIR*, 1997, p. 7, italics added.)

Since then, geotechnical investigations at the project site in March 2014 identified a "medium dense to very dense sand, sand with clay, clayey sand, silty sand and sand with silt, known as the Colma Formation, [] encountered below the sand and clay in portions of the site." (Langan Treadwell Rollo Preliminary Geotechnical Evaluation, p. 2-3.) The Colma Formation involved sand between 5 and 35 feet thick, more than 19 feet below the ground surface. (Ibid.) That is a greater depth than the Event Center's projected excavations, but a 2014 report by ESA Associates Cultural Resources team suggesta pre-construction boring strategy as part of an Archaeology Testing Program ("ATP"):

> The ATP will need to include a pre-construction geoarchaeological boring strategy across the project area to determine: (a) whether the upper surface of the Colma Formation is intact or was eroded away in antiquity (and therefore whether there is even the potential for archaeological materials to be present); and (b) if the upper surface of the Colma Formation is intact, whether there are, in fact, any archaeological materials present.

The actual boring strategy is not known. A firm called Archeo-Tec made a proposal, but it was criticized by the ESA team: "The Archeo-Tec proposal only specifies trenching beginning at a depth of 10-15 feet below ground surface (after mass excavation has already started)." ESA noted that the Archeo-Tec plan did "not correlate with ERO standards" and was "not in line with Planning Department requirements for the project area." Further, "trenching will not address [City archaeologist Randall Dean's] specific concerns …"

The 1987 Chavez report had conceded that "[w]ith the exception of some limited archaeological testing in sensitive areas" the "actual areal extent, specific nature and location of historic features and artifact caches, and depositional integrity of the archaeological deposits" in South Mission Bay are unstudied. Further, "specific information of that nature is important in determining the actual significance of archaeological resources and in developing appropriate mitigation plans." (Chavez, *Cultural Resource Evaluation For the Mission Bay Project*, p. 105.)

Years later, archaeologist Dean properly criticized the Initial Study's cursory review of archaeological impacts, pointing out that:

> … [w]e know a lot more than we did 20 years ago about both buried and submerged potential horizontal and vertical locations and types of prehistoric deposits that may be present throughout SF. The project site lies within the mudflats of Mission Bay subject to shallow tidal waters but well within the paleoshorelines of 5,000 B.P. [...] the type of prehistoric deposits that might be affected would be within the Middle Holocene epoch which would make them of significant scientific value.

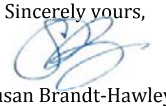
Incomplete information regarding cultural resources conflicts with CEQA's requirements for an adequate environmental setting/baseline to provide "special

emphasis" on "resources that are rare or unique …" (Guidelines, § 15125 (c).) Mitigation measures proposed in the Initial Study and DSEIR, including the Archaeological Testing Program, must be preceded by updated analysis of affected resources and performance standards. Since the Initial Study and the DSEIR rely on outdated information from the 1990 Mission Bay EIR, there is a higher potential for subsurface archaeological resources at the site than previously evaluated. The EIR must be revised to include a current analysis of cultural resources, potentially significant impacts, and performance-based mitigation.

****

Thank you for your attention and responses to each of these environmental issues.

Sincerely yours,



Susan Brandt-Hawley
Skyla V. Olds

CP&DR CALIFORNIA PLANNING & DEVELOPMENT REPORT

The Power of Grid

1 September 1998 - 12:00am
Morris Newman

Restraint is rarely touted as a virtue in urban design. Often, instructors in the History of Urban Design tend to treat the subject as a series of Greatest Hits - of grand interventions by such magnificently meddlesome people as Andre LeNotre or Baron Haussman or Robert Moses. Teachers in graduate seminars rarely show slides of, say, a Midwestern town and exclaim, "Look at how well the urban designers held themselves back!"

The blockbuster mentality makes the current master plan of Mission Bay, the 300-acre redevelopment area in San Francisco, all the more remarkable. Here, after all, is a giant canvas of largely undeveloped waterfront acreage in a major U.S. city. The first impulse (at least for eternal first-year design students, like myself) is to create a miniature city with a hierarchy of major and minor roads, a radial plan with diagonal streets, major and minor axes, formal green spaces with equestrian statues and topiary plantings - in other words, the whole nine yards of Beaux Arts planning, or its poor relation, the New Urbanism.

The current master plan, which is the fifth to be done in 20 years, resists the temptation to make a grand statement, however. Instead, the plan by Johnson Fain Partners opts to impose a more-or-less regular grid over the area that corresponds, in the dimensions of the blocks, to the original 10 blocks of downtown San Francisco. And while the restraint of this plan may or may not seem intuitively like the most exciting or most elegant solution, a close examination of the program suggests that this is the most urbane and best integrates this former railyard into the cultural and business life of the larger city.

Indeed, the history of planning efforts at Mission Bay shows the tensions between the need to integrate the area into the city, while creating a memorable place in itself. The site itself is also especially tempting for planners, because it sits at the crossroads of two grids: the commercial-industrial grid, on northeast-southwest coordinates, and a residential neighborhood, on north-south coordinates, immediately south of the commercial area.

The first four of the five plans done in the past 20 years, in fact, succumb to the temptation to bring the grids together in dramatic juxtaposition. The first plan, done 20 years ago by John Carl Warnecke envisioned a set of high-rise buildings (office and hotel) on either side of the Mission Bay Channel, which conforms to the commercial-industrial grid. The same plan pulled the north-south grid north of 16th street, to bring housing into Mission Bay. The density and height of the scheme aroused public opposition.

In the I.M. Pei/WRT scheme of 1985, the designers attempted to maximize the waterfront by carving out an oval-shaped channel south of Mission Bay Channel; ingeniously, this channel, and the resulting island at its center, are the formal devices to divide the commercial grid from the residential grid. This plan was also opposed for its density. And like the Warnecke plan before it, the Pei scheme was largely lacking in open space along the precious bay waterfront.

The third scheme by the Mission Bay Planning Team, led by EDAW and Dan Solomon, is an elegant, Beaux-Arts design that provides a clear hierarchy of streets arranged around a linear park or "common." This scheme also sets aside some bayfront land for a linear park. Pleasing as a graphic design, the plan arguably may have created some confusion on the ground, however, because streets are frequently changing in direction. Those same diagonal streets also disturb the views of the bay that could otherwise be available with streets that run straight east and west. The subsequent Skidmore Owings Merrill plan of 1989 is an inelegant truncation of the Solomon-EDAW that reflects the consensus of public hearings. This plan offers a further elongation of the bay front linear park, while providing more space for commercial construction.

New uses at Mission Bay, including a new baseball stadium immediately north of the site and a new campus for UC San Francisco, occasioned the fifth and current plan, this time by Johnson Fain Partners. The campus plan, which conforms to the larger scheme, is by the East Coast firm of Machado + Silvetti. As part of a Willie Brown-endorsed ambition to create a "synergy" between a research university and bio-tech businesses in San Francisco, landowner Catellus donated 43 acres of Mission Bay to UC San Francisco. That acreage is located smack-dab in the center of the master plan.

The great achievement of the scheme is to knit Mission Bay into the existing fabric of the city, rather than setting it apart as a separate "campus" or miniature city of its own. Faced with the difficulty of planning around a centrally located campus, the Johnson Fain team, led by principal William Fain, chose to organize most of the site with the north-south (residential) grid; the diagonal streets are limited to either side of the channel. Medium-to-high-density residential blocks (with densities averaging 110 units per acre) can be found both north and south of the channel. Happily, the plan preserves the common of the Solomon/EDAW scheme. A small traffic circle at the far west is the anti-climactic device that connects the two grids.

What is most remarkable about this scheme is how thoroughly the university campus has been integrated into the grid. This contrasts with the typical University of California campuses, which are master planned as separate cities and communicate poorly with the cities that surround them. In a competition winning scheme, Machado + Silvetti, has responded with a very urbane, non-hierarchical scheme that uses open spaces as the landmarks, rather than big buildings. Jose Begazo, Johnson Fain's project architect, has likened the campus design to residential blocks in Paris.

Importantly, the Johnson Fain designers chose to base the new grid on the historic "vara" block, the same dimension of the first 10 blocks of the city laid out by Vioget in 1839. A vara is a Spanish linear measure equal to 2.75 feet. The vara block is 100 by 150 varas, or 275 feet by 413 feet. Johnson Fain principal William Fain argues that the vara block, beyond its historic associations, has near-ideal dimensions for an urban block.

The use of the urban Vara block, in fact, helps clarify, if clarity were needed, what precisely makes San Francisco the most walkable city in America: the dimensions of the grid. No longer an abstract issue, the dimensions of grid here become elements in the sensuous enjoyment of cities - providing the energizing sense of movement through a regular tempo of streets and blocks.

This new plan, by relying heavily on the grid rather than special effects, promises to extend the pedestrian experience of San Francisco to the newest part of the city. In a sense, the Johnson Fain/Machado Silvetti scheme could be described as the scheme that resists the temptation to be grand, and in favor of being appropriate. Whether or not college lecturers add Mission Bay to their teaching syllabi remains to be seen. Even so, the scheme is a quiet but convincing argument about the power of the grid.

RE: Comments on Environmental Review for Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Dear Ms. Bohee:

This firm represents the Mission Bay Alliance, an organization dedicated to preserving the environment in the Mission Bay area of San Francisco. This letter is submitted on behalf of Mission Bay Alliance regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Project"), and provides comments on the following topical areas: Greenhouse Gases, Geology and Soils, Hazardous Materials, Utilities and Service Systems, Recreation, Energy, Wind and Shadow, Project Description, and Urban Decay. These comments are supported by five subject matter expert reports, attached as Exhibits A-E, which are discussed and summarized below. In addition to responding to this letter, please provide responses to the detailed comments contained in the reports that are incorporated by reference and attachment to this letter. (CEQA Guidelines, § 15132, subd. (d), 15088.)

The comments set forth in this letter and its attachments address deficiencies contained in the DSEIR's analyses as well as subject areas where the DSEIR impermissibly failed to provide any substantive analysis. The Notice of Preparation / Initial Study ("NOP/IS") for the Project determined that nine topical areas were adequately analyzed in the 1990 and 1998 EIRs prepared for the Mission Bay Redevelopment Plan, and therefore no additional analysis was required in the present DSEIR for these specific areas. A fundamental problem with this approach is that the Mission Bay Plan was 303 acres and lacked site-specific review of the current 11-acre site. In the Mission Bay Redevelopment Plan, the four-block Project area was designated as "Commercial Industrial (Mixed Use including Retail)." (DSEIR, Figure 3-3.) This land use was then analyzed at a very general level. As described in the letter as shown in the "Land Use" section of the July 27, 2015 letter from the Brandt-Hawley Law Group, the Project is not consistent with the Mission Bay Redevelopment Plan or with the land use plans and zoning controls that are subordinate to the Mission Bay Redevelopment Plan.

In addition to the Project itself being different, the conditions under which the Project is undertaken, as compared to 1998, have changed substantially. Changed conditions include both changes in standards and practices for analyzing impacts, changes in overall environmental conditions, and changes to the site itself. As described in the comment letter submitted by the Mission Bay Alliance regarding tiering, all of these changes, in combination with the massive and impactful Project now being proposed, require preparation of a new EIR that examines every resource area at project-level detail. The City's strategy of relying on a very general environmental review document that is over 17 years old for topics required to be analyzed *and* mitigated in detail does not work for the public, nor is it compliant with CEQA's most basic requirements.

1. <u>Greenhouse Gas Emissions are Not Adequately Analyzed – DSEIR Chapter 5.5.</u>

Under AB 900, a "Leadership Project" receives an expedited CEQA review process and other streamlining benefits. (Pub. Resources Code, § 21178 et seq.) Leadership projects are supposed to create high quality permanent jobs and innovative measures to reduce environmental impacts, including greenhouse gas ("GHG") emissions. As a result of the certification received under AB 900, the DSEIR claims that the Project will "not result in any net additional GHG emissions." (DSEIR, p. 5.5-10.)

As explained below and in the attached technical comments by SCS Engineers, dated July 20, 2015 ("SCS" attached as <u>Exhibit A</u>), the AB 900 Application process does not meet minimum standards for calculation of GHG emissions, nor does it provide a substitute for CEQA's EIR process or substantive standards. The DSEIR relies entirely on the existence of the AB 900 certification for its analysis of the Project's contribution to the cumulative impact to GHG emissions. While the AB 900 certification is not subject to judicial review (Pub. Resources Code, § 21184, subd. (b)(1)), the content of the Application for AB 900 certification does not substitute for an adequate analysis of GHG emissions in the DSEIR. As a result, the DSEIR fails to meet minimum standards of disclosure and also incorrectly concludes that GHG emissions are less than significant. These flaws in the DSEIR require revision and recirculation of the DSEIR with an adequate GHG analysis.

a. The AB 900 Application Conflicts with State GHG Policies.

As explained in the SCS Memo (pp. 4-6), the AB 900 Application severely underestimated the emissions from this Project. It did so by overestimating the baseline for comparison, and then by underestimating Project emissions. The AB 900 Application made several unsupported assumptions to minimize the baseline conditions against which the Project's GHG emissions would be compared, including:

- Assuming a 76 percent reduction in baseline GHG emissions from Oracle arena due to relocation of the team to San Francisco, potentially omitting emissions that would occur if Oracle continues to emit more than 24 percent of its current GHG emissions (SCS, p. 4); and

- Overestimating, possibly by a factor of two, the trip linking benefits provided by location of the arena adjacent to other uses (SCS, p. 5).
The AB 900 Application then underestimated the Project's GHG emissions by:

- Omitting from its analysis entirely the GHG emissions for structures other than the arena that are planned as part of the Project, including the two 160 foot office towers, the gatehouse, the food hall, Warriors Headquarters, and retail uses, which comprise approximately 730,000 square feet of new uses that clearly will emit GHG (SCS, p. 5; see also NOP/IS, p. 11).

Additionally, the GHG mitigation offered in the AB 900 Application is not effective. After miscalculating the GHG emissions of the Project, the Application simply states that "with offsets purchased, there will be no net greenhouse gas emissions from the operation of the project." (Leadership Application, p. 9.) Yet, as explained by SCS Engineers (pp. 6-8), there are several flaws with this approach, including:

- Not requiring that any GHG emissions offsets be purchased unless the Project has a 90 percent utilization rate, raising the possibility that GHG emissions offsets would not be purchased at all (SCS, p. 7);

- The failure to require that purchased GHG emissions offsets are verified by the California Air Resources Board ("CARB"), consistent with California GHG reduction policies and AB 32, to ensure that they are real, permanent, quantifiable, verifiable, enforceable, and additional and thus will actually result in GHG emissions reductions (SCS, pp. 2-3, 8; see also Health & Saf. Code, § 38562, subd. (d)(1),(2));

- Not requiring that the emissions offsets purchased as mitigation for the Project be retired so that the offsets cannot be reused later to allegedly mitigate other projects' GHG emissions (SCS, pp. 2, 8);

- Only requiring that GHG emissions from the Project be offset for the first 30 years, ignoring GHG emissions that the Project would continue to produce after that point (SCS, p. 7);

- Using the faulty GHG inventory to estimate total GHG emissions from the Project over a 30-year period now, and allowing the applicant to purchase 30 years of GHG emissions offsets now, rather than continuing to use updated data regarding actual Project GHG emissions (SCS, p. 6); and

- Not including ongoing monitoring to ensure that estimated Project GHG emissions are similar to actual emissions and that purchased GHG offsets are actually effective in reducing GHG emissions (SCS, pp. 7-8).

In addition to these technical flaws (described in more detail by SCS Engineers in Exhibit A), the reliance on offsets to reduce GHG emissions is inconsistent with the intent of AB 900 to promote use of innovative measures to reduce GHG emissions. (Pub. Resources Code, § 21178, subd. (g).) Design features and/or mitigation measures could actually reduce the project's GHG emissions and create other environmental benefits. Instead, the Project simply plans to write a check to an unknown entity to supposedly "offset" GHG emissions.

Further, the deduction for GHG emissions based on the assumption that Oracle will only host 21 events into the foreseeable future is unwarranted in light of the City of Oakland's express plans to turn "Coliseum City" into an economically viable sports and entertainment hub. (See pp. 10-12 of July 19, 2015 Comments Regarding Air Quality Impact Analysis and Mitigation; Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32 by Autumn Wind Associates, Inc., attached as Exhibit 1 to the July 26, 2015 letter from the Law Offices of Thomas N. Lippe regarding the Project's Air Quality Impacts.

b. The Flawed AB 900 Application Cannot Substitute for an Adequate Analysis Under CEQA in the DSEIR.

The DSEIR simply refers to the result of the AB 900 certification process, providing no additional analysis or disclosure in the DSEIR itself regarding the expected GHG emissions of the Project or how those impacts would be mitigated. To the extent

the DSEIR intends to incorporate the faulty AB 900 Application into the DSEIR instead of setting forth the analysis in the DSEIR, it did not follow procedures required to do so. CEQA Guidelines section 15150 requires that "the incorporated part of the referenced document shall be briefly summarized where possible or briefly described if the data or information cannot be summarized." The AB 900 Application was not summarized or described in the DSEIR, nor was it included as an appendix. If the AB 900 Application is to be offered as environmental analysis in the DSEIR, it would have to be included as an appendix to the DSEIR so that the public could review it. (CEQA Guidelines, § 15147; *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 (where lead agency "relied on information not actually incorporated or described and referenced in the FEIR, it failed to proceed in the manner provided in CEQA").)

Nor can the DSEIR rely on analysis in the 1998 FSEIR. Though GHG emissions are briefly mentioned in the 1998 FSEIR (DSEIR, p. 5.5-1), this Project being proposed years later was not analyzed. Moreover, the approach to GHG emissions has changed dramatically in the intervening years.

The approach to calculating GHG emissions in the AB 900 Application is also inconsistent with basic CEQA principles as well as the DSEIR's approach to analysis of other impacts of the Project. As described above, large components of the Project to which the AB 900 certification and the "no net increase in GHG emissions" allegedly apply were simply omitted from the inventory, including over 700,000 square feet of retail and office uses. (DSEIR, Figure 3-5 and Table 3-1.) While there is no discussion in the DSEIR, the AB 900 Application claims that these other uses were "fully vested legal rights" permitted by the land use plan, and therefore did not quantify the GHG emissions from that part of the Project. (Leadership Application, p. 8.)

The Leadership Project application process does not provide any direction to exclude aspects of the project from the Leadership Application. (Pub. Resources Code, § 21183, subd. (c).) Nor does it substitute the AB 900 certification for an adequate analysis under CEQA. Certainly if the Legislature had intended that an approved Leadership application could substitute for mandated analysis in an EIR, it would have so stated; it did not. As the certification is for the entire complex, including office and retail, there is no justification to exclude part of the project from the analysis. The result is an impermissible decrease of the GHG emissions calculated to occur as a result of the Project.

The notion that having a vested right to do something affects the obligation under CEQA to disclose the impact of doing it has been squarely rejected. (*Communities For A*

Better Environment v. South Coast Air Quality Management Dist. (2010) 48 Cal.4th 310, 323-25, citing Pub. Resources Code, §§ 21002.1, subd. (b), 21081, subd. (a)(1); CEQA Guidelines, § 14, §§ 15040, 15126.4, subd. (a)(2) [lead agency ability to condition project]; § 21081; CEQA Guidelines, § 15042 [lead agency ability to deny the project].) Moreover, consistency with a plan does not preclude the need for analysis. (See *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 354.) Notably, neither the air quality nor the traffic impact chapters of the DSEIR attempt to include credit for baseline development claimed as"vested." The completely different approach taken by the DSEIR with respect to analysis of GHG emissions is unsupported and must be corrected; the correct baseline is "no project."

The "mitigation" proposed for GHG emissions impacts is also contrary to CEQA's most basic requirements. Mitigation must be enforceable in order to be effective.. (CEQA Guidelines, § 15126.6, subd. (a)(2).) Here, as described above, the purchase of offsets may never occur, or if it does occur, may do nothing to reduce GHG emissions. The DSEIR's failure to identify enforceable mitigation measures is an error of law. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260–1262*; Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope. . . ."].) To the extent that the City intends to incorporate the purchase of offsets as a "design feature" or otherwise incorporate it into the project description, recent case law clarifies that this strategy violates CEQA's mandate to disclose project impacts and separately address feasible mitigation measures. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56 (incorporating mitigation measures for redwood trees into the project description violated CEQA "[b]y compressing the analysis of impacts and mitigation measures into a single issue . . ."].)

As a result of the City's improper approach to analysis of GHG emissions from the Project, the GHG analysis is incomplete and must be rewritten. Moreover, the "less than significant" determination for the Project's GHG emissions is based on errors of law described above, including splitting the Project into smaller pieces and excluding several of these pieces from the GHG calculation and failing to identify enforceable mitigation measures. According to air quality experts versed in GHG emissions and the use of GHG offsets: "The GHG analysis provided and proposed MM I-C-GG-1 are not sufficient to demonstrate that the Project will result in no net increase in GHG emissions" and "the determination in the [DSEIR] that GHG emissions are a less than significant impact is erroneous." (SCS, p. 2.)

2. <u>The DSEIR Was Required under CEQA to Analyze Impacts Related to Hazardous Materials – 1998 FSEIR Chapter 5.J.</u>

The NOP/IS correctly identified hazards and hazardous materials as an impact area generally requiring analysis under CEQA. (NOP/IS, pp. 106-122.) However, the DSEIR did not address hazardous materials at all (DSEIR, p. 1-9) because the NOP/IS concluded that there were no new or more severe impacts within this category than addressed in the 1998 FSEIR (NOP/IS, pp. 106-107.) This approach fails under any standard of review because the currently-proposed Project is different than the project described in the 1998 FSEIR, the 1998 FSEIR relies on outdated data and methodology to analyze impacts, and conditions have changed such that the 1998 FSEIR does not even describe the present contamination at the site. The recirculated DSEIR will need to include a full analysis of this issue that includes a thorough review of the extensive history of contamination of this site, and the resulting potentially significant impacts and mitigation required in the context of this Project.

These comments are supported by expert analysis from the firm BSK Associates. BSK reviewed several documents, including the DSEIR, NOP/IS, 2006 Revised Remedial Action Plan ("2006 RRMP"), and 1998 SEIR, and prepared a report addressing the adequacy of these documents and the potentially significant impacts associated with existing contamination by hazardous materials within the Project site. The BSK HazMat Report is attached as <u>Exhibit B</u>.

a. The 1998 SEIR Cannot be Relied Upon to Analyze Impacts Associated with Hazardous Materials.

The BSK HazMat Report explains that the 1998 SEIR cannot serve as a basis for any analysis of impacts associated with hazardous materials because that document relies upon long-outdated methodology for analyzing such impacts. (BSK HazMat Report, comment A1.) For example, the 1998 SEIR's analysis of risk to human health relied upon preliminary remediation goals developed by the EPA, and yet this methodology has been replaced by Environmental Screening Levels developed in 2013. Further, the 1998 SEIR relied upon averaged concentrations of chemical contaminants even though the total number of samples was too low to use such average values. (BSK HazMat Report, comment A2.) The BSK HazMat Report identifies further technical deficiencies that render the methodology followed in the 1998 SEIR inadequate for present use. (BSK HazMat Report, pp. 1-4.) It is telling that the NOP/IS never mentions the outdated methodology utilized in the 1998 SEIR, much less attempts to explain how applying current methodologies would achieve the same result.

b. Petroleum Hydrocarbon Contamination Has Always Been Just One Component of the Site's Overall Contamination.

Setting aside the issue of outdated methodology, the 1998 SEIR cannot serve as the basis for CEQA review because it does not adequately disclose current contamination at the Project site. Implicitly acknowledging that the 1998 EIR fails to disclose and analyze all contamination at the site in light of the characterization/remediation efforts following certification of the 1998 EIR, the NOP/IS purports to correct this admitted gap by providing a discussion entitled, "Actions Completed Since Publication of the Mission Bay FSEIR." (NOP/IS, p. 116.) However, this discussion misleads the public by suggesting that petroleum hydrocarbons are presently the only contaminant of concern onsite. The NOP/IS fails to adequately supplement the 1998 SEIR because it ignores contaminants other than petroleum hydrocarbons.

The NOP/IS asserts that there is no remaining soil and groundwater contamination at issue because, following the 1998 SEIR, remediation occurred in compliance with the San Francisco Bay Regional Water Quality Control Board ("RWQCB") Order R2-2005-028, which was ultimately rescinded in 2014. (NOP/IS, pp. 117-118.) What the NOP/IS fails to mention, however, is that Order R2-2005-028 and the subsequent remediation effort **solely addressed petroleum contamination, and no other contaminants onsite**. This limited scope is demonstrated with clarity in, for example, the RWQCB's subsequent Order R2-2014-0022 rescinding the prior order RS-2005-0028. Order R2-2014-0022 explained that the prior order only "address[ed] the existence of separate phase petroleum hydrocarbons products." Further, Order R2-2014-0022 explained that rescission of that prior order was appropriate because, "Post-remediation groundwater monitoring has shown that the residual petroleum products have very limited impact on the groundwater beneath the site." (Order R2-2014-0022.)

The limited nature of this remediation effort is further demonstrated in the subsequently-prepared Revised Risk Management Plan dated August 2006 ("2006 RRMP"). As the BSK HazMat Report explained:

> [T]here was no discussion of the semivolatile organic chemicals that were detected in soil and groundwater at the site. Summary tables presented in Appendix A of the RMP indicate that polycyclic aromatic hydrocarbons (PAHs) were detected in the soil at various locations and in groundwater collected from MW-11. A possible source and significance of the PAHs was not presented in the RMP.

(BSK HazMat Report, comment B2.)

In other words, even though other contaminants were identified in the 1998 SEIR, the subsequent RRMP focused only on petroleum hydrocarbon remediation. While both the City and the applicant clearly understood this limited scope of the remediation efforts following the 1998 SEIR (NOP/IS, p. 118 [explaining that remediation "has effectively removed free petroleum products in the Pier 64 area . . ."]), this understanding was in no way communicated to the public in the NOP/IS. To the contrary, the NOP/IS, misrepresents the current status of contamination at the site by asserting in relevant part:

> While the completion of remedial actions described above would be considered substantial changes that have occurred at the project site, implementation of these actions has effectively removed free petroleum products in the Pier 64 area and reduced risks to human health and the environment in this area compared to conditions described in the FSEIR.

(NOP/IS, p. 118.)

These statements mischaracterize the status of the Project site by ignoring the presence of other contaminants. As acknowledged in the NOP/IS, the site was previously used for "bulk fuel storage and distribution; railroad operations; a machine shop; boiler house; steel mill; well casing manufacturer; warehousing, shipping and receiving operations for a variety of products; fruit cannery, junk yards vehicle parking and maintenance facilities and a ready-mix concrete facility." (NOP/IS, p. 115.) Even the 1998 SEIR acknowledged that the Project site could contain other contaminants and that insufficient surveys at that time had been performed to characterize the contamination and resulting risk. (1998 SEIR, pp. V.J.1 – 110.) With respect to metals, for example, the 1998 SEIR stated, "All 17 metals that were included in the list of analytes tested . . . were detected in varying concentrations in soil throughout Mission Bay South." (1998 SEIR, p. V.J.36.) The same was true for asbestos and creosote as well. (1998 SEIR, pp. V.J.15 – 16.)

Thus, contaminants other than hydrocarbon were identified as early as 1998, which is not surprising based on the various historical uses of the Project site. Notwithstanding this, the only remediation identified in the NOP/IS relates to hydrocarbon contamination. The NOP/IS fails as an informational document because other contaminants that are contained in the soil have not been publicly disclosed. As discussed more fully below, these other contaminants create potentially significant impacts that must be addressed.

c. Activities Following the 1998 SEIR Have Increased the Project Site's Contamination.

The 1998 SEIR cannot be relied upon for environmental analysis of hazardous materials impacts of the Project because subsequent activities at the site have significantly altered the nature and scope of contamination. As explained in the BSK HazMat Report, a Phase II Environmental Site Assessment prepared by Langan Treadwell Rollo, dated June 2015 ("2015 Phase II Report"), identifies additional contamination following the 1998 SEIR that has been ignored in the present NOP/IS and DSEIR. (BSK HazMat Report, comments A3, A4, B3, B4.)

Based upon review of the 2015 Phase II Report, the BSK HazMat Report explains that additional hazardous waste materials were actually imported onto the Project site during petroleum hydrocarbon remediation activities in 2005. Specifically, contaminated construction debris and other hazardous waste were used as backfill in 2005 in violation of the Mission Bay remedial action plan ("RMP"). (BSK HazMat Report, comments A3, B5.) While the prior Mission Bay RMP may have allowed the movement and reuse of certain levels of contaminated soils, "DTSC's determination does not apply to building debris or waste soils or other waste materials for any necessary remediation activities." (BSK HazMat Report, comments A3.) In other words, while the occurrence of petroleum hydrocarbon contamination may have been reduced as a result of subsequent remediation activities, the occurrence and associated risk posed by other forms of contamination actually increased following the 1998 SEIR. While the 1998 SEIR could not have addressed this new contamination because it occurred in 2005, this does not excuse the omission of this critical information from the NOP/IS and DSEIR.

The BSK HazMat Report also finds, based in the 2015 Phase II, that significant amounts of both previously-existing and subsequently-imported hazardous waste remain on the site today. The presence of this existing hazardous waste raises many unaddressed issues. First, it appears that this hazardous waste will need to be excavated and removed in order to construct the proposed Project. The BSK HazMat Report explains, "Significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase." (BSK Hazmat Report, comment C1.) According to the NOP/IS, "[T]he maximum depth of excavation on-site would be approximately 30 feet below San Francisco City Datum; this would require approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (NOP/IS, p. 17.) It is not clear how this estimate was derived or how it relates to the actual excavation needed for purposes of removing contaminated soils. The excavation, removal, transport, and disposal of this

massive volume of contaminated soil creates potentially significant impacts that have not been disclosed. (CEQA Guidelines, Appendix G, section VIII (a), (b), (c).)

Other serious questions arise if all or even some portion of the hazardous waste is not ultimately removed from the Project site. If not removed, what is the remediation plan to reduce risk of exposure to the public? How will workers be protected during construction of the Project? Does the 350,000 cubic yards include excavation associated with stormwater and other infrastructure remediation work, or will that construction occur in the contaminated soil that remains? Will any of this contaminated soil be used to create the 3.2 acres of open space, or the additional open space located across the street at the Bayfront Park? Will an impermeable cap be used to separate contaminated soil from at-grade landscaped open space? Since much of the landscaped open space appears to be elevated, is this a design feature intended to quietly address the human health risk associated with the contaminated soil? The DSEIR fails to address these important questions.

The presence of contaminated soil within the Project site cannot be swept under the rug. The contamination must be quantified along with its appropriate exposure risks. These risks and adequate mitigation measures must be disclosed to the public in a revised and recirculated DSEIR that complies with CEQA.

d. The DSEIR's Treatment of Hazardous Materials Fails under Any Applicable Standard.

As established above, the City's strategy of relying on the 1998 SEIR as supplemented with updated information from the NOP/IS violates CEQA.

First, this strategy fails to provide an adequate project-level informational document because the 1998 SEIR does not describe current conditions, and the supplemental information provided in the NOP/IS misleads the public by ignoring all hazardous constituents other than hydrocarbon contamination.

Second, the DSEIR is inadequate because substantial evidence supports a fair argument that constructing the Project on the existing contaminated soil will result in potentially significant impacts. The information contained in the DSEIR, together with the BSK Hazmat Report and the 2015 Phase II Report, demonstrate that the present contamination poses potentially significant hazards due to proposed construction in soil containing hazardous waste, and transport and disposal of the same hazardous waste.

Third, even if the City were to rely on Public Resources Code section 21166, the subsequent remediation activities that increased the presence of certain hazardous waste constituents following the 1998 SEIR represents a change in circumstances that requires preparation of a supplemental EIR. The proposed site plan with several acres of landscaped open space also constitutes a change to the project that was described in 1998 (simply a land use plan for 303 acres) and significantly increases the potential public hazard by exposing people to hazardous waste in the soil even if the RMP is followed. A recirculated DSEIR must include a thorough analysis of hazardous materials using current methodologies.

e. The City Cannot Rely on Mitigation Measures for Hazardous Materials without Analyzing the Impacts.

Seemingly in furtherance of an implicit goal to avoid substantive public disclosure of hazardous materials impacts in the DSEIR, the City takes the remarkable position in the NOP/IS that it can adopt mitigation measures without analyzing and disclosing impacts. This approach is employed with respect to risks associated with naturally occurring asbestos (NOP/IS, pp. 113-115) as well as risks associated with exposed contaminated soil prior to site development as regulated in the City by the Maher Ordinance (NOP/IS, p. 116). This approach is fundamentally flawed, however, because CEQA does not permit an agency to adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts. A mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123*; Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

The flaw in this approach is easily seen in both contexts. With respect to compliance with the Maher Ordinance, for example, section 2(b) of this letter explains that the NOP/IS fails to describe the existing heavy metals and other hazardous waste contained in the soil.[1] The DSEIR's failure to mention this contamination prevents public disclosure of its scope, its implications for future construction work onsite, and potential exposure to the public during occupancy of the Project. As a document of public information, the DSEIR cannot avoid meaningful disclosure of this information by announcing that compliance with the Maher Ordinance will fix everything. That strategy is the opposite of informed decision-making and public participation.

---

1 It is noted that the NOP/IS does not attempt to make compliance with the Maher Ordinance an enforceable mitigation measure.

The same analysis applies to the acknowledged asbestos-containing backfill material located onsite. First, it is not at all clear that California Air Resources Control Board's ("CARB") Asbestos Airborne Toxic Control Measure ("ATCM") even applies because this is not an instance where construction is occurring in an area of naturally occurring asbestos material. (Cal. Code Regs., tit. 17, § 93105, subd. (b).) As acknowledged in the NOP/IS, the material is processed (i.e., crushed) asbestos containing rock that was imported onto the site and used as backfill material. Accordingly, CARB's Asbestos ATCM does not apply here. Consistent with this misapplication of the Asbestos ATCM in the NOP/IS, the "no visible emission at property boundary" standard (NOP/IS, p. 114) does not apply because it is inadequate for both public and worker safety. Rather, the Project must comply with BAAQMD Regulation 11, Rule 2.

Second, even if the NOP/IS had identified the proper regulatory standard, the underlying strategy of relying on promises to comply with regulatory standards does not satisfy CEQA's informational disclosure mandates. The City has the duty under CEQA to investigate and disclose the extent of the potentially significant impact prior to setting forth potential mitigation measures. (*Galante, supra,* (1997) 60 Cal.App.4th at 1123.) Considering that many other flaws will require preparation of a Recirculated DSEIR, there will be ample opportunity to include the results of further study of contamination in that forthcoming document.

3. <u>Geology and Soils – 1998 FSEIR Chapter 5.H.</u>

According to the NOP/IS, there are no new or more severe Geology and Soils impacts associated with the Project than were analyzed in the 1998 FSEIR. (NOP/IS, pp. 85-86.) Thus, the DSEIR did not address Geology and Soils. (DSEIR, p. 1-9.) The omitted analysis fails under any standard of review because the currently-proposed Project is different than the project described in the 1998 FSEIR and conditions have changed such that the 1998 FSEIR does not adequately describe it. The 1998 FSEIR also relies on outdated data and methodology to analyze Geology and Soils impacts. Moreover, the Project has never been subject to a thorough analysis regarding Geology and Soils Impacts in any document.

As described in the attached reports prepared by geotechnical engineer Lawrence Karp, CE, CEG ("Karp Geotech", attached as <u>Exhibit C</u>), BSK engineering geologist Martin Cline, CEG, and hydrogeologist Kurt Balasek, PG, CHG, QSD ("BSK Geotech", attached as <u>Exhibit D</u>), the 1998 EIR fails to provide adequate analysis of impacts related to Geology and Soils. In particular, the seismic and tsunami risks associated with the site and the Project have not been analyzed or mitigated to an acceptable level. As explained below, these unanalyzed impacts put the public at unnecessary risk and require that the

DSEIR be revised and recirculated for public review. The recirculated DSEIR must include a thorough review of geotechnical conditions of this site and the resulting potentially significant impacts and mitigation required in the context of this Project.

a. Seismic Hazards.

i. The Seismic Standards for the Site have Changed Since 1998.

The NOP/IS claims that there are "no new or more severe effects," ignoring "[s]ignificant changes to the California Building Code and the standard of practice for analyzing ground motion and liquefaction evaluation have occurred since the 1998 SEIR was published." (BSK, comment B1.) At the time the 1998 EIR was written, the San Francisco Building Code was based on different maps and seismic design standards were much less stringent. (Karp Geotech, p. 3.) Later mapping by the State delineates the site as subject to liquefaction-induced ground displacement, and no analysis of the parameters used in 1998 and those applicable today has been prepared to support the claim that there are no new or more severe impacts than discussed in the 1998 FSEIR. The ground motion parameters required of a public assembly use are also much more stringent now, as described by Dr. Karp. (Karp Geotech, pp. 3-4.)

ii. A Complete Geotechnical Investigation Has Not Been Completed.

The proposed Project, which is a "public assembly use" for occupancy greater than 300 requires a different and more thorough analysis with respect to seismic hazards than the "Commercial Industrial (Mixed Use including Retail)" land use designation analyzed in 1998. (Karp Geotech, p. 1; see also DSEIR, Figure 3-3.) The site has not been properly classified for a public assembly use and the prior geotechnical reports prepared for the site underestimate public response. Public assembly uses for occupancies greater than 300 require a different approach to engineering than a typical project.

The evaluation reports prepared for the site after the 1998 EIR do not address the Risk Category III Importance under the Building Code[2] and the data underestimates site response to strong motion. (Karp Geotech, p. 1.) Moreover, later documents, such as the

[2] According to the California Building Code, § 1604.5: Risk Category III includes those "[b]uildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300."

2011 Langan Treadwell Rollo Geotechnical Investigation, were prepared for previously-proposed office buildings, not an arena. The other more recent report by the same firm states it is "Privileged and Confidential – For Discussion Purposes Only" (BSK Geotech, comment B.2; Karp Geotech, p. 1) and is not stamped by an engineer. In any case, neither the 1998 EIR or these more recent reports classify the current site use or address Risk Level III Importance requirements.

iii. Seismic Risk Is Underestimated.

The site is subject to two geotechnical risks, liquefaction and amplification. (Karp Geotech, p. 2.) The liquefaction risks were not adequately analyzed in 1998 EIR for this Project type, and the 1998 EIR does not analyze amplification. Liquefaction and amplification "hazards are different but related; liquefaction potential (sand) can be mitigated but the structure must be designed to resist soft ground (clay) amplification from strong motion." (Karp Geotech, p. 2.)

With respect to liquefaction, the risk can be mitigated with various ground improvement techniques. (Karp, p. 5.) Techniques include overexcavation and compaction, however the extent of excavation needed to fully address liquefaction has not yet been determined. (BSK Geotech, p. 5.) According to the NOP/IS, excavation on-site would extend approximately 30 feet, requiring approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (NOP/IS, p. 17, 89.)[3] No explanation is provided, however, as to how this amount of excavation was determined, or how it relates to the amount of material that must be removed due to contamination, or for geotechnical purposes. (BSK Geotech, comment A5; see also *ante* section 2. regarding Hazard Impacts.) Additionally, once soils are excavated, the 1998 SEIR and the NOP/IS do not specify when or how engineered fill would be used as opposed to other types of fill. All of these details would be part of a complete seismic analysis.

iv. The Pile System is Not Adequately Developed and is of Limited Assistance to Protect the Public.

The 1998 EIR and the NOP/IS refer to the use of piles for structural stability. (1998 FSEIR, p. II.20, V.H.12; NOP/IS, pp. 17, 86, 87, 88-91.) Piles would be subject to

[3] See also comments on Air Quality submitted by Tom Lippe. The failure to accurately quantify the amount of soil excavation that will be required to address liquefaction and site contamination (see section 3. *infra*) also make the air emissions estimates and traffic impacts analysis unreliable. Additionally, availability of disposal sites cannot be analyzed without a reasoned estimate of needed excavation.

amplification, which was not studied in the 1998 DSEIR. (Karp Geotech, p. 5.) Moreover, piles are discussed only in the context of the arena structure. However, "[p]ile support systems do little to provide mitigation from liquefaction and settlement of surrounding utilities/roads and other support systems that may be damaged during a seismic event." (BSK Geotech, comment A1.) Settlement due to sand boils is a potential concern that has not yet been fully addressed in terms of impacts to supporting structures and necessary mitigation standards. (BSK Geotech, comments A10, A11.) These Project details must be studied in the context of an EIR. (See BSK Geotech, comment A4.)

v. Impacts of Dewatering and Pile Driving Have Not Been Studied.

Dewatering necessary for construction has not yet been studied to the degree of detail needed to understand the required mitigation. A 2015 Langan Treadwell Rollo memorandum discusses dewatering, but does not address engineering effects of dewatering, such as the increase in effective stress that causes areal subsidence. (Karp Geotech, p. 6.) The NOP/IS unreasonably dismisses these risks with no analysis. (BSK Geotech, comment B6.) Vibrations from pile driving can also create additional risks, which have not been analyzed for this Project. (Karp Geotech, p. 6.) Test programs, dynamic analyses and site-specific engineering are needed, and have not yet been completed, to identify the nature and extent of the impacts and the necessary mitigation to address these impacts. (Karp Geotech, p. 6.)

vi. Hazards of Lateral Spread and Liquefaction Induced Boils Are Not Addressed.

In 1998, mapping for lateral spread risk did not include the site. (BSK Geotech, comment B5.) Liquefaction-induced sand boils have also been identified as a hazard since 1998. (BSK Geotech, comment C4.) These hazards individually and jointly must be analyzed in the context of an EIR in order to fully inform the public regarding the potential impacts of the Project consistent with CEQA. (See generally Pub. Resources Code, § 21002.)

In summary, a thorough analysis of all seismic risks that utilizes the most current methodologies must be performed to adequately protect the public. Candlestick Park provides a relevant case study of the need to ensure thorough analysis and mitigation. In 1985, Lawrence Karp was involved in a study of how Candlestick Park would perform in a serious seismic event, and attended a summary meeting in City Hall with Norm Karasick, the City architect. The discussion was about the cost of rebuilding the deteriorated concrete bleachers to then-current standards. It was recognized that one or more sections could collapse in an earthquake. Mr. Karasick pointed out that the City

probably would not want to spend the money to strengthen the bleachers, stating, "What are the odds there would be an earthquake during a game?" The City ultimately decided to do the work, and on October 17, 1989 the Loma Prieta earthquake occurred during a World Series game. Nobody was injured at the game. Had the City not engaged in that updated study, and mitigated to current standards, the result might have been disastrous. The same practice must be followed here. The City must correct its outdated and deficient seismic analyses in the recirculated DSEIR.

b. Tsunami Hazards Are Not Addressed.

According to the 1998 FSEIR, the "likelihood of tsunami inundation is very slight." (1998 FSEIR, p. II.20.) The 1975 model used in the 1998 EIR to determine potential tsunami hazards is outdated. (BSK Geotech, Comment A.6.) The current approach for assessing tsunami risk is to perform a Probabilistic Tsunami Hazard Analysis, which has not been done for this site. (BSK Geotech, comment A.6.)

Since 1998, part of the Project site was mapped as a Tsunami Hazard Zone established by the State of California (California Emergency Management Agency, June 15, 2009 Map). (BSK Geotech, comment A.2; see also Figure 1.) This updated map indicates that the tsunami hazard is now considered significant. (BSK Geotech, comment A.2.)

The 1998 FSEIR, NOP/IS and DSEIR do not address the tsunami hazard in the context of extreme high tides or sea level rise. (BSK Geotech, comments A7, B9, C1.) The 1998 FSEIR and the NOP/IS relied on "datum established in the 19th century," which has not been updated to reflect current sea level data. (BSK Geotech, comments A8, B8.) The 1998 FSEIR and NOP/IS minimize the tsunami hazard based on these outdated methodological approaches. Reliant upon these conclusions, the DSEIR discounts the risk of tsunami and provides no analysis of the impact. (BSK Geotech, comment C3.)

Currently, structures designated as Risk Category III are specifically prohibited in a Tsunami Hazard Zone under the California Building Code. (BSK Geotech, comment A9; see also Figure 1.) The NOP/IS and the DSEIR fail to mention this important fact. (BSK Geotech, comment C5.) The DSEIR must be rewritten and recirculated to address tsunami hazards.

c. Inadequate Mitigation is Provided for Geology and Soils Impacts.

i. There are No Effective Seismic Mitigation Measures.

No mitigation in the form required by CEQA is included for Geology and Soils Impacts despite the discussion of the need for mitigation measures identified in more recent site-specific geotechnical reports. (BSK Geotech, comment C2.) The NOP/IS relies on a combination of old and inadequate mitigation from the 1998 EIR, compliance with the Building Code, and future geologic and other investigations. All mitigation for the serious impacts associated with Geology and Soils has been impermissibly deferred.

While the NOP appears to point to mitigation developed in 1998 as applicable to the Project, DSEIR Appendix-MIT indicates that there are no mitigation measures listed that apply to the Project's Geology and Soils impacts. Yet the findings and conclusions of the geotechnical work completed for the site by Langan Treadwell Rollo identify numerous conditions requiring mitigation, including: "excessive static and dynamic settlements, liquefaction including sand boils, lateral spread, intense ground motion, shallow groundwater and corrosive soils." (BSK Geotech, comment C2.)

In 1998, the site's soils were identified as highly corrosive, which can damage concrete and metal used in foundation measures and other underground infrastructure. (See Karp Geotech, p. 5.) The NOP/IS states that Mitigation Measure H.7 from the 1998 FSEIR would require testing of the soil. (NOP/IS, p. 86.) Yet, Appendix MIT of the 2015 DSEIR states that this Mitigation Measure H.7 is not required. (DSEIR, MIT-22.)

With no site-specific or Project specific mitigation, the NOP/IS relies primarily on the Building Code to mitigate for seismic impacts. (NOP/IS, p. 87, 88, 90.) Yet reliance on a regulatory standard is inadequate when the underlying impacts have never been analyzed in the first place. While mitigation may properly be deferred in some instances (CEQA Guidelines, § 15126.4, subd. (a)(1)(B)), the "perfunctory listing of possible mitigation . . . [that] are non-exclusive, undefined, untested and of unknown efficacy," is inadequate. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 74, 93.) Here, the DSEIR's lack of seismic analysis addressing this Project and this site severely compounds the problem.

According to the IS/NOP (pp. 87, 93) future geotechnical investigations will disclose the conditions and the required mitigation. Neither the future study nor the alleged future mitigation are enforceable. Moreover, to the extent these references relate to the contemporary geotechnical evaluations and investigations, such as the 2011 Langan Treadwell Rollo report for office buildings, they are inapplicable to the building

type now proposed. These more recent reports also clearly state that they are not to be used for design purposes.

According to Dr. Karp, the current documents for the Project do "not include sufficient countermeasures to liquefaction" risks. (Karp Geotech, p. 5.) For instance, ground improvement measures also need to lessen the effects of strong motion in the underlying Bay Mud during earthquakes. (Karp Geotech, p. 5.) Countermeasures could include various actions, but those actions must be compatible with a piling system that would be subject to liquefaction loads and motion amplification from Bay Mud. (Karp Geotech, p. 5.) Specific measures to address differential settlement have not yet been developed. (BSK Geotech, comment B3, B6.) Mitigation must be developed in the context of a contemporary environmental review process. A test program should also be developed to evaluate these measures. (Karp Geotech, pp. 5-6.)

In addition to proper design of the Project, mitigation must address public safety concerns regarding evacuation from an earthquake or tsunami. Even if overexcavation and fill and other measures could be effective to address liquefaction at the site, surrounding utility roads and emergency support systems would not be protected by the proposed supporting piles discussed in the 1998 DSEIR and the IS/NOP. (BSK Geotech, comments A1, A10.) Additionally, adequate escape routes from the area must be available in the event of an earthquake or a tsunami. A collapse of the Third Street Bridge was previously identified as subject to damage in a major earthquake and limiting escape routes out of Mission Bay. (1988 DEIR, Vol. II, Chapter VI.D.3, 9 and 44.)

ii. No Mitigation is Provided for Tsunami Risk.

While the NOP/IS discusses possible mitigation for tsunami in the text, none of those measures are included in the Mitigation Measures. (BSK Geotech, comment B10.) Additionally, it is unclear why mitigation is being provided at all if the risk is indeed less than significant. (BSK Geotech, comment C1.) Additional mitigation in the form of design parameters that could assist in reducing the risk are not specified or required. (BSK Geotech, comment B11.) And flood improvements are a feasible mitigation measure required for the portion of Mission Bay subject to Addendum 9 to the 1998 FSEIR. (FSEIR, Addendum 9, Mitigation Measure K.06.) It appears that these measures would also be appropriate for the Project.

In conclusion, the United States Geological Survey forecasted a 67% probability that an earthquake of magnitude 7.0 or greater will occur on the San Andreas or Hayward faults by the year 2020. (Karp Geotech, p. 2.) This Project will draw up to 18,500 people into a zone subject to many risks. A full environmental analysis, with a testing program and adequate mitigation must be included in a recirculated EIR. Risks to the public from earthquakes and tsunamis are too dire to ignore or treat lightly based on decades-old environmental review and outdated models and standards.

4. <u>The DSEIR's Analysis of Utilities and Service Systems Violates CEQA – DSEIR Chapter 5.7.</u>

The DEIR's analysis of utilities and service systems fails to comply with CEQA's mandates. First, the DSEIR relies upon a water supply assessment for an earlier, different project, in a different location, prepared before the City had its water rights curtailed. The DSEIR also fails to address necessary stormwater infrastructure issues and relies on the prior NOP/IS that affirmatively misrepresents the capacity of that anticipated system. Finally, the DSEIR impermissibly defers virtually all substantive analysis and mitigation regarding needed wastewater infrastructure.

a. Inadequate Analysis of Water Supply and Conveyance Facilities.

The DSEIR impermissibly fails to consider whether the Project will result in the construction or expansion of any water conveyance facilities that may result in significant environmental impacts. This approach is based on the claim that the NOP/IS establishes that there are no significant impacts. (DSEIR, p. 5.7-9.) The NOP/IS, however, fails to provide sufficient information to make any conclusion in this issue by deferring any meaningful analysis. (NOP/IS, pp. 68-69.)

More specifically, the NOP/IS acknowledges:

> If the water distribution system as approved under the Mission Bay Infrastructure Plan is inadequate to meet the project's demand, the project sponsor would be responsible for funding the construction of required new water mains and appurtenances. The construction of the new water mains and appurtenances would require excavation, trenching, soil movement, and other activities typical of construction of development projects in San Francisco.

(NOP/IS, p. 69.)

This analysis is flawed in several respects. First, having acknowledged that the infrastructure may not be adequate for the Project, and that construction of an unknown scope may be necessary to install this infrastructure, the SDEIR may not simply defer analysis of whether the infrastructure is adequate. And yet that is precisely what the City

purports to do, stating in relevant part: "As part of the standard permit review process, the Mission Bay master developer, in coordination with the project sponsor, would be required to request a hydraulic analysis of the SFPUC water distribution system to confirm that the existing and planned water distribution system is adequate to meet the project's water distribution demands, including fire suppression system pressure and flow demands." (NOP/IS, p. 69.) No explanation is given as to why this assessment could not have been made prior to the release of the DSEIR, which is the intended vehicle to provide public disclosure of these very issues. As a result, the decision-makers and the public are left completely in the dark about the very matter at issue, namely whether additional infrastructure is required and, if so, the scope of construction work that may be necessary to install that infrastructure.

The environmental impacts of construction may not be lightly dismissed as done in the NOP/IS. (NOP/IS, p. 69.) While construction of water conveyance facilities might, generally speaking, be "typical of construction of development projects in San Francisco," the Project site includes soil and groundwater contamination that make such construction activities anything but "typical." (<u>Exhibit B</u>, comments A1, A2, A3, B1, B3, B4, B5, B6, C1.)

The DSEIR fails as an informational document because it impermissibly defers any meaningful analysis of water conveyance facilities. Moreover, there is substantial evidence of a fair argument that construction of these facilities, if required, may result in significant environmental impacts. The recirculated DSEIR needs to address this issue.

Similarly, the DSEIR dismisses the question of adequate water supply without analysis, relying on the lack of potentially significant impacts identified in the NOP/IS. (DSEIR, p. 5.7-1.) The NOP/IS states that the City is relying on a water supply assessment ("WSA") prepared in May 2013 for the then-proposed arena site located at Piers 30-32 ("2013 WSA"). The DSEIR fails as in informational document with respect to water supply issues because it may not rely on the 2013 WSA.

First, the DSEIR does not address how the proposed Project is a revision of the Piers 30-32 project for purposes of Water Code section 10910. While the two projects may share some common features of an arena, there are considerable differences. The projects are at different locations. Further, the prior project proposed 208,844 square feet of residential uses and 178,406 square feet of hotel uses, that are eliminated in the current Project that proposes 580,000 square feet of commercial uses. The basic site plans are different for the two projects.

Second, even if the proposed Project could be considered a revision to the abandoned Piers 30-32 project, the DSEIR may not rely on the prior WSA because there has been a significant change in circumstances since preparation of the 2013 WSA. (Wat. Code, § 10910, subd. (h).) Water Code section 10910, subdivision (h)(2) provides that a prior WSA may not be subsequently relied upon when there are "[c]hanges in the circumstances or conditions substantially affecting the ability of the public water system . . . to provide a sufficient supply of water for the project." The ongoing drought is a major change in circumstances that substantially affects the City's ability to provide water to the Project. On June 26, 2015 the State Water Board sent the City a notice curtailing its pre-1914 water rights. With no relief to the drought in sight, it is reasonable to expect further curtailments to the City's water rights. This change in circumstances prohibits the City from relying on the 2013 WSA for the project. And the DSEIR's failure to discuss this critical water supply issue renders it inadequate as an informational document.

b. The DSEIR Provides a Misleading Discussion of Stormwater Treatment Facilities.

The DSEIR also fails as an informational document with respect to its analysis of stormwater treatment because it provides both inconsistent and misleading information about the facilities intended to handle stormwater runoff.

First, the DSEIR is internally inconsistent with the NOP/IS, upon which it purportedly relies. With respect to stormwater facilities, the NOP/IS asserts that the impact is potentially significant (IS, p. 64 Table 11.c) and will be analyzed in the DSEIR (IS, p. 72.) The subsequent DSEIR, however, states that it is not providing a project level analysis of the issue, asserting in relevant part:

> With respect to stormwater facilities, however, the stormwater system improvements already construction and currently under construction address both the near-term and long-term needs. . . . ***A separate project impact analysis is not provided***.

(DSEIR, p. 5.7-10 (emphasis added).)

The DSEIR violates CEQA because it fails to address the potentially significant impacts of project-level stormwater infrastructure. While the DSEIR provides some analysis of cumulative stormwater impacts, it concludes that the impact is less than significant with no need for any mitigation. (DSEIR, p. 5.7-18.) Thus, the NOP/IS and the DSEIR play a shell game with respect to analysis of stormwater impacts. It is unclear

what the DSEIR's ultimate conclusion is regarding project-level stormwater infrastructure impacts, and no substantial evidence supports this unknown conclusion.

Setting aside the internal inconsistency, the DSEIR's ultimate conclusion of less than significant cumulative impact is based on a misleading characterization of the Project's stormwater infrastructure. The DSEIR asserts:

> The project stormwater analysis completed for the project sponsor concluded that the capacity of the separated stormwater system as built is adequate to serve the project as well as other development projects that would be constructed at full buildout of Mission Bay South.

(DSEIR, p. 5.7-18.)

This representation is inaccurate and misleading. A technical report, referenced in a footnote but not actually attached as an Appendix to the DSEIR, describes the stormwater facilities very differently. (DSEIR, p. 5.7-18, fn 20 citing "BKF, Mission Bay Blocks 29-32 – Stormwater Memorandum, January 6, 2015" ("Stormwater Memorandum").) The Stormwater Memorandum provides a more accurate description of the stormwater infrastructure, and provides in relevant part:

> The storm drain system and pump station are designed to handle runoff from a 5-year storm event. During larger events such as a 100-year storm event, runoff is conveyed through the streets to a controlled overflow to the Bay.

(Stormwater Memorandum, p. 6.)

Thus, the Project's stormwater system can in no way handle project-level stormwater runoff, much less the Project's runoff in combination with cumulative projects. This is because the system has the capacity to handle only up to five-year storm events, which is significantly smaller than the 100-year capacity typically required. Any storm larger than a five-year event will result in flooding the streets.[4] In light of this anticipated flooding, the Project, which includes multiple levels below grade, will "be

[4] The Stormwater Memorandum asserts that use of public streets to channel storm flows in this manner was analyzed in a *Revised Summary Drainage Study for the South of Channel Watershed for Mission Bay Project*, dated December 1, 2000, yet this document was not posted on the OCII as required for the project to comply with the streamlining requirements of AB 900.

sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment." (Stormwater Memorandum, p. 6.) The necessity to flood proof the Project due to inadequate stormwater facilities was never addressed in the DSEIR. Moreover, to the extent that increasing impervious surfaces on the Project site will result in additional flooding in the public streets that are shared by other structures, the DSEIR fails to address the need for additional flood proofing of other buildings in the area.

The analysis contained in the Stormwater Memorandum is also inconsistent with the DSEIR's analysis of flooding risks, which is based on the NOP/IS's analysis of Impact HY-4. Contrary to the information provided in the NOP/IS, the Project would result in exposing people and structures to a significant risk of loss and injury due to flooding for any event above the five-year event. (CEQA Guidelines, Appendix G, Section IX(i).) This is true for both the Project site as well as offsite. Finally, the strategy of relying on public streets as de facto spillways significantly contributes to substantial additional sources of polluted runoff. (CEQA Guidelines, Appendix G, Section IX(e).) This represents a new significant impact that was never addressed in the DSEIR.

The resulting public safety risk created by this situation cannot be overstated. The Project includes an 18,000-seat arena. In instances where arena events occur during moderate storm events (anything above a five-year event), thousands of visitors to the arena will exit onto streets that are serving as flood channels for stormflow. The combination of flooded streets, thousands of densely-packed pedestrians, at-grade transit cars and automobiles – all at night – presents a very dangerous situation that has never been discussed, analyzed, or mitigated in the DSEIR.

c. The DSEIR Deferred Analysis of Wastewater Impacts.

The DSEIR's analysis with respect to wastewater capacity and infrastructure is similarly flawed. After acknowledging that the City does not have sufficient wastewater capacity to address project-level impacts, the DSEIR very generally mentions vague "interim improvements to temporarily increase the dry-weather capacity" of the Mariposa Pump station. (DSEIR, p. 5.7-12) In failing to explain when these interim improvements will be completed or to analyze their environmental impacts, the DSEIR fails as an informational document. (*Ibid.*)

The DSEIR's analysis of cumulative wastewater impacts also fails to provide necessary information to the public and decision-makers. While acknowledging that permanent improvements are necessary, the DSEIR fails to provide any information

about the environmental impacts of these improvements. (DSEIR, pp. 5.7-13 – 14.) The DSEIR dismisses this deficiency because "SFPUC has not completed the planning and design of specific improvements," (DSEIR, 5.7-14), but this does not alleviate the duty of a lead agency to disclose available information. (CEQA Guidelines, § 15144.) One critical piece of information with respect to future construction activity, ignored in the DSEIR, is that a substantial amount of such construction would likely occur in areas of existing soil and groundwater contamination. (Exhibit B, comments A1, A2, A3, B1, B3, B4, B5, B6, C1.) The DSEIR's conclusory dismissal of the impacts associated with constructing necessary wastewater infrastructure fails to address that issue.[5]

5. The DSEIR Improperly Excluded Analysis of Impacts to Recreation – 1998 SEIR Chapter 5.M.

The DSEIR did not address the Project's impacts on recreational facilities because the NOP/IS determined that no new or more severe significant impacts would occur than previously identified in the 1998 SEIR. As set forth more fully below, the information contained in the DSEIR supports a fair argument that use of Bayfront Park by thousands of crowded arena visitors will accelerate its substantial deterioration, which will be a significant environmental impact. (CEQA Guidelines, Appendix G, section XV(a).) A fair argument exists that the Project's recreation-related construction,at Bayfront Park will result in significant environmental impacts through possible exposure to hazardous materials. Even if the Project is considered a "revision" to the project analyzed in the 1998 SEIR, the addition of a massive, 18,000-seat arena will have a significantly greater impact to Bayfront Park than disclosed in the 1998 SEIR requiring analysis in a recirculated DSEIR.

a. Crowds From the Project May Substantially Degrade Bayfront Park.

The DSEIR failed to include an analysis of impacts to recreation based on the NOP/IS's determination there would be no new or more severe impacts than identified in the 1998 SEIR. (NOP/IS, pp. 61-64.) This conclusion is in error because a fair argument exists that the Project will result in potentially significant impacts to recreation and recreational facilities.

The fundamental flaw in the NOP/IS's analysis is seen in the following statement: "The increase in demand for recreational facilities generated by the project would

---

5 Further discussion regarding the City's abdication of its CEQA duties with respect to wastewater treatment is addressed in the July 26, 2015, letter submitted by Tom Lippe.

generally be consistent with that described in the Mission Bay FSEIR." (NOP/IS, p. 63.) This remarkable conclusion is unsupported by any citation or factual support. Rebutting this statement is the project description itself: an arena with a capacity of more than 18,000 seats holding up to 225 events per year. The expected huge crowds, and employees associated with the 580,000 square feet of commercial uses, would be crammed into an 11 acre parcel. The only respite to the congested arena environment would be 3.2 acres of alleged open space. While at first blush this might appear adequate, in reality this "open space" consists of small, disjointed spaces. Many of these spaces are located on the tops of buildings and unavailable to thousands of arena visitors.

In contrast to the functionally unusable "open space" within the Project site, immediately across the street from the Project is the planned Bayfront Park – a single, expansive, ground level, landscaped park of 5.5 acres. It is very likely that the near-daily crowds of congested arena visitors will use Bayfront Park to gather both before and after shows rather than the oddly disjointed "open spaces" located on top of various buildings throughout the site.

These thousands of additional arena visitors are in addition to the people associated with the Project's 580,000 square feet of office space, the Project's 125,000 square feet of retail space, and all other people within the larger Mission Bay area who are anticipated to visit Bayfront Park. The open space needs of such arena crowds were nowhere contemplated in the 1998 SEIR. The Project will result in significantly accelerated physical deterioration of Bayfront Park, not disclosed in the 1998 SEIR, and is a significant impact under CEQA. (CEQA Guidelines, Appendix G, section XV(a).)

b. The Project Will Require Construction of Bayfront Park That May Have an Adverse Impact on the Environment.

The DSEIR acknowledges the development of the Project triggers development of Bayfront Park and must be completed prior to occupancy. (DSEIR, p. 3-37-38.) In other words, development of the Project requires construction of Bayfront Park. (See, e.g., CEQA Guidelines, Appendix G, section XV(b).) Accordingly, construction of Bayfront Park is a "reasonably foreseeable consequence of the initial project," and requires analysis in the DSEIR. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 396.) It may not, as occurred here, be dismissed as a separate project for purposes of CEQA. (DSEIR, p. 3-37.) Serious questions exist about whether construction of Bayfront Park will result in adverse physical effects on the environment due to the presence of hazardous materials on that site. (*Ibid.*)

As set forth above, the NOP/IS failed to disclose the present existence of hazardous waste in the soil within the Project site. The soil underlying the future Bayfront Park is similarly contaminated. (2006 RRMP, p. 2-5.) This contamination has not been disclosed in the NOP/IS or the DSEIR. Since it appears that Bayfront Park will be constructed along with the Project, the same questions are raised about hazardous materials impacts as discussed in sections 2(b) and (c) of this letter.

The potentially significant impacts regarding hazardous materials are exacerbated because Bayfront Park will be a ground-level landscaped park. Having failed to disclose that the soil underlying Bayfront Park is contaminated, the NOP/IS also fails to explain whether such contaminated soil will be left in place and thereby expose visitors to hazardous materials. There is no discussion of whether an impermeable cap will be used to protect future park visitors from the existing contaminated soil.

The failure to address these critical issues supports a fair argument that the Project will require construction of a recreational facility (i.e., Bayfront Park) that will have an adverse effect on the environment by facilitating the exposure of contaminated soils to humans and the environment. (CEQA Guidelines, Appendix G, section XV(b)). The City may not dismiss this potentially significant impact based on its own failure to conduct a reasonable analysis of the issue. (*Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311 ("[t]he agency should not be allowed to hide behind its own failure to gather relevant data . . . . If the local agency has failed to study an area of possible environmental impact, a fair argument may be based on the limited facts in the record").) The recirculated DSEIR will need to analyze this potential significant impact.

6. <u>The DSEIR Failed to Disclose Energy Impacts.</u>

The DSEIR is fatally defective because it fails to provide information about the Project's energy requirements as mandated by Appendix F of the CEQA Guidelines ("Appendix F"). A California appellate decision recently reaffirmed the need for a detailed analysis of energy consumption and mitigation in EIRs, stating in relevant part:

> Under CEQA, an EIR is "fatally defective" when it fails "to include a detailed statement setting forth the mitigation measures proposed to reduce wasteful, inefficient, and unnecessary consumption of energy." (*People v. County of Kern* (1976) 62 Cal.App.3d 761, 774.) The requirement to adopt energy impact mitigation measures "is substantive and not procedural in nature and was enacted for the purpose of requiring the lead agencies to focus upon the energy problem in the preparation of the final EIR." (*Ibid.)*

(*California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 209 (*CCEC*).)

The City failed to comply with this mandate to prepare a detailed statement in the DSEIR. In fact, the DSEIR fails altogether to address the issue of energy consumption because the NOP/IS inaccurately determined that the issue was sufficiently addressed in the 1998 SEIR. (DSEIR, 1-9; NOP/IS, pp. 122-125.) This did not happen.

As explained in *CCEC*, Appendix F lists the information that satisfies CEQA's mandate to "assure that energy implications are considered in project decisions." (CEQA Guidelines, Appendix F; *CCEC*, *supra*, 225 Cal.App.4th at 209.) As just one example, the list includes "total energy requirements of the project by fuel type and end use." (CEQA Guidelines, Appendix F, Section II(A)(2). The 1998 SEIR failed to prove this information. With respect to construction energy requirements, the NOP/IS concedes: "The FSEIR did not estimate energy consumption specific to the development of proposed on Blocks 29-32 or the amount of water that would be used during construction.") (NOP/IS, p. 123.) With respect to operational energy requirements, the NOP/IS concedes, "The amount of fuel use attributable to development on Blocks 29-32 was not specifically calculated in the FSEIR." (NOP/IS, p. 123.) Finally, with respect to transportation energy requirements, the NOP/IS concedes: "The amount of fuel use attributable to development on Blocks 29-32 was not specifically calculated in the FSEIR." (NOP/IS, p. 123.)

The 1998 SEIR thus failed to address the issue of energy demand and mitigation for the project proposed in 1998, much less for the very different Project now proposed. Contrary to the conclusion in the NOP/IS, the 1998 SEIR cannot be relied upon to avoid providing the analysis in the DSEIR.

The NOP/IS and DSEIR make much of the proposed LEED certification for the Project. While LEED certification may be relevant to a lead agency's duties under Appendix F, referencing LEED certification alone is inadequate. The *CCEC* decision addressed this point in the context of Title 24 building energy code standards:

> Although the Building Code addresses energy savings for components of new commercial construction, it does not address many of the considerations required under appendix F of the CEQA Guidelines. These considerations include whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope.

CCEC, *supra*, 225 Cal.App.4th at 211.)

The same analysis applies to LEED certification. While relevant, LEED certification does not end the discussion or obviate the lead agency's duty to comply with Appendix F. What is more, as explained in the context of GHG emissions a lead agency may not avoid its duty to disclose project impacts and mitigation measures by incorporating mitigation measures into the project description. To the extent that the City intends to incorporate the purchase of offsets as a "design feature" or otherwise incorporate it into the project description, recent case law clarifies that this strategy violates CEQA's mandate to separately disclose project impacts and feasible mitigation measures. (*Lotus*, *supra*, 223 Cal.App.4th 645, 655-56 (incorporating mitigation measures for redwood trees into the project description violated CEQA "[b]y compressing the analysis of impacts and mitigation measures into a single issue").) To the extent that LEED certification reduces the Project's energy demand, the DSEIR must disclose the Project's unmitigated energy consumption and show how LEED certification reduces that consumption.

In summary, the City's failure to address the Project's energy demands as required by Appendix F renders the DSEIR "fatally defective." (*CCEC*, *supra*, 225 Cal.App.4th at 209.)

7. <u>Wind and Shadow – DSEIR Chapter 5.6.</u>

a. Wind Impacts are Inadequately Analyzed.

According to the DSEIR, a wind impact would be significant if it would alter wind in a manner that would substantially affect public areas. (DSEIR, p. 5.6-6.) Thus, the wind analysis only addresses offsite areas. (DSEIR, pp. 5.6-10 to -13.) Yet, this Project is so large that it also contains publicly accessible areas within the Project. While the DSEIR includes a discussion of wind impacts in these areas, it does so only for "informational purposes." (DSEIR, p. 5.6-18.) This analysis shows that exceedances of the criteria will occur, yet no mitigation is required. Instead, the DSEIR discusses "refinements that could be incorporated into the project . . . ." (DSEIR, p. 5.6-19.)

The City's approach to addressing wind impacts violates CEQA's mandates that an EIR identify potentially significant impacts and set forth with specificity all feasible mitigation measures. The DSEIR must identify potentially significant impacts to public spaces within the Project site, and cannot conflate public disclosure of that impact with the separate and distinct analysis of feasible mitigation measures. (*Lotus*, *supra*, 223

Cal.App.4th at 655-56.) Further, the DSEIR may not defer formulation such mitigation measures in the absence of any performance standards and explanation as to why deferral is necessary. (*Communities for a Better Environment, supra,* 184 Cal.App.4th at 93.)

b. Shadow Impacts are Undisclosed.

According to the DSEIR, the Project would have a significant shadow impact if it substantially affected a publicly-accessible open space area, such as Bayfront Park. (DSEIR, p. 5.6-6.) With respect to the methodology for assessing the Project's impacts, the DSEIR refers to the South Design for Development. (DSEIR, p. 5.6-8.) However, the land use designation in the Mission Bay Redevelopment Plan for the four-block Project area was designated as "Commercial Industrial (Mixed Use including Retail)." (DSEIR, Figure 3-3.) The proposed Project will require that the South Design for Development be modified to accommodate the arena and accompanying development, so it is not clear that the standards developed for the 1998 land use plan apply in this circumstance. Moreover, conditions have likely changed such that the South Design for development, which did not require any analysis of shadow for the months from October to February, no longer reflects current practices and values. Especially with the increased visitors to the area as a result of the Project throughout the year, shadow impacts on the very parks those people will use should be fully analyzed.

The DSEIR's approach of ignoring the generally-applicable City standard is also inconsistent with the DSEIR's approach to analysis of wind impacts. With respect to wind, the DSEIR relies on Planning Code section 148 to determine what level of wind would constitute a substantial alteration, even though it is superseded by the South Design for Development Standards. (DSEIR, p. 5.6-6.) Yet the DSEIR does not mention the typically applicable standard – Section 295 of the Planning Code, also known as "Proposition K" and "the Sunlight Ordinance." The absence of a substantive standard for shadow is all the more reason to refer to Section 295 for purposes of analyzing shadow impacts.

> Section 295 mandates that new structures above 40 feet in height that would cast additional shadows on properties under the jurisdiction of, or designated to be acquired by the Recreation and Parks Department can only be approved by the Planning Commission if the shadow is determined to be insignificant or not adverse to the use of the park. Also, a recommendation from the Recreation and Parks Commission is required prior to the Planning Commission hearing.

(S.F. Planning Department Application Packet for Shadow Analysis, available at: http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=539.) Impacts to Bayfront Park should be analyzed according to Section 295 to ensure that shadow impacts are disclosed and mitigated.

In conclusion, the analysis in the DSEIR fails to adequately address the wind and shadow impacts of the Project under current conditions, using standards developed by the City to ensure public spaces are comfortable and enjoyable. The DSEIR should be revised and recirculated to provide a thorough analysis and incorporate all feasible mitigation. Such mitigation may include changes to the structures to address wind and shadow impacts both on and off the Project site.

8. <u>The DSEIR's Project Description is Inconsistent.</u>

The DSEIR is fundamentally flawed because the project description is internally inconsistent, thwarting intelligent public participation relating to the Project and its impacts. (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 197.) As described more fully below, the DSEIR appears to variously include and exclude the departure of the Warriors from the existing Oracle Arena.

DSEIR section 1.1.2 (Project Objectives) provides in relevant part:

> The Golden State Warriors currently play their home games at Oracle Arena, located at 7000 Coliseum Way in Oakland, California and lease their management offices and practice facility at the Oakland Convention Center at 1011 Broadway in downtown Oakland. The proposed project would consolidate these facilities in one location.

(DSEIR, p. 1-3.)

Consistent with this approach, the Project's AB 900 Application expressly incorporates into the project description reduced events at the existing Oracle Arena in order to reduce the Project's greenhouse gas emissions. This strategy is depicted both textually and graphically in the AB 900 Application:

> Though the Oracle Arena will no longer host GSW games, it is assumed that approximately 50% of the non-game events will still occur at the Oracle Arena, or 24% of a typical year's game and non-game events will still occur at the Oracle Arena. Thus, emissions calculations for the

remaining non-game events at Oracle Arena use a 24% scaling factor to account for this reduction in number of events.

(AB 900 Application, p. 63.)

Table 1. Project Description

Element	Oracle Arena and GSW Oakland Headquarters	Event Center Project
First Operational Year Considered	2017	2017
Oracle Arena	500 KSF	500 KSF
GSW Games [1]	100%, 47 games	No games
Non-game Events [2]	100%, 42 events	50%, 21 events
Mission Bay Event Center	-	750 KSF
GSW Games [1]	-	100%, 47 games
Non-game Events [3]	-	100%, 161 events
GSW Headquarters	Oakland	Mission Bay, 25 KSF

1. Number of GSW games in both scenarios is based on the 2013-2014 season. Averages for the previous years were skewed by the 2011 NBA lockout.
2. Number of non-game events at Oracle Arena is based on the schedule from recent years. In the Event Center Project scenario, half of the non-game events are assumed to remain at Oracle Arena while the other half are transferred to the Mission Bay Event Center.
3. Number of non-game events at Mission Bay Event Center is based on the Notice of Preparation dated 11/19/2014.

Consistent with the DSEIR's discussion of project objectives on page 1-3 as well as in the AB 900 Application, the DSEIR's analysis of greenhouse gas emissions incorporated event reductions at Oracle Arena for purposes of decreasing the Project's carbon footprint. (DSEIR, p. 5.5-11.) Page 5.5-11 of the DSEIR provides in relevant part:

> As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits. Net additional GHG emissions would be

> calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the project.[6]

Thus, while not expressly stated in the text of the DSEIR's analysis of GHG emissions, the analysis nonetheless incorporates reduced events at Oracle Arena for purposes of calculating the project's net GHG emissions.

While taking the environmental "benefit" of lower mobile-source GHG emissions resulting from reduced events at Oracle Arena, the DSEIR deftly avoids analysis of the environmental consequences of this component of the overall Project. For example, the project description includes continued operation of Oracle Arena even though it is predicted to host merely 21 events per year. (AB 900 Application, pp. 63, 81 of 155.) As explained by Ph.D. economist Philip King, it would be unreasonable for Oracle Arena to continue to operate with so few events. Dr. King concludes that one likely scenario is that Oracle Arena would need to close as a result of the reduced demand, which in turn creates the potential for urban decay at the Oracle Arena site. The DSEIR never analyzed the resultant potential for urban decay. Nor did the DSEIR analyze the impacts associated with demolition of the existing Oracle Arena as a result of its shuttering.

The DSEIR is thus flawed because the project description is internally inconsistent. The project description includes reduced events at Oracle Arena when doing so helps to minimize the Project's environmental impacts, but excludes operation of Oracle Arena in order to avoid addressing its problematic environmental impacts. This inconsistency misleads the public about the Project and its impacts. (See, e.g., *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 655-656 ("By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading").)

The same analysis applies to the DSEIR's inconsistent treatment of the construction of Bayfront Park and realignment of Terry Francois Blvd. The DSEIR notes, consistent with the redevelopment plan, that both the Bayfront Park and realignment are triggered by the Project, which makes them "reasonably foreseeable consequence[s] of the initial project" requiring analysis in the DSEIR. (*Laurel Heights, supra*, 47 Cal. 3d at 396.) Even though these are components of the Project as a matter of law, the DSEIR purports to characterize Bayfront Park and the roadway alignment as

6 Curiously absent from the DSEIR's discussion is any reference that the "net additional GHG emissions" from the AB 900 certification expressly relies upon credits from reduced events at Oracle Arena.

separate projects for purposes of CEQA. (DSEIR, p. 3-37.) As a result of this inconsistent project description, the DSEIR fails to address potentially significant hazardous materials impacts associated with construction and occupancy of Bayfront Park.

In summary, a lead agency may not concurrently expand and contract the described scope of a proposed project – and may certainly not do so when the result is to avoid analysis of potentially significant impacts. The recirculated DSEIR will need to provide a stable and consistent project description.

9. <u>The DSEIR Fails to Analyze Possible Urban Decay in Oakland.</u>

"Under CEQA, a lead agency must address the issue of urban decay in an EIR when a fair argument can be made that the proposed project will adversely affect the physical environment." (*CCEC*, *supra*, 225 Cal.App.4th at 188.) An EIR is to disclose and analyze the direct and the reasonably foreseeable indirect environmental impacts of a proposed project if they are significant. (CEQA Guidelines, §§ 15126.2, 15064, subd. (d)(3).) Economic and social impacts of proposed projects are outside CEQA's purview. (Guidelines, § 15131.) However, when there is evidence that economic and social effects caused by a project could result in a reasonably foreseeable indirect environmental impact, such as urban decay or deterioration, then the CEQA lead agency is obligated to assess this indirect environmental impact. (*CCEC*, *supra*, 225 Cal.App.4th at 188; *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1182; *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d 433, 446 ("The potential economic problems caused by the proposed project could conceivably result in business closures and physical deterioration of the downtown area").)

Here, substantial evidence supports a fair argument that the Project will result in economic impacts that would foreseeably lead to urban decay in Oakland. The DSEIR explains that the project include relocating the Warriors home games from the existing Oracle Arena in Oakland to San Francisco. (DSEIR, p. 1-3.) In addition to relocating all NBA games from Oakland to San Francisco, the Project description also includes relocating half of all existing non-NBA games from Oakland to San Francisco. (AB 900 Application; DSEIR, p. 5.5-11.) Thus, a direct economic impact of the Project is to reduce Oracle Arena events from 89 to 21 per year. As explained by economist Philip King, this is a severe direct economic impact from the Project. (See <u>Exhibit E</u>, a memorandum from Philip King, Ph.D., dated July 13, 2015 ("King Report"), pp. 6-7.)

Such a dramatic economic impact may reasonably be expected to have indirect impacts. Dr. King explains that revenues from a mere 21 events per year will not likely

justify the ongoing operational costs of maintaining such a facility. (King Report, pp. 7-8.) Accordingly, a likely indirect impact is the ultimate shuttering of Oracle Arena. Repurposing such a massive facility is difficult to impossible, and so it is very likely that the facility will likely stand dormant and invite the physical deterioration that is characteristic of urban decay. (King Report, pp. 8-9; *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 184, 1212 [urban decay characteristic of "long-term vacancies that deteriorate and encourage graffiti and other unsightly conditions"].)

Despite acknowledging that the Project would have significant detrimental economic impacts in Oakland, which in turn may result in physical deterioration, the DSEIR ignores the issue of urban decay. It thus fails as an informational document on this issue. The recirculated DSEIR will need to provide an analysis of the economic impacts in Oakland resulting from the predicted reduction of events at Oracle Arena, the potential for physical deterioration to result, and feasible mitigation measures to address these potentially significant impacts. (*CCEC*, *supra*, 225 Cal.App.4th at 188-190.)

* * *

Thank you for the opportunity to provide comments on the Project. For the reasons discussed above, and in the attached expert reports, the Mission Bay Alliance objects to certification of this EIR and approval of this Project.

Very truly yours,

July 20, 2015
File No. 01215159.00

MEMORANDUM

TO: Osha Meserve, Soluri Meserve

FROM: Patrick S. Sullivan, SCS Engineers
John Henkelman, SCS Engineers

SUBJECT: Greenhouse Gas Analysis for Golden State Warriors Event Center

SCS Engineers (SCS) has reviewed the greenhouse gas (GHG) analysis prepared for the proposed Golden State Warriors (GSW) Event Center (Project). The GHG analysis was performed to demonstrate that the GHG emissions from the proposed Event Center would meet the requirements under Assembly Bill 900 (AB900), including that it would result in "no net increase" in GHG emissions. SCS has performed many GHG analyses for purposes of permitting, mandatory reporting, verification, CEQA and other requirements. The resumes of Patrick Sullivan and John Henkelman are provided as an attachment.

The documents reviewed include the following:

- *Application for CEQA Streamlining: GHG Emissions Methodology and Documentation*, Environ 2015
- *Application for Environmental Leadership Development Project, Golden State Warriors, Event Center and Mixed-Use Development at Mission Bay Blocks 29-32*, Golden State Warriors 2015
- *ARB Staff Evaluation for Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32*, ARB Staff 2015
- *Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 Draft Subsequent EIR*, Office of Community Investment and Infrastructure 2015

SCS does not agree with the conclusion of the AB900 determination letter from the California Air Resources Board (CARB) dated April 20, 2015 stating that the Project would not result in any net additional GHG emissions for purposes of certification under AB900. The methodology used to conclude there would be no increase in GHG emissions is inconsistent CARB GHG policies such as the *First Update to the Climate Change Scoping Plan* (CARB 2014) and furthermore does not substitute for an adequate analysis of GHG under CEQA.

The Project quantified the expected GHG emissions for the construction and operating phases of the Project. The construction emissions were quantified using the California Emissions Estimator Model (CalEEMod) with some site-specific inputs. Operational emissions analysis includes the emissions from the existing Oracle Arena, the existing GSW headquarters, and the proposed

Event Center in the analysis. The emissions from the Oracle Arena were quantified using some site-specific values and some intensity factors obtained from CalEEMod and projected electricity intensity factors from CalEEMod. GHG emissions for the proposed Event Center were calculated using a similar methodology, but all electricity and utility use must be projected using CalEEMod factors. The GHG emission calculations for the Event Center also include GHG reductions for energy efficiency and trip linking.

The Project proposes to achieve GHG neutrality through the acquisition of GHG emission offsets equal to the projected GHG emissions from the Project over a 30-year Project life. The Project includes Mitigation Measure (MM) I-C-GG-1, which requires offsets for GHG emissions from construction and operation of the proposed Event Center.

The GHG analysis provided and proposed MM I-C-GG-1 are not sufficient to demonstrate that the Project will result in no net increase in GHG emissions for the following reasons:

- GHG methodology includes inappropriate Project operational emission baseline
- Monitoring of GHG emissions is not sufficient to demonstrate that GHG emissions are net zero
- MM I-C-GG-1 does not require use of offsets consistent with California GHG policy

As a result, the determination in the Draft Subsequent Environmental Impact Report (DSEIR) that GHG emissions are a less than significant impact is erroneous.

GHG OFFSETS BACKGROUND

GHG offsets are a critical element of the MM I-C-GG-1, which the GHG evaluation indicates would result in net zero GHG emissions from the Project. The concept behind a GHG offset is that a project developer creates GHG emission reductions above and beyond what is considered to be "business as usual" (BAU), meaning that the GHG reduction would not have occurred in the absence of the GHG reduction project. For a GHG reduction offset to be generated for use in the CARB Cap and Trade (C&T) program, the reduction must be *real, additional, quantifiable, permanent, verifiable, and enforceable*. The GHG reduction registries that may create GHG offsets under the C&T program, Climate Action Reserve[1] (CAR), the American Carbon Registry[2] (ACR), and the Verified Carbon Standard[3] (VCS), also adhere to similar principles when creating their GHG offset protocols.

The "Real" requirement for eligible offset sources means that reductions must result from demonstrable action and the methodology used to quantify that reduction must account for appropriate GHG emission sources, sinks, and reservoirs. "Real" assures that GHG generated by

[1] Climate Action Reserve Program Manual (CAR October 2011)
[2] American Carbon Registry Standard v4.0 (ACR January 2015)
[3] VCS Program Guide (October 2013)

GHG offset projects is accounted for and that projects emitting more GHG than they reduce do not generate offsets.

Offset "additionality" means that the GHG reduction activity must produce a result better than BAU. The activity cannot be the normal practice. For example, destruction of ozone depleting substances (ODS) by governments is common practice but that destruction is not commonplace for commercial or industrial facilities. Thus, destruction of ODS is not additional when the ODS is sourced from a government but it is additional when the ODS comes from a company facility.

Quantifiable, verifiable, and enforceable assure that the GHG reduction can be measured, that a third party can confirm the quantification, and that CARB can hold a party liable for performing the GHG offset activity if necessary. These principles provide assurance that GHG reductions are calculated accurately and the supporting data have been reviewed by CARB and a third party verifier.

The principles of real, additional, quantifiable, permanent, verifiable, and enforceable are critical to achieving the goal of reducing GHG in the atmosphere. The need for these assurances is shown by problems with some markets and programs, such as the Clean Development Mechanism (CDM) and Chicago Carbon Exchange (CCX), which have suffered from a lack of confidence in the legitimacy of the generated GHG reduction offsets.

CARB currently allows GHG reduction credits for forest projects, livestock projects, ozone depleting substance (ODS) projects, and mine methane capture (MMC). CARB has proposed the adoption of a rice cultivation project type. The livestock, ODS, and MMC projects achieve GHG reduction through the destruction of gases with a high potential for global warming (methane or ODS). For forest projects, the carbon reduction occurs by setting aside forested land where trees remove carbon from the atmosphere and store it as wood and plant material.

When the GHG offset developer wishes make the offsets available for purchase on the market, the developer uses a third-party verifier to confirm that the project meets program requirements and that reductions have been accurately quantified. The offset registry (CAR, ACR, or VCS) then issues the offsets to the developer. If the protocol was one of those eligible under the C&T regulation, those offsets are traded in the CARB offset market and used for regulatory compliance under the C&T regulation. If those GHG offsets are not generated under a C&T protocol, as apparently intended with the Warriors Arena, they are traded through environmental offset brokers. Non-C&T GHG offsets can be retired at the request of the offset holder to remove those offsets from the market, thereby finalizing the GHG reduction.

FLAWS IN PROJECT OPERATIONAL EMISSIONS CALCULATION

The GHG analysis in the AB900 Certification by CARB and the *Application for CEQA Streamlining: GHG Emissions Methodology and Documentation* makes several assumptions about the Project operational emissions that are not appropriate, including an assumption that the

number of events at the Oracle Arena will be limited to 21 and in the reduction of emissions from the Oracle Arena by a factor of 76 percent.

Unsupported Oracle Arena Emission Reductions

The GHG analysis underestimates GHG emissions from the Project by using the operation of the Oracle Arena as the baseline emissions (*Application for CEQA Streamlining: GHG Emissions Methodology and Documentation*, Environ 2015). The new arena Project emissions are then calculated by subtracting the projected Oracle Arena emissions from the proposed Project emissions. Operational emissions for the Oracle Arena in the Project scenario assume that all GSW games plus 50 percent of all non-GSW events that occur at the Oracle Arena will be held at the new arena location in San Francisco. This assumption results in a reduction of emissions from Oracle Arena by 76 percent (based on the current 47 GSW games and non-GSW 42 events per year).

No basis for the validity of this assumption is provided in the GHG analysis. The GHG analysis includes the Oracle Arena in the baseline condition then limits the number of events at the Oracle Arena in the Project scenario, providing the Project with a large and unenforceable GHG credit at the outset of the calculation.

When assumptions are made that limit impacts from a Project, those assumptions must be the result of enforceable conditions. In this case, MM I-C-GG-1 does not limit the events at the Oracle Arena to a maximum of 21. With no enforceable condition limiting the number of events at the Oracle Arena, it is not appropriate to assume that the number of events will decrease. The GHG analysis has already assumed that arena events will be generated by the Project based on the 89 events at Oracle Arena in the baseline scenario and 229 events in the Project scenario (21 at Oracle Arena, 47 GSW games at the Event Center, 161 non-GSW events at the Event Center). The GHG Analysis provides no justification for the reduced number of events at the Oracle Arena while assuming that the total number of events will increase.

If an enforceable condition were to be added to limit the number of events at Oracle Arena to only 21, it would be appropriate to reduce GHG emissions in the Project scenario. However, the methodology used to calculate the reduction in emissions associated with the reduced number of events at the Oracle Arena is not appropriate.

The emissions from the Oracle Arena are also directly scaled using the 76 percent reduction factor based on the number of events. This is unreasonable because it assumes that no emissions occur when events are not scheduled. It is unlikely that the Oracle Arena will cease all energy and utility use while not holding an event. It is even more unlikely that the emissions from area sources (e.g. landscaping equipment) will directly scale with the number of events.

Application Omits GHG Non-Arena Buildings

The AB900 Application does not include any GHG emissions from the non-Arena buildings that are included in the Project. Only the GHG emissions from the proposed Event Center were included in the AB900 Analysis. Emissions from other structures, including the two 160-foot office towers, the gatehouse, the food hall, GSW headquarters and retail uses for instance, are not included in the analysis, which are 730,000 square feet of space. (DSEIR, p. 2-18 to 2-19, Figure 3-5 and Table 3-1.) This omitted square footage is comparable to the square footage of the Event Center (750,000 square feet), and the emissions could equal or exceed the emissions from the Event Center. The AB900 analysis for the Project scenario omits any GHG emissions from these structures because they are assumed to be "fully vested legal rights" in the Project scenario. (Application, pp. 2, 8.)

This approach of omitting the GHG emissions from non-Arena facilities in the Project scenario because it is a "fully vested legal right" is inappropriate because those buildings have been included in the Project Description and they do not already exist. Excluding those buildings because of "fully vested legal rights" is inconsistent with CEQA requirements that impacts be evaluated based on the actual (i.e. existing) baseline condition, not a possible (i.e. permitted) condition. Also, since the AB900 certification is for the entire Project, GHG emissions from all project components must be included for the inventory to be complete.

Double Counting of Emission Reductions from Trip Linking

The Project includes a significant GHG emission reduction (7 percent of total before reductions) from trip linking. This GHG reduction accounts for some trips which would combine retail trips and trips to the arena. Some of the project operational GHG emissions were calculated with CalEEMod, and CalEEMod already includes factors for trip linking in its emission calculations for mobile sources. The GHG analysis offers no justification for why the trip linking described in the GHG analysis is not already accounted for in the CalEEMod emission calculation. This error overestimates the benefits of trip linking.

Project Methodology is Not Rigorous and is Poorly Defined

The description of the Project in the AB900 Application performed by Environ and relied upon in the GSW AB900 Application is internally inconsistent. The Environ document describes the Project as "development of a new arena." (Application p. 1.) The Environ Project Description shows the proposed land uses near the proposed Event Center, but does not clearly include the buildings in the Project. The Environ AB900 Application then proceeds with the GHG analysis from only the proposed Event Center, omitting emissions from all other buildings and implying that the Project consists of only the Event Center. That Project described in the Environ Application does not discuss the two office buildings, a gatehouse, food hall, GSW headquarters, and retail uses, and consequently uses inappropriate boundaries when analyzing the GHG emissions from the Project.

The Project described in the DSEIR consists of the proposed event center as well as two office buildings, a gatehouse, food hall, GSW headquarters, and retail uses.

, That Project Description is consistent with the Project description in the CARB Analysis, and the GSW Application, which includes the Event Center plus several other buildings including the

two office buildings, the gatehouse, food hall, and retail uses; however, no emissions from these other sources are included in the evaluation.

Throughout the AB900 Analysis, the boundaries of the analysis are poorly defined and no justification for the boundaries is provided. The CARB Analysis confirmed the GHG calculations are accurate but failed to analyze the appropriateness of the boundaries or the concept of "vested legal rights" used in the AB900 Analysis.

The baseline scenario includes the Oracle Arena, though the Project itself involves no modifications to the Oracle Arena. The Project scenario assumes a 76 percent reduction in the emissions from Oracle Arena without proposing modifications to the facility or limiting activity at the Oracle Arena. The Project excludes GHG emissions from towers included in the Project Description from the Project GHG emission calculation. All of these inconsistencies serve to increase the baseline scenario GHG emissions while reducing the Project scenario GHG emissions, resulting in an artificially small increase in GHG emissions from the Project. The actual GHG emissions increase is likely to be significantly larger than the projected increase due to these inconsistent boundaries.

THE ALLEGED PROJECT EMISSIONS REDUCTIONS LACK MONITORING AND ENFORCEABILITY

The AB900 Application and the 2015 DSEIR refer to mitigation in the form of the acquisition of GHG offsets. MM I-C-GG-1 requires that the Project acquire GHG offsets for the GHG emissions for a 30-year period. As described above, the GHG emissions methodology utilized relied on CalEEMod and projected emissions forward for 30 years. This mitigation is insufficient because it is based on modeled emissions rather than actual emissions, and GHG emissions are projected well into the future with no confirmation that predicted emissions are accurate.

30-Year Evaluation Period

The evaluation of the Project's operational emissions for purposes of offset purchases is for a 30-year period, which is too long to be consistent with California's GHG policy. Evaluating the GHG emissions for such a long period is not reasonable and not consistent with California's GHG offset program. GHG offsets generated for use in California's C&T program only have a ten year crediting period, with the exception of forestry offsets. This ten year accounting period is consistent with other GHG evaluation programs such as the CAR, ACR, and VCS. Similarly, the California GHG Scoping Plan requires updates every five years. Projecting GHG emissions 30 years into the Project lifetime, and then purchasing offsets for 30 years into the future from an unverified source is unreasonable and will certainly be inaccurate in terms of matching the actual GHG emissions of the Project.

While the 30-year evaluation period is too long to be consistent with accepted GHG accounting periods, there is no reason to arbitrarily end the Project's GHG emissions after the 30-year period. Oracle Arena opened in 1966, 49 years ago. The proposed Event Center should have a similar operating lifespan of 49 or more years. The analysis of GHG emissions after 30 years is unaccounted for in the GHG evaluation. The conclusion that the Project results in no net GHG emissions is based on MM I-C-GG-1, which requires that the Project acquire GHG offsets for the GHG emissions for a 30-year period. Any GHG emissions after this 30-year period would not be offset, resulting in emissions greater than zero from the Project. The Project must include enforceable conditions to require offsetting of emissions beyond the 30-year period or require cessation of emission after that period.

Operational Mitigation Trigger Requirement too Lenient

As discussed above, MM I-C-GG-1 requires that operational GHG emissions be offset. The offset requirement is triggered when the Event Center reaches 90 percent utilization. Thus, it is possible that the offset requirement is never triggered. Oracle Arena currently holds 89 events per year. Even if every one of these events were moved to the proposed Event Center, it would be at only 42 percent of the number of events in the Project GHG evaluation. There is no mechanism in the Project or mitigation measures that would require that offsets from the Project be offset if the Project does not reach 90 percent utilization.

No GHG Monitoring Plan

Monitoring of the mitigation for GHG emissions is inadequate. It has been the experience of SCS that Projects that result in GHG emissions prior to mitigation should be required to submit GHG monitoring plans for relatively small periods of time, typically three to five years. Such periodic reevaluation of GHG emissions is consistent with the California Scoping Plan, which must be updated every five years. Such a plan must require quantification of GHG emissions since the previous GHG monitoring plan and a projection of GHG emissions until the next GHG monitoring plan. The quantification of historical GHG emissions in each plan must rely on as much site-specific data as feasible. At a minimum, those data must include the electricity use, natural gas use, other utility and fuel use, the number of events, and the event attendance or trip count.

Such monitoring is also needed to confirm that the energy efficiency assumed in the GHG evaluation due to the Leadership in Energy and Environmental Design (LEED) gold certification is accurate. By using actual measured electricity use to calculate GHG emissions, uncertainties in the actual energy efficiency of the structures would be removed. This monitoring is critical due to the failure of many LEED certified buildings to achieve expected energy use reduction predictions.

The GHG monitoring plan must also include all facilities included in the GHG emission calculations, including the Oracle Arena. If the Oracle Arena is included in the GHG monitoring plan, GHG emissions resulting from more than 21 events in a year would be then captured by the evaluation. An ongoing GHG monitoring plan would also resolve the issue of GHG emissions after the 30-year evaluation period.

MITIGATION APPROACH INCONSISTENT WITH STATE GHG POLICIES

The AB900 Application and MM I-C-GG-1 require that the Project proponents obtain GHG emission offsets for the GHG emissions resulting from the Project. However, there is no assurance that the GHG offsets will be consistent with CARB GHG reduction goals.

The Project is only required to purchase GHG offsets from a “qualified GHG emissions broker.” To be consistent with state GHG policy, the offsets should meet California GHG reduction goals and be required to be real, additional, quantifiable, permanent, verifiable, and enforceable. The offsets purchased to meet mitigation requirements should also be thereafter retired and removed from circulation. As written, this “mitigation” allows the credits to be sold again, allowing those same offsets to be used again as mitigation on other projects.

Because neither the AB900 Document nor MM I-C-GG-1 require that the GHG offsets be obtained from a registry that demonstrates that the offset will result in real, additional, quantifiable, permanent, verifiable, and enforceable GHG offsets, and the language allows the GHG offsets to be sold after acquisition, the measure does not provide any assurance that the Project GHG emissions will be net zero or less than significant.

CONCLUSIONS

The GHG analysis used to support the determination that the Project met the requirements of AB900 is insufficient to demonstrate that the GHG emissions from the Project will be net zero and less than significant under CEQA for the following reasons:

- The GHG analysis makes unsupported assumptions about Oracle Arena, trip linkage, and energy use which artificially lower the expected GHG emissions from the Project and do not provide an accurate evaluation of the GHG emissions that can be expected to result from the Project.

- The GHG analysis does not require project monitoring and periodic GHG reporting to assure the accuracy of the projected emissions.

- The GHG offsets proposed as a mitigation measure are not required to be consistent with California GHG reduction goals and policies, could be used for other projects, and may not ever be required for the operational emissions.

Resumes

PATRICK S. SULLIVAN, CPP, REPA

Education

BA – Harvard University, Biology/Ecology, 1989

Professional License/Certifications

Approved Lead Verifier under California Air Resources Board (CARB) AB 32 Greenhouse Gas (GHG) Program
South Coast Air Quality Management District, Certified Permitting Professional (No. A-1716)
Registered Environmental Property Assessor, No. 519692, National Registry of Environmental Professionals

Professional Affiliations

Solid Waste Association of North America (SWANA): Vice Chairman of Landfill Gas (LFG) Division
Air and Waste Management Association (AWMA); Vice Chairman, Mother Lode Chapter
Technical Advisory Group; Cal Recycle, LFG
Technical Advisory Group, CARB, AB 32 Landfill Methane Rule
Waste Industry Air Coalition (WIAC); Co-Chairman
California Biomass Collaboration; Executive Board
Solid Waste Industry Group in California
Solid Waste Industry for Climate Solutions (SWICS), Co-Chairman
Society for Risk Analysis

Professional Experience

Mr. Sullivan has over 24 years of experience in the area of environmental engineering, specializing in solid waste-related issues. He is the Managing Director of SCS Engineers' (SCS) consulting and engineering operations within the Southwestern United States; the largest of all of SCS's engineering business units. He also serves as the Practice Leader for SCS's Solid Waste Practice in the same region. Mr. Sullivan is the National Partner for SCS's companywide Air Quality and GHG programs. He also oversees SCS's company-wide Risk Assessment program and one of the national experts on risk assessment and toxic exposure issues for solid waste facilities. Mr. Sullivan is a company Senior Vice President and Principal-in-Charge for compliance and permitting projects for related to solid waste facilities as well as related engineering services. SCS has published over 25 technical papers in industry journals and publications and presented at over 35 conferences, seminar, and workshops.

Because of this expertise, Mr. Sullivan has been the Principal-in-Charge and/or lead technical expert on a variety of projects related to solid waste facility investigations, risk assessments, LFG management, air quality and GHG, as well as other environmental issues at landfills and solid waste facilities.

Air Quality

Title V Permit Applications and Documentation for Industrial Facilities and Landfill Sites. Mr. Sullivan has been involved with over 100 Title V permitting projects, including Title V compliance reporting for over 75 facilities.

New Source Review (NSR)/Prevention of Significant Deterioration (PSD) Permit Applications and Documentation for Industrial Facilities and Landfill Sites. Mr. Sullivan has been involved with over 50 NSR/PSD permitting projects for various types of industrial facilities. This includes permitting for over 30 landfill expansions in California and over 30 energy facilities.

New Source Performance Standard (NSPS) Applicability Reviews and Compliance Activities. Mr. Sullivan has overseen the completion of NSPS Tier 1 and 2 emission rate studies and reports, LFG system (GCCS) design plans, surface emission monitoring plans, and other documentation for over 100 landfills under the NSPS program, including NSPS compliance reporting for over 75 landfill sites. In addition, Mr. Sullivan has worked on NSPS compliance activities for various other sources, including boilers, incinerators, engines, turbines, etc.

National Emission Standards for Hazardous Air Pollutants (NESHAPs)/Maximum Achievable Control Technology (MACT) Compliance Activities. Mr. Sullivan has been involved with over 75 NESHAPs/MACT projects for various regulated sources, including development of Startup, Shutdown, and Malfunction (SSM) plans and various other compliance documents. This has included landfills and various industrial facilities, such as aerospace facilities, boilers, incinerators, engines, etc.

Development and Teaching of Training Courses for Air Quality and GHG Compliance at over 40 Seminars. Compliance and regulatory issues that have been taught included Title V, NSPS, NESHAPs/MACT, NSR/PSD, Urban Air Toxic Strategy (UATS), Tailoring Rule, federal GHG reporting rule, and related state and local requirements.

Regulatory Advocacy for the Landfill Industry on the NSPS Rule, Title V Operating Permit Programs, NESHAPSs rule, and other regulations, where landfills are included as a regulated source. Mr. Sullivan has developed industry comments and negotiated with the agencies on behalf of the industry.

Preparation of Numerous Local Air District, State, and Federal Permitting Documents for the installation of air pollution control devices and industrial equipment, including boilers, cooling towers, air strippers, wastewater treatment plants, biogas collection systems and flares, biogas and recovery plants, and various industrial systems. Mr. Sullivan has managed over 100 state or local air permitting projects for landfills.

Permitting, Compliance, and Due Diligence Projects for over 35 Renewable Energy Projects throughout the United States. Some of these projects have also included registration of GHG credits, facilitation of trades for GHG credits, and development of methodologies for estimation of GHG reductions as well as all of the air quality and GHG permitting tasks. Mr. Sullivan has permitted over 30 biogas to energy and biomass plants across the country.

Air Quality, GHG, and Risk Assessment Sections of Environmental Impact Reports (EIRs) for approximately 35 landfill expansions, new landfills, transfer stations, other solid waste facilities, and various commercial/industrial projects in California, including evaluations of health risks, air quality, GHG, and/or odors. This has included the preparation of a variety of California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA) documentation.

Air Quality Solid Waste Assessment Tests (SWATs) for various landfill sites in California.

Air Sampling and Source Testing for Various Emitting Devices, including sampling for volatile organic compounds (VOCs), criteria pollutants, particulate heavy metals, and asbestos fibers. Oversight of sources testing at over 75 landfill sites and development of a database of landfill source tests for use in the work of the WIAC.

Mr. Sullivan has completed air permitting and compliance activities for the following types of industrial facilities:

- Solid waste incinerators.
- Biomass energy plants.
- Landfills.
- Recycling facilities and transfer stations.
- LFG recovery plants.
- Cement and asphalt plants.
- Chemical manufacturing facilities.
- Aerospace facilities.
- Jewelry manufacturing facilities.
- Sand and gravel facilities.
- Electronics facilities.
- Site remediation projects.
- Paint and solvent manufacturing plants.
- Boat manufacturing plants.

Completed Landfill Air Quality Services in the Following Air Districts in California and States: San Joaquin Valley Air Pollution Control District (APCD), Bay Area Air Quality Management District (BAAQMD), South Coast AQMD, Sacramento Metropolitan AQMD, San Diego County APCD, Yolo-Solano AQMD, Feather River AQMD, Kern County APCD, Ventura County APCD, Santa Barbara County APCD, Shasta County APCD, Antelope Valley APCD, Mojave

Desert AQMD, Placer County APCD, North Coast Unified AQMD, Butte County APCD, and El Dorado County APCD. States of Nevada, Oregon, Washington, Hawaii, Arizona, Idaho, Montana, New Mexico, Colorado, Utah, Texas, Ohio, Pennsylvania, Illinois, Kansas, Oklahoma, and several others.

Landfill Gas

Principal-in-Charge for Design, Bidding Support, and Construction Oversight for LFG Control System, Highway 59 Landfill, Merced County, CA. The system was initially designed to prevent LFG migration and provide corrective action for groundwater impacts. The system successfully remediated LFG migration and brought the facility in compliance with Resource Conservation and Recovery Act (RCRA) Subtitle D requirements. Currently, Mr. Sullivan oversees the operations and maintenance (O&M) of the LFG system. Recently, Mr. Sullivan oversaw the design and construction quality assurance (CQA) for a major expansion of the existing LFG system to meet federal and state air quality and GHG requirements. In addition to the LFG services, Mr. Sullivan has completed a variety of air quality and GHG tasks for the project, including permitting and compliance reporting as well as closure design and groundwater corrective action.

Principal-in-Charge, Completion of Various LFG Engineering/Construction Oversight and Groundwater Services, Various Waste Management, Inc. (WM) Landfills. Landfill sites have included Bradley, Simi Valley, Columbia Ridge, DADS, Lancaster, Redwood, Lockwood, Antelope Valley, Rio Rancho, Butterfield, Northwest Regional, Anderson, and El Sobrante. Engineering tasks have included design of wellfield expansions, new blower/flare stations, header upgrades and replacements, groundwater monitoring and reporting, groundwater corrective action plans, as well as a variety of air quality services.

Principal-in-Charge, LFG Engineering, American Avenue Landfill, Fresno County, CA. SCS first developed a LFG master plan for the site. Upon completion of the conceptual plan, Mr. Sullivan oversaw the completion of the engineering design, including preparation of formal plans and specifications for bidding for the original and one expansion to the LFG system. Bid assistance was provided to the County as well as construction management and CQA services. The County expanded SCS's contract to include O&M of the LFG system as well as design of two subsequent phases of LFG system expansion. In addition to the LFG services, Mr. Sullivan has completed a variety of air quality and GHG tasks for the project.

Principal-in-Charge, Completion of LFG Planning and Engineering for Various Republic Services (Republic's) Landfills. Landfill sites have included Otay, Sycamore, Vasco Road, West Contra Costa Sanitary, Foothills, Tower Road, ECDC, Wasatch, Ox Mountain, Wasatch, and Central Landfills. Engineering tasks have included design of wellfield expansions, new blower/flare stations, and header upgrades and replacements as well as CQA. Under SCS's direction, SCS upgraded Republic's LFG Master Plans and prepared a LFG remediation plan to address LFG migration issues. In addition to the LFG services, Mr. Sullivan has completed a variety of air quality and GHG tasks for the projects.

Principal-in-Charge, Planning, Design, and Construction Oversight for LFG System at Recology's Landfills, California. Project Director and Manager for the planning, design, and construction oversight for an expansion to the LFG system at Recology's Pacheco Pass, Ostrom Road, and YSDI Landfills to address air quality requirements, LFG migration, and groundwater impacts. These projects were completed on a design-build basis. In addition to the LFG services, Mr. Sullivan has completed a variety of air quality and GHG tasks for Recology landfills.

Principal-in-Charge, Completion of LFG Planning and Engineering for Waste Connections, Inc.'s (WCI's) Landfills. Sites have included Chiquita Canyon, Fairmead, Potrero Hills, Cold Canyon, LRI, and Avenal Landfills. Engineering tasks have included design of wellfield expansions, new blower/flare stations, and header upgrades and replacements as well as CQA. SCS has upgraded WCI's LFG Master Plans and developed long-term cost estimates for LFG system expenditures. In addition to the LFG services, Mr. Sullivan has completed a variety of air quality and GHG tasks for the sites.

Principal-in-Charge, Various Other LFG Planning or Engineering Projects throughout California, Arizona, Nevada, Oregon, and Colorado, including Stanislaus County's Geer and Fink Road Landfills, Butte County's Neal Road Landfill, Sunnyvale Landfill, L&D Landfill, Sacramento County's Kiefer Landfill, Madera County's Fairmead Landfill, Yolo Central Landfill, as well as various other smaller closed landfill sites. Many of these projects included engineering design, CQA, and/or design-build of LFG system expansions.

CEQA/NEPA Analyses

CEQA Air Quality Analysis and Toxics Risk Assessment, Proposed Expansion to Fink Road Landfill, Stanislaus County, CA. As part of an EIR for a proposed expansion to the Fink Road Landfill in Stanislaus County, California, SCS completed an air toxics risk assessment, which evaluated the potential human health impacts due to current and future exposures from the project. The risk assessment was part of a larger air quality analysis completed for the expansion EIR. The analysis included an evaluation of health risk due to diesel exhaust from heavy equipment and refuse hauling vehicles at the landfill. As part of this project, SCS also researched the conversion of refuse hauling fleets to alternative fuels in order to generate ERCs for CEQA mitigation measures.

CEQA Air Quality Analysis and Toxics Risk Assessment, Salinas Valley Solid Waste Authority Landfill Project, Monterey County, CA. SCS completed air quality and risk assessment sections of a large EIR being prepared for long-term refuse collection and disposal options for the Salinas Valley Solid Waste Authority's Regional Landfill Project. The project included three landfills and 10 transfer stations, which were combined into four different project scenarios. The project included emissions estimates, air dispersion modeling, and risk calculations. The analysis included an evaluation of health risk due to diesel exhaust from heavy equipment and refuse hauling vehicles at the landfills and transfer stations, which were part of the project.

CEQA Mitigation Measures Development and Implementation for El Sobrante Landfill, Corona, CA. SCS was enlisted to develop a series of mitigation measures for fugitive dust emissions from landfill construction and operations at the El Sobrante Landfill in Corona, California. SCS also developed an implementation plan for the CEQA Mitigation Monitoring and Reporting Program (MMRP), which was required as part of the approval of the EIR. SCS is currently doing ambient monitoring for particulate matter less than 10 microns (PM10) levels and working with the SCAQMD to develop a long-term strategy to reduce dust emissions.

Landfill Risk Assessment, Closure and Post-Closure Development BKK Landfill, West Covina, CA. As part of an EIR for proposed closure and post-closure development of the Class III portion of the BKK Landfill, SCS completed a risk assessment that evaluated the potential human health impacts due to current and future exposures to contaminants in LFG and other environmental media. The risk assessment was part of a larger air quality analysis completed for the EIR. Through reasonable risk estimates, SCS was able to demonstrate that the proposed development of the landfill (i.e., golf course and Business Park) could occur without causing adverse health effects above CEQA significance levels.

CEQA Air Quality/GHG Analyses and Toxics Risk Assessments and Air Permitting, Proposed Landfill Expansions. Projects included expansions to the Newby Island, Forward, Crazy Horse, Johnson Canyon, Jolon, Fairmead, Keller Canyon, Redwood, Altamont, and various other landfills. As part of EIRs for the proposed expansions, SCS completed an air quality impact analyses that included risk assessments evaluating the potential human health impacts due to current and future exposures to contaminants from the project. The risk assessments were part of larger air quality analyses completed for the expansion EIRs. The projects included emissions estimates, air dispersion modeling, GHG evaluation, and risk calculations.

Landfill Investigation and Risk Assessment

Landfill Investigation, LFG Engineering, Human Health Risk Evaluation and Impact Assessment, Proposed Residential Developments, Adjacent to the Otay Landfill, Chula Vista, CA. Project activities at the site have included an evaluation of LFG migration, LFG engineering and testing, air quality permitting and compliance, soil and LFG sampling and analysis, human health risk assessment and nuisance/odor evaluation, CEQA assistance, operations and maintenance of the LFG collection and control system, and other landfill engineering and construction services. The risk assessment and odor/nuisance analysis was completed to support residential development adjacent to the landfill.

Environmental Investigations and Risk Assessment at the Former BKK Main Street Landfill in Los Angeles County. This landfill is a closed site that may have received both hazardous and non-hazardous wastes; it is currently occupied by two golf courses and other commercial and residential developments and is being considered for additional redevelopment. Project work at this facility has included completion of soil vapor surveys, installation and monitoring of LFG migration probes, LFG sampling/analysis, oversight of cover and subsurface soil and groundwater sampling, completion of a human health risk assessment, CEQA assistance, and negotiations with regulatory agencies. The site is currently being considered for listing on the

National Priorities List (NPL) as a potential Superfund site. Oversight of the landfill is provided by EPA Region IX, Department of Toxic Substance Control (DTSC), and the Los Angeles County landfill local enforcement agency (LEA).

LFG Assessment, Cover Maintenance, and Monitoring, Cogen Kramer Landfill, Los Angeles, CA. The site is located adjacent to residential development and two County correctional facilities have been developed on landfill property. Project tasks include LFG assessment, installation of LFG migration probes, emergency cover repair and ongoing cover maintenance, preparation of LFG and cover assessment work plan, regulatory liaison with the Los Angeles County LEA, Cal Recycle, and the South Coast AQMD. In addition, methane monitoring is conducted associated with the use of one of the closed jail facilities for TV and movie productions.

Environmental Monitoring and Postclosure Care, Cal-Compact Landfill, Carson, CA. The site is a former hazardous waste landfill that is being considered for redevelopment. The site is currently under the oversight of the DTSC. Project tasks have included LFG assessment, LFG engineering, design of methane protection systems, and development of a LFG monitoring program. In addition, Mr. Sullivan currently oversees the completion of post-closure care services at the site, including LFG monitoring, LFG system operations and maintenance (O&M), groundwater sampling and analysis, cover maintenance and repair, site security, storm water sampling/analysis and inspections, and regulatory liaison.

LFG Assessment, Cover Maintenance, and Monitoring, Lane Road Disposal Site, Irvine, CA. The site is located adjacent to residential development and has been redeveloped into a golf course. Project tasks have included LFG assessment, including methane testing in nearby homes, installation of LFG migration probes, cover repair and ongoing cover maintenance, preparation of LFG assessment and cover maintenance plan, regulatory liaison with the Orange County LEA, Santa Ana Regional Water Quality Control Board (RWQCB), CIWMB, and SCAQMD. SCS also completed the design and installation of LFG collection and control system to prevent migration onto residential properties.

Burn Dump Investigation in San Joaquin County, CA. As part of this project, Mr. Sullivan provided technical oversight for investigations of a burn dump site, which included soil investigations, trenching investigations to determine extent of refuse, LFG migration assessment, waste sampling/analysis, hazardous waste determination, and other project tasks. The project site was slated for residential development; therefore, all project elements we completed in consideration for this type of development.

Investigation, Risk Assessment, and Remediation Kaiser Ventures Inc. Facilities, Fontana, CA. For the former Kaiser Steel plant in Fontana, Remedial Investigation (RIs)/Feasibility Studies (FSs), Remedial Action Plans (RAPs), and Remedial Designs were prepared for three on-site operable units under DTSC's oversight. Mr. Sullivan was responsible for a number of individual soil, groundwater, surface water, and waste investigations at the Kaiser site, including treatability studies, risk assessments, RAPs, and hydrogeological studies, storm water pollution prevention plans, and spill prevention, control, and countermeasure (SPCC) plans. These projects included investigations of two landfill sites, with both hazardous and non-hazardous wastes, including

soil, waste materials, hazardous waste, groundwater, and surface water issues. The site has been redeveloped into the California Speedway, a NASCAR race track.

Investigation, Risk Assessment, and Remediation Feasibility Study, Mission Bay Landfill, San Diego, CA. For this site, Mr. Sullivan managed a significant forensic investigation and site assessment of the former landfill site, which is located next to a river, bay, and amusement park and is used heavily for recreational purposes. This work has included investigations of extent of refuse, cover thickness, LFG composition and migration, soil, surface water, groundwater, and other environmental media associated with Mission Bay. The field investigations will be followed by a risk assessment, and given the highly visible and public nature of the landfill project; focus on risk communication will be of primary importance. Ultimately, several candidate risk-based remediation methods applicable to the site will be identified with typical costs associated with each method. This project included interface with the San Diego County APCD, RWQCB, LEA, and DTSC.

Landfill Engineering, LFG Migration Assistance, and Human Health Risk Assessment, Geer Road Landfill, Modesto, CA. Mr. Sullivan has managed and been involved with a variety of project at the Geer Road site including closure design and CQA services, cover repair, LFG engineering, air quality compliance, human health risk assessment, LFG system O&M, LFG and groundwater monitoring, as well as acted as an expert witness in defending the landfill against a citizen lawsuit. Project work was under the jurisdiction of the landfill LEA and RWQCB.

Odor Evaluations

Air Quality and Odor Analysis for proposed municipal solid waste (MSW) landfill and composting operation in Mariposa County, CA.

Air Quality and Odor Analysis, including ambient air testing and air dispersion modeling, for MSW landfill, composting facility, and materials recovery facility (MRF) in Placer County, CA.

Air Quality and Odor Analysis, including air dispersion modeling, for MSW landfill in Chula Vista, CA.

Odor Analysis for proposed MRF in San Bernardino County, CA.

Odor Analysis for an MSW landfill expansion in Kings County, CA.

Odor Analysis for an MSW landfill expansion in Santa Clara County, CA.

Compliance Review and Odor/Air Quality Impact Assessment for existing composting operation in San Diego, CA, which is adjacent to a proposed residential development.

Development of Expert Report and review of opposing experts' work on air quality and odor analyses of a composting facility in Adelanto, CA.

Air Quality Permitting and Compliance, including Odor Analyses, for landfills and composting facilities in Vacaville, Milpitas, and Novato, CA.

Feasibility Analysis, Best Available Control Technology (BACT) Cost-Effectiveness Analysis, and Hydrogen Sulfide Testing for the evaluation of sulfur removal technologies as odor control for LFG-derived odors for 10 landfill sites.

Odor analyses as part of the air quality sections of over 10 EIRs for landfill expansions.

Management of numerous LFG design projects related to odor control of LFG emissions.

Litigation Support

- **Expert Witness Experience:**
  - Last 4 years
    - Crane et al vs. County of Merced. Expert report and deposition and trial testimony.
    - Brian Kahn vs. The Dewey Group. Expert deposition and trail testimony
    - Tommy McCarty, et. al., vs. Oklahoma City Landfill, LLC. Expert report and deposition.

Litigation Support and Preparation of Expert Report in Defense of a Landfill Company in Pittsburgh, PA, which was sued under the third-party provisions of the federal Clean Air Act. Project tasks including emissions estimation, regulatory applicability review, and preparation of an expert report. The case was settled in favor of our client.

Litigation Support as part of a CERCLA Cost Recovery Action Filed by a Group of PRPs Against Various Municipalities and Public Agencies that Disposed Refuse at a Mixed Hazardous and Municipal Solid Waste Landfill in California. Project tasks included review of depositions, evaluation of industrial and hazardous waste disposed in the landfill, and development of a draft report on the contribution of the various PRPs to contamination in the landfill. Our clients were successful in the litigation.

Litigation Support in Defense of a Landfill Company in San Antonio, Texas Against Enforcement Action Brought by the State of Texas. Project tasks including emissions estimation, odor assessment, and air modeling. The case was settled in favor of our client.

Litigation Support in a Lawsuit Filed by a Landfill Owner/Operator in New Mexico Versus the State Environmental Agency with Respect to Air Quality Permitting for Landfills. The case included litigation support and preparation of expert reports.

Litigation Support and Expert Testimony as Part of a Toxic Tort Litigation filed by a Local Residence Against a County-owned Closed Landfill in Modesto, CA. Project tasks included a

site investigation, risk assessment, groundwater evaluation, and expert testimony (deposition and trial). The case was settled with minimal damages for our client.

Litigation Support and Expert Testimony as Part of a Toxic Tort Litigation filed by a Local Residence against a County-owned Active Landfill in Merced, CA. Project tasks included a LFG assessment, site investigation, risk assessment, groundwater evaluation, and expert testimony (deposition and trial). The case was ruled in favor of our client.

Litigation Support and Expert Testimony in Defense of a Nuisance Claim and a CERCLA Cost Recovery Action Filed Against an Electronic Relay Manufacturing Facility in Los Angeles, CA. Project tasks included a remedial investigation, feasibility study, remedial design, remedial action, risk assessment, and expert testimony (deposition only). The first case was settled with insurance coverage; the second case was settled for deminimis contribution from our client.

Litigation Support in Defense of a CERCLA Cost Recovery Action Filed Against an Electronic Relay Manufacturing Facility in Azusa, CA. Project tasks included a review of documents and preparation of a technical response to U.S. EPA's proposed settlement offer.

Litigation Support and Expert Testimony as Part of a Toxic Tort Litigation Filed by a Plaintiff Group against a Large Aerospace Company in Burbank, CA. Project tasks included emissions estimation, air dispersion modeling, air toxics risk assessment, and expert testimony before arbitration judge. The case was settled in favor of our clients.

Litigation Support and Preparation of an Expert Report as Part of a Toxic Tort Litigation in Defense of a Metal Heat Treating Facility in Phoenix, AZ. Project tasks included emissions estimation, air dispersion modeling, and air toxics risk assessment. The case was settled in favor of our client.

Litigation Support and Expert Testimony as Part of a Nuisance Lawsuit Filed by the Current Owner of a Screw Manufacturing Facility against the Former Owner in Santa Fe Springs, CA. Project tasks included a site investigation, compliance audit, evaluation of on-site disposal of waste oil, and expert testimony before an arbitration judge.

Litigation Support as Part of an Insurance Claim Filed by an Aerospace Facility Against Its Insurance Carrier in Natick, MA. Project tasks included review of soil vapor data, vadose zone modeling, determination of the vapor-phase plume, and preparation of exhibits to be used in court. Our client was successful in the litigation.

Litigation Support in Defense of a Nuisance Claim and a CERCLA Cost Recovery Action Filed Against a Steel Mill in Fontana, CA. Project tasks included a remedial investigation, feasibility study, remedial design, remedial action, risk assessment, and assistance in the cross-examination of opposing experts. The case was settled in favor of our client.

Litigation Support in two Lawsuits Where Contractors Were Unwittingly Exposed to Asbestos during Building Demolition after the property owners claimed that the buildings did not have asbestos-containing materials.

Litigation Support as Part of a Property Damage Filed by the Property Owner Against its Former Tenant at a Plastic and Rubber Manufacturing Plant in Ontario, CA. Project tasks included a site investigation, remediation, risk assessment, and expert testimony (deposition only).

Mr. Sullivan's litigation experience includes the following Proposition 65 cases in California. These cases include preparation of exposures and risk analyses and participation in settlement conferences:

- Litigation support for a defendant in a Proposition 65 lawsuit concerning exposure to methylene chloride in a silk flower cleaner.
- Litigation support for a defendant in a Proposition 65 lawsuit concerning exposure to dichlorobenzene and toluene in a bicycle tire repair kit.
- Litigation support for a defendant in a Proposition 65 lawsuit concerning exposure to lead in PVC grips and handles for various tools and equipment.
- Litigation support for a defendant in a Proposition 65 lawsuit concerning exposure to lead in cosmetics.
- Litigation support for a defendant in a Proposition 65 lawsuit concerning exposure to chromated copper arsenate in treated wood used for children's playground equipment.
- Litigation support for a defendant in a Proposition 65 lawsuit concerning the exposure to various pollutants emitted from landfills and other solid waste facilities in California (six total facilities).

Organic Waste Composting OWC) Protocol

- American Organics OWC
- Grover Environmental Products
- Jepson Prairie Organics
- South Valley Organics

AB32 Mandatory Reporting. Completed State of California Mandatory GHG reporting under AB32 for the following general stationary combustion facilities:

- Altamont Landfill
- Bradley Landfill
- CalEnergy Geothermal Plants City of Fresno Wastewater Treatment Plant
- El Sobrante Landfill
- G2 Ostrom Road
- Kirby Canyon Landfill
- Mid-Valley Landfill
- Penrose Landfill Gas Conversion, LLC
- Redwood Landfill
- San Bernardino County Solid Waste Mgmt. - MVSL
- Simi Valley Landfill
- Sunnyvale WWTP Toyon Landfill Gas Conversion, LLC

GHG Compliance for Landfills. Completed GHG compliance services for over 75 landfills related to the AB32 mandatory reporting rule, AB32 landfill methane rule, and federal "Tailoring" rule for GHG.

U.S. EPA GHG Reporting Rule. Management and oversight for over 250 U.S. EPA GHG mandatory reporting rule projects for landfills.

GHG Emissions Inventory and Verification of Creditable GHG Reductions. Performed GHG emissions inventory services, verification of creditable GHG reductions, and development of GHG management plan under CEQA for Kern County Waste Management Department, California.

GHG Consulting. Provided GHG consulting services for Sacramento County, Los Angeles County, City of Carlsbad, City of Alameda, and the City of Palo Alto and virtually all of the major solid waste companies. Acted as the primary consultant supporting the membership of the SWICS group. As part of this effort, Mr. Sullivan has developed protocols for landfill GHG emission estimates and lead SWICS advocacy efforts on the proposed AB 32 early action rule for landfills.

GHG Emissions Inventory and Certification of Donated GHG Reductions (to make event GHG neutral), Super Bowl, Houston, TX.

Certification of Donated GHG Reductions (to make event GHG neutral), Winter Olympics, Salt Lake City, UT.

GHG Inventory and CCAR Reporting for Republic Services, Inc. Under Mr. Sullivan's direction, SCS prepared an entity-wide GHG inventory for Republic's solid waste operations and facilities in California. In addition, SCS completes federal GHG reporting for all Republic landfills nationally.

SWICS Group. Involvement with the leadership of the SWICS group. As part of this effort, Mr. Sullivan has developed protocols for landfill GHG emission estimates and led SWICS advocacy efforts on the proposed AB32 early action rule for landfills, cap and trace, as well as the AB32 and federal GHG mandatory reporting rules.

Private Waste Company GHG Consulting. Provided GHG consulting for all of the large private waste management companies.

Development of GHG Guidance Document. Developed the guidance document titled, *"Technologies and Management Options for Reducing Greenhouse Gas Emissions from Landfills,"* under contract to the California Integrated Waste Management Board (CIWMB).

JOHN HENKELMAN

Education

B.S., Chemical Engineering, University of Nevada, June 2002

Professional Licenses and Registrations

Engineer-in-Training (EIT)

Professional Affiliations

Air and Waste Management Association (AWMA)

Certifications

OSHA 40-Hour Hazardous Waste Operator

Professional Experience

Mr. Henkelman has 12 years of experience as a chemist and engineer. His duties have included air dispersion modeling using several regulatory models, including AMS/EPA Regulatory Model (AERMOD), Industrial Source Complex Short Term 3 (ISCST3), Screen 3, AERSCREEN, and Areal Locations of Hazardous Atmospheres (ALOHA). He has used modeling results in risk assessments, accidental release planning, permit applications, and environmental impact assessments. He has written workplans for and performed sampling of soil vapor, landfill gas, soil, and water. He has assisted with compliance and permitting under the Clean Air Act. He has assisted in greenhouse gas reporting and verification under the California Climate Action Registry, The Climate Registry, and California's Mandatory greenhouse gas reporting regulation. He also has experience in manufacturing that includes production scheduling, quality assurance, quality control, product development, and health and safety.

Select project experience includes the following:

Modeling for Permitting of Newby Island Sanitary Landfill, Milpitas, CA: Support included dispersion modeling using a screening model (SCREEN3) used in support of an Environmental Impact Report (EIR) and California Environmental Quality Act (CEQA) report. Modeling included all major emission sources at the site. Model results were used to evaluate human health risk and National Ambient Air Quality Standards (NAAQS) compliance.

Modeling for Permitting of Forward Landfill, Manteca, CA: Modeling included dispersion modeling using a complex model (AERMOD) used in support of an EIR and CEQA report. Modeling included all major emission sources at the site. Model results were used to evaluate human health risk and NAAQS compliance.

Modeling for Permitting of Fairmead Landfill, Madera, CA: Modeling included dispersion modeling using a complex model (AERMOD) used in support of an EIR and CEQA report.

Modeling included all major emission sources at the site. Model results were used to evaluate human health risk and NAAQS compliance.

Modeling Evaluation for Avenal Landfill, Avenal, CA: Evaluation included dispersion modeling used in an EIR and CEQA evaluation. Modeling was completed using ISCST3. Model results were used to evaluate human health risk.

Modeling Evaluation for Central County Landfill, Petaluma, CA: Evaluation included dispersion modeling used in an EIR and CEQA evaluation. Modeling was completed using CAL3QHCR. Model results were used to evaluate human health risk.

Modeling Evaluation for East Los Angeles Transfer Station, East Los Angeles, CA: Evaluation included dispersion modeling used in an EIR and CEQA evaluation. Modeling was completed using SCREEN3. Model results were used to evaluate human health risk and NAAQS compliance.

Modeling Evaluation for West Artesia Material Recovery Facility, Compton, CA: Evaluation included dispersion modeling used in an EIR and CEQA evaluation. Modeling was completed using SCREEN3. Model results were used to evaluate human health risk and NAAQS compliance.

Assisted in Health Risk Assessment for a Former Plastic Bottle Manufacturing Facility, Toluca, Mexico: The assessment included developing a soil vapor sampling plan, collecting soil vapor samples, developing exposure scenarios for soils and soil vapor, developing toxicity criteria, and developing exposure parameters.

Assisted in a Focused Health Risk Assessment for a Former Aerospace Research Facility, Los Angeles, CA: The assessment included developing exposure scenarios for groundwater and indoor air, developing toxicity criteria, and developing exposure parameters.

Assisted in a Health Risk Assessment for Former Industrial Sites in Southern California: The sites were being developed for residential use. The assessment included developing exposure scenarios for soil vapor and modeling risk using the Johnson Ettinger model.

Assisted in the Development of Copper and Cyanide Cleanup Levels for Surface and Air, San Marcos, CA. Development included focus on exposure scenarios, toxicity criteria, and exposure parameters. Chronic health hazard-based cleanup levels for both contaminants were developed for future residential and commercial use of the facility.

Assisted in the Development of Health Based Beryllium Cleanup Levels for Surfaces, Kansas City, MO: Development included defining exposure scenarios, toxicity criteria, and exposure parameters. Cleanup levels were based on increased cancer risk for commercial workers.

Assisted in the Development of Contaminant Cleanup Levels for Soil Gas throughout California: Development included defining exposure scenarios, toxicity criteria, and exposure parameters. Cleanup levels were based on both increased cancer risk and chronic health effects.

Assisted in a Health Risk Assessment for an Asbestos Landfill, Copperopolis, CA: Assessment included developing emission rates of asbestos, modeling dispersion of asbestos emissions using the Industrial Source Complex Short Term 3 (ISCST3) model to determine downwind concentrations, developing exposure scenarios for outdoor air, developing toxicity criteria, developing meteorological data, and developing exposure parameters.

Performed Soil Vapor Surveys, including Sample Location Selection, Sample Collection, and Sample Analysis throughout California and Oregon: Surveys were performed in support of vapor intrusion risk assessments.

Modeling for Permitting of Kirby Canyon Landfill, Morgan Hill, CA: Support included dispersion modeling using screening and complex models (ISCST3, AERMOD, and SCREEN3) for permitting of flares and potential engines. Modeling results were used to determine human health risk.

Modeling for Permitting of Tri-Cities Landfill, Fremont, CA: Support included dispersion modeling using screening and complex models (ISCST3 and SCREEN3) for permitting of flares and potential engines. Modeling results were used to determine human health risk.

Modeling for Permitting of McCommas Landfill, Dallas, TX: Support included dispersion modeling using a screening model (SCREEN3) in support of a permit application for flares. Modeling results were used to determine NAAQS compliance.

Modeling for Permitting of Hay Road Landfill, Vacaville, CA: Modeling included dispersion modeling using a complex model (AERMOD) used in support of an EIR and CEQA report. Modeling included all major emission sources at the site. Model results were used to evaluate human health risk and NAAQS compliance.

Review of Modeling for Redwood Landfill, Novato, CA: Review included dispersion modeling completed for Prevention of Serious Deterioration (PSD) evaluation of flares and engines for a landfill gas to energy (LFGTE) project using AERMOD. Model results were used to determine human health risk.

Reviewed Air Toxics Health Risk Assessments for Los Angeles Unified School District (LAUSD), los Angeles, CA: Review included emission calculations, air dispersion modeling using ISCST3, risk and exposure criteria selection, and risk calculation. Also reviewed hazardous material accidental release scenarios.

Reviewed Air Toxics Risk Assessment of a Quarry, Novato, CA: Review of the assessment performed by another firm included emissions calculations, modeling, and risk evaluation.

Review concluded that the emission calculations were fundamentally flawed and that the quarry may pose a significant health risk to nearby residential areas.

Evaluated Emissions from Vehicles using Emfac2007 for Various Sites in California: Emissions calculations have been used in fleet emission calculations and health risk assessments.

Assisted in the Permitting of Industrial Facilities Throughout California: Permitting included developing appropriate emission factors, calculating emissions, and preparation of permit application materials. Permitted facilities have included several landfills, transfer stations, and a lumber factory.

Prepared New Source Performance Compliance Standards (NSPS) Tier 2 Reports for 10 Landfills, CA: Preparation included creating a workplan for the sample collection, collecting samples at the landfills, calculating emissions, and writing the report which was submitted to regulators.

Evaluated Greenhouse Gas Regulations for Landfills and the Steel Industry, Pittsburg, CA: Evaluation included investigation of current and future legislation and regulations regarding greenhouse gasses.

Performed Analysis for Best Attainable Control Technology (BACT) for composting operations, Novato, CA: Analysis included evaluating the effectiveness and cost of several control technologies.

Specialized Training

Completed 2-Day Training Course for ISCST3 and AERMOD: Course included model selection, meteorological data processing, source and receptor parameters selection, and terrain processing.

Subject: Draft Review
Hazardous Materials
Mission Bay Project
San Francisco, California

Dear Ms. Meserve:

At the request of Soluri Meserve, BSK Associates (BSK) reviewed the following documents:

A. **Mission Bay Subsequent Environmental Impact Report, Dated September 17, 1998, Sections:**
   - Chapter V.J.1 to V.J.109, Environmental Setting and Impacts, Contaminated Soils and Groundwater
B. **Risk Management Plan (RMP), Mission Bay Area San Francisco, California, Dated May 11, 1999, Prepared by Environ Corporation and Revised Risk Management Plan, August 2006 Prepared by BBL Environmental Services, Inc.**
C. **Notice of Preparation of an Environmental Impact Report, Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, Dated November 19, 2014**
   - Pages 106 to 122
D. **Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015**
   - Pages 1-60 to 1-62, Summary of Impacts and Mitigation Measures, Hazards and Hazardous Materials
   - Page 5-1
   - Page 6-5

The following section (A1 to A4) presents our comments based on a review of the Mission Bay Subsequent Environmental Impact Report, Dated September 17, 1998

A1. Section V.J.42, Under Existing Human Health Risks, states " ENVIRON compared the maximum concentration of chemicals detected in the soil anywhere in the Project Area to the risk-based preliminary remediation goals (PRGs) developed by U.S. EPA Region IX for the protection of industrial land uses (Region IX Industrial PRGs)." EPA PRGs are currently not considered appropriate for use in the San Francisco Bay Area as site screening levels. PRGs have been replaced by Environmental Screening Levels (ESLs) developed by the San Francisco Bay Regional Water Quality Control Board in 2013 (SFBRWQCB, 2013). The ESL user guide (SFBRWQCB, 2013) identified significant differences between EPA PRGs and SFBRWQCB ESLs, listed below:

"The U.S. EPA Regional Screening Levels or RSLs (formerly PRGs; U.S. EPA, 2013d) address human health concerns associated with direct exposure to chemicals in soil, but do not address ecological concerns. Exposure routes and receptors not addressed by the RSLs, but included in the ESLs are listed below:

- direct-exposure screening levels for construction and trench workers' exposure to subsurface soils;
- groundwater screening levels for vapor intrusion;
- groundwater screening levels for the protection of aquatic habitats/surface water quality
- soil screening levels for urban area ecological concerns;
- soil and groundwater ceiling levels to address potential presence of Non-Aqueous Phase Liquids (NAPL) and nuisance odor concerns
- soil and groundwater screening levels for Total Petroleum Hydrocarbons (TPH)."

Using PRGs would lead to significant gaps in determining the risks from impacts with respect to vapor intrusion, of aquatic habitats/surface water quality and urban area ecological concerns.

A2. Section V.J.43 first paragraph states: "The upper numerical limit of a calculated statistical average of the concentration of each COPIC in the exposed soils was compared with Region IX Industrial PRGs to determine if any PRGs were exceeded." The appropriate use of an averaged concentration typically involves a robust statistical analysis based on a statistically sufficient number of samples with respect to the area size and requires normally distributed values. The number of samples utilized in the analysis appears to be insufficient considering the large area of the project.

A3. Section V.J.53 last paragraphs states: As discussed in more detail in "General Soil Movement and Transport During Construction," below, DTSC has determined that soils excavated during construction in the Mission Bay Project Area can be moved around and reused in the Project Area without triggering hazardous waste management requirements, provided the soils are managed in accordance with RMP measures. However, DTSC's determination does not apply to building demolition debris or waste soils or other waste materials from any necessary remediation activities. In the event these wastes contain levels of constituents that would result

in their classification as hazardous waste, the hazardous waste regulations described above would apply to those materials."

Based on our review of the boring logs recent Phase II Environmental Site Assessment (Langan, 2015), it appears that soil with construction debris was used as fill during the 2005 remediation effort for the Pier 64 clean-up. Our review of the Langan 2015 report boring log soil descriptions indicates that near surface soils at boring locations LB-8, LB-12, LB-26 and LB-29 contain brick fragments. These borings were completed in the area of the Pier 64 clean-up that reportedly removed petroleum impacted soil to a depth of 9 feet and filled in the area (Langan 2015). Furthermore, as stated in B7 below, the area of fill from the Pier 64 clean-up may contain soil impacted with soluble lead that would classify it as a California Hazardous Waste.

The presence of brick, that is probably demotion debris, and soluble lead in the fill material placed during the Pier 64 clean-up effort, indicates that the Risk Management Plan (RMP) or implementation of the RMP, was ineffective and did not comply with the DTSC determination listed above.

A4. Section V.J.83 under Human Health Risk Assessment states: "The SSTLs were developed using methods consistent with the Risk-Based Corrective Action (RBCA) methodology, as developed by the American Society for Testing and Materials (ASTM) and described in ASTM E-1739, 'Standard Guide for Risk-Based Corrective Action Applied at Petroleum Release Sites, 1995'."

Use of the RBCA methodology may be valid for areas impacted with petroleum hydrocarbon related releases. In other non-petroleum release areas, chemicals-of-concern, such as metals and PAHs not related to petroleum hydrocarbons were detected in soil or groundwater. Use of SSTLs developed for petroleum site based RBCA for non-petroleum related constituents may not be a valid approach. Furthermore, 1995 ASTM E 1739-95 standard under Section 1.1 Scope states: "Ecological risk assessment, as discussed in this guide, is a qualitative evaluation of the actual or potential impacts to environmental (nonhuman) receptors."

Summary of Review 1998 - Mission Bay Subsequent Environmental Impact Report

The Mission Bay Subsequent Environmental Impact Report (SEIR), dated September 17, 1998 utilized screening level methods (EPA PRGs) that would not be adequate for current site clean-up standards and would not be appropriate for use on non-petroleum related constituents. The number of samples utilized in the analysis appears to be insufficient considering the large area of the project. Risk Management Plan (RMP) or implementation of the RMP, was ineffective and did not comply with the DTSC determination. Furthermore, the methodology used to develop site risk screening values did not properly incorporate ecological receptors. Given these changes and deficiencies, with consideration of current site conditions, a re-evaluation using current methods and standards of the environmental impacts and risks is required.

The following section (B1 to B7) presents our comments based on a review of the Risk Management Plan (RMP), Dated May 11, 1999 and Revised RMP dated August 2006.

B1. Page 2-1, there was no discussion of the semivolatile organic chemicals that were detected in soil and groundwater at the site. Summary tables presented in Appendix A of the RMP indicate that polycyclic aromatic hydrocarbons (PAHs) were detected in the soil at various locations and in groundwater collected from MW-11. A possible source and significance of the PAHs was not presented in the RMP.

B2. Page 2-2, the RMP states "No chemicals were detected at concentrations that would pose a threat to human health or the aquatic ecosystem following the completion of the planned development, with the potential exception of the Free Product Area." Based on our review of the receptors presented in Appendix E, Tables E-1, E-2. E-3 and E-4, it appears that ecologic receptors were not included in the risk assessment.

B3. Page 3-2, Section 3.2 states: "In addition, mean chemical concentrations in surface soil (estimated by calculating the 95 percent upper confidence limit (UCL) of the arithmetic mean) were below the ITLs developed under assumptions of long-term (i.e., 25 to 30 years) direct contact pathways (i.e., soil ingestion and dermal contact)." The use of mean concentrations typically involves a robust statistical analysis based on a statistically sufficient number of samples with respect to the area size. The number of samples utilized in the analysis appears to be insufficient considering the large area of the project. Furthermore, the depth of soil sampling was limited to samples collected at less than five feet below the ground surface (bgs). Proposed developments may require excavating soil to depths significantly deeper than 5 feet bgs. This may expose receptors to soils that have not been adequately characterized. The recent Phase II Environmental Site Assessment (Langan, 2015) performed additional soil sampling at Blocks 29 to 32 and found "The fill unit was characterized as either a State of California Class I hazardous material based on soluble chromium, lead, and nickel concentrations or a Class II non-hazardous material, likely related to debris from the 1906 earthquake and resulting fire." Designation of the site soils as California Class I hazardous waste is a significant change from what was presented in the 1998 RMP. Additional impacts that would result from excavating and transportation of a large volume of soil for off-site disposal at a Class I disposal site were not evaluated in the 1998 Subsequent Environmental Impact Report (SEIR).

B4. Page 4-1, Section 4.1 states: "As described below in Section 4.3.11, additional sampling may be required on individual development parcels in order to comply with the Ordinance Requirements for Analyzing the Soil for Hazardous Wastes in Appendix F. Depending on the results obtained during any additional sampling, supplemental management measures, in addition to the management measures identified below, may be required on a parcel-by-parcel basis." The RMP specified a deferred sample and analysis protocol to a later date and as stated in section A4 above, deferred analysis may produce dramatically different results. Significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase.

B5. Section 4.3.5.3 indicates that excavated soil may be re-used as fill on-site. There is no contingency for the handling of excavated wooden piles or railroad ties that may be treated with wood preservatives (creosote) that may be classified as a RCRA hazardous waste. Creosote often contains polycyclic aromatic hydrocarbons (PAHs), some of which are listed RCRA hazardous waste constituents.

B6. Section 4.3.5.3 allows for re-use of soils that may potentially be hazardous waste as fill inside the RMP. Based on our review of the recent Phase II Environmental Site Assessment (Langan, 2015), it appears that soil with elevated lead levels were used as fill during the 2005 remediation effort for the Pier 64 clean-up. Shallow soil samples collected from Langan Treadwell Rollo borings LB-12, LB-13, LB-26, LB-27, LB-28, LB-29 and LB-30 had results of soluble lead (California Waste Extraction Test) above the California Soluble Threshold Limit Concentration (STLC) that would classify the soil as hazardous waste. These soil samples were collected in the Pier 64 clean-up fill area (See Figure 2 of Langan 2015 report) at depths of less than 9 feet below the ground surface (bgs). The Pier 64 clean-up reportedly removed petroleum impacted soil to a depth of 9 feet and filled in the area (Langan 2015). The re-use of soil that is classified as hazard waste resulted in a significant volume of soil that, if excavated and removed from the RMP area will need to be transported off-site and disposed at an appropriate facility. These are new and additional impacts not previously incorporated into the impact analysis. These additional impacts must be incorporated into additional risks to receptors outside the RMP as well as additional traffic, noise, and air contaminants.

B7. Page 4-22 states "If the levels are below the relevant health-based Site Specific Target Levels (SSTLs), and the RWQCB concludes that the potential for ecological impacts is insignificant and does not require mitigation, then soil removal activities will not be required and the soil may be temporarily stored elsewhere pending reuse in the RMP Area." Based on our review of the receptors presented in Appendix E, Tables E-1, E-2. E-3 and E-4, it appears that ecologic receptors were not included in the risk assessment.

Summary of Review 1999 - Risk Management Plan

The Risk Management Plan (RMP), dated May 11, 1999 and Revised RMP dated August 2006 failed to properly identify possible sources and significance of the PAHs and did not have disposal protocols for PAH containing wastes. The site specific target levels developed for the site did not include ecological receptors. The RMP utilized an insufficient number of samples and questionable statistical analysis techniques considering the large area of the project. The RMP did not have developed protocols for addressing off-site disposal of large volumes of soil that is currently classified as California Class I Hazardous Waste.

The following section (C1 to C2) presents our comments based on a review of Notice of Preparation of an Environmental Impact Report/Initial Study (NOP/IS), Dated November 19, 2014.

C1. Page 106 under Topics: 16. Hazards and Hazardous Material – Would the project: a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? Is listed as "No New or More Severe Significant Effects." As stated in A4 above this is in direct conflict with the findings of the recent Phase II Environmental Site Assessment (Langan 2015). Significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase. The transportation of hazardous waste off-site will increase the potential for items b) and c) on page 106. Excavation and transportation of soil to a Class I hazardous waste disposal site would significantly increase the potential for release of hazardous materials during the loading, excavation and transportation process. The additional trucking will cause additional exposures to exhaust fumes, traffic and noise. The additional impacts related to off-site transportation of hazardous waste will require further evaluation.

C2. Page 114 introduces Mitigation Measure M-HZ-1b: "Geologic Investigation and Dust Mitigation Plan for Naturally Occurring Asbestos." M-HZ-1b is a new mitigation measure for an impact that was not addressed in the 1998 SEIR. The new hazards associated with Naturally Occurring Asbestos (NOA) conflicts with the designation of "No New or More Severe Significant Effects" on items 16 a), 16 b) and 16 c) listed on page 106 of the NOP.

Summary of Review 2014 Notice of Preparation of an Environmental Impact Report (NOP)
The Notice of Preparation (NOP), dated Novemeber 19, 2014 failed to identify new or more severe significant effects with respect to the large volume of soil classified as Class I hazardous waste that will require off-site disposal at a Class I Hazardous Waste Disposal Facility. New mitigation measures for naturally occurring asbestos were not properly identified as new or more severe significant effects.

The following section (D1 to C4) presents our comments based on a review of the Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015.

D1. Page 1-61 under Hazards and Hazardous Materials, Initial Study Section E16, does not include the findings in the recent Phase II Environmental Site Assessment (Langan, 2015) with respect to significant volumes of soil classified as hazardous waste that will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase. These additional impacts were not previously included in the impact analysis.

D2. Page 1-61 Impact HZ-2, under Mission Bay FSEIR Mitigation Measure J.2, the RWQCB is listed as the agency responsible for reviewing risk evaluations for a public school or child care facility. The Department of Toxics Substances Control (DTSC) School Property Evaluation and Cleanup Division is the responsible agency for assessing, investigating and cleaning up proposed school sites (DTSC, 2015).

D3. Page 5.1-1 under 5.1.1 Scope of Analysis, Issues Scoped Out in the Initial Study, states "The Initial Study determined that the following topics were adequately analyzed in the Mission Bay FSEIR such that the proposed project would have no new significant impacts or no substantially more severe significant impacts than those previously found significant on these resources:… Hazards and Hazardous Materials;…" As stated in C1 above significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility

causing significant additional impacts during the construction phase. These additional impacts were not previously included in the impact analysis.

D4. Page 6-5 under Section 6.3 Effects Found Not to be Significant under Hazards and Hazardous Materials states "The project would not cause risk of upset and accident conditions involving release of hazardous materials; emit hazardous materials within 0.25 mile of a school; be located on a site listed on a hazardous materials database; be located on airport or air strip land use areas; impair implementation of emergency response or evacuation plan; expose people or structures to fire risk; or create construction related hazards and hazardous materials impacts. As stated in C1 above significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase. These additional impacts were not previously included in the impact analysis.

Summary of Review 2015 – Draft Subsequent Environmental Impact Report
The Draft Subsequent Environmental Impact Report (DSEIR), dated June 5, 2015 failed to identify new or more severe significant effects with respect to the large volume of soil classified as Class I hazardous waste that will require off-site disposal at a Class I Hazardous Waste Disposal Facility. The DEIR is inadequate by not accounting for additional impacts that from additional transportation of soil off-site that will cause additional exposures to exhaust fumes, traffic and noise.

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with questions regarding the review comments presented this letter.

Respectfully submitted,

Martin B. Cline, CEG – Project Geologist

Professional Background:

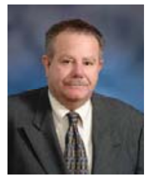
Mr. Cline has more than 28 years of experience in geology, engineering geology, petroleum geology and environmental field studies, including assessments for hillside grading, subsurface drainage design, and landslide repair and mitigation. As Project Geologist, his responsibilities include performing field investigations for geotechnical, geologic, and environmental studies. He has experience in planning and implementing geologic and geomorphic mapping and analyses of soil, bedrock and groundwater conditions as they pertain to engineering works. Mr. Cline's experience also includes construction observation and testing, and geotechnical laboratory testing. He has extensive project experience including Phase I and II environmental assessments for a wide variety of commercial and industrial properties, including wholesale/retail petroleum product outlets and heavy industrial sites. He also has extensive experience in the completion of CEQA Special Studies, as well as section preparation, for Environmental Impact Reports.

Relevant Project Experience:

Engineering Geology – Seismic Hazards Investigation Projects

Mr. Cline has expertise in the planning and implementation of geologic/seismic hazard investigations and development of seismic design criteria as they pertain to engineering works. Experience includes surface fault rupture investigations, deterministic/probabilistic site specific ground motion evaluations, site condition modeling, response spectra using time histories development, liquefaction, lateral spreading and seismic settlement analysis. Additionally, Mr. Cline has expertise in seismic hazards evaluations for Hospital and Schools according to OSHPD and DSA Title 24 specifications. Representative projects include:

- Geologic/Seismic Hazard Evaluation and time-history analysis, AT&T Central Office Seismic Upgrade, San Francisco, California
- Geotechnical Investigation/Liquefaction Analysis, AT&T Building Seismic Upgrade, San Francisco, California
- Geologic/Seismic Hazards Evaluation, Proposed Multi-Use Sports Complex, West Hills College, Lemoore, California
- Geologic/Seismic Hazards Evaluation, Proposed Wellness Center, West Hills College, Coalinga, California
- Geologic/Seismic Hazard Evaluation, College of the Sequoias, Tulare, California
- Geologic/Seismic Hazard Evaluation, Clovis Community Medical Center



Qualifications

Environmental Engineering Projects

Soil and Groundwater Remediation - Projects have included feasibility studies, system design, application for permits, remedial action oversight for clean-up of petroleum and heavy metals using in-situ treatment and excavation and disposal, and post closure monitoring. Projects of this nature include:

- Remedial Investigation/Feasibility Study-UST Site, Stockton, California
- Remedial Investigation for Seepage Pits - Visalia, California
- Well Design and Installation of a 3-Stage Monitoring Well - NASA Ames Research Center, Moffett Field, California
- Feasibility Study for former Service Station - Castro Valley, California
- Remedial Investigation for Foundry Site - Union City, California
- Feasibility Study for Pump and Treat Design, Tracy Army Depot, Tracy, California
- Operation and Maintenance, Dual Phase Vapor Extraction, Truck Stop, Dunnigan, California
- Remedial Investigation for Former Trucking Facility, Carson, California

Environmental Assessment Studies - Mr. Cline has expertise in the planning of field operations, sampling and analysis plans, workplan preparation, monitoring well design and construction, site assessment (Phase I and II), regulatory compliance, contaminant mobility and plume characteristics determinations, data acquisition and interpretation, and development of remedial action plans.

He has worked on sites impacted with petroleum, solvent and/or heavy metal contamination. Projects of this nature include:

- UST Assessment Service Station in Castro Valley, California
- UST Assessment for the City of Livermore, Livermore, California
- UST Assessment Trucking Facility in Sunnyvale, California
- UST Assessment Food Processing Plant in Stockton, California
- UST Assessment Trucking Facility in Sacramento, California
- UST Assessment Moving and Storage Facility in Fairfield, California
- UST Assessments Numerous Service Stations in Sacramento, California
- Jet Fuel Release Assessment, NASA-Ames Research Center, Moffett Field, California
- Phase I ESA, City of Pittsburg Redevelopment Agency, Pittsburg, California
- Phase I ESA, California Department of Water Resources - 60 acre site, Hood, California.
- Phase I ESA, Multi-unit Retirement Community in Fairfield, California
- Phase II ESA, Chrome Plating Facility, Oakland, California
- Phase II ESA, Future Elementary School Site, Dublin, California
- Phase I/II ESA, Future Elementary School Site, Empire, California
- Phase II ESA, Foundry Sand Deposition Site, Newark, California
- Phase I ESA, Fertilizer Distribution Facility, Lathrop, California
- Phase I ESA, Fertilizer Distribution Facility, Maxwell, California

Geographic Information Systems (GIS) Experience

Mr. Cline has expertise using GIS to evaluate and process data from numerous sources including AutoCAD, GPS and LiDAR data. Experienced with ESRI ArcMap, ACOE's HEC-RAS, HEC-GeoRAS, LASTools and ArcHydro.

GIS Project Experience:

500 Acre Solar Farm, Mohave, CA - CEQA Level Preliminary Geohazards Investigation for proposed construction of future photovoltaic systems in Mohave, California.

Solar Farm and Aquifer Restoration, Fremont Valley, CA - CEQA Level Preliminary Geohazards Investigation for proposed construction of a 4,800 acre photovoltaic system, included analysis of 37 miles of water lines and 98 miles of transmission lines in Fremont Valley, California.

Putah Creek Restoration Plan, Yolo County, CA: Developed supporting documents using GIS for permitting and design of a 2 mile-long watershed restoration project on Putah Creek for the City of Winters and the Putah Streamkeeper.

Lower Putah Creek Restoration Project, Solano and Yolo Counties, CA – BSK provided support activities related to the determination of ordinary high water mark and wetland delineation. Mr. Cline utilized

LiDAR to develop a Digital Elevation Model (DEM) for 21 linear miles of Putah Creek for USACE NWP-27 and for a Regional General Permit.

Cache Creek Plans, Yolo County, CA – Provided GIS support. LiDAR vegetation analysis for patch and trajectory modeling, as well as channel migration studies, to technical advisors for approximately 19.5 miles of restoration planning for the Cache Creek Yolo County Resource Management Planning Area.

Kurt Balasek, PG, CHG, QSD – Senior Hydrogeologist

BSK Associates Engineers & Laboratories

Professional Background:

Mr. Balasek is the Sacramento Senior Hydrogeologist for BSK. He has more than 25 years experience providing geologic, hydrogeologic and environmental consulting to western U.S. businesses and government agencies. His experience includes managing teams of scientists and engineers on projects ranging from large-scale brownfield developments, CEQA compliance and groundwater studies. He has provided project management of water resource evaluations and conjunctive use studies, as well as numerous petroleum hydrocarbon-related groundwater contamination investigations and remedial designs. Mr. Balasek has completed geologic hazard studies for proposed school sites in accordance with the Office of State Architect requirements and has completed detailed geologic surface mapping assignments in the foothills of the Sierra Nevada.

Mr. Balasek has spent his career working to evaluate hundreds of properties for the purposes of development, redevelopment and preservation as conservation easements. Conducting or leading these evaluations has given Mr. Balasek vast experience preparing site investigation strategies with an emphasis toward negotiating with regulatory agencies regarding future land use. Mr. Balasek has worked with redevelopment teams in numerous northern California cities and extensively under EPA community-wide assessment grants in the Cities of West Sacramento, Esparto, and Rancho Cordova. He has worked with local, State, and Federal agencies in evaluating a wide range of environmental contaminated and lighted, assessing community needs, and using tools to develop site cleanup goals. His skills of using land use covenants and maintenance tools provides for blighted property that have led to showcases community revitalization efforts. Mr. Balasek has completed numerous landfill characterization studies and provided detailed analysis to assist in consolidation and clean closure decision making.

Representative Project Experience:

City of Rancho Cordova, California, Community Redevelopment Agency, Brownfield Assessments-Mr. Balasek provided senior management oversight on a community-wide assessment of over 460 properties in Rancho Cordova, California. Approximately 30 parcels warranting Phase I and/or Phase II Environmental Site Assessments (ESAs) were identified. To date, a Phase I and II ESA were conducted on two parcels of a planned community college campus.

Senior Staff Hydrogeologist

Putah Creek Park North Bank Improvement Project, California-The North Bank Improvement Project stemmed from a federal appropriation of 2 million dollars to enhance the Solano County Transportation Department's automobile bridge replacement at the City of Winters. The project funds are administered by **CalTrans** so extensive coordination with this agency regarding project description and permitting has been a substantial portion of this project. The project was developed by the City of Winters. Mr. Balasek and his team were initially tasked with obtaining the biological opinion for mitigation as it related to disturbance of Valley Elderberry shrubs. Instead of purchasing mitigation credits from a Service-approved mitigation bank, Mr. Balasek and his staff devises a unique plan to develop a small on-site mitigation area within the Winters Putah Creek Nature Park. If approved, the mitigation area will provide enough mitigation credits to offset the Solano County Bridge project, the north bank improvement project and a proposed pedestrian bridge. Money will be set aside for maintenance of the mitigation area in perpetuity but will enable the project proponents to mitigate habitat damage locally and keep local control of the money. To develop this plan, Mr. Balasek and his team developed the financial model to predict the amount of money required to establish a non-wasting endowment. This model was submitted to USFWS and is undergoing review. U.S. Representative Mike Thompson and his staff are involved in the project and are assisting with negotiations with USFWS.

Winters Putah Creek Park Revised Master Plan CEQA Support- Winters, California-Mr. Balasek and his team prepared the Initial Study/Mitigated Negative Declaration (IS/MND) based on the revised master plan for Winters Putah Creek Park. This document was compiled in advance of implementing several projects outlined in the park master plan. The document was reviewed by the Winters City Council and adopted by the Winters planning commission without comment by the trustee agencies and with only one comment from the public. The document framed the foundation for environmental permitting for all of the following restoration-related projects.

City of West Sacramento, Housing and Community Investment Division, West Sacramento, California- Mr. Balasek has managed several Environmental Projects for the City of West Sacramento, including: West Capitol Corridor Study, 427 "C" Street, Tower Court, Sacramento Generator, and Vlad's Toyota.

City of Winters PG&E Training Center, Winters California-During critical property negotiations, due diligence studies revealed the historic presence of an underground fuel storage tank. Me. Balasek we retained by the City on an emergency basis to advise City Council and staff. Mr. Balasek mobilized BSK resources and conducted a comprehensive, soil, groundwater and soil vapor investigation on the site. Mr. Balasek also advised the City throughout the project and represented the City in numerous negotiations with PG&E. As a result of a well planned and executed investigation, a $70 million state-of-the-art training facility project is moving through the CEQA process and is scheduled to break ground late in 2015. This project is a huge success for the small City of Winters and will act as a catalyst for a downtown hotel project. Mr. Balasek's work in the field and at the negotiating table were a key part of the success of this project.

Stockton Worknet Center, Stockton, California-Provided project management for a contaminated site. The site characterization and remediation was funded by a State of California Brownfield Grant. The source of contamination was determined to have come from a pipeline located under railroad tracks. Removal and backfill of soil from an excavation that was 35 feet wide by 400 feet long was completed prior to construction of the new center.

River City Baseball – River Cats Stadium, West Sacramento, California-The site was located adjacent to a chemical mixing plant and as part of the owner's due diligence an environmental assessment was conducted. Contamination of volatile organics was determined and remediation followed. Based on these findings the foundation design was also adjusted to accommodate shallow groundwater. Based on Mr. Balasek's recommendation, Gorsorb™, a passive form of soil vapor testing, was used to delineate the contamination. A Risk Assessment report was provided to determine if the level of contamination exposure based on the properties intended use. All this work was completed at an accelerated pace to facilitate construction.

Colusa County, Three UST Sites, Colusa, California-Underground storage tanks at the County Sheriff's Department, Central Services, and County Jail were removed soil and water samples were tested for contamination. As project manager, Mr. Balasek managed the team who provided soil excavation and shallow groundwater monitoring for petroleum hydrocarbons. The three projects took place concurrently resulting in a cost savings to the county.

Sacramento International Airport Terminal Construction, Sacramento, California-Mr. Balasek and his team installed monitoring wells and conducted aquifer performance tests in advance of massive dewatering efforts to facilitated construction at the new Sacramento International Airport Terminal project. Data developed from this study was used to quantify discharge volumes and evaluate water quality. The data was subsequently used as the basis for dewatering design related to a large basement structure extending approximately 17 feet below grade for the entire terminal building as well as subterranean tunnel structures. The new Sacramento Terminal opened in the fall of 2011.

Yolo Ranch Agricultural Landfill Remediation, Yolo County, California-Provided project management and oversight during landfill excavation and remediation. This project involved careful coordination with regulatory personnel from the Illegal Abandoned Landfill Group at the former California Integrated Waste Management Board to remove and/or encapsulate a wide range of ag-related waste in the Yolo ByPass. The work involved remediation and subsequent site closure of an agricultural landfill adjacent to sensitive natural habitats. This work was done as part of a property transaction and demonstrated creative problem solving that included an on-site solution which saved the client tens of thousands of dollars.

Kurt M. Balasek, PG, CHG, QSD– Senior Hydrogeologist

Butte County, California-Mr. Balasek and his team conducted the base-line hydrogeologic analysis of the site vicinity in support of the gravel mining permit application submitted to Butte County. Mr. Balasek's team also conducted the slope stability evaluations for the propose mine. Both technical documents were used to support an EIR commissioned by Butte County on behalf of the project proponent. In addition, Mr. Balasek's team provided consultation on pit capture and anadromous fish entrapment if high water resulted in overtopping of the pit. The work also involved analyzing resource data to identify the bottom of economically recoverable resource.

Cold Spring Rancheria, Tollhouse, California-Mr. Balasek oversaw the preparation of a comprehensive long range water development program for the Cold Springs Rancheria. This program examined available surface and groundwater resources, outlined potential problems with existing infrastructure and water rights and prioritize projects for improvement. Mr. Balasek and his staff also prepared a revised Quality Assurance Assessment Plan (QAAP) for the Rancheria that outlined procedures for all field sampling activities. These plans were funded by the Bureau of Indian Affairs and are required planning documents in advance of project implementation funding.

Subject: Proposed Golden State Warriors Arena
Mission Bay, Blocks 29-32, San Francisco
Geotechnical Engineering Review

Dear Ms. Meserve:

As authorized, this review is based on information necessary to update a 1998 EIR for a current project proposed within an area bordered by 3rd, South, and 16th Streets, and Terry Francois Boulevard located on Mission Bay fills over Bay Mud. The four blocks are mapped within a seismic hazard area (CDM&G 2000*a*) requiring investigation (CDM&G 2000*b*) and mitigation of potential liquefaction hazards (CGS 2008). The site is also subject to amplification of strong motion due to soft ground (2013 SFBC, ASCE 2013). None of the geotechnical engineering reports for the property classify the site as required by current codes and standards. The data in the existing geotechnical reports underestimates site response to strong motion required for risk to a structure whose primary occupancy will be public assembly with an occupant load greater than 300.

Proposed Project

The project considered, on Blocks 29, 30, 31 and 32, is an event center and parking for the Golden State Warriors basketball team. The project includes two 160 foot office towers, gatehouse, food hall, and retail spaces. 17 years ago an EIR for another project was prepared (C&CSF 1998) based on information for an unspecified location in Mission Bay as no subsurface investigation for the proposed arena site had been undertaken. Later, the four blocks were investigated and reported (Treadwell & Rollo 2007, 2008*a*, 2008*b*) for other projects. Composite reports for four commercial buildings for the four blocks was produced for Alexandraa (Treadwell & Rollo 2008*a*) and salesforce.com (Langan Treadwell Rollo 2011). Subsequent evaluation reports for the arena (LTR 2014*a*, 2014*b*), marked "...privileged...confidential...", have been issued but they do not classify the site nor do they address the Risk III Importance (ASCE 2013, 2013 SFBC) for a known project primarily intended for public assembly. The recent draft EIR (C&CSF 2015) does not address these issues and the current California requirements for mitigation of seismic hazards have not been followed.

Ground Conditions

Several years after the 1998 EIR was prepared, California's seismic hazard mapping program delineated the area of the proposed project (CMD&G 2000*a*) as being subject to liquefaction-induced ground displacement resulting from the shaking of saturated granular sediments that comprise the sands and other artificial fills placed in Mission Bay 100 to 150 years ago.

The property, which was not the subject of a subsurface exploration program when the 1998 EIR was prepared, also includes deposits of Bay Mud of varying thicknesses under the fills that will produce ground amplification from strong motion generated by earthquakes. These hazards are different but related; liquefaction potential (sand) can be mitigated but the structure must be designed to resist soft ground (clay) amplification from strong motion. The data (exploratory boring logs showing materials, sampling, and testing) in the composite reports for the four block area (Treadwell & Rollo 2008a, Langan Treadwell Rollo 2011) verify that both potential hazards exist at the proposed project site.

Seismic Environment

The site is located in the earthquake active San Francisco Bay Area which is seismically dominated by the presence of the San Andreas Fault System. In the theory of plate tectonics, the San Andreas is the boundary between the northward moving Pacific Plate (west of the fault) and North American Plate (east of the fault) which is manifested by the San Andreas system. The faults in the system produce dextral horizontal shear movements resulting from the relative motion of the Pacific and North American plates. Based on history and theory, the land of the proposed project site (sand and rubble fill over Bay Mud)[1] will be subjected to strong shaking from earthquakes generated along both the active San Andreas (8 miles to the west) and Hayward (10 miles to the east) faults.

The northwestward movement of the Pacific Plate relative to the North American Plate persistently causes right-lateral slip across the major faults and deformation between the faults. In the Bay Area, this movement is distributed across a complex system of strike-slip, right lateral parallel and subparallel faults. The San Andreas fault ruptured on 4/18/1906 (estimated M = 8.0) and last severely shook the area on 10/17/89; other earthquakes that epicentered relatively recently along the San Andreas fault occurred on 10/1/69 (Santa Rosa, M = 5.7) and 3/22/57 (Daly City, M = 5.3). Maximum moment magnitudes (scaled size of earthquakes in terms of energy released)[2] are San Andreas $M_W = 7.9$, and Hayward $M_W = 6.9$.

The U. S. Geological Survey forecasted a 67% probability that one or more earthquakes of M = 7.0 (0.20 to 0.45g) or greater will occur on the San Andreas or Hayward faults by the year 2020 (Peterson 1996). Shortly afterwards, the Working Group on California Earthquake Probabilities concluded that the Hayward - Rogers Creek fault system has a 32% probability of generating a large earthquake (M = 6.7 to 7.4) by the year 2030. The average earthquake recurrence interval for the East Bay is roughly 220 years, give or take 100 years As for ground rupturing, there has been a quiescent period of seismic activity after the great 1906 earthquake on the San Andreas fault and there has been no rupturing along the Hayward fault for more than 100 years. The 1998 EIR does not cogently explain the seismic environment of the site.

[1] A layered sequence of soft, plastic, expansive sediments forming the bottom of San Francisco Bay (often referred to as "Younger Bay Mud"). Bay mud is a very weak, compressible soil, consisting of clay-sized and silt-sized particles interspersed with stringers and pockets of peat, fine sand, and minor amounts of gravel, and having a water content ranging from 30 to 92% (commonly 50 to 60% in the uppermost 50 to 100 feet of the deposit).

[2] The moment magnitude scale is used to measure earthquake magnitude M_W taking into account the size of the fault rupture, the stiffness of rock, and the amount of the movement of the fault using values that can be estimated from the size of several types of seismic waves; while the older Richter scale is a numerical scale used to measure the magnitude M of an earthquake using values based on the size of the earthquake's largest seismic waves.

Research, including trenching by the USGS at the Mira Vista Country Club in the Berkeley Hills, indicates that the northern segment of the Hayward fault is overdue for a characteristic major earthquake (Schwartz & Lettis 1998). On 8/24/14, in not unusual ground conditions, a damaging M = 6.0 earthquake occurred off the northern segment in Napa.

Liquefaction (cyclic mobility, which occurs when loose granular soils that are saturated undergo a rapid loss in shear strength as a consequence of ground shaking, and movement amplification of the Bay Mud due to strong motion, will occur at the proposed project site (and nearby sites) during significant earthquakes. This is the reason why California mapped the seismic hazard zones in the state in 2000 and requires mitigation of the seismic hazards.

Ground Motion Parameters

The National Earthquake Hazards Reduction Program ("2009 NEHRP") document "Recommended Provisions for Seismic Regulations for New Buildings and Other Structures" (FEMA 450-1) feeds into the ASCE (American Society of Civil Engineers) 7-10 "Minimum Design Loads for Buildings & Other Structures" (ASCE 2013) development process, and ASCE 7 in turn serves as the primary referenced standard in the 2012 International Building Code (2012 IBC). The 2013 San Francisco Building Code (2013 SFBC) is the City's iteration and adoption of the 2013 California Building Code, which is the State's iteration and adoption of the 2012 IBC. At the time the 1998 EIR was written the San Francisco Building Code was based on superficial maps in the Uniform Building Code (ICBO 1998) when seismic design standards were much less stringent than those of today.

Ground motion parameters, for this review of data in reports of subsurface investigation for the project site, all of which were gathered and presented after the 1998 EIR, were determined for the site using USGS ASCE 7 (2013) based calculation tools derived from published ground motion maps. Seismic ground motion values for use in characterizing and classifying the site for the current project are as follows:

General:

Site Location (USGS):	Latitude 37.7678°N Longitude -122.3875°W
Risk Category (2013 SFBC Table 1604.5)[3]:	III
Seismic Importance Factor I_e (ASCE 7 Table 1.5-2):	1.25

Mapped Acceleration Parameters (2013 CBC §1613.3.1):

Determination of Maximum Considered Earthquake (MCE) spectral response accelerations, mapped at short (0.2 second) period S_s and at a full second (1.0 second) period S_1, for the site:

Determined Site Classification (input Latitude/Longitude):	E
Short period (0.20 second) mapped spectral acceleration S_s:	1.500g
Site Coefficient F_a (2013 SFBC Table 1613.3.3(1); function/Site Class E & S_s):	0.900
Adjusted MCE 0.20 second period spectral response acceleration $S_{MS\text{-}B} = F_a S_s$:	1.350g

[3] "Buildings and other structures that represent a substantial hazard to human life in the event of failure."

One second period mapped spectral acceleration S_1:	0.600g
Site Coefficient F_v (2013 SFBC Table 1613.3.3(2); function/Site Class E & S_1):	2.400
Adjusted MCE one second period spectral response acceleration $S_{M1-B} = F_v S_1$:	1.440g

Design Spectral Response Acceleration Parameters (2013 SFBC §1613.3.3):

Site Classification definitions are dependent on geotechnical data (2013 SFBC §1613.2.1; ASCE 7 §§20.3.2, 20.3.3(3) [softer soil category to be used due to differing criteria][4]).

Defined Site Classification (2013 SFBC §1613.3.2 & ASCE 7 Table 20.3-1):	E
Site Coefficient F_a (2013 SFBC Table 1613.3.3(1); function/Site Class E & S_s):	0.900
Adjusted MCE 0.20 second period spectral response acceleration $S_{MS-D} = F_a S_s$:	1.350g
5% damped short period design spectral acceleration $S_{DS} = 0.67 S_{MS-D} = 0.67(1.350)$:	0.905g
Site Coefficient F_v (2013 SFBC Table 1613.3.3(2); function/Site Class E & S_1):	2.400
Adjusted MCE one second period spectral response acceleration $S_{M1-D} = F_v S_1$:	1.440g
5% damped one sec. period design spectral acceleration $S_{D1} = 0.67 S_{M1-D} = 0.67(1.440)$:	0.965g

Seismic Design Categories (SDC); Risk Category III, $S_1 \geq 0.75$ (2013 SFBC §1613.3.5, ASCE 7 §11.6):

Determination of Seismic Design Category (SDC) is based on occupancy or use and level of expected soil/rock-modified seismic ground motion at the site (adjusted per ASCE 7 §11.6).

Short period response acceleration SDC_{DS} (2013 SFBC Table 1613.3.5(1) adjusted):	E
One second period response accel. SDC_{D1} (2013 SFBC Table 1613.3.5(2) adjusted):	E

Mapped MCE Geometric Mean Peak Ground Acceleration PGA (ASCE 7 §11.8.3, 2013 SFBC §1805.5.12(2)):

PGA (USGS output):	0.523
Site Coefficient F_{PGA} (Site Class E, ASCE Table 11.8-1, PGA ≥ 0.50):	0.900
Peak Ground Acceleration adjusted for site class effects $PGA_M = F_{PGA} PGA$:	0.471g

The above ground motion parameters, reporting just recently required per ASCE 7 (ASCE 2013) where applicable under 2013 SFBC §1805.5.12, and calculated for a structure having an occupant load greater than 300, must be used for analysis in a new EIR. Lateral force resisting systems must meet seismic detailing requirements and limitations set forth in ASCE 7 (2013 SFBC §1604.10).

---

[4] Langan Treadwell Rollo 2011 (ASCE 7 Table 20.3-1):
B 29-8 8/31/11 Bay Mud, soft-wet 12-35' (21'>10')
B 32-1 5/1/07 Bay Mud, soft-wet 11-42' (31'>10'), MC=57% (>40%)
B 30-4 5/5/07 Bay Mud, soft-wet 25-50' (25'>10'), MC=63-74% (>40%)
B 31-4 9/1/11 Bay Mud, soft-wet 12-35' (23'>10'), s_u=400 psf (<500 psf)
Treadwell & Rollo 2008*a* (ASCE 7 Table 20.3-1):
1030 (AGS) 3/1/00 Bay Mud, moist-soft 22-51' (29'>10'), PI=58% (>20%)
1031 (AGS) 2/29/00 Bay Mud, moist-soft 16-55' (39'>10'), PI=38-62% (>20%)

Mitigation of Seismic Hazards

California's Special Publication 117A (CDM&G 2008) mandates countermeasures to liquefaction because liquefaction has been a major source of damage during past earthquakes where deposits of saturated sands were present. The risk of liquefaction and associated ground deformation can be reduced by various ground-improvement techniques, but consideration of also lessening the effects of strong motion in the underlying Bay Mud (from transient porewater pressure increases) during earthquakes must also be part of mitigation. The EIR of 17 years ago (C&CSF 1998) contains no mitigation measures, and the newest draft EIR (C&CSF 2015) does not include sufficient countermeasures.

The latest composite report for the site (Langan Treadwell Rollo 2011) anticipated four buildings. Alternative mitigation measures were recommended in the report for those buildings including "rapid impact compaction" ("RIC") "stone columns" and "compaction grouting". A more appropriate countermeasure, deep soil mixing of slurry at depth, has been suggested (Langan Treadwell Rollo 2014*a*). Gravel drains in backfilled bored holes to dissipate pore pressures are an effective counter-measure to liquefaction (Seed & Booker 1977). However, the proposed arena would probably be supported by piles arranged in concentric circular or elliptical patterns, and those piles will be subject to not only liquefaction loads from saturated relatively loose granular materials in the sand and rubble fill but from strong motion amplification of the relatively soft cohesive materials of the Bay Mud.

By embedding the piles into a mat capping the piles, and strengthening the liquefiable sand in the fill (not by "compaction grouting" but by permeation grouting using microfine cement or Portland cement slurry mixed with the sand), and socketing the piles into the Colma (or bedrock near the south end of the site), the effective length of the prestressed concrete piles will be reduced considerably by fixing end conditions and shortening the effective lengths of piles within the Bay Mud. The undersigned believes a program of combination of techniques should be modeled and tested before project approval.

Arena Foundation System

The latest composite report for the site (Langan Treadwell Rollo 2011) was for four separate buildings, one on each of the four lots. The proposed arena (Langan Treadwell Rollo 2014*a*) will be the principal structure in a complex that includes other structures. The 2011 report provides foundation alternatives for each building mainly because the Colma formation (dense to very dense sand, silty sand, clayey sand) is thin at the southeastern part of the site. Structural steel piles should not be used as the Bay Mud is highly corrosive and cathodic protection systems are problematical (Karp 1977).

If the proposed arena project were to proceed, it is more than likely that the foundation system, arranged in a pattern of concentric circles or ellipses. would be comprised of either precast prestressed concrete piles or cast-in-place concrete piles that are drilled through casing that is part of the machinery with the piles concreted as the casing is withdrawn. Piles would derive their support from the Colma formation, except at the southern part of the site bedrock would be the supporting medium. For embedment in the Colma formation or very stiff to hard clay and bedrock where the Colma formation is not present, depth-limited augered piles could penetrate dense materials or precast prestressed concrete piles could be driven with steel stingers and where the Colma formation is not present, the piles could be piloted into the very stiff to hard clay or bedrock. Although various deep foundation alternatives are theoretically possible, the proposed current project, which is particularly sensitive due to its public assembly nature, should have a testing program instituted to test alternatives.

Vibrations During Construction

Driving displacement piles causes noise and vibrations from impact that are transferred though dense subgrade materials to nearby structures. As the configuration of the proposed arena will likely be circular or elliptical and vibrations, particularly driving those at the western side of the project, would likely affect the UCSF Medical Center building at 1650 3rd Street. Prior to project approval, an indicator pile test program must be implemented to monitor vibrations and verify the suitability of the intended foundation system for the area.

Drilling and casting-in-place reinforced concrete shafts, if feasible to required depths, may be an appropriate suitable alternative to driven piles. As noted below for shoring, shafts are augered and spoils removed through casing contained in the rig that is withdrawn as concrete is placed. Using tremie methods, concrete displaces water in the hole so it rises and is pumped out with low ground-water loss. Before the project is approved, a test program should be implemented to ascertain the feasibility of using cast-in-place piles or where appropriate, a combination of drilled and driven piles.

Shoring & Groundwater

As an underground parking garage would be part of the project, secant piles, drilled in a circular or elliptical pattern to form a tension ring, would likely be the shoring, but drilling/concreting operations will encounter and displace groundwater that would have to be continuously tested for contaminants and otherwise managed under an advance plan. A Memorandum (Langan Treadwell Rollo 2015) suggests "Construction Dewatering Discharge Options" which may be helpful for that problem but the actual engineering effects of dewatering (increase in effective stress that causes areal subsidence) was not addressed. The effects upon surface improvements from dewatering in the area of the project must be studied before project approval.

Shoring of the excavations for the intended subgrade portions of the proposed current project, the appropriate method would be, as noted above, secant piles. Secant piles are sequentially drilled shafts that intersect each other to form a solid wall. Primaries (soft piles) are drilled apart in rows (or curves) closer together than the pile diameter. Primary shafts are augered and spoils removed with low water loss. Secondary shafts (hard piles) are augered between and arched into both of adjacent primaries, and wet-set reinforced with steel. In the saturated sand, it would be at this stage (casing/augering, and reinforcing) and afterwards (tolerance deviation from verticality, joints between overlapping piles, and movement) when groundwater and sand will be lost.

Depending on depth below groundwater level, hydrostatic pressures (head) are about one-half psi which will allow water and sand to migrate into the excavation. Pressure is only reduced if groundwater level drops outside the wall. When water is lost, increases in effective stress with vibrations from hard pile installations will densify the sand with differential settlement of improvements. The only methods to minimize water and sand flowing into the excavation with simultaneous drawdown of the groundwater level is to recharge outside the wall or construct the shoring in a circular pattern with large overlaps acting in ring compression.

Under current codes and standards, below grade walls for the proposed underground structures will require dynamic analysis (2013 SFBC §1803.5.12(1)) as well as engineered design to protect surface improvements, wall backdrainage, groundwater collection, piping, and discharge facilities.

Contamination

Although it is understood that others will discuss contamination, the subject is a very important environmental and geotechnical engineering concern for reasons that include intended subgrade excavation and construction. Mission Bay was used for many years as a dump and then a railroad yard. Bayward of the site there were fuel terminals that included tanks and pipelines which are known contributors to contamination. The Pier 64 area has received past attention under the auspices of developers (Langan Treadwell Rollo 2014*b*) but the extent and sufficiency of actual clean-up is not really known from second hand information. The report of geotechnical investigation produced for salesforce.com (Langan Treadwell Rollo 2011), 327 pages, contains no contaminant sampling, testing, or even recognition of the potential problem.

Contamination seems to have been dismissed as a thing of the past, but contaminants in groundwater do not simply go away without complete ground remediation. The 1998 environmental document is vague so "change" from then to now cannot be quantified. For instance, the "2001 Phase I Remedial Excavation" resulted in a record that "Soil containing residual oil below the target zone was left in place." (Langan Treadwell Rollo 2014*b*, pg 9). The observance of living birds congregating where water has ponded is not a reliable yardstick for declaring a site free of contamination. Hands-on testing by an independent laboratory would be appropriate measures that should be undertaken before a public assembly project at this site is approved.

Yours truly,

Lawrence B. Karp

Subject: Review
Mission Bay Subsequent Environmental Impact Report (September 17, 1998)
Notice of Preparation of an Environmental Impact Report (November 19, 2014)
Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015
Mission Bay Project
San Francisco, California

Dear Ms. Meserve:

At the request of Soluri Meserve, BSK Associates (BSK) reviewed the following documents:

A. **Mission Bay Subsequent Environmental Impact Report (SEIR), Dated September 17, 1998, Sections:**
   - Chapter II.20 to II.21, Summary
   - Chapter V.H.1 to V.H.24, Seismicity
   - Chapter VI.37 to VI.39, Mitigation Measures, Seismicity
   - Chapter VI.87 to VI.93 Mitigation Measures, Geology
   - Chapter IX.2 to IX.3, Irreversible Environmental Changes
   - Chapter XII.187 to XII.188, Public Comments, Seismicity
   - Appendices A.49 to A.54, Initial Study, Geology
   - Appendices G.1 to G.4, Seismicity
B. **Notice of Preparation of an Environmental Impact Report/Initial Study, Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, Dated November 19, 2014**
   - Pages 84 to 105
C. **Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015**
   - Pages 1-47 to 1-48, Summary of Impacts and Mitigation Measures, Hydrology and Water Quality
   - Pages 1-59 to 1-60, Summary of Impacts and Mitigation Measures, Geology and Soils
   - Pages 5.9-9 to 5.9-29, Flooding
   - Page 6-5, Effects Found Not to be Significant

Our review was limited to Geology, Engineering Geology and Seismic related aspects of the subject documents. The following section (A1 to A14) presents our comments based on a review of the Mission Bay Subsequent Environmental Impact Report (SEIR), Dated September 17, 1998.

A1. Section II.20 Summary-Seismicity, fourth paragraph indicates that structures would be supported on piles between 30 and 200 feet deep to reduce the effects of groundshaking and liquefaction. This type of structural support may provide mitigation of liquefaction hazard of the main building structure, however pile support systems do little to provide mitigation from liquefaction and settlement of surrounding utilities/roads and other support systems that may be damaged during a seismic event. Due to the shallow occurrence of the liquefiable layers, sand boils may develop during a seismic event. Ground settlements due to development of sand boils can be large and unpredictable. Design of these surrounding systems, not proposed to be supported on piles, cannot withstand the effects of sand boils and can lead to excessive and differential settlement without further technical analysis, and mitigation measures such as recompaction.

A2. Section II.20 states "the likelihood of tsunami inundation is very slight." The fact that portions of the proposed facility are located in a Tsunami Hazard Zone established by the State of California (California Emergency Management Agency, June 15, 2009 Map) indicates that the tsunami hazard is significant.

A3. Section V.H.12 states that "To reduce potential effects in the Liquefaction Hazard Zone, Catellus has committed to construction of major structures in the Project Area on foundations supported by piles driven into dense sands, stiff clays, or bedrock in areas where such materials are too deeply buried by unengineered fill and/or Bay mud to provide adequate support for foundations." The conditions that trigger use of piles and areas where they are needed were not delineated and the method for determining the requirement criteria was not provided. Futhermore, as stated in section A1 above, piles alone may not provide sufficient mitigation for areas surrounding the building structures.

A4. Section V.H.13 states that "If not mitigated as described in Chapter VI of this SEIR, the above-described risks to people posed by seismically induced groundshaking and liquefaction would be significant impacts of the project." Many risks described in Section V.H.13 are from structures/facilities located outside the project area. The mitigation measures presented in Chapter VI of the SEIR are for structures/facilities located in the project area. It is not possible to mitigate hazards to structures located outside the project area by mitigation measures that were developed for structures located inside the project area.

A5. Section V.H.16 states "Some grading of the Project Area, including the excavation of some potentially liquefiable materials and replacement with engineered fill, would occur prior to the construction of underground infrastructure to ensure that the systems could be designed to accommodate expected settlement along their specific routes, and to prevent liquefaction damage." This is vague with respect to which areas will require regrading and how deep the fill replacement extends. The technical criteria that is to be used to determine if an area requires replacement was not provided.

A6. Section V.H.17 first paragraph utilizes U.S. Army Corp of Engineers (ACOE) 1975 run-up model for 100-year and 500-year events to estimate potential tsunami hazards. The indented use for ACOE 1975 report was for determining 100-year and 500-year flood levels for the purpose of requiring flood insurance. The ACOE report considered the probabilities of tsunami sources from Alaska and the Aleutian trench alone, assuming that the 100-year and 500-year events are not strongly affected by events from other regions of the Pacific. They did not address the possibility of locally generated tsunamis (Borrero. et al, 2006). More recent studies used to develop the 2009 Tsunami Inundation Map uses multiple seismic sources including local faults (Point Reyes Thrust Fault, Rodgers Creek-Hayward Fault and San Gregorio Fault) and other distant sources such as the Cascadia Subduction Zone.

It should be noted that for designing structures against structural collapse the 2013 California Building Code uses a ground motion values from a Risk-Targeted Maximum Considered Earthquake (MCEr). The MCEr is defined as the ground motion from an earthquake at the 1% in 50 years (4975 year return interval) hazard level.

The most technically accurate method for assessing tsunami risk to a site is to perform a Probabilistic Tsunami Hazard Analysis (PTHA). The computational method in PTHA generally follows the Probabilistic Seismic Hazard Analysis (PSHA) method that is widely used in assessing seismic hazards (Geist, 2006). Given that the tsunamis are caused by earthquake events, the analysis should use the same standard hazard level as earthquakes (1% in 50 years), not the flood insurance risk return interval. Using an analysis based on 100-year or 500-year return intervals may not capture the controlling seismic event that may cause the maximum Tsunami run-up.

A7. Section V.H.17 first paragraph references an "extreme high tide crest condition" of an additional 2.95 feet above mean sea level. The reference source for the "extreme high tide crest condition" was not provided. Our review of the nearest tide station (Yerba Buena Island Tide Station 914782, NOAA Website) station information data sheet indicates that the Mean High Water (MHW [1]) level is 2.31 feet above mean sea level (msl) and the Mean Higher-High Water (MHHW[2]) is 2.91 feet above msl. The proponent assumes that the "extreme high tide" is a rare event with low probability of occurrence. The 2.95 feet above msl that is assigned to the assumed low probability event is not significantly different from the average event, Mean High Water of 2.31 feet above msl. The difference between what the proponent assumes is a low probability event value based on an "extreme high tide" and the Mean High Water value is probably less that the uncertainty in the model that was used. The analysis provided in the DSEIR attempts to minimize the apparent risk from a tsunami that occurs during a high tide through confusing and unsubstantiated statistical analysis.

---

[1] MHW - Mean High Water: The average of all the high water heights observed over the National Tidal Datum Epoch. For stations with shorter series, comparison of simultaneous observations with a control tide station is made in order to derive the equivalent datum of the National Tidal Datum Epoch.

[2] MHHW - Mean Higher High Water: The average of the higher high water height of each tidal day observed over the National Tidal Datum Epoch. For stations with shorter series, comparison of simultaneous observations with a control tide station is made in order to derive the equivalent datum of the National Tidal Datum Epoch.

The tsunami run-up analysis presented in the SEIR also failed to account for future sea level rise due to climatic change. Estimate of future sea level rise in the San Francisco Bay Area range from 3.1 feet to 5.5 feet in next the 90 years (Nation Research Council, 2015). Tsunami run-up elevation analyses should incorporate future sea level rise.

A8. Section V.H.17 utilized the local San Francisco City Datum (SFCD) for the analysis. Page V.H.20 defines the SFCD as "For surveying purposes in San Francisco, a local datum was established, in the 19th century, at 8.66 above mean sea level, approximately higher high tide at the time." It is not clear what national datum the SFCD is related to since there is no citation. The proponent asserts the SCFD is the 8.66 above MSL in the 19th century, however, they fail to identify how this elevation relates to the current datum, used in other parts of their analysis. Current mean sea level data is referenced to the North American Vertical Datum of 1988 (NAVD88) that was established in 1991. NAVD88 replaced the National Geodetic Vertical Datum of 1929 (NGVD29). Tidal datums such as the Mean Sea Level (MSL), Mean High Water (MHW) and Mean Higher High Water (MHHW) are referenced to Geodetic Datums such as NAVD88 or prior to 1991, NAVD29 (NOAA 2015). To calculate flood levels, data that uses a consistent Geodetic Datum must be used (FEMA 2015). For example, MSL using NAVD88 is not the same as MSL using NAVD29. Using a local datum such as the SFCD, that uses an unknown Geodetic Datum and relating to tidal data that uses a known Geodetic Datum such as NAVD88 would produce erroneous results.

A9. Section V.H.17 last paragraph attempts to minimize the tsunami hazard. As shown on the attached Figure 1, portions of the site are located in a California State Designated Tsunami Hazard Zone. According to Appendix M, Section M101.4 of the 2013 California Building Code (CBC): "Construction within the Tsunami Hazard Zone - Construction of structures designated Risk Category III and IV as specified under 2013 CBC Section 1604.5 shall be prohibited within a Tsunami Hazard Zone."

Category III Risk Category includes: "Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:

- Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
- Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250.
- Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500.
- Group I-2 occupancies with an occupant load of 50 or more resident care recipients but not having surgery or emergency treatment facilities.
- Group I-3 occupancies.
- Any other occupancy with an occupant load greater than 5,000.
- Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Risk Category IV.
- Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that: Exceed maximum allowable quantities per control area

as given in Table 307.1 (1) or 307.1 (2) or per outdoor control area in accordance with the California Fire Code; and Are sufficient to pose a threat to the public if released."

The proposed structures are probably located in an area that conflicts with the requirements specified in Appendix M, Section M101.4 of the 2013 California Building Code.

A10. Section VI.88, Table VI.8, K.2b refers to designing connections between pile-supported structures and unsupported sidewalks and driveways to reduce the likelihood of separation due to settlement. This analysis identifies unknown, but high settlements that may occur due to liquefaction and development of surface sand boils. Sand boils occur when liquefied units reach the ground surface and sand is ejected from the ground surface. Settlements due to sand boils can be large and unpredictable and greater than what was presented in the report. Without adequate mitigation for these high unknown settlements, the impacts would be significant.

A11. Section VI.89, Table VI.8, K.2c refers to using flexible connections for utilities serving pile-supported buildings to accommodate the settlement expected. This analysis identifies unknown, but high settlements that may occur due to liquefaction and development of surface sand boils. Without adequate mitigation, the impacts would be significant.

A12. Section VI.89, Table VI.8, K.4 indicates that leveling jacks should be used on buildings with shallow foundations. This measure would not be effective to mitigate differential settlements due to liquefaction or dry seismic shaking settlements. High differential seismic settlements may cause building collapse or the over-turning of structures rendering leveling jacks useless.

A13. Section VI.91, Table VI.8, K.15 states that "As deemed necessary by geotechnical studies, make sandy materials more dense to reduce the potential for liquefaction." This appears to conflict with the requirement of pile-supported foundations. The requirement is vague with respect to criteria to be used to determine how deep the densification should extend and is not adequate to mitigate a significant impact. Furthermore, the densification methods are not identified nor how this unknown process would work as mitigation.

A14. Appendices Section A.49 under Tsunami and Seiche states "Although the Project Area is relatively close to sea level, historical records indicate little likelihood of inundation by tsunami or seiche." In the next sentence it is stated that the portions of the project area would be below the level of inundation predicted by the U.S. Army Corps of Engineers computer models. It was also stated that techniques for reducing the inundation, tsunami and seiche hazards would be presented in the SEIR. The only mitigation measure against tsunami hazards presented was a vague reference to setbacks from the Bay and Channel made in Section V.H.17. As stated above in A9, the type of proposed structure would not be allowed according to Appendix M, Section M101.4 of the 2013 CBC.

Summary of Review 1998 - Mission Bay Subsequent Environmental Impact Report

The Mission Bay Subsequent Environmental Impact Report (SEIR), dated September 17, 1998 relied on an inadequate Tsunami hazard analysis, relied on out dated methodology and failed to provide adequate mitigation measures for Tsunami Hazard impacts. The SEIR failed to fully address high ground settlements and provide mitigation measures for impacts from sand boils. The SEIR failed to properly identify impacts and provide mitigation measures for areas of the project that may be impacted from liquefaction induced lateral spread hazards. The mitigation measures presented to address the impacts from high settlements due to liquefaction would not be effective in all areas of development, in particular with respect to impacted areas located outside building footprints.

The following section (B1 to B11) presents our comments based on a review of the Notice of Preparation of an Environmental Impact Report/Initial Study (IS), Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, Dated November 19, 2014.

B1. Page 84 Topics: 14 Geology and Soils - lists the impacts for all subsections of the Geology and Soils Impacts as "No New or More Severe Significant Effects." Significant changes to the California Building Code and the standard of practice for analyzing ground motion and liquefaction evaluation have occurred since the 1998 SEIR was published. Geotechnical reports showing details of older analysis versus analysis based on newer ground motion criteria were not available for review. Without a comparison of the two analyses, it cannot be concluded that there are no new or more severe significant effects.

B2. Page 86 last paragraph: identifies the Langan Treadwell Rollo, Preliminary Geotechnical Evaluation Report, dated March 28, 2014 as the preliminary geotechnical evaluation for the project. Our review of that report indicates that the letter report carries the stamp "Privileged and Confidential – For Discussion Purposes Only" Furthermore, the geotechnical evaluation report states in the last paragraph "The conclusions and recommendations presented herein are preliminary and should not be relied upon for design." Other detailed geotechnical reports providing data and analysis were not referenced in the IS or available to review.

B3. Page 87 second paragraph states "On the basis of the preliminary geotechnical evaluation for the project, recommended measures for addressing these effects include improving the soil to resist liquefaction and lateral spreading as well as use of flexible utility connections, utility hangers, and hinged slabs to address differential settlement." As stated above in Section A10, high settlements may occur due to liquefaction and development of surface sand boils. Without adequate mitigation for these high unknown settlements, the impacts would be significant.

B4. Page 87 third paragraph states "As indicated by the project-specific geotechnical evaluation, no substantial changes have occurred nor has new information become available that would result in new or more severe project impacts related to seismic hazards including fault rupture, seismic groundshaking, seismically induced ground failures, or landslides." The referenced 2014 geotechnical report is insufficient in content and analysis to support this statement. A comparison of current and the 1998 derived ground motion design criteria, static and dynamic settlement values was not provided in the geotechnical report or the IS.

B5. The 2014 Langan Treadwell Rollo report also identified the potential hazard from lateral spread as high. The 1998 SEIR presented lateral spread as a hazard within several hundred feet of China Basin Channel. Due to the distance of the Site from from China Basin Channel (>2,000 feet), the lateral spread hazard identified in the 1998 SEIR would not have included blocks 29-32. This new hazard was not identified or acknowledged in the IS. A mitigation measure for the impact of lateral spread in the area between the proposed structure and San Francisco Bay was not presented in the IS or in the 2015 DSEIR.

B6. Page 88 under Settlement states "The Mission Bay FSEIR addressed settlement issues related to differential settlement of the underlying geologic materials that are relevant to the project site, but it did not address impacts related to settlement associated with excavation or dewatering.

However, these impacts would all be less than significant, as described below." As stated above in Section A10, high settlements may occur due to liquefaction and development of surface sand boils for which mitigation has not been provided.

B7. Page 90 third paragraph states: "In addition, noise and vibration concerns could limit the use of driven piles." The structure foundation mitigation measures specify the use of driven piles and no other foundation mitigation method alternative was provided.

B8. Page 98 under Mission Bay Plan Effects Related to Tsunami and Seiche. As stated in A6 above, the U.S. Army Corp of Engineers model is outdated and has been replaced with other modern methods of analysis.

B9. Page 103 under Inundation by Seiche or Tsunami. This section provides conflicting values. The older values from the FSEIR and newer values from the 2011 Tsunami Response Annex report by the City and County of San Francisco. It should be noted that on page 24 of the 2011 Tsunami Response Annex report states: "The map is intended for use as evacuation planning tools (Attachment B). The Tsunami run-up zone information are approximations due to limitations in modeling and baseline coastal data." The IS provides a tsunami and seiche run-up values of "approximately 6 feet" based on the 2011 Tsunami Response Annex report. Our review of the report indicates that that value is referenced to mean sea level. The 6 foot value does not account for diurnal high tides that may reach approximately 7 feet and sea level rise due to climatic change that may reach approximately 5 feet. To estimate Tsunami run-up elevations, the maximum run-up is calculated as a sum of the Tsunami run-up (6 feet), the tide level at the time of the Tsunami (may be as high as 7 feet) and sea level rise (may reach 5 feet). Not accounting for all the ocean level variables may cause a significant underestimation of Tsunami run-up.

B10. Page 104 under Inundation by Seiche or Tsunami. This section provides mitigation measures such as 1) Set Back, although no distance is given 2) Raise occupied portions, no elevation is given and 3) Tsunami Warning System, for hazards that were determined to be less than significant. If the hazard is less than significant, then mitigation measures would not be required. This presents an improper analysis by providing mitigation measures for an impact that was previously identified to be less than significant.

B11. Page 104 under Structures states: "Although some damage to the structures could occur, the improvements constructed under the proposed project would be resilient to tsunamis or seiches." A reference to the building code that provides design parameters for tsunamis resilient structure needs to be provided.

Summary of Review - 2014 the Notice of Preparation/Initial Study

The Notice of Preparation (NOP) of an Environmental Impact Report/Initial Study (IS), dated June 5, 2015 did not fully analyze the Tsunami hazard, relied on out dated methodology and failed to provide adequate mitigation measures for the area that is located in a State Tsunami Hazard Zone. The mitigation measures for Tsunami impacts provided in the IS were developed without performing a proper Tsunami hazard analysis. The IS failed to properly analyze, identify and address new or more severe significant effects. Recent Geotechnical reports (Langan 2014) identified new and significant impacts (lateral spread for example) that were not addressed in the IS.

The following section (C1 to C5) presents our comments based on a review of the Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015.

C1. Pages 1-47, Table 1-2 Summary of Impacts and Mitigation Measures, Hydrology and Water Quality list Impact HY-5 "The project would not expose people or structures to a significant risk of loss, injury or death involving inundation by seiche or tsunami" as LS or Less-Than-Significant Impact (no mitigation required). Portions of the site are located in a State Identified Tsunami Hazard Zone, furthermore as stated in A6 and B9 above, the Tsunami hazard has not been adequately analyzed using current standards. The designation of LS or Less-Than-Significant Impact (no mitigation required) conflicts with the IS listing Tsunami mitigation measures, see B10 above.

C2. Pages 1-59 to 1-60, Table 1-2 Summary of Impacts and Mitigation Measures, Geology and Soils lists Impacts GE-1 through GE-5 and C-GE-1 with significance determinations of LS or Less-Than-Significant Impact (no mitigation required). This is contrary to the findings, conclusions and recommendations found in previous geotechnical evaluations (Langan 2014 and Langan 2011). The Langan geotechnical evaluations identified numerous conditions at the site requiring mitigation measures. The items included excessive static and dynamic settlements, liquefaction including sand boils, lateral spread, intense ground motion, shallow groundwater and corrosive soils. The Langan 2011 report presented numerous mitigation measures requiring extensive ground improvement modifications, specialized foundation design, dewatering and excavation shoring.

C3. Page 5.9-29 states " … and flooding as a result of failure of a levee or dam; and inundation by seiche, tsunami, or mudflow (Impact HY-5). Therefore, no further analysis of these subjects is presented in this section." As stated in A6 above, the Tsunami hazard methodology presented in the 1998 SEIR is dated and requires and updated analysis and evaluation.

C4. Page 6-5 under Section 6.3 Effects Found Not to be Significant in the Geology and Soils states "The project would not expose people or structures to geologic hazards; cause soil erosion or loss of topsoil; be affected by the presence of unstable soils or geologic units; be affected by the presence of expansive soils or soils incapable of adequately supporting wastewater disposal systems; or cause a substantial change of topography." This is in conflict with the newly identified hazards (Lateral Spread) and inadequately analyzed hazards (liquefaction induced sand boils).

C5. Page 6-5 under Section 6.3 Effects Found Not to be Significant in the Hydrology and Water Quality states: "The project would not deplete groundwater supplies; alter drainage patterns, resulting in erosion; place housing and/or structures within a 100- year flood zone; expose people and structures to hazards associated with flooding, failure of a levee or dam, seiche, tsunami, or mudflow; or cause construction-related water quality impacts." The portions of the site are located in a State-Identified Tsunami Hazard Zone and as stated above in Section A6 and B9, the Tsunami hazard was evaluated in the 1998 SEIR and 2014 IS using dated and/or inappropriate methodologies.

Summary of Review - 2015 Draft Subsequent Environmental Impact Report

The Draft Subsequent Environmental Impact Report (SDEIR), dated June 5, 2015 did not fully analyze the Tsunami hazard, relied on out-dated methodology and failed to provide adequate mitigation for portion of the site that are in a State Tsunami Hazard Zone. The SDEIR failed to address and provide mitigation for newly identified significant hazards such as lateral spread. Much of the SDEIR relies on analysis from the IS and 1998 SEIR without fully addressing newly identified hazards, data gaps and the need to apply current methodologies to analyze project impacts.

Our review was limited to the Geology, Engineering Geology and Seismic related aspects as they relate to the development as described in the reports made available for review.

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with questions regarding the review comments presented this letter.

BSK Associates Engineers & Laboratories

Review - Mission Bay Subsequent Environmental Impact Report San Francisco, California	Figure 1 Tsunami Inundation Map

Martin B. Cline, CEG – Project Geologist

BSK Associates Engineers & Laboratories

Professional Background:

Mr. Cline has more than 28 years of experience in geology, engineering geology, petroleum geology and environmental field studies, including assessments for hillside grading, subsurface drainage design, and landslide repair and mitigation. As Project Geologist, his responsibilities include performing field investigations for geotechnical, geologic, and environmental studies. He has experience in planning and implementing geologic and geomorphic mapping and analyses of soil, bedrock and groundwater conditions as they pertain to engineering works. Mr. Cline's experience also includes construction observation and testing, and geotechnical laboratory testing. He has extensive project experience including Phase I and II environmental assessments for a wide variety of commercial and industrial properties, including wholesale/retail petroleum product outlets and heavy industrial sites. He also has extensive experience in the completion of CEQA Special Studies, as well as section preparation, for Environmental Impact Reports.

Relevant Project Experience:

Engineering Geology – Seismic Hazards Investigation Projects

Mr. Cline has expertise in the planning and implementation of geologic/seismic hazard investigations and development of seismic design criteria as they pertain to engineering works. Experience includes surface fault rupture investigations, deterministic/probabilistic site specific ground motion evaluations, site condition modeling, response spectra using time histories development, liquefaction, lateral spreading and seismic settlement analysis. Additionally, Mr. Cline has expertise in seismic hazards evaluations for Hospital and Schools according to OSHPD and DSA Title 24 specifications. Representative projects include:

- Geologic/Seismic Hazard Evaluation and time-history analysis, AT&T Central Office Seismic Upgrade, San Francisco, California
- Geotechnical Investigation/Liquefaction Analysis, AT&T Building Seismic Upgrade, San Francisco, California
- Geologic/Seismic Hazards Evaluation, Proposed Multi-Use Sports Complex, West Hills College, Lemoore, California
- Geologic/Seismic Hazards Evaluation, Proposed Wellness Center, West Hills College, Coalinga, California
- Geologic/Seismic Hazard Evaluation, College of the Sequoias, Tulare, California
- Geologic/Seismic Hazard Evaluation, Clovis Community Medical Center

Qualifications

Registration:

Professional Geologist, California, 6248
Certified Engineering Geologist California, 2084

Education:

BA, Geology, California State University, Chico, 1982

Experience:

BSK Associates 1988

1983 – 1988, SOHIO Petroleum Geologist

1980 – 1983, Exploration Logging Geologist

1982, ANATEC Laboratories

1977 – 1981, Graham Gas Geologist

Clovis, California
- Seismic Hazards Update HAZUS Reclassification, Kern Medical Center, Bakersfield, California
- Geologic/Seismic Hazard Investigation, Woman's Health - Adventist Hospital, Hanford, California
- Geologic/Seismic Hazard Investigation, State Courthouse, Madera, California
- Surface Fault Rupture Hazard, Commercial Development, Fremont, California
- Surface Fault Rupture Hazard, Service Station, San Leandro, California
- Surface Fault Rupture Hazard, Public Library, Frazier Park, California
- Surface Fault Rupture Hazard, USFS Visitors Center, Lone Pine, California
- Surface Fault Rupture Hazard, New Fire Station, Pine Mountain, California
- Surface Fault Rupture Hazard, New Hospital Site, Tehachapi, California
- CEQA Level Geohazards Investigation, Solar Farm, Mohave, California
- Fault Evaluation Report Peer Review, Kern County, California
- Fault Evaluation Report Peer Review, City of Bakersfield, California
- Fault Evaluation Report Peer Review, Inyo County, California
- CEQA Level Geohazards Investigation Peer Review, Kern County, California
- Slope Stability and Erosion Evaluation, Petroleum Pipeline Crossing, Kern County, California

Environmental Engineering Projects

Soil and Groundwater Remediation **-** Projects have included feasibility studies, system design, application for permits, remedial action oversight for clean-up of petroleum and heavy metals using in-situ treatment and excavation and disposal, and post closure monitoring. Projects of this nature include:

- Remedial Investigation/Feasibility Study-UST Site, Stockton, California
- Remedial Investigation for Seepage Pits - Visalia, California
- Well Design and Installation of a 3-Stage Monitoring Well - NASA Ames Research Center, Moffett Field, California
- Feasibility Study for former Service Station - Castro Valley, California
- Remedial Investigation for Foundry Site - Union City, California
- Feasibility Study for Pump and Treat Design, Tracy Army Depot, Tracy, California
- Operation and Maintenance, Dual Phase Vapor Extraction, Truck Stop, Dunnigan, California
- Remedial Investigation for Former Trucking Facility, Carson, California

Environmental Assessment Studies - Mr. Cline has expertise in the planning of field operations, sampling and analysis plans, workplan preparation, monitoring well design and construction, site assessment (Phase I and II), regulatory compliance, contaminant mobility and plume characteristics determinations, data acquisition and interpretation, and development of remedial action plans.

He has worked on sites impacted with petroleum, solvent and/or heavy metal contamination. Projects of this nature include:

- UST Assessment Service Station in Castro Valley, California
- UST Assessment for the City of Livermore, Livermore, California
- UST Assessment Trucking Facility in Sunnyvale, California
- UST Assessment Food Processing Plant in Stockton, California
- UST Assessment Trucking Facility in Sacramento, California
- UST Assessment Moving and Storage Facility in Fairfield, California
- UST Assessments Numerous Service Stations in Sacramento, California
- Jet Fuel Release Assessment, NASA-Ames Research Center, Moffett Field, California
- Phase I ESA, City of Pittsburg Redevelopment Agency, Pittsburg, California
- Phase I ESA, California Department of Water Resources - 60 acre site, Hood, California.
- Phase I ESA, Multi-unit Retirement Community in Fairfield, California
- Phase II ESA, Chrome Plating Facility, Oakland, California
- Phase II ESA, Future Elementary School Site, Dublin, California
- Phase I/II ESA, Future Elementary School Site, Empire, California
- Phase II ESA, Foundry Sand Deposition Site, Newark, California
- Phase I ESA, Fertilizer Distribution Facility, Lathrop, California
- Phase I ESA, Fertilizer Distribution Facility, Maxwell, California

Geographic Information Systems (GIS) Experience

Mr. Cline has expertise using GIS to evaluate and process data from numerous sources including AutoCAD, GPS and LiDAR data. Experienced with ESRI ArcMap, ACOE's HEC-RAS, HEC-GeoRAS, LASTools and ArcHydro.

GIS Project Experience:

500 Acre Solar Farm, Mohave, CA - CEQA Level Preliminary Geohazards Investigation for proposed construction of future photovoltaic systems in Mohave, California.

Solar Farm and Aquifer Restoration, Fremont Valley, CA - CEQA Level Preliminary Geohazards Investigation for proposed construction of a 4,800 acre photovoltaic system, included analysis of 37 miles of water lines and 98 miles of transmission lines in Fremont Valley, California.

Putah Creek Restoration Plan, Yolo County, CA*:* Developed supporting documents using GIS for permitting and design of a 2 mile-long watershed restoration project on Putah Creek for the City of Winters and the Putah Streamkeeper.

Lower Putah Creek Restoration Project, Solano and Yolo Counties, CA – BSK provided support activities related to the determination of ordinary high water mark and wetland delineation. Mr. Cline utilized

Martin B. Cline, C.E.G. – Project Geologist

LiDAR to develop a Digital Elevation Model (DEM) for 21 linear miles of Putah Creek for USACE NWP-27 and for a Regional General Permit.

Cache Creek Plans, Yolo County, CA – Provided GIS support. LiDAR vegetation analysis for patch and trajectory modeling, as well as channel migration studies, to technical advisors for approximately 19.5 miles of restoration planning for the Cache Creek Yolo County Resource Management Planning Area.

BSK

Kurt Balasek, PG, CHG, QSD – Senior Hydrogeologist

BSK Associates Engineers & Laboratories

Professional Background:

Mr. Balasek is the Sacramento Senior Hydrogeologist for BSK. He has more than 25 years experience providing geologic, hydrogeologic and environmental consulting to western U.S. businesses and government agencies. His experience includes managing teams of scientists and engineers on projects ranging from large-scale brownfield developments, CEQA compliance and groundwater studies. He has provided project management of water resource evaluations and conjunctive use studies, as well as numerous petroleum hydrocarbon-related groundwater contamination investigations and remedial designs. Mr. Balasek has completed geologic hazard studies for proposed school sites in accordance with the Office of State Architect requirements and has completed detailed geologic surface mapping assignments in the foothills of the Sierra Nevada.

Mr. Balasek has spent his career working to evaluate hundreds of properties for the purposes of development, redevelopment and preservation as conservation easements. Conducting or leading these evaluations has given Mr. Balasek vast experience preparing site investigation strategies with an emphasis toward negotiating with regulatory agencies regarding future land use. Mr. Balasek has worked with redevelopment teams in numerous northern California cities and extensively under EPA community-wide assessment grants in the Cities of West Sacramento, Esparto, and Rancho Cordova. He has worked with local, State, and Federal agencies in evaluating a wide range of environmental contaminated and lighted, assessing community needs, and using tools to develop site cleanup goals. His skills of using land use covenants and maintenance tools provides for blighted property that have led to showcases community revitalization efforts. Mr. Balasek has completed numerous landfill characterization studies and provided detailed analysis to assist in consolidation and clean closure decision making.

Representative Project Experience:

City of Rancho Cordova, California, Community Redevelopment Agency, Brownfield Assessments-Mr. Balasek provided senior management oversight on a community-wide assessment of over 460 properties in Rancho Cordova, California. Approximately 30 parcels warranting Phase I and/or Phase II Environmental Site Assessments (ESAs) were identified. To date, a Phase I and II ESA were conducted on two parcels of a planned community college campus.

Qualifications

Registrations:

Certified Hydrogeologist, California, No. 299

Education:

MS, Hydrogeology, California State University, Chico 1989

BA, Geology. University of California, Santa Barbara, 1985

Experience:

BSK Associates 2009

1991-2009, Wallace-Kuhl Director of Environmental Services

1989 – 1991 Terrestrial Tech. Senior Staff Hydrogeologist

Putah Creek Park North Bank Improvement Project, California-The North Bank Improvement Project stemmed from a federal appropriation of 2 million dollars to enhance the Solano County Transportation Department's automobile bridge replacement at the City of Winters. The project funds are administered by **CalTrans** so extensive coordination with this agency regarding project description and permitting has been a substantial portion of this project. The project was developed by the City of Winters. Mr. Balasek and his team were initially tasked with obtaining the biological opinion for mitigation as it related to disturbance of Valley Elderberry shrubs. Instead of purchasing mitigation credits from a Service-approved mitigation bank, Mr. Balasek and his staff devises a unique plan to develop a small on-site mitigation area within the Winters Putah Creek Nature Park. If approved, the mitigation area will provide enough mitigation credits to offset the Solano County Bridge project, the north bank improvement project and a proposed pedestrian bridge. Money will be set aside for maintenance of the mitigation area in perpetuity but will enable the project proponents to mitigate habitat damage locally and keep local control of the money. To develop this plan, Mr. Balasek and his team developed the financial model to predict the amount of money required to establish a non-wasting endowment. This model was submitted to USFWS and is undergoing review. U.S. Representative Mike Thompson and his staff are involved in the project and are assisting with negotiations with USFWS.

Winters Putah Creek Park Revised Master Plan CEQA Support- Winters, California-Mr. Balasek and his team prepared the Initial Study/Mitigated Negative Declaration (IS/MND) based on the revised master plan for Winters Putah Creek Park. This document was compiled in advance of implementing several projects outlined in the park master plan. The document was reviewed by the Winters City Council and adopted by the Winters planning commission without comment by the trustee agencies and with only one comment from the public. The document framed the foundation for environmental permitting for all of the following restoration-related projects.

City of West Sacramento, Housing and Community Investment Division, West Sacramento, California- Mr. Balasek has managed several Environmental Projects for the City of West Sacramento, including: West Capitol Corridor Study, 427 "C" Street, Tower Court, Sacramento Generator, and Vlad's Toyota.

City of Winters PG&E Training Center, Winters California-During critical property negotiations, due diligence studies revealed the historic presence of an underground fuel storage tank. Me. Balasek we retained by the City on an emergency basis to advise City Council and staff. Mr. Balasek mobilized BSK resources and conducted a comprehensive, soil, groundwater and soil vapor investigation on the site. Mr. Balasek also advised the City throughout the project and represented the City in numerous negotiations with PG&E. As a result of a well planned and executed investigation, a $70 million state-of-the-art training facility project is moving through the CEQA process and is scheduled to break ground late in 2015. This project is a huge success for the small City of Winters and will act as a catalyst for a downtown hotel project. Mr. Balasek's work in the field and at the negotiating table were a key part of the success of this project.

Stockton Worknet Center, Stockton, California-Provided project management for a contaminated site. The site characterization and remediation was funded by a State of California Brownfield Grant. The source of contamination was determined to have come from a pipeline located under railroad tracks. Removal and backfill of soil from an excavation that was 35 feet wide by 400 feet long was completed prior to construction of the new center.

River City Baseball – River Cats Stadium, West Sacramento, California-The site was located adjacent to a chemical mixing plant and as part of the owner's due diligence an environmental assessment was conducted. Contamination of volatile organics was determined and remediation followed. Based on these findings the foundation design was also adjusted to accommodate shallow groundwater. Based on Mr. Balasek's recommendation, Gorsorb™, a passive form of soil vapor testing, was used to delineate the contamination. A Risk Assessment report was provided to determine if the level of contamination exposure based on the properties intended use. All this work was completed at an accelerated pace to facilitate construction.

Colusa County, Three UST Sites, Colusa, California-Underground storage tanks at the County Sheriff's Department, Central Services, and County Jail were removed soil and water samples were tested for contamination. As project manager, Mr. Balasek managed the team who provided soil excavation and shallow groundwater monitoring for petroleum hydrocarbons. The three projects took place concurrently resulting in a cost savings to the county.

Sacramento International Airport Terminal Construction, Sacramento, California-Mr. Balasek and his team installed monitoring wells and conducted aquifer performance tests in advance of massive dewatering efforts to facilitated construction at the new Sacramento International Airport Terminal project. Data developed from this study was used to quantify discharge volumes and evaluate water quality. The data was subsequently used as the basis for dewatering design related to a large basement structure extending approximately 17 feet below grade for the entire terminal building as well as subterranean tunnel structures. The new Sacramento Terminal opened in the fall of 2011.

Yolo Ranch Agricultural Landfill Remediation, Yolo County, California-Provided project management and oversight during landfill excavation and remediation. This project involved careful coordination with regulatory personnel from the Illegal Abandoned Landfill Group at the former California Integrated Waste Management Board to remove and/or encapsulate a wide range of ag-related waste in the Yolo ByPass. The work involved remediation and subsequent site closure of an agricultural landfill adjacent to sensitive natural habitats. This work was done as part of a property transaction and demonstrated creative problem solving that included an on-site solution which saved the client tens of thousands of dollars.

Kurt M. Balasek, PG, CHG, QSD– Senior Hydrogeologist

Butte County, California-Mr. Balasek and his team conducted the base-line hydrogeologic analysis of the site vicinity in support of the gravel mining permit application submitted to Butte County. Mr. Balasek's team also conducted the slope stability evaluations for the propose mine. Both technical documents were used to support an EIR commissioned by Butte County on behalf of the project proponent. In addition, Mr. Balasek's team provided consultation on pit capture and anadromous fish entrapment if high water resulted in overtopping of the pit. The work also involved analyzing resource data to identify the bottom of economically recoverable resource.

Cold Spring Rancheria, Tollhouse, California-Mr. Balasek oversaw the preparation of a comprehensive long range water development program for the Cold Springs Rancheria. This program examined available surface and groundwater resources, outlined potential problems with existing infrastructure and water rights and prioritize projects for improvement. Mr. Balasek and his staff also prepared a revised Quality Assurance Assessment Plan (QAAP) for the Rancheria that outlined procedures for all field sampling activities. These plans were funded by the Bureau of Indian Affairs and are required planning documents in advance of project implementation funding.

Memo

To: Patrick Soluri, Attorney at Law

From: Philip King, Ph.D.

Re: Urban Decay Analysis of Proposed Relocation of Golden State Warriors from Oakland to San Francisco

Upon your request I examined the Environmental Review[1] prepared in conjunction for the proposed relocation of the NBA franchise Golden State Warriors from Oracle Arena in Oakland to San Francisco. The project description for the AB900 Application included significantly reduced events at Oracle Arena in order to take advantage of GHG reductions. However, the project's EIR took an inconsistent approach to the scope of the project, and did not analyze the potential for urban decay resulting from these significant event reductions, which has been recognized as an environmental impact that should be analyzed under the California Environmental Quality Act (CEQA).

My analysis (Table A below and described in more detail in this memo) indicates that the move from Oakland to San Francisco would lead to a direct loss of $44.9 million and 494 jobs. When one also includes the indirect and induced impacts, this impact increases to $86.6 million and 805 jobs.

Although Oakland has benefited from the recent economic recovery, it's well known that the City suffers from high crime rates as well as high levels of blight and urban decay. Indeed, the Oracle Arena is located in a former Redevelopment Area (RDA) that the City declared blighted. Removing these jobs and this economic activity will exacerbate existing urban decay and seriously impact the City's ability to respond to this decay.

[1] See Application for Environmental Leadership Development Project Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 ("AB900 Application").

Table A: Economic Impact of the Golden State Warriors in Alameda County

Economic Impact in Alameda County

Impact Type	Employment	Labor Income	Output
Direct Effect	494.3	$28,490,621	$43,900,000
Indirect Effect	110.8	$6,084,031	$13,153,869
Induced Effect	200.6	$10,746,179	$29,546,005
Total Effect	**805.6**	**$45,320,831**	**$86,599,874**

The Economics of Moving a Basketball Team

A convenient starting point to examine the economic impact of the Golden State Warriors' relocation to San Francisco from Oakland is the Seattle Supersonics' relocation to Oklahoma City. An economic report prepared in conjunction with the move indicated that the departure of the team would result in the loss of 1,200 – 1,300 jobs and $188 million in economic activity, slightly larger than the $170 million that the City of Oklahoma projected it would gain from the arrival of the team. Contrary to both of these projections, a sports economist for the Supersonics testified to the broad consensus within the economics literature that the departure or arrival of a professional sports team has no significant economic impact whatsoever upon the larger metropolitan area as a whole. When pressed by the city's legal team, this economist did, however, concede that the arrival, departure or relocation of a professional sports team can have a measureable effect upon the *distribution* of economic activity within the larger metropolitan area.[2]

There are two primary reasons given within the sports economics literature for why the presence of a professional sports team within a metropolitan area has no significant economic impact: substitution and leakage.

> "Promotional impact studies ignore or underestimate the effects of consumer substitution and leakages from the local economy connected to sports facilities… These studies rely largely on the assumption that all (or much of the) spending on sports teams is new to the local economy and that this spending has a similar effect on the local economy as spending on other consumption goods and services. Both of these assumptions are false." [3]

When a sports team relocates to a city, the money that is spent at its games does not come from outside the metropolitan area, but instead generally comes from money that is already being spent on leisure activity within that same metropolitan area. Similarly, when the team departs, the money that was previously being spent at the games will

[2] http://sports.espn.go.com/nba/news/story?id=3452509
http://www.seattletimes.com/sports/nba/sonics-argue-team-has-little-economic-impact-on-seattle/
http://www.forbes.com/2008/06/25/seattle-supersonics-nba-biz-sports-cx_mw_0625seattle.html
[3] Siegfried, John and Zimbalist, Andrew, "A Note on the Local Economic Impact of Sports Expenditures" Journal of Sports Economics, Vol. 3 No. 4, November 2002, 361-366, http://web.centre.edu/johnsonb/eco406/Apr%2021/seigfried.pdf

now be spent on other leisurely activities within the same area. The amount of money that people spend on leisurely activity is relatively fixed and spending at a sports venue only comes as a substitute for and thus at the expense other venues within the area. "The net effect on spending within the metropolitan area then is zero, or very close to zero. While sports teams may rearrange the spending and economic activity in an urban area, they are not likely to add much to it." [4]

In addition to the high degree of substitution associated with spending on professional sports, a high degree of economic leakage is also cited as a reason for the low impact that a professional sports team has upon a metropolitan area. The professional sports industry involves almost always involves the large transfer of money from local spectators to highly paid athletes and investors whose households typically do not reside and thus do not frequent businesses within the same metropolitan area. This outward flow of money typically cancels out whatever economic activity the team might bring from outside the metropolitan area.

The high degrees of economic substitution and leakage associated with the professional sports industry are responsible for the negligible economic impact that results from the relocation of a professional team from one metropolitan to another. **However, the same cannot be said for the relocation of a professional sports team within the same metropolitan area as in the case of the Golden State Warriors.**

> "Even though it is difficult to justify new stadium construction on economic growth grounds, it is possible that such construction would facilitate efforts to redevelop an urban core… [I]t is possible for sports facilities to reposition economic activity within a metropolitan area." [5]

Since the Warriors are relocating *within* the larger San Francisco/Oakland metropolitan area we can reasonably assume both substitution and leakage will remain constant before and after the move. Whereas we could not say that Oklahoma City was taking economic activity from the City of Seattle since the same fans would no longer be attending Supersonic games, we can, however, say that the City of San Francisco will take economic activity from the City of Oakland since the same fans will continue to attend Warriors games.

[4] Siegfried, John and Zimbalist, Andrew, "The Economics of Sports Facilities and Their Communities", The Journal of Economic Perspectives, Vol. 14, No. 3, (Summer 2000), 95-114, http://www.csus.edu/indiv/h/howellj/econ145_s2009/Assignments/SportsStadiumFunding.pdf See also: http://www.forbes.com/2008/06/25/seattle-supersonics-nba-biz-sports-cx_mw_0625seattle.html

[5] Siegfried, John and Zimbalist, Andrew, "The Economics of Sports Facilities and Their Communities", The Journal of Economic Perspectives, Vol. 14, No. 3, (Summer 2000), 95-114, http://www.csus.edu/indiv/h/howellj/econ145_s2009/Assignments/SportsStadiumFunding.pdf

Reversing Directions across the Bay Bridge

After the relocation of the Warriors from Oakland to San Francisco, spectators from the East Bay will then choose between finding a local substitute within the East Bay and traveling to the West Bay to watch the Warriors games. While it is the case that leisured spending has a high substitution effect over a large community such as a metropolitan area, the same cannot be said for more narrowly deigned areas, such as the East Bay industrial area.

> "A stadium or arena will have more added effects on a very narrowly defined community than on a largely encompassing community. The reason for this is that the more narrowly the host community is defined, the more of the spending at the stadium and the nearby restaurants, bars, and hotels will come from outside the community. However, that spending will come largely at the expense of the home communities of the fans that travel into the stadium from outlying areas. The substitution effect for the broadly defined area is quite large, but for the narrowly defined stadium community it is much smaller. What this points out is that stadiums and sports teams may be a tool for redistributing income in which the people from suburbs subsidize businesses in the city."[6]

Consequently, we can expect that most Warriors fans will continue attending games after the relocation rather than seeking local substitutes. The relocation of the Warriors, then, constitutes a significant redistribution of economic activity within the larger Bay Area.

During the Warriors' 2014/15 season 803,436 fans attended home games in Oakland (34% more than the Supersonic their last season in Seattle) and took in $168 million dollars in total revenue.[7] Table 1 (below) shows that, assuming that the distribution of Warriors spectators is proportionate to the distribution of residents within the larger metropolitan area, $99 million in Warriors revenue came from the East Bay while $69 million came from San Francisco and the Peninsula. It is worth emphasizing, however, that the Warriors relocation to San Francisco does not merely entail that the $69 million will cease coming into the East Bay from the West, but that the additional $99 million that was being spent by local East Bay residents will be lost to San Francisco. Spending in Oakland will decrease by $168 million regardless of where the fans actually reside.

[6] Coates, Dennis and Humphreys, Brad R., "The Stadium Gambit and Local Economic Development" Regulation, Volume 23, No. 2, July 2000, 15-20, http://object.cato.org/sites/cato.org/files/serials/files/regulation/2000/7/coates.pdf

[7] http://www.forbes.com/teams/golden-state-warriors/ http://www.census.gov/popest/data/counties/totals/2013/CO-EST2013-01.html

Table 1. Attendance and Revenue for Warriors' 2014/15 Season

Attendance and Revenue for Golden State Warriors Home Games (2014/15 Reg. Season)			
	Total	East Bay (59%)	West Bay (41%)
Attendance	803,436	475,538	327,898
Spending	$168,000,000	$99,435,935	$68,564,065

Leakage

In the last section we discussed where the money that is spent on Warriors games comes from within the larger Bay Area. In this section we will briefly consider where the money goes after these games, as well as the effect of economic leakage.

Table 2. The Redistribution of Economic Activity due to the Warriors' Relocation

The Redistribution of Economic Activity due to the Golden State Warriors' Relocation			
	Total (millions)	**Percent**	**Redistributed** (millions)
Operating Income:	$44.9	0%	$0.0
Players' Salary:	$78.0	10%	$7.8
Other Expenses:	$45.1	80%	$36.1
Total:	**$168.0**	**26%**	**$43.9**

Table 2 (above) divides up the Warriors' $168 million in total revenue into three categories: operating income, players' salary and other expenses. $44.9 million in operating income is the money that goes to the owners and investors of the Warriors. Since we have little reason to assume that these people live within the larger metropolitan area, let alone the East Bay, we can assume that relocating the team will not redistribute this money to any significant degree. Similarly, only 29% of NBA players live within the same larger metropolitan area as the team they play for[8]. We can also expect a large amount of the $78.0 in Warriors players' salary to be spent outside of, and thus "leak" from the larger San Francisco/Oakland metropolitan area leaving 10%, or $7.8 million to be redistributed within the Bay Area. This leaves $45.1 million that went to other expenses (wages, inventory, etc.) during the 2014/15 season. We assume that 80%, or $36.1 million, was spent within the larger metropolitan area.

[8] Siegfried, John and Zimbalist, Andrew, "A Note on the Local Economic Impact of Sports Expenditures" Journal of Sports Economics, Vol. 3 No. 4, November 2002, 361-366, http://web.centre.edu/johnsonb/eco406/Apr%2021/seigfried.pdf

While $168 million was spent by fans within the Bay Area on Warriors games, we estimate that only 26% or $43.9 million stayed within the area. It is this $43.9 million that will be redistributed from the Easy Bay to the West with the Warriors' relocation. Table 3 (below) lists the most popular professions among the 3,432 Bay Area residents that are employed within the sports spectator industry and gives a general idea regarding how a professional sports team such as the Warriors spend their money[9].

Table 3. Occupations within the Sports Spectator Industry

Employed	Sports Spectator Industry within the San Francisco/Oakland Metropolitan Area	Hourly Wage	Annual Salary
878	Personal Care and Service Occupations	$12.06	$25,080
572	Arts, Design, Entertainment, Sports, and Media Occupations	$31.60	$65,730
559	Entertainment Attendants and Related Workers	$11.32	$23,540
455	Entertainers and Performers, Sports and Related Workers	$33.10	$68,850
402	Athletes, Coaches, Umpires, and Related Workers	*	$72,060
324	Sales and Related Occupations	$15.70	$32,660
285	Office and Administrative Support Occupations	$16.91	$35,170
258	Protective Service Occupations	$15.76	$32,790
251	Food Preparation and Serving Related Occupations	$10.28	$21,380
243	Other Protective Service Workers	$15.26	$31,730
243	Animal Care and Service Workers	$12.49	$25,980
233	Ushers, Lobby Attendants, and Ticket Takers	$10.21	$21,230
3,432	**Industry Total**	**$20.45**	**$42,540**

Economic Impact

In addition to the direct loss of $43.9 million in economic activity to the City of Oakland, there are also indirect and induced effects which are associated with this loss. However, in addition to this direct spending, there are indirect and induced impacts, often referred to as "multiplier effects" –since arena and team spending also generate other jobs and economic activities in the region, and without the Warriors' spending other economic sectors of the Alameda County would shrink as well.

IMPLAN is standard Input/Output software specifically design to project the indirect and induced multiplier effects associated with the Warriors' direct spending in Alameda County. Table 4 (below) lists the economic impact of the Golden State Warriors within Alameda County by impact type. With indirect and induced impacts included, the Warriors generate 805 jobs and $86.6 million in economic activity. Table 5 (below) lists 10 most impacted industries within the county. In addition to the 547 jobs and $48.6 million in economic activity created within spectator sports industry, food and drinking

[9] http://www.bls.gov/opub/ted/2014/ted_20140131.htm

places, real estate establishments, private hospitals and other physicians are significantly affected by the East Bay presence of the Warriors.

Table 4. Economic Impact of the Golden State Warriors in Alameda County

Economic Impact in Alameda County

Impact Type	Employment	Labor Income	Output
Direct Effect	494.3	$28,490,621	$43,900,000
Indirect Effect	110.8	$6,084,031	$13,153,869
Induced Effect	200.6	$10,746,179	$29,546,005
Total Effect	**805.6**	**$45,320,831**	**$86,599,874**

Table 5. Industries in Alameda County Impacted by the Golden State Warriors

Industries in Alameda County Impacted by the Golden State Warriors

Description	Employment	Labor Income	Output
Spectator sports companies	547.3	$31,541,779	$48,601,401
Food services and drinking places	25	$617,563	$1,701,992
Real estate establishments	13.1	$299,013	$2,820,104
Promoters and agents for public figures	12.9	$133,694	$717,837
Private hospitals	11.6	$1,363,445	$2,336,587
Physicians and other health practitioners	10.4	$886,704	$1,498,858
Employment services	7.2	$287,482	$370,425
Retail Stores - Food and beverage	7.2	$290,137	$520,763
Nursing and residential care facilities	6.5	$274,706	$490,435
Private household operations	6.5	$77,727	$82,572
All Industries	**805.6**	**$45,320,831**	**$86,599,874**

Urban Decay

Although the EIR ignores the issue in the context of urban decay impacts, the EIR and AB900 Application conclude that that Oracle Arena will continue to operate with approximately 21 events per year. This is an impractical assumption from an economic perspective. As a practical matter, one of two outcomes will occur. The first possible outcome is that the Oracle Arena will continue to operate by attracting more than 21 non-NBA events per year.

The second possible outcome is that Oracle Arena will close without the Golden State Warriors. I spoke with Alexander Michael, an expert on the business and financing of

sporting arenas. Based on that information, a strong argument exists that the Oracle Arena (or indeed any similar venue in a similar situation) will not be viable without the Golden State Warriors and there are no other sports teams in the offing for this venue. A similar case is the IZOD center located in East Rutherford, New Jersey. The IZOD center housed the New Jersey Devils hockey team Nets NBA basketball team until they left in 2007. The IZOD arena also hosted the New Jersey Nets basketball team, who left in 2010. The State of New Jersey attempted to keep the Izod arena open for many years. However, the demand for other events such as concerts, ice shows, etc., was insufficient. As with the Oracle arena in Oakland, the Izod arena is located near a number of other sports venues and near Manhattan, which offers a wide variety of venues. The Izod arena shutdown earlier this year after an official forecast that the center would lose $8.5 million a year.[10]

It is difficult to determine which outcome is more likely since the EIR ignored the issue of potential urban decay associated with reduced events at Oracle Arena. The EIR should have included an economic impacts analysis that would have provided more information about the ultimate fate of Oracle Arena and, by extension, impacts to the physical environment.

Once the Oracle arena has been shutdown, it would be extremely difficult and expensive to repurpose the arena for other activities and thus it will almost certainly be shuttered and perhaps demolished at some future date. A closed arena will be a magnet for graffiti, crime, drug deals and other signs of urban decay. The City of Oakland can mitigate for this urban decay, but it would involve a costly increase in police and other public safety officials.

The City of Oakland and Alameda County are obligated to a $79.7 million dollar Lease Revenue Bond that must be paid or default. Without revenues from the Oracle Arena the bond would either go into default or the City/County would have to pay the principal and interest on the bond. If the City County pay out of their General Fund dollars, it will reduce their ability to fund other needed public services. If the default it could damage their credit rating and make it more difficult to finance other future (non-sports) projects which could enhance the welfare of the City and County

Oakland was rated the third most dangerous City in the Country in 2012.[11] According to the FBI, Oakland had the highest crime rate of any major City in California[12] and this year (2015) homicides in Oakland are on track to exceed 2014.[13]

[10] See http://www.nytimes.com/2015/01/16/nyregion/deserted-by-devils-nets-and-profits-izod-center-in-north-jersey-is-to-close.html?_r=0.

The City declared the area blighted and formed a redevelopment area (see Figure 1 below). Although Redevelopment Areas have been disbanded, the blight issues remain. Indeed, the suspension of RDAs eliminates a funding stream for the City to help ameliorate urban decay and blight.

The reduction in economic activity also significantly reduces the tax base for the City that reduces its ability to mitigate for urban decay and provide police and other public safety officials.

In my professional opinion, this issue (urban decay) should have been identified in any environmental analysis and mitigated where possible. A number of mitigation options are available including: (1) paying a mitigation fee to the City of Oakland, (2) preserving some of the jobs for Oakland residents; (3) shifting some of the taxes/fees to the City of Oakland. Without any kind of urban decay analysis none of these mitigation options are possible.

Re: **Air Quality Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 19, 2015, letter report authored by Greg Gilbert (attached as Exhibit 1) and the July 20, 2015, letter report authored by Paul Rosenfeld and Jessie Jaeger (attached as Exhibit 2).

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to Air Quality Impacts.

A. Dust: the DSEIR's impact assessment for construction-related dust pollution is based on legal errors and not supported by substantial evidence.

Regarding dust pollution, the DSEIR states:

> The site-specific Dust Control Plan would require the project sponsor to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of

> wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project sponsor would be required to designate an individual to monitor compliance with these dust control requirements.

(DSEIR, p. 5.4-30.)

The Dust Control Plan is either part of the project description, or a mitigation measure, or both. Either way, what the Project Sponsor is actually going to do to control dust - on the ground - must be described. Otherwise, the DSEIR violates CEQA.

If the Dust Control Plan is part of the project description, the DSEIR fails to present a complete project description, making it impossible for the public or other agencies to comment on the potential environmental impacts of this part of the project.

If the Dust Control Plan is a mitigation measure, the DSEIR defers the development of this mitigation measure until after Project approval, without meeting CEQA requirements for doing so, because (1) Article 22 B specifies a suite of measures but does not require the adoption of any in particular, (2) the DSEIR does not specify a performance standard by which the success of the Dust Control Plan can be judged, and (3) there is no evidence it is impracticable to develop and include the Dust Control Plan in the DSEIR, before project approval. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*CBE*); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

Also, by failing to identify the Dust Control Plan as a CEQA mitigation measure, the DSEIR throws the enforceability of the Plan under CEQA into doubt. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope..."].)

B. Criteria air pollutants: the DSEIR's impact assessment for construction and operational criteria air pollutants is based on legal errors and not supported by substantial evidence.

1. The City cannot use the DSEIR's thresholds of significance for criteria air pollutants until it formally adopts them in a rule--making procedure.

The DSEIR's thresholds of significance are:

> For the impacts analyzed in this section, the project would have a significant impact related to air quality if it were to:
> ● Conflict with or obstruct implementation of the applicable air quality plan;
> ● Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
> ● Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
> ● Expose sensitive receptors to substantial pollutant concentrations; or
> ● Result in a cumulative air quality impact in combination with past, present and reasonably foreseeable future projects in the vicinity.

(DSEIR 5.4-23.)

For criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the Bay Area Air Quality Management District ("BAAQMD") for ROG (54 lbs/day); NOx (54 lbs/day); Exhaust PM10 (82 lbs/day); Exhaust PM2.5 (54 lbs/day).

> The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NOx, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day). These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

(DSEIR p. 5.4-25; see also p. 5.4-31.)

The City uses these numerical thresholds of significance for virtually all land use development projects in the city that require CEQA review. This is shown by the following sample of excerpts from recent Environmental Impacts Reports and Negative Declarations attached hereto as Exhibits 4 through 16. All of them use the BAAQMD numbers as the thresholds of significance for these pollutants.

Therefore, the City is required to undertake its own rule-making proceeding to adopt these thresholds as its own and determine in a public process that they are supported by substantial evidence.

> (b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence.
> (c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

(CEQA Guideline, § 15064.7.) Since the City has not formally adopted the air quality significance thresholds in a public process supported by substantial evidence, it cannot use these thresholds on an ad hoc basis as it has done in this EIR.

2. The DSEIR's numerical thresholds of significance for criteria pollutants (ozone precursors, PM10, PM2.5) borrowed from the BAAQMD are invalid.

As noted above, for its impact assessment and mitigation strategy for criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the BAAQMD. But the DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.

The result of using these thresholds is a deeply misleading impact assessment and mitigation strategy because using these invalid thresholds allows the DSEIR to avoid finding impacts are significant, and it allows the DSEIR to understate the severity of impacts deemed "significant" because it implies that most of the quantity of emissions below the thresholds are not "significant." Also, using these invalid thresholds underestimates the degree of mitigation required to reduce significant impacts to less then significant, and therefore, the DSEIR curtails its consideration of the feasibility of additional mitigation measures that could further substantially reduce emissions.

The numerical thresholds borrowed from the BAAQMD are logically and legally invalid, and

they are not supported by substantial evidence. The thresholds are contained in the BAAQMD's "CEQA Air Quality Guidelines."[1] But neither the DSEIR or the BAAQMD CEQA Air Quality Guidelines describe any evidence that might support the use of these thresholds. The same is true of BAAQMD's other publications relating to these thresholds, i.e., Appendix D of the BAAQMD CEQA Air Quality Guidelines, BAAQMD's Revised Draft Options and Justification Report, (October 2009), and the Bay Area AQMD Proposed Air Quality CEQA Thresholds of Significance, published May 3, 2010.

While these BAAQMD publications purport to include substantial evidence supporting the use of these thresholds for all criteria air pollutants for which the Bay Area is in non-attainment, they do not. Instead, the BAAQMD CEQA Air Quality Guidelines merely provide policy rationales for why it is a good idea to have thresholds of significance. Nowhere does the document actually provide evidence for why any number of pounds per day below, for example, 54 for NOx or ROG, is not "cumulatively considerable."

The BAAQMD's Revised Draft Options and Justification Report (October 2009) states the thresholds "are based on the trigger levels for the federal New Source Review (NSR) Program and BAAQMD's Regulation 2, Rule 2 for new or modified sources." (See page 2.) These New Source Review Program rules provides that any new source that will emit pollutants above the levels stated in the left hand column of Table 4 (e.g., 10 lbs/day of NOx and ROG) must impose "Best Available Control Technology ("BACT")." (Id. pp. 16-17.) These rules also provide that any new source emitting pollutants above the levels stated in the right hand column of Table 4 (e.g., 54 lbs/day of NOx and ROG) must offset all emissions. (Id. pp. 16-17.)

In addition to the inherent flaws in the NSR rules described above, it is inappropriate to base the EIR's significance determination for purposes of CEQA on the Air District's "triggers" for an entirely different regulatory program, i.e., New Source Review under the Clean Air Act ("CAA").[2] One of CEQA key purposes is to require "disclosure" of significant impact, and it allows agencies to approve projects where emissions exceed its thresholds of significance after feasible mitigations are first adopted and as long as the project's benefits outweigh the environmental harm. The CAA, in contrast, is not primarily concerned with public disclosure, and it provides absolute limits on emissions (i.e., the offset triggers in Table 4) that cannot be exceeded under any circumstances. A

[1] The BAAQMD CEQA Air Quality Guidelines were published May 2010, and updated May 3, 2011.

[2] The CAA establishes health-based ambient air quality standards and ranks air districts nationwide based on their level of attainment of those standards. The CAA also establishes a timetable for air districts to reach attainment, and authorizes specific penalties where a deadline is not met. CEQA, on the other hand, requires lead agencies to analyze and discuss significant impacts on air quality, and to continue to mitigate those impacts so long as they remain significant or no additional mitigation is feasible.

standard that shuts down economic activity (i.e., the CAA offset standard) is necessarily and appropriately different than a standard (i.e. a CEQA threshold of significance) that requires disclosure of the impact to the public and the adoption of feasible mitigation measures.

Indeed, if it is possible to borrow any CAA NSR standard for use as a CEQA threshold of significance, it would be the BACT triggers in Table 4 (i.e., when ROG or NOx emissions exceed only 10 lbs/day), because those standards force the adoption of feasible mitigation measures, similar to CEQA's thresholds of significance.

NSR Regulation 2, Rule 2 for new or modified sources requires that if ozone precursor emissions exceed 54 lbs per day (i.e., 10 tpy), the polluter must offset *all* emissions. In contrast, the DSEIR Mitigation Measure M-AQ-2b only requires offsetting emissions above 54 lbs per day (i.e., 10 tpy). This BACT standard is much lower than the NSR offset standard and the DSEIR's threshold of significance of 54 lbs/day. But, there is no parallel requirement in the DSEIR for imposing anything like BACT to this Project's construction or operational emissions that exceed 10 lbs/day.

Regarding NSR Regulation 2, Rule 2's offset standards (i.e., 54 lbs/day for ROG or NOx), the BAAQMD's Revised Draft Options and Justification Report (October 2009) observes: "These levels represent a cumulatively considerable contribution."[3] But there is no evidence that emissions below these thresholds are not also "cumulatively considerable."

Moreover, regardless of any evidence included in these other BAAQMD documents, no such evidence can overcome a fundamental logical and legal flaw in the EIR's assumption that these thresholds are appropriate for the purpose for which the DSEIR uses them. Using the DSEIR's logic, if the City finds that one project will add 53 lbs/day of ozone precursors, it is considered a less-than-significant impact, but if that project will add 55 lbs/day of ozone precursors, it is considered significant. Yet, if the City approved two new large projects in the area in the same 2- or 3-year period, or where operational impacts cause increased emissions, each emitting 53 lbs/day of ozone precursors, it is considered a less-than-significant impact even though the total of the two added together equals 106 lbs/day of ozone precursors!

This scenario is not hypothetical; it is unfolding in San Francisco, and in the Mission Bay area now. (See Table 3, July 21, 2015, letter report by traffic engineer Larry Wymer, attached as Exhibit 2 to the July 27, 2015, letter from this office regarding impacts on Transportation for a list of project undergoing or about to undergo construction in this area of San Francisco.) As a result, the thresholds violate a fundamental CEQA principal that regardless of whether projects' incremental impacts are deemed insignificant in isolation, they may be cumulatively significant.

---

[3]Exhibit 4, p. 2.

The significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm. (*Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-721.)

This area is in "non-attainment" status under federal and state clean air laws for these criteria pollutants; and this project, along with many others, will substantially contribute to that existing significant adverse impact. There is no evidence to the contrary. The City's untenable position is that public agencies in the Air Basin can approve project after project, each emitting (in the case of ozone precursors) up to 54 lbs/day of new and additional ozone precursors, without ever causing a cumulatively considerable increase in air pollution. This approach runs counter to the reason for conducting cumulative impact analysis. If the City (and other agencies in the Air Basin) continues to find that projects that make air quality worse - when it is already significantly degraded - do not have a significant adverse cumulative impact on air quality, then the City will have no legal obligation to adopt feasible mitigation measures to reduce the significant cumulative impact.

Here, the BAAQMD CEQA Guidelines present ample evidence that the Bay Area's air quality is degraded and has been for a very long time. Therefore, the idea that agencies can forever approve multiple projects that each add 53 lbs of ROG and NOx to the air every day and never be deemed cumulatively considerable is absurd. Rather than explain why this is not true, the BAAQMD documents simply ignore the issue.

The DSEIR's use of the BAAQMD thresholds of significance is erroneous as a matter of law for several other reasons.[4] The DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards. The DSEIR uses BAAQMD's thresholds of significance uncritically, without any factual analysis of its own, in violation of CEQA.[5] This uncritical application of the BAAQMD's thresholds of significance

---

[4] *Endangered Habitats League v County of Orange* (2005) 131 Cal.App.4th 777, 793 ("The use of an erroneous legal standard [for the threshold of significance in an EIR] is a failure to proceed in the manner required by law that requires reversal.").

[5] *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 [underscore emphasis added], citing *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ("*CBE*"); accord *Mejia v. City of Los Angeles*

represents a failure of the City to exercise its independent judgment in preparing the DSEIR.[6] Just as disagreement from another agency does not deprive a lead agency of discretion under CEQA to judge whether substantial evidence supports its conclusions,[7] agreement from another agency does not relieve a lead agency of separately discharging its obligations under CEQA. The BAAQMD CEQA Guidelines do not provide any factual explanation as to why the 54 lbs. per day standard represents an appropriate threshold for judging the significance of project-level ozone pollution impacts. More importantly, the DSEIR also fails to include any such explanation, and is therefore inadequate as a matter of law.[8] It is well-settled that compliance with other regulatory standards cannot be used under CEQA as a basis for finding that a project's effects are insignificant, nor can it substitute for a fact-based analysis of those effects.[9]

Also, the DSEIR's reliance on information not contained in the DSEIR for purposes of showing these thresholds are supported by substantial evidence violates CEQA's informational requirements. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405 ["whatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what

---

(2005) 130 Cal.App.4th 322, 342 ["A threshold of significance is not conclusive...and does not relieve a public agency of the duty to consider the evidence under the fair argument standard."].)

[9] *See*, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford*, *supra*, 221 Cal.App.3d at pp. 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

is lacking in the report"]; *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 ["[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis'"], 443 ["The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project. That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant ... The question is therefore not whether the project's significant environmental effects *can* be clearly explained, but whether they *were*"] (emphasis in original).)

Finally, the attached report by Greg Gilbert and Paul Rosenfeld and Jessie Jaeger detail additional reasons why the DSEIR has not adequately supported its use of these thresholds.

3. The DSEIR's impact assessments for construction related criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.

DSEIR Table 5.4-8 shows construction-related daily emissions of the ozone precursor ROG at 47 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 49 lbs/day (mitigated by Tier 4 engines) and of the ozone precursor NOx at 144 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 73 lbs/day (mitigated by Tier 4 engines).

The DSEIR's impact assessments for construction-related ozone precursor emissions are invalid because the DSEIR uses the invalid thresholds of significance discussed above.

Because NOx construction-related emissions are reported as higher than the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day), the DSEIR concludes the Project's impact on ozone pollution is significant. While this conclusion is correct, it is also misleading because it understates the severity of the impact deemed "significant." The DSEIR implies that the only fraction of the Project's NOx emissions that are "significant" is the fraction above 54 lbs/day. But as discussed above, this threshold of significance is invalid. Using this invalid threshold implies that most of the quantity of emissions below the threshold are not "significant." (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].)

The DSEIR assumes that adoption of Mitigation Measure M-AQ-1, requiring use of off-road equipment with engines meeting Tier 2 or Tier 4 standards, will reduce construction-related ROG emissions to 47 or 49 pounds per day, respectively, which are both below the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day). (DSEIR, p. 5.4-33, Table 5.4-8.) But equipment meeting Tier 2 or Tier 4 standards are not sufficiently available to meet either requirement. (See Exhibit 2.) Therefore, the impact assessment must be recalculated to more realistically estimate the percentage of construction equipment that will meet Tier 2 or 4 standards.

Also, the DSEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the California Emissions Estimator Model ("CalEEMod"), to determine the on-road hauling emissions that would occur during construction. Using this default value, rather than a site-specific trip length to the actual haul destination, results in an underestimation of the Project's construction emissions. Therefore, the impact assessment must be recalculated to realistically account for the actual haul destination of the excavation spoils. (See Exhibit 2.)

a. Mitigation Measure M-AQ-1 does not comply with CEQA's legal requirements.

Mitigation Measure M-AQ-1 (at DSEIR, p. 5.4-35) does not comply with CEQA's legal requirements. As discussed above, the requirement that off-road equipment meet Tier 2 standards is illusory, and therefore ineffective, because the Project Sponsor will not be able to obtain enough equipment meeting this standard.

M-AQ-1 includes a limit on idling time of two minutes, and provides exceptions to this limit as provided in state law (DSEIR, p. 5.4-36), but utterly fails to describe what these exceptions are. The DSEIR must fully describe this measure in order for the public and City decision makers to assess its effectiveness.

M-AQ-1 requires the Project Sponsor prepare a Construction Emissions Minimization Plan, and the Project Sponsor must certify compliance with the Plan. (DSEIR, p. 5.4-36.) This is asking the fox to guard the henhouse. (See Exhibit 1.)

4. The DSEIR's impact assessments for operational criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.

The operational impact assessment for ozone precursor, PM10, PM2.5 and TAC emissions is invalid for many reasons.

DSEIR Table 5.4-9 shows operational daily emissions of criteria pollutants as follows:

ROG:	79 lbs/day [14 tpy]
NOx:	124 lbs/day [23 tpy]
PM10:	80 lbs/day [14.6 tpy]
PM2.5:	25 lbs/day [4.5 tpy]

(DSEIR, p. 5.4-39.)

The DSEIR's impact assessments for these criteria pollutants emissions are invalid because

they are based on the invalid thresholds of significance discussed above.

Because construction-related emissions of ROG and NOx are higher than the applicable (but invalid) threshold of significance for these pollutants, the DSEIR concludes the Project's impact on ozone pollution is significant. As discussed above, while correct, this conclusion is misleading because it understates the severity of the impact deemed "significant" by implying that the only fraction of the Project's NOx emissions is are "significant" is the fraction above 54 lbs/day.

The DSEIR's impact assessment for operational ozone precursor emissions is also misleading because it omits from its quantitative tally of criteria pollutants the emissions the Project will generate in San Francisco and the Mission Bay neighborhood from basketball game-associated "vehicle miles traveled" (DSEIR, p. 5-37.) The DSEIR's rationale for this startling omission is that moving the Warriors games from Oakland to San Francisco will reduce the same number of "vehicle miles traveled" in Oakland that the Project will generate in San Francisco and the Mission Bay neighborhood.

This rationale is based on the unstated, but incorrect, assumption that the environmental setting at Oracle Arena and the Mission Bay site are identical. These settings are very different, in many crucial respects. First and foremost, the Mission Bay neighborhood and the surrounding areas of San Francisco are populated by San Franciscans, not Oaklanders. The residents, citizens, and registered voters of San Francisco are entitled to know what the Project's air quality impacts will be *on them*, regardless of whether the residents, citizens, and registered voters of Oakland will experience an air quality benefit as a result of the move.

Second, Oracle Arena sits in the middle of a vast parking lot. To the west is I-880, various commercial properties, wetlands, and the Bay. To the east is the Coliseum, railroad tracks, ABC Supply (provider of industrial equipment), East Bay Truck and Auto Repair, BART tracks and the Coliseum BART Station, and then, over 2,000 feet away to the northeast there is a group of apartment buildings. To the north and south stretch commercial properties for well over a mile without any residences. This stands in stark contrast to the dense residential population surrounding the Mission Bay site.

The DSEIR's suggestion that respiratory disease, heart disease, and cancer-causing air pollution is fungible and transferable, without regard to the location or environmental setting in which it occurs, is unsupported.

a. Mitigation Measure M-AQ-2b does not comply with CEQA's legal requirements.

Mitigation Measure M-AQ-2b requires the Project Sponsor pay a fee to the BAAQMD that the BAAQMD will use to purchase ozone precursor offsets. The purpose is to offset the amount by which the project's ozone precursors emissions exceed the numerical thresholds discussed in the previous section of this letter.

Therefore, to the extent the thresholds are invalid, as argued above, M-AQ-2b fails to reduce ozone precursor emissions to less-than-significant levels. Further, the DSEIR does not even consider the feasibility or effectiveness of more robust mitigation strategies that could reduce ozone precursor emissions further below the (invalid) thresholds. (See DSEIR, p. 5.4-39, Table 5.4-9, "Estimated Emissions Reduction Required".)

The amount of the offset fee required by M-AQ-2b is calculated by multiplying the total amount of *annual* criteria pollutant emissions exceeding the annual (invalid) thresholds by $18,030 per weighted ton of criteria pollutant emissions; then adding 5% of that product for BAAQMD's administrative fees, as follows:[10]

ROG tons	4.4
NOx tons	12.6
PM tons x 20	0
Subtotal	17
Fee per ton	$18,030.00
Subtotal	$306,510.00
Admin fee 5%	0.05
Admin fee	$15,325.50
Total Fee	$321,835.50

The DSEIR indicates M-AQ-2b requires the Project Sponsor to pay only $321,835.50, which is the amount required to offset one year's worth of the Project's operational criteria pollutant emissions. (See DSEIR, p. 5.4-41.) But the sports and entertainment arena portion of this Project has an operational life of at least 50 years, probably much longer,[11] and the office towers will last even longer. In contrast, the life spans of offset credit sources are much shorter than the expected life span of this Project. (See Exhibit 1.) Therefore, the actual amount required to offset the Project's above-threshold ozone precursor emissions is much higher than $321,835.50. Therefore, the DSEIR's premise that M-AQ-2b will achieve a complete offset of the Project's above threshold construction and operational criteria pollutant emissions is misleading and false.[12]

To address this deficiency, M-AQ-2b must be amended. The DSEIR must disclose the

[10]54 lbs per day of ROG emissions equals 10 tons per year.

[11]Oracle Arena was built in 1966, 49 years ago, and is still functional.

[12]The DSEIR indicates that construction-related criteria pollutant emissions are mitigated by including them in the operational period emission mitigation strategy. (DSEIR, p. 5.4-34.)

average life span of the offset credit sources the BAAQMD typically buys, then amend M-AQ-2b to require recalculation of the offset fee or other offset requirement after the average life span of such offset credit sources to account for their limited life span, changes in emissions, changes in attainment status, etc. In addition, M-AQ-2b must be amended to include a mechanism, in the event that BAAQMD does not spend the offset fee and returns it, to ensure the required offsets are purchased through another bona fide, verifiable offset program.

Accepting, *arguendo*, the validity of the 17 ton offset requirement, the DSEIR's discussion of Mitigation Measure M-AQ-2b leaves many questions unanswered regarding BAAQMD's offset program. For example, the effectiveness of the measure depends directly on the validity of numerous assumptions, including: (1) the assumption that $18,030 is enough to purchase a ton of criteria pollutant emissions; (2) the assumption that the offset market has 17 tons of criteria pollutant emissions that can be reduced by engine retrofits or other offset techniques; (3) the assumption the Project Sponsor will accurately measure actual construction and operational emissions for purpose of determining how many tons of criteria pollutants must be offset; and (4) the assumption that BAAQMD has and will have reliable verification procedures in place ensuring that 17 tons of offset will actually be achieved.

5. The DSEIR's impact assessment for Project-caused increases in Toxic Air Contaminants (TACs) is invalid.

The DSEIR's impact assessment for operational Toxic Air Contaminants (TACs) - Impact AQ-3 - is invalid for a number of reasons, in particular because the DSEIR's use of thresholds of significance for Project-caused increases in cancer risk and $PM_{2.5}$ is inconsistent, confusing, and legally erroneous.

a. The DSEIR's health impact assessment for the Project-caused increases in cancer risk from TACs is invalid.

The DSEIR uses a threshold of significance for the Project's impact of increasing cancer risk in the area of "100 in one million." As discussed above, for criteria pollutants the DSEIR borrows thresholds of significance from the BAAQMD to determine the significance of both the direct, incremental increase in emissions caused by the Project, and the Project's contribution to cumulative increase in emissions in the area.

In contrast, in its assessment of the Project's impact of increasing cancer risk in the area, the Project ignores BAAQMD's stated "Individual Project" threshold of significance "for Risk and Hazards for new sources and receptors" which is stated as "Increased cancer risk of >10.0 in a million." (Exhibit 1, p. 2-2.) Instead, the DSEIR uses BAAQMD's stated "Cumulative Project" threshold of significance "for Risk and Hazards for new sources and receptors" which is stated as "Increased cancer risk of >100.0 in a million." (DSEIR, p. 5.4-13; see, May 2011, BAAQMD

Updated CEQA Guidelines, p. 2-2.).[13]

The DSEIR estimates the Project's impact of increasing cancer risk for children living at UCSF's Hearst Tower as either 91 or 46 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 1, based on DSEIR, p. 5.4-49, Table 5.4-11.)

Table 1

Hearst Tower Child		No Tier 2/VDECS	Tier 2/VDECS
Background	26	26	26
No Tier 2/VDECS	54	54	
Tier 2/VDECS	9.2		9.2
Operations - Generators	30	30	30
Operations - Mobile	7.2	7.2	7.2
Total	126.4	117.2	72.4
less background		26	26
Project incremental impact		91.2	46.4

The DSEIR estimates the Project's impact of increasing cancer risk for adults living at UCSF's Hearst Tower as either 40 or 38 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 2, DSEIR, p. 5.4-49, Table 5.4-11.)

Table 2

Hearst Tower - Adult		No Tier 2/VDECS	Tier 2/VDECS
Background	26	26	26
No Tier 2/VDECS	2.8	2.8	
Tier 2/VDECS	0.48		0.48
Operations - Generators	30	30	30
Operations - Mobile	7.2	7.2	7.2
Total	66.48	66	63.68
less background		26	26
Project incremental impact		40	37.68

[13]This is also a City criterion for defining "Air Pollutant Exposure Zones" (APEZ). (DSEIR, p. 5.4-12.) An APEZ is "an area in which modeled air pollution exceeds "either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter (ug/m3) (including ambient).... Since the Project is not in an APEZ, the subsequent criterion of significance is whether or not the Project will create an APEZ." (DSEIR, Appendix-TR, Air Quality Appendix, p. 9.)

The DSEIR estimates the Project's impact of increasing cancer risk for adults living at UCSF's Hearst Tower as either 45 or 42 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 3, DSEIR, p. 5.4-49, Table 5.4-11.)

Table 3

UCSF Hospital Child		No Tier 2/VDECS	Tier 2/VDECS
Background	44	44	44
No Tier 2/VDECS	28	28	
Tier 2/VDECS	4.8		4.8
Operations - Generators	30	30	30
Operations - Mobile	7.2	7.2	7.2
Total	114	109.2	86
less background		44	44
Project incremental impact		65.2	42

As discussed above, the DSEIR's premise that the Project Sponsor can obtain a substantial quantity of off-road construction equipment meeting Tier 2 and NOx VDECS standards is illusory. Therefore, the only relevant numbers are the three higher numbers, i.e., 91, 40 and 45. But even using the lower numbers, i.e., 46, 38, and 42, all of them exceed the BAAQMD's "Individual Project" threshold of significance for increased cancer risk of 10 per one million." (Exhibit 1, p. 2-2.) Instead of explaining why, after using BAAQMD's thresholds of significance for all criteria pollutants, the DSEIR does not use the BAAQMD's "Individual Project" increased cancer risk threshold of significance of 10 per one million, the DSEIR simply ignores this threshold.

Thus, the DSEIR uses at least two strategies to avoid disclosing a significant increase in cancer risk: using BAAQMD's cumulative standard instead of its individual project standard, and assuming the Project Sponsor can obtain a substantial quantity of off-road construction equipment meeting Tier 2 and NOx VDECS standards. Dropping either of these unwarranted predicates reveals the Project's impact of increasing cancer risk is significant.[14]

The DSEIR explains its choice of a threshold of significance for cancer risk from TAC's of

[14]See e.g., DSEIR, p. 5.4-49 ["With the minimum level of compliance with this mitigation measure (Tier 2 plus NOX VDECS), increased cancer risk as a result of project construction activities at the maximally impacted receptor would be approximately 9.2 in one million and cumulative excess cancer risk at all receptor locations would be reduced to below the significance threshold of 100 per one million. ¶ While unmitigated increased cancer risk at the maximally impacted receptors would exceed the threshold of 100 in one million, with implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization), increased cancer risk at the maximally impacted receptors would be below the threshold of 100 in one million"].)

100 per one million persons as follows:

> The 100 per one million persons (100 excess cancer risk) criterion discussed above is based on USEPA guidance for conducting air toxic analyses and making risk management decisions at the facility and community-scale level. As described by the BAAQMD, the USEPA considers a cancer risk of 100 per million to be within the "acceptable" range of cancer risk. Furthermore, in the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking, the USEPA states that it "…strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately one in one million and (2) limiting to no higher than approximately one in ten thousand [100 in one million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years." The 100 per one million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on BAAQMD regional modeling.

(DSEIR, p. 5.4-13.)[15]

The City's reliance on the EPA's judgment of "acceptable" cancer risk is legally flawed for several reasons. First, the City relies on a simplistic misrepresentation of actual EPA policy. Second, even if EPA policy is what the City implies it is, the DSEIR errs as a matter of CEQA law by using the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts.

The EPA's actual policy is to assess increased cancer risk based on a host of site-specific factors within a range of values from 1 in one million to 100 in one million. This policy reflects the agency's attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (See e.g., Starfield, L.E., "The 1990 National Contingency Plan: More Detail and More Structure, But Still a Balancing Act"; Environmental Law Reporter, June 1990, pp. 10222-10251, attached hereto as Exhibit 3.)[16]

---

[15]Footnote 21 cites to "54 Federal Register 38044, September 14, 1989." As of July 6, 2015, this document was not included on the City's AB900 mandated web page dedicated to preparing the administrative record concurrently with its CEQA review of the Project. (See Pub. Res. Code § 21186 (a), (b), and (c).)

[16]"In the proposed NCP [Superfund National Contingency Plan], the Agency [EPA] had defined the acceptable risk range as being from 10^{-4} to 10^{-7}, meaning that when the excess risk to an individual

Instead of following this analytic approach, the DSEIR selects one value at the least environmentally protective end of the EPA's "acceptable risk" range and uses it to determine the significance of the Project's impacts, but without regard to the Project's site-specific considerations. Again, the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's cancer risk impact significant.

Also, CEQA neither requires nor allows the City to use the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. The City's discretion to decide that significant environmental harm is "acceptable" in light of the project's benefits arises at the end of the CEQA analysis, in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant.

> A statement of overriding considerations is required, and offers a proper basis for approving a project despite the existence of unmitigated environmental effects, only when the measures necessary to mitigate or avoid those effects have properly been found to be infeasible. (Pub. Resources Code, § 21081, subd. (b).) Given our conclusion the Trustees have abused their discretion in determining that CSUMB's remaining effects cannot feasibly be mitigated, that the Trustees' statement of overriding circumstances is invalid necessarily follows. CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's

---

of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 [100 in one million] and 1 in 10 million, it is judged to be an acceptable exposure. As a measure of additional protection, the proposal provided that there should be a "point of departure" of 10^{-6}, toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range. ¶ The final rule maintained the point of departure of 10^{-6}, but narrowed the risk range to 10^{-4} through 10^{-6}. This action was taken in response to public comment and concerns that the Superfund range went below the accepted de minimis level used by other EPA programs and those of other federal agencies. ... the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below 10^{-6}. The use of a range of acceptable risk is general practice for most government programs. As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the balancing phase of the remedy selection process." (Id., 20 ELR 10237 [footnotes omitted].)

> benefits, unless the measures necessary to mitigate those effects are truly infeasible. Such a rule, even were it not wholly inconsistent with the relevant statute (id., § 21081, subd. (b)), would tend to displace the fundamental obligation of "each public agency [to] mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so" (id., § 21002.1, subd. (b)).

City of Marina v. Board of Trustees of the California State University (2006) 39 Cal.4th 341, 368-69.

This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," the City is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether the City will allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined that 46 additional child cancer cases per one million persons is significant, whether or not the City would have found the Project's benefits outweigh its environmental and adverse human health effects.

The DSEIR also attempts to support its "100 in a million excess cancer cases" by stating: "The 100 in a million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on the District's recent regional modeling analysis." (DSEIR p. 5.4-13, citing the 2009 BAAQMD Justifications report, p. 67). Neither document, however, explains what this means. For example, how are "excess" cancer cases "consistent" with "ambient" cancer risk? What does "most pristine" mean? On a scale of 1 to 10, are Mission Bay and the "most pristine areas" separated by 1 unit, or 10 units, or somewhere in between? In short, this justification for the threshold is mere verbiage.

b. The DSEIR's health impact assessment for Project-caused increases in $PM_{2.5}$ invalid.

The DSEIR uses a threshold of significance for the Project's health impact of increasing $PM_{2.5}$ concentrations of "10 µg/cubic meter." As discussed above, for criteria pollutants, the DSEIR borrows thresholds of significance from the BAAQMD to determine the significance of both the direct, incremental increase in emissions caused by the Project, and the Project's contribution to cumulative increase in emissions in the area.

In contrast, in its assessment of the Project's health impact of increasing $PM_{2.5}$ concentrations, the Project ignores BAAQMD's stated cumulative threshold of 0.8 µg/cubic meter. (See Exhibit 1, p. 2-2.) According to BAAQMD, "Cumulative emissions within the 1,000 foot evaluation zone would be considered significant where the increased average annual ground-level concentrations of $PM_{2.5}$ would be greater than 0.8 µg/m^3." (Exhibit 4, p. 5.)

Obviously, there is a huge discrepancy between the 10 µg/cubic meter threshold used in the DSEIR compared to the 0.8 ug/cubic meter threshold recommended by BAAQMD. This discrepancy is particularly troubling given that the DSEIR reports Project-caused cumulative increases in $PM_{2.5}$ concentrations just below the 10 µg/cubic meter threshold, but well above the 0.8 µg/cubic meter threshold.

It would appear, once again, that the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's health risk impact from increases in $PM_{2.5}$ significant.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Comments Regarding Air Quality Impact Analysis and Mitigation

Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32

Draft Subsequent EIR (San Francisco, CA)

Autumn Wind Associates, Inc.
Newcastle, CA

Prepared for Tom Lippe, Attorney

July 19, 2015

I. Introduction

Autumn Wind Associates provides the following comments regarding air quality analysis and mitigation measures identified in the Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32 (hereinafter referred to as "Events Center" or "project") DSEIR at the request of Tom Lippe, Esq.

This review and commentary focuses on the DEIR's use of flawed construction mitigation measures that will not deliver purported emission benefits; a failure to provide substantive discussion on whether wastewater improvement-related emissions made necessary for completion of the Event Center project should have been reviewed in the DSEIR; failure to meaningfully evaluate and mitigate with effective alternatives to diesel equipment and diesel fuel, including requirement to use zero-emission electric options when appropriate; the unjustified use of trip-related emissions of major sports events from the Oracle Arena for application to the project's sports arena; failure to evaluate the use of the latest available OEHHA health risk guidance known to be under discussion during the preparation of the DSEIR; the Lead Agency's reliance on thresholds of significance that have not been adopted in compliance with CEQA Guidelines; and the use of emission offsets with substantially less lifetime mitigation value than that relied upon by the Lead Agency in the DSEIR.

II. Construction Emissions From Wastewater Improvements Have Not Been Adequately Reviewed in the DSEIR

At DSEIR pg. 1-9, significant environmental impact areas in the Event Center environmental review process are identified. One of those includes sewer processing plant and related utility improvements made necessary for the Events Center and associated development of the 11 acre project area:

> "As indicated on Table 1-2, the SEIR determined that the proposed project would result in significant and unavoidable impacts in the areas of....utilities (construction of new or upgraded wastewater facilities, and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand)."

Based on the language noted above, it appears the DSEIR's project at Mission Bay Blocks 29 – 32 cannot proceed without sewer and associated utility improvements. However, at DSEIR pg. 1-43 it appears that the project is considered by the Lead Agency to not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities. Then, at DSEIR pg. 1-44 information from measure M-C-UT-4 shows that the project sponsor must pay for "fair share" improvements to the Mariposa Pump Station:

> The project sponsor shall pay its fair share for improvements to the Mariposa Pump Station and associated wastewater facilities required to provide adequate sewer capacity within the project area and serve the project as determined by the SFPUC. The contribution shall be in proportion to the wastewater flows from the proposed project relative to the total design capacity of the upgraded pump station(s). The project sponsor shall not be responsible for any share of costs to address pre-existing pump station deficiencies.

However, at DSEIR, pg. 5.7-13, it appears the wastewater improvements are made necessary by the project and that it cannot proceed without them:

> "Therefore, permanent improvements to the pump station and a long term increase in capacity would be needed to accommodate the proposed project in combination with other proposed and planned development in the Mission Bay South Plan area. In addition, as discussed in Section 5.9, Hydrology and Water Quality, the increased wastewater flows from **the proposed project** (emphasis added) in combination with other foreseeable future projects could increase the volume of combined sewer discharges (CSDs) from the Mariposa Pump Station which could necessitate improvements to the Mariposa wet weather pump station."

If the DSEIR project necessitates the improvements to local wastewater treatment facilities and related utility improvements, the associated construction emissions should be analyzed and mitigated as appropriate within the DSEIR and not piecemealed to some other review process or ignored altogether. No information is found in the DSEIR's Air Quality element that shows that construction-related emissions from the necessary wastewater utility improvements were recognized and evaluated within the DSEIR.

III. Air Quality Thresholds of Significance Used in the DSEIR Are Based On Outdated, Non-Scientific NSR Values

BAAQMD (District) is regionally responsible for attaining or maintaining healthy air quality in the 9-county Bay Area that includes the proposed Event Center and Mission Bay Blocks 29 -32; the District implements a number of programs for attainment of regional air quality, including issuance of CEQA guidance used by Lead Agencies in the review and mitigation of air quality impacts and specified emissions of new development. The District has historically acted under CEQA as a commenting agency for new developments subject to CEQA review not otherwise subject to District regulations. CEQA thresholds, used by the City as Lead Agency and applied to the DSEIR (see Table 5.4-6 Criteria Air Pollutant Thresholds), were developed by the BAAQMD many years ago, well prior to the last Ozone Attainment Plan issued by the District in 2001.

How the District's air quality CEQA thresholds were developed is relevant to whether they are appropriate and effective for use in evaluating the potential significance of air impacts of the proposed event center and other land use types anticipated within the DSEIR. While CEQA encourages the use of thresholds (Guidelines section 15064.7) to promote consistency and integration of environmental review activities across regulatory and planning disciplines and programs, the Lead Agency's air quality thresholds must reflect the true significance of the environmental impact for which they act as an impact or mitigation measuring device. Moreover, the courts have found that use of regulatory thresholds must not be applied "in a way that forecloses the consideration of any other substantial evidence showing there may be a significant effect" (CBE v. CA Resources Agency; 126 Cal. Rptr. 2d. 441, Cal.App.3 Dist., 2002).

In this case, the Lead Agency's use of District thresholds ignores air pollution nonattainment and ambient air quality monitoring evidence that they have not been adequately effective in reducing land-use related mobile source emissions in the air basin. Importantly, the BAAQMD's CEQA threshold increments (expressed in lbs/day or tons/yr of specified pollutants) were based decades ago on NSR (New Source Review) quantitative increments intended solely for ensuring that the region's stationary source emissions, regulated under permits issued by the BAAQMD, would not cause the region to fall out of "attainment" status for complying with federal air quality ozone standards. NSR increments were established decades ago within federal Clean Air Act programs, aimed exclusively at regulating stationary (not mobile) sources of air pollution, and were keyed quantitatively to an area's air quality designations; worse air quality invokes use of more restrictive NSR daily or annual emission limits.

Surprisingly, there is no scientific basis for how NSR values were established, nor is there any substantive information regarding their formulation or formation left in the historical record; we have researched this issue extensively and have been unable to find written material or anyone in regulatory air agencies (CARB, EPA) who is intimately familiar with or is still alive who can recall how NSR increments were established nearly fifty years ago.

In the DSEIR, BAAQMD's CEQA thresholds of significance were used; those thresholds were established by borrowing NSR values intended to ensure that the BAAQMD's stationary sources would not lead to regional air pollution "nonattainment" episodes. As a practical matter, the region's failure to attain the federal ozone standard is evidence of the lack of scientific credibility in how the BAAQMD's CEQA thresholds were established, as well as their lack of efficacy—had they been scientifically tied to land use growth and the mobile source emissions they create, it would be easily argued that the Bay Area would not now be designated "marginal nonattainment" for ozone air pollution after years of nonattainment.

Use of NSR values that were never scientifically designed, to establish current BAAQMD CEQA thresholds, makes even less sense when comparing the emissions inventory of stationary sources in the Bay Area to emissions resulting from mobile sources (vehicles) that routinely emit regulated pollutants traveling to or from new land use developments. Quite simply, there is no rational nexus between the two categories since stationary source emissions equate to typically less than one-sixth those emitted by the basin's mobile sources.

A more effective method for use by BAAQMD in designing CEQA threshold levels would have been to base them on growth in vehicle emissions expected to occur from projected land use growth in the basin---this method was developed and used in 2002 by the Sacramento Metropolitan Air Quality Management District (SMAQMD) to establish CEQA thresholds logically and arithmetically based on estimated increments of mobile source emissions of new development. The increment of new development-related emissions was derived from careful review of five years of immediately-prior building permit records obtained in the nonattainment area, and then adjusted to account for processes (such as ongoing development of rapid transit in the basin) expected to reduce vehicle-miles-travelled from new developments. CEQA threshold emission quantities (expressed as lbs/day or tons/yr) were then set at levels that would account for---and mitigate---only that new land use portion of the basin's total emissions determined by modeling and inventory analyses as necessary to achieve attainment of air quality standards under federal Clean Air Act requirements.

Under this "nexus analysis" approach, CEQA thresholds are scientifically established by correlating increased mobile source emissions from projected land use growth in the nonattainment area to the number of tons of related reductions needed for attainment by CAA-specified date(s). Such an approach greatly reduces the risk of under- or over-mitigating, and provides far more certainty that the estimated tons of emission reductions to result from their use, and critical to ensuring attainment of ambient air quality standards, will be realized. BAAQMD CEQA thresholds were not established scientifically, and the region has continued to violate ambient air quality standards for ozone for many years now—both act as potent evidence to call into serious question the effectiveness of BAAQMD's NSR-based CEQA thresholds in the DSEIR for Event Center/Mission Bay Blocks 29 – 32. Further, they suggest that air quality impacts are likely underestimated, and mitigation values are overestimated in the DSEIR.

IV. Construction and Operational Mitigation Options Have Not Been Thoroughly Reviewed for Diesel Alternatives

Mitigation Measure M-AQ-1 at DSEIR pg. 5-4.36 under item B requires reporting of alternative fuel quantities used to power construction vehicles and equipment at the project site during its 26 month duration. M-AQ-1 should be revised to require the use of low-emission and/or low-CO2 alternative fuels unless costs are substantially (~100%) greater than routine diesel fuel costs. One such product that should have been carefully evaluated in the DSEIR is "Diesel HPR", made from 98% renewable content (a rate about 4 times greater than regular B-20 biodiesel) and currently marketed at 18 locations throughout northern CA and the Bay Area. The price for this ultra-low carbon-intensity diesel, said to have better performance characteristics than traditional petroleum diesel fuel, is competitive with standard onroad and offroad diesel available in CA (as advertised recently in the Sacramento area at $2.89 a gallon).

Fossil diesel has a cetane rating of 40. The HPR Diesel product, or similar, has a cetane rating of 74. That level of higher cetane results in lower PM and NOx---which are needed reductions for the project. Because the density of the fuel is slightly lower, so is the chemical energy per unit volume (3%). But because the cetane rating is so much higher PM otherwise not emitted is converted into productive energy, with tractive horsepower (per unit volume) slightly higher than fossil diesel (1%).

Onroad project-serving construction vehicles that cannot otherwise operate without diesel fuel should also be required to use the very low carbon-intensity "Diesel HPR" or similarly effective product, with receipts proving purchase and use provided to the independent, onsite construction mitigation manager (referred to inappropriately as an "Air Quality Specialist" in the DSEIR, as noted elsewhere in this letter) for regular, weekly relay to the OCII. ("Similarly effective" does not mean use of B-20, since its proportion of bio-derived fuel will not exceed 20%, whereas the Diesel HPR product or similar will come almost entirely from renewable sources.)

Additionally, the project will rely on several emergency diesel gensets---these power units will produce emissions during regular testing, and are very likely to emit far greater quantities of emissions during any actual power outages. Those units should be operated on an alternative, low-emission non-diesel fuel. If not possible, those diesel units should be operated solely on the "Diesel HPR" or similar product. No information is found in the DEIR that discusses whether the diesel (and not alternatively fueled) genset option is critically necessary, whether lower-emitting options are available for them, and why those options are or are not permissible for use at the project.

See http://www.sacbee.com/news/business/article15203738.html for more information on the Diesel HPR product, and particularly its locations for purchase, costs, and emission benefits over traditional diesel fuel.

V. Construction Mitigation Is Unenforceable and Places Inappropriate Reliance on Project Sponsor for Interpretation and Compliance Determinations

At DSEIR pg. 5.4-35, Mitigation Measure M-AQ-1 is identified and discussed for reducing project-related construction equipment emissions. Under this measure's Item A, a Construction Emissions Minimization Plan is required:

> **"Construction Emissions Minimization Plan**. Prior to issuance of a construction permit, the project sponsor shall submit a Construction Emissions Minimization Plan (Plan) to the OCII or its designated representative for review and approval by an Air Quality Specialist."

The measure then goes on to lay out "Compliance Alternatives" that require use of specified types of engines with prescribed emission standards (known as Tiers) utilizing VDECS (Verified Diesel Emission Control Strategies) to reduce equipment NOx emissions and particulates.

Because the project's construction emissions are estimated to exceed the BAAQMD's NOx threshold of significance, and due to the serious nature of diesel particulate matter (DPM) as a toxic air contaminant subject to EPA and CARB regulations resulting from PM2.5 emissions for which the region is designated nonattainment, it is essential that this measure be implemented and executed effectively for the duration of the project. As written, however, the measure lacks enforceability because there is no recognized definition of or qualification process provided in the DSEIR for "Air Quality Specialist" who will pass judgment on the adequacy of construction equipment and emissions levels to be submitted by the project sponsor for approval.

While the BAAQMD has agency positions designated "Air Quality Specialist", those positions possess skillsets exclusive to their particular area of expertise, ranging across the sub-specialties of air quality planning, permitting, compliance and enforcement, stationary source inspection, engineering, air monitoring, incentive programs, etc. There is no generic "air quality specialist", as implied in the DEIR's use of the term, and the DSEIR fails to identify the necessary skillsets for this important position. Ensuring compliance with the components of M-AQ-1 will require an individual experienced with CEQA mitigation requirements; air quality regulations and VDECS technology options and functionality; construction site operations and safety issues; a wide variety of offroad and onroad construction equipment and vehicle engines; hands-on engine and VDECS experience to ensure daily compliance with the applicable Compliance Alternative; and precise, effective record-keeping skills, across the 26 month construction duration. The "'Specialist" must be present during all work hours at the site for each day of construction work across the two-plus years of work that would involve operations of construction engines and vehicles at the 11-acre site.

Because of the importance of the role of the "air quality specialist" in ensuring compliance with M-AQ-1 across the many phases and months of the Arena's construction, this position must be independent, full-time on the project site, and required to provide weekly report submittals to OCII. At pg. 5.4-36, reporting to OCII is required on a quarterly basis. This is without doubt too long a duration since equipment will come and go on a daily basis, and as written now M-AQ-1 can (and probably will) permit a project sponsor "Specialist" to creatively develop post-hoc equipment compliance records that may appear legitimate but are, in fact, not. Considering that there are no checks and balances built into the Measure, the Lead Agency cannot ensure that compliance with the essential objective of the mitigation measure will actually occur.

Because of the unusual nature of the duties of the Measure's "Specialist", and as a result of the need for independence from the Applicant to prevent conflict of interest, the EIR must discuss filling the position with a capable, qualified BAAQMD employee under contract to OCII. Should this not be possible, the position must be filled by a qualified, independent contractor chosen by and subject only to the authority of OCII.

Further, M-AQ-1 specifies numerous sub-part requirements (A 1 through 5) to be included in the Construction Emissions Mitigation Plan, and in each case compliance with those sub-parts is left to the "project sponsor". So, too, is compliance with the Measure's additional duties required under M-AQ-1 items B and C. This is not appropriate when considering the extent, complexity,

and costs that will be incurred for effective mitigation measure compliance across the 26-month construction period; permitting the project sponsor to create, implement, report, and determine compliance with the Measure is akin to having the fox guard the henhouse and must not be allowed.

As written, the measure is not enforceable due to the subjective, undefined nature of "Air Quality Specialist" who will approve the project sponsor's Construction Emissions Mitigation Plan. Further, it is unacceptable that the Measure will permit the project sponsor to determine compliance with each of the measure's components, record and report information signifying compliance, and then, under part C certify their own compliance with the Plan and its various requirements.

We have inspected construction project sites, under air district contract, to determine compliance with air district-imposed construction equipment mitigations and have found uniformly poor compliance; to exemplify, at one residential subdivision project in south Sacramento County we determined that only one offroad construction vehicle out of nearly twenty were actually compliant with the mitigation requirements that had been imposed on the project by the Lead Agency. This is because there has traditionally been very little, if any, post-EIR follow-through to verify mitigation compliance by Lead Agencies or by the local air district after the CEQA project has been approved for development and construction has started. Knowing this, construction and development firms commonly let air quality mitigations go unmet, although records purporting to show compliance can be easily formulated and submitted post hoc in order to fulfill a paper requirement. Without an independent, qualified 3rd party contractor onsite each day to track, verify, and record emissions- and activity-related information on construction vehicles used at the project site to ensure the EIR's mitigations are implemented effectively, the project is very unlikely to produce more than a token of the emission reductions claimed in the DSEIR.

Similarly, M-AQ-2a begins with "The project sponsor shall implement the following measures as feasible:"... The introduction of "as feasible" is a poison pill, since the measure does not conclusively identify the party responsible (and liable) for determining sub-component measure feasibility. This determination must not be left to the project sponsor, but, rather, vested with a qualified independent contractor chosen by and reporting solely to the OCII, or to the BAAQMD on behalf of OCII, to ensure measure implementation at every truly "feasible" turn. Without specifying duties for the accurate determination of what constitutes "as feasible", and then ensuring that those duties are actually implemented by a non-conflicted 3rd party (which, as written currently, the project sponsor cannot possibly fulfill without potential for conflict of interest), M-AQ-2a lacks necessary enforceability and cannot be expected to produce those real, quantifiable, surplus mitigated emission benefits claimed in the DSEIR.

Finally, M-AQ-2b leaves it to the project sponsor to calculate the amount of emission offsets required to satisfy the project's estimated ozone precursor burden of 17 tons per year, after they have decided what is feasible for Tier 4 equipment to be used at the site and what then to report to OCII under the requirements of M-AQ-1. In total, the construction mitigations proposed in the DEIR are riddled with potential conflicts of interest by leaving the determination of compliance and feasibility to the very party that must identify, implement and pay for them. As written, they cannot be relied upon to deliver the emission benefits that the DEIR assumes will actually occur. The DEIR must be revised to place a qualified, independent, 3rd party entity at the project site daily for the 26 month project duration, making them responsible and liable for accurate, weekly (not quarterly) verifications of equipment emission rates and reductions in reports to the City.

VI. Operational Mitigation Measure for Electrical Outlets is Vague and Unenforceable

Mitigation Measure M-AQ-2a at DSEIR pg. 5.4-42 is designed to reduce the project's operational emissions, requiring the project sponsor to provide outlets for electrically powered landscape equipment "as feasible." As written, this measure is unenforceable since it permits the sponsor to determine feasibility. There is no doubt that the measure will be feasible, since electric power will be ubiquitous across the project site in built structures, at their exteriors, and in power supplied to lighting and other exterior improvements across the project's eleven acres.

Additionally, the mitigation measure should be revised to require that the project sponsor and any future property owners or tenants require in any landscaping contracts the requirement that landscape maintenance firms at the project use only electrically powered landscape equipment. Merely requiring outlets without mandating their use for landscaping onsite renders this portion of M-AQ-2a entirely unreliable for producing actual emission benefits.

VII. Offsets for Operational Emissions from Warriors Games Appear to be Double-Counted

At DSEIR pg. 5.4-37, new operational emissions from vehicle trips generated by Warrior games are, for the purposes of mitigation, discounted based on the assumption that those emissions have already been counted in the CEQA-review process conducted for Warriors' games at the Oracle Arena (Oakland). This approach is used in the DSEIR to justify the purchase of fewer

emission offsets from BAAQMD necessary to reduce the project's onroad emission impacts to less-than-significant levels, and it is predicated on the assumption that no new large sports events will occur at the Oakland Coliseum/Oracle Arena once large-venue sports games move across the Bay to the proposed Arena in San Francisco. From pg. 5.4-37:

> "Some of the motor vehicle trips that would be generated by Golden State Warriors basketball games at the proposed event center would be regional trips similar to those currently generated by basketball games occurring at the Oracle Arena in Oakland, and as a result, the emissions associated with these regional trips would not represent new emissions to the air basin."

At the bottom of the same page, additional material reinforces the crediting strategy:

> "It is unlikely that there would be another NBA franchise in the Bay Area, so all of the professional basketball games occurring in the region would likely be played at the new event center. This assumption is consistent with that of the City of Oakland in its CEQA related analyses."

For the purposes of estimating vehicle trip emissions from large Warriors game-style sporting events that will be held at the proposed San Francisco Events Center, the Lead Agency has assumed that existing (Oracle Arena-based) Warriors game-related vehicle trip emissions will shift from Oakland to the new San Francisco Events Center. Under this DSEIR perspective, there would be no net increase in vehicle trips (and related emissions) since game attendees are expected to drive the same distance (25 miles on average) to the new facility in San Francisco that they are assumed to currently drive to attend a Warriors game (or similar large-venue sports event) at the Oracle Arena in Oakland. Crucial to this perspective is the notion that there would be no new, large-venue sporting events at the Oracle arena which would then act to backfill the loss of Warriors games---otherwise there must be a net gain in total, large-venue sporting event emissions created between the two arenas. In fact, the "no net gain" perspective taken by the Lead Agency in the DSEIR is used to justify deducting those Warriors game "existing trip" emissions from the project's emissions modeling so that fewer emission offsets would be required for the project. Based on our review of information contained in a recent Oakland EIR, this appears to be inappropriate.

For the above-referenced approach to be viable for use in the DSEIR, the vehicle-trip emissions resulting currently from the large-sports venue games held at Oracle must transfer to the proposed San Francisco Event Center *and must then not be backfilled with new, large-sports venue games at Oracle*—otherwise there will be a net gain in emissions not accounted for in either the new Events Center DSEIR or the EIR conducted for the expanding Oracle Arena.

In contradiction to the DSEIR's claim is this statement from Oakland's Coliseum Area Specific Plan DEIR1, Vol. I, pg. 1-1:

> "The Project seeks to retain Oakland's three major professional sports franchises with three new venues and an accompanying mixed-use residential....."

On the next page, this information further clarifies that Oakland will backfill with large sports venues that will continue the emissions currently associated with the Warriors operation at the Oracle Arena:

> "The development of Sub-Area A and a portion of Sub-Area B (the "Coliseum District") is based on the Coliseum City Master Plan, which calls for three new sports venues (a new football stadium and a new baseball park in Sub-Area A plus a new basketball arena and multi-purpose events center in Sub-Area B)..."

At Coliseum Area Spa DEIR, pg. 4.2-59, mobile source emission impacts were modeled based on three scenarios:

- Existing criteria pollutant emissions from the Coliseum District area ("Existing No Project", or "2013 Baseline"),
- Future 2035 criteria pollutant emissions from the Coliseum District if the Project were not developed (i.e., future no Project, or 2035 Baseline), and
- Future 2035 criteria pollutant emissions from the Coliseum District (i.e., future plus Project, or 2035 plus Project).

By logical inference from the first- and second-bulleted points noted above, large sports venue-related emissions currently attributed to Warriors games appear to remain "on the books" for Oracle. Correspondingly, at pg. 4.2-60, existing emissions quantities associated with the Warriors games are retained:

> "Table 4.2-7 shows estimated average daily and annual maximum criteria emissions under current conditions (2013 Baseline), as well as the emissions projected from current land uses at the Coliseum District as they would occur in 2035 (2035 Baseline). These projected 2035 baseline emissions are based on a continuation of existing land uses, vehicle trips, and VMTs."

[1] City of Oakland; Coliseum Area SPA DEIR Vol I; SCH #2013042066; August 2014

Based on the information cited above, it is clear that the City of Oakland anticipates retention of mobile source emissions generated by the equivalent of Warriors games at their Coliseum/Oracle Arena. Further, it appears that the Coliseum/Oracle EIR was certified prior to issuance of the Warriors NOP---thus the claim in the Warriors EIR that large sports venue-related emissions can be transferred from Oakland to San Francisco, and with credit applied to compliance with Mitigation Measure M-AQ-2b (Emission Credits) shown at pg. 5.4-41, is likely neither applicable nor appropriate under CEQA.

VIII. Project Health Risks May Be Underestimated Using Older Guidance

The DSEIR provides analysis and discussion of the project's potential to cause significant health risks from project-related toxics, with specific details on health risks and PM2.5 calculations and methodology found in Appendix AQ. Exposure parameters presented in Section 3 of Appendix AQ do not appear to reflect current methods for calculating excess cancer risks, and as a result it is likely that the HRA underestimates Warriors Arena's potential excess cancer risks.

Table 3 lists daily breathing rates referencing BAAQMD's Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines released in January 2010.[2] These breathing rates are consistent with rates recommended by the California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Risk Assessment Guidelines released in 2000.[3] After publicly working on revisions during 2014, OEHHA released updated Risk Assessment Guidelines in early 2015 that outline risk calculations for specific age groupings. The new methods incorporate higher daily breathing rates than those listed in the BAAQMD's 2010 Guidelines and used in the HRA. To comply with the latest OEHHA Guidelines, the inhalation intake factors should be re-calculated for the EIR using the updated 95% daily breathing rate for children of 1,090 L/kg-day.[4]

Additionally, the screening approach taken in the HRA to evaluate operational cancer risks should be revised to include a refined, site-specific analysis of impacts using the USEPA AERMOD

[4] OEHHA, February 2015. Air Toxics Hot Spots Program Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessment. Section 5.4.1.1: Residential Inhalation Dose for Cancer Risk Assessment. Available at: http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

model. With respect to the number of years of data to model, the USEPA Guideline on Air Quality Models states:

> "Five years of representative meteorological data should be used when estimating concentrations with an air quality model. Consecutive years from the most recent, readily available 5-year period are preferred.[5]"

The DSEIR used meteorological data from 2008; updated AERMOD results, employing five years of the most recent meteorological data, should be used with exposure parameters and methodology in compliance with the 2015 OEHHA Risk Assessment Guidelines to calculate excess cancer risk.

IX. CEQA Air Quality Thresholds of Significance Have Not Been Adopted By the Lead Agency

At Page 5.4-25 the DSEIR establishes criteria pollutant thresholds adopted by the Bay Area Air Quality Management District (BAAQMD). Following their adoption by the BAAQMD, the City of San Francisco has used these numerical thresholds for virtually all land use development projects undertaken in the City and requiring CEQA review.

However, CEQA Guidelines, § 15064.7(b) requires that "[t]hresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence." Without exception, this Guidelines section requires that, prior to application of thresholds in actual CEQA environmental reviews, the City undertake its own rule-making proceeding to adopt these thresholds as their own after determining in a public process that they are supported by substantial evidence. Since the City has not formally adopted the air quality significance thresholds in a public process, supported by substantial evidence, their ad hoc application to the DSEIR is inappropriate.

X. Mobile-Based Emission Offsets Are Unlikely To Produce Needed Project-Lifetime Reductions

Mitigation Measure M-AQ-2b at DSEIR pg. 5.4-42 identifies the use of emission offsets for the project, requiring the project sponsor pay a mitigation-offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division. The measure is designed to

[5] USEPA, November 9, 2005, Guideline on Air Quality Models. 40 CFR 51, Appendix W, Section 8.3.1.2.a.

offset operational project emissions that have been estimated to exceed the DSEIR's air quality thresholds of significance. As noted at pg. 5.4-42:

> "...the project sponsor shall pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division in an amount not to exceed $18,030 per weighted ton per year of ozone precursors plus a 5 percent administrative fee to fund one or more emissions reduction projects within the San Francisco Bay Area Air Basin (SFBAAB). This fee is intended to fund emissions reduction projects to achieve reductions of 17.0 tons per year of ozone precursors."

There is a serious, fundamental flaw in the logic applying to the measure's requirement to purchase emission offsets, since emission reductions developed through the BAAQMD's Strategic Incentives Division are based on mobile source emission reduction projects with limited and intentionally impermanent lifetimes. These projects typically operate for several years before they are rendered obsolete by new vehicle emission control standards and technologies, and thus they must not be expected to produce the 17 tons per year of ozone precursor offsets, year in and year out, across what is at least a 30 year project planning lifetime.

Accordingly, M-AQ-2b must be revised to require emission offsets for project operations for, at a minimum, the aforementioned 30 year life of the project. To exemplify, if the BAAQMD purchases mobile emission offsets with an emission reduction life of less than 10 years, the project sponsor must then pay mitigation-offset fees for mobile emission reductions until emission offsets are realized for the minimum 30 year period. Without such protection the project can be expected to offset its significant ozone precursors for no more than one-third of its lifetime; this is clearly inconsistent with CEQA's interest in mitigating the project's significant impacts across its planned lifetime.

** ** **

In summary, we believe the project DSEIR's treatment of air quality impact analysis and mitigation has inaccurately characterized certain project emissions, applied mitigation measures which are unenforceable or will simply not be implemented effectively if they are substantively implemented at all, failed to use thresholds of significance previously adopted by the Lead Agency's Board of Directors pursuant to CEQA Guidelines, and has incorrectly assumed the transfer of Warriors game-related operational emissions established for the Oracle Arena to apply to the project arena to be built in San Francisco.

Should you have any questions regarding this comment letter, please feel free to contact me at your convenience.

Sincerely,

Greg Gilbert

STATEMENT OF QUALIFICATIONS

Autumn Wind Associates

Greg Gilbert is director and founder of Autumn Wind Associates, Inc, located northeast of Sacramento, CA. Utilizing primarily ex-air agency personnel, AWA provides expert review, analysis, and estimation of potential air quality and associated environmental impacts of proposed land-use development projects involving both indirect- (mobile) and stationary (operating under air agency permit) sources of air pollution. He has consulted on air quality land use planning, mobile, and stationary source matters and projects to private and public clients since leaving public service as an air agency manager in 2000. Previously, he was national marketing director for an emissions catalyst products and technology firm with international markets in mobile and stationary sources. Between 1990 and 2000 Mr. Gilbert was employed in two California air agencies, most recently as project manager in the Mobile Source Division of the Sacramento Metropolitan Air Quality Management District (SMAQMD). While at SMAQMD Mr. Gilbert was responsible for assisting in the development and implementation of the agency's heavy-duty diesel vehicle low-emission incentive program that would later serve as the model for the statewide Moyer Program of the California Air Resources Board (CARB); the evaluation of land use-related air quality emission impacts and control strategies, development of California Environmental Quality Act (CEQA) thresholds to evaluate and mitigations to reduce, offset, or eliminate air quality impacts of new land use; development of air-related CEQA guidance; and creation of the first air quality CEQA mitigation fee program with percentage-based emission reduction options for developers to mitigate project-specific construction and operational development-related emissions.

Since 2001, AWA has provided consulting expertise to private entities and air agencies, provided input for revisions to the URBEMIS (urban emissions model to predict development-related mobile- and area-source emissions) model, conducted research on construction practices and equipment emissions, assisted with development of CEQA land-use guidance documents and mitigation strategies for CA air quality agencies, and provided modeling and consulting expertise for toxics-related health risk assessments. Mr. Gilbert reviews and provides expert written and testimony on CEQA- and development-related project-specific environmental analysis, mitigation, and documentation for a wide range of public-, private-, and environmental-sector clients, including law firms specializing in CEQA-NEPA cases.

Subject: Comments on the Event Center and Mixed-Use Development Project at Mission Bay Blocks 29-32

Dear Mr. Lippe:

We have reviewed the June 5, 2015 Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development Project ("Project") at Mission Bay Blocks 29-32. GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an approximately 11-acre site on Blocks 29-32 within the Mission Bay South Redevelopment Plan Area of San Francisco. The proposed event center would host the Golden State Warriors basketball team during the NBA season, and provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences, and conventions.

Our review concludes that the DSEIR fails to adequately assess the Project's air quality impacts.

1. The FEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the *California Emissions Estimator Model* ("CalEEMod"),[1] to determine the on-road hauling emissions that would occur during construction; however, utilizing this default value, rather than a site specific trip length, results in an underestimation of the Project's construction emissions.
2. The DSEIR attempts to mitigate the Project's criteria air pollutant emissions by limiting the off-road equipment used during construction to machinery equipped with, at a minimum, Tier 2 engines with 40 percent NOx verified diesel emission control strategies (VDECS), and at a maximum, Tier 4 or Tier 4 interim engines (Volume 2, p. 5.4-32). However, the DSEIR does not demonstrate the feasibility of this proposed measure. The Project will need to acquire approximately 195 pieces of equipment outfitted with Tier 2 and/or Tier 4 engines. Due to the

[1] CalEEMod website, *available at*: http://www.caleemod.com/

limited supply of cleaner-burning off-road equipment, the implementation of this measure, in its entirety, is highly unrealistic. As a result, the proposed Project should not rely on this mitigation measure to reduce emissions; rather the Project should pursue additional, feasible mitigation measures other than Tier 2/Tier 4 construction equipment to reduce the Project's criteria air pollutant emissions.

3. The DSEIR does not assess the Project's individual excess cancer risk to the Bay Area Air Quality Management District's (BAAQMD) 10 in one million significance threshold.[2] Rather, it determines the Project's significance by comparing the cumulative cancer risk (background risk plus Project risk) to BAAQMD's cumulative risk threshold of 100 in one million.
4. The DSEIR also fails to utilize BAAQMD's cumulative PM2.5 threshold of 0.8 $\mu g/m^3$.

A revised DSEIR should be prepared to address these inadequacies and to incorporate mitigation to reduce impacts which otherwise would affect regional air quality, and health impacts from toxic air contaminants.

Inadequate Use of CalEEMod Default Values

The DSEIR calculates the emissions from on-road haul trucks during Project construction by assuming a trip length of 20-miles, which represents the default hauling trip length provided by CalEEMod (Volume 3, Appendix AQ, p. 6). This default trip length, however, does not represent the actual haul trip length that would occur. Therefore, in an effort to accurately estimate the actual haul trip length, we conducted an independent analysis using the best resources available.

The DSEIR "estimates that the maximum depth of excavation on-site would be approximately 30 feet below San Francisco City Datum; this would require approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (Volume 3, Appendix AQ, p. 17). In order to transport this soil off-site, the DSEIR anticipates that approximately 39,952 haul trips will be required over the course of approximately four months (Volume 3, Appendix AQ, Table 6.1-13, pp. 1243).

The DSEIR fails to disclose where this excavated soil will be transported to. According to the DSEIR, in 2006, the City of San Francisco adopted the Construction and Demolition Waste Ordinance[3], which mandates that 75 percent of construction and demolition debris be recycled (Volume 3, Appendix AQ, p. 70). Therefore, it can be assumed that 75 percent of the approximately 350,000 cubic yards of construction debris will be transported to a registered construction and demolition (C&D) debris recovery facility, and the remaining 25 percent will be transported to a registered landfill. The Construction and Demolition Waste Ordinance requires that C&D materials be transported to a registered recovery facility, and provides a list of the facilities currently approved by the City.[4] The

[3] San Francisco Ordinance No. 27-06, *available at:* http://sfenvironment.org/sites/default/files/fliers/files/cd_ordinance.pdf

[4] San Francisco Ordinance No. 27-06, List of Registered Transporters and Registered Facilities, *available at:* http://sfenvironment.org/sites/default/files/fliers/files/sfe_zw_cd_registered_facilities_list.pdf

permitted daily capacity of each facility is not disclosed in the DSEIR; however, due to the large amount of debris that will have to be transported off-site over a very short period of time (four months), it can be assumed that this material will most likely be transported to multiple recovery facilities. Again, because the DSEIR does not disclose where this material will be transported to, we measured the distance of each recovery facility to the Project site, and then used the average distance of these facilities to represent the one-way hauling trip length (see table below).

Recovery Facility Name	Distance From Project Site (miles)
Big for Hauling and Demolition	2.1
Marin Resource Recovery Center	25.6
Smart Demolition	3.1
Blue Line Transfer, Inc.	12.1
Premier Recycle	55.3
West Contra Costa Sanitary Landfill	21.1
Certified Blue Recycling, Inc	19.6
Recology San Francisco	5.0
Windsor Materials Recovery Facility	70.6
Davis Street Transfer & Recycling Center	19.5
SF Recovery Inc	5.5
Zanker Materials Processing Facility	58.5
Average Distance From Project Site	**25**

Using this method, we can assume that approximately 29,964 haul trips will transport 262,500 cubic yards of material approximately 25 miles one-way.

The remaining 25 percent, or approximately 87,500 cubic yards, of C&D material will most likely be transported to a landfill. San Francisco currently has a contract with Waste Management, Inc., to transport waste to the Altamont Landfill, which is approximately 53 miles away from the Project site.[5] Once the Altamont Landfill contract expires in 2016, the City of San Francisco is proposing to enter a new agreement with Recology's Hay Road Landfill, which is located approximately 70 miles away from the Project site.[6] According to the DSEIR, construction activities are anticipated to occur starting in 2015, with full Project build out in 2018 (Volume 3, Appendix AQ, p. 5). For that reason, depending on when construction activities actually start, there is the possibility that C&D materials will be transported to the Hay Road Landfill. Therefore, we estimated total haul emissions assuming that 25 percent of C&D material would be transported to the Altamont Landfill (Scenario 1), and then we estimated emissions

[5] "Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County." Notice of Availability of and Intent to Adopt a Negative Declaration, March 4, 2015. *Available at:* http://sfmea.sfplanning.org/2014.0653E_NOA.pdf

from an alternative scenario, where we assumed that 25 percent of C&D material would be transported to the Hay Road Landfill (Scenario 2).

The tables below summarize the results of our analysis for each scenario.

Scenario 1: Current Contract with Altamont				
Location		One-Way Distance (miles)	Total One-Way Haul Trips	Total Vehicle Miles Traveled
75%	Recovery Facilities	25	29,964	744,106
25%	Altamont Landfill	53	9,988	527,366
100%	-	-	**39,952**	**1,271,472**

Scenario 2: Proposed Contract with Hay Road Landfill Approved				
Location		One-Way Distance (miles)	Total One-Way Haul Trips	Total Vehicle Miles Traveled
75%	Recovery Facilities	25	29,964	744,106
25%	Hay Road Landfill	70	9,988	695,165
100%	-	-	**39,952**	**1,439,271**

When we compared the total vehicle miles traveled (VMT) from each of the above scenarios to the VMT from the CalEEMod default trip length of 20 miles, we found that Scenario 1 would result in a 37 percent increase in VMT, and found that Scenario 2 would result in a 44 percent increase in VMT (see table below).

Scenario	Vehicle Miles Traveled (VMT)
1 – Altamont Landfill	1,271,472
CalEEMod Default	799,040
Net Increase in VMT	**472,432**
Percent Increase in VMT	***37%***
2 – Hay Road Landfill	1,439,271
CalEEMod Default	799,040
Net Increase in VMT	**640,231**
Percent Increase in VMT	***44%***

[6] "Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County." Notice of Availability of and Intent to Adopt a Negative Declaration, March 4, 2015. *Available at:* http://sfmea.sfplanning.org/2014.0653E_NOA.pdf

We derived emission factors from the California Air Resources Board's (CARB) EMFAC2011 model to estimate the increase in emissions when site specific hauling trip lengths are used.[7] We specified a 2015 calendar year for Scenario 1, which assumes that the Altamont Landfill contract is still active, and we specified a 2016 calendar year for Scenario 2, which assumes that the Altamont Landfill contract has expired, and has been replaced by a new contract with Hay Road Landfill. Additional parameters used to derive these emission factors are specified in the table below.

EMFAC2011 Parameter	Input
Region Type	Air Basin
Region	San Francisco Bay Area
Season	Annual
Vehicle Class	T7 Tractor
Model Year	Aggregated
Speed	Aggregated

EMFAC2011 does not provide emission factors for CH_4 and N_2O, which are mobile-source greenhouse gases that contribute to the effects of climate change. Therefore, we used heavy duty diesel truck emission factors from the Environmental Protection Agency's (EPA) *Emission Factors for Greenhouse Gas Inventories,* which specifies a CH_4 emission factor of 0.0051 grams per mile (g/mile), and a N_2O emission factor of 0.0048 g/mile.[8] We applied Global Warming Potentials (GWPs) to each of these pollutants in order to convert these emissions to carbon dioxide equivalents (CO_2e).[9]

According to the DSEIR, the CalEEMod default vehicle type for hauling is a mix of all heavy-heavy duty trucks (HHDT), labeled as a T7 vehicle type (Volume 3, Appendix AQ, pp. 1244). Furthermore, the CalEEMod emissions estimates take into account idling emissions, starting exhaust, evaporative emissions, and running losses, as well as emissions from road dust (Volume 3, Appendix AQ, pp. 1245 – 1248). Because our analysis is a bit more simplistic than the emissions calculated in CalEEMod, we estimated the emissions, using the methods and input parameters described above, from a 20-mile default hauling trip length. In an effort to demonstrate consistency, we used 2015 emissions factors to estimate the net increase in emissions for Scenario 1, and used 2016 emission factors to estimate the net increase in emissions for Scenario 2. The results of our analyses are summarized in the table below (see attachment for calculation details).

Scenario 1 vs. CalEEMod Default Hauling Emissions						
	ROG	CO	NOx	CO2e	PM10	PM2.5
Pounds per Day:

	ROG	**CO**	**NOx**	**CO2e**	**PM10**	**PM2.5**
Pounds per Day:						
Scenario 2	8.800	39.466	273.077	60,759	6.947	4.427
CalEEMod Default (2016)	4.886	21.910	151.604	33,732	3.857	2.458
Net Increase	**3.915**	**17.556**	**121.473**	**27,027**	**3.090**	**1.969**
	ROG	**CO**	**NOx**	**CO2e**	**PM10**	**PM2.5**
Tons per Year (CO2e in Metric Tons per Year):						
Scenario 2	0.387	1.737	12.015	2,430	0.306	0.195
CalEEMod Default (2016)	0.215	0.964	6.671	1,349	0.170	0.108
Net Increase	**0.172**	**0.772**	**5.345**	**1,081**	**0.136**	**0.087**

Our simple analysis indicates that the use of a CalEEMod default hauling trip length results in an approximate 37 – 44 percent underestimation in mobile-source, hauling emissions. CalEEMod default values should only be relied upon when site specific information is not available. As indicated by our analysis above, hauling destinations can be derived very easily. If site specific information is used to determine hauling trip lengths, the emissions increase significantly. As a result, an updated DSEIR should be prepared to adjust the hauling trip length to reflect site specific distances. Furthermore, worker and vendor trip lengths, which we were not able to determine due to a lack of information disclosed in the DSEIR, should also be adjusted to reflect site specific distances.

Incorrectly Presumed the Use of Tier 2 and Tier 4 Interim Engines

In this updated analysis, it is presumed that all off-road construction equipment will be outfitted with, at a minimum Tier 2 engines with 40 percent NOx verified diesel emission control strategies (VDECS), and at a maximum, Tier 4 or Tier 4 interim engines (Volume 2, p. 5.4-32). There is no substantial evidence, however, to support the assumption that the roughly 195 pieces of off-road equipment utilized during Project construction will meet these standards. Furthermore, it may not be technically feasible to acquire machinery with Tier 2 or Tier 4 engines for the Project's entire construction equipment fleet. As a result, this mitigation measure should not be relied upon to reduce the Project's construction emissions to below levels of significance. Rather, the Project should pursue additional mitigation measures that are more technically feasible to implement.

The United States Environmental Protection Agency's (USEPA) 1998 nonroad engine emission standards were structured as a three-tiered progression. Tier 1 standards were phased-in from 1996 to 2000 and Tier 2 emission standards were phased in from 2001 to 2006. Tier 3 standards, which applied to engines from 37-560 kilowatts (kW) only, were phased in from 2006 to 2008. The Tier 4 emission standards were introduced in 2004, and were phased in from 2008 – 2015. [10] These tiered emission standards, however, are only applicable to newly manufactured nonroad equipment. According to the United States Environmental Protection Agency (USEPA) "if products were built before EPA emission standards started to apply, they are generally not affected by the standards or other regulatory requirements."[11] Therefore, pieces of equipment manufactured prior to 2000 are not required to adhere to Tier 2 emission standards, and pieces of equipment manufactured prior to 2008 are not required to adhere to Tier 4 emission standards. Construction equipment often lasts more than 30 years; as a result, Tier 1 equipment and non-certified equipment are currently still in use.[12] It is estimated that of the two million diesel engines currently used in construction, 31 percent were manufactured before the introduction of emissions regulations.[13] Furthermore, in a 2010 white paper, the California Industry Air Quality Coalition estimated that approximately 7% and less than 1% of all off-road heavy duty diesel equipment in California was equipped with Tier 2 and Tier 3 engines, respectively.[14] It goes on to explain that "cleaner burning Tier 4 engines…are not expected to come online in significant numbers until 2014." Given that significant production activities have only just begun within the last year, it can be presumed that there is limited availability of Tier 4 equipment. Furthermore, due to the complexity of Tier 4 engines, it is very difficult if not nearly impossible, to retrofit older model machinery with this technology.[15] Therefore, available off-road machinery equipped with Tier 4 engines are most likely new. According to a September 20, 2013 EPA Federal Register document, a new Tier 4 scraper or bulldozer would cost over $1,000,000 to purchase.[16] It is also relatively expensive to retrofit a piece of old machinery with a Tier 3 engine. For example, replacing a Tier 0 engine with a Tier 3 engine would cost roughly $150,000 or more.[17] Therefore, before applying mitigation measures of this caliber to a Project, the applicant should consider both the cost of the proposed equipment as well as determine the

probability of obtaining an entirely Tier 2 or Tier 4 construction fleet. Unless the Project applicant can demonstrate to the public, either through budget or through a signed contractual agreement with a contractor or supplier, that they will purchase/rent exclusively Tier 2 or Tier 4 construction equipment, this mitigation measure should not be relied upon as a feasible way of reducing Project emissions.

Failure to Assess Individual Health Risk from Proposed Project

The DSEIR fails to assess the individual health risk that construction of the Project may have on nearby sensitive receptors. According to the DSEIR, because "both the PM2.5 and cancer risk assessments account for background (existing) concentrations and risk levels," the Project's contribution to PM2.5 concentrations and excess cancer risks are instead combined with background concentrations, and are then compared to cumulative significance thresholds (Volume 2, p. 5.4-45). Instead, the DSEIR uses the individual project cancer risk threshold of 10 in one million to determine the significance of emissions from the proposed emergency generators, exclusively (Volume p. 5.4-46). This application of the 10 in one million threshold is inconsistent with CEQA thresholds set forth by BAAQMD. As a result, the significance of the Project's toxic air contaminant (TAC) emissions during construction is not adequately determined. An updated DSEIR should be prepared to accurately assess the Project's individual health risk according to CEQA guidance set forth by BAAQMD.

The DSEIR does not apply the project risk threshold of 10 in one million to the Project as a whole (stationary, area, and mobile sources of TACs); rather, the DSEIR applies this threshold to stationary sources, exclusively, to the proposed emergency generators that will be used during Project operation (Volume 2, p. 5.4-46). The DSEIR explains this application by stating the following:

> "The permitting process under BAAQMD Regulation 2, Rule 5 requires a Health Risk Screening Analysis, the results of which are posted on the District's website. Per its Policy and Procedure Manual, the BAAQMD requires implementation of Best Available Control Technology for Toxics and would deny an Authority to Construct or a Permit to Operate for any new or modified source of TACs that exceeds a cancer risk of 10 in one million" (Volume 2, p. 5.4-46).

The requirements and thresholds set forth in BAAQMD's Regulation 2, Rule 5, as referred to in the DSEIR, however, apply only to stationary sources. As a result, the TAC emissions from on- and off-road mobile sources, such as construction equipment and heavy duty diesel trucks, are not held to any sort of significance threshold. This application of the 10 in one million threshold is inconsistent with CEQA thresholds set forth by BAAQMD. According to the BAAQMD's May 2011 *Recommended Methods for Screening and Modeling Local Risks and Hazards*, "the thresholds for local risks and hazards from TAC and PM2.5 are intended to apply to all sources of emissions, including both permitted stationary sources and on- and off-road mobile sources, such as sources related to construction, busy roadways, or freight movements."[18] Therefore, an individual project would be considered significant if the total project's TAC

[18] "Recommended Methods for Screening and Modeling Local Risks and Hazards." Bay Area Air Quality Management District, May 2011. *Available at:* http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20Modeling%20Approach.ashx

emissions, including exhaust from construction equipment, heavy duty diesel trucks, and diesel-powered generators, would result in an increased cancer risk greater than 10 in one million, or would result in an increased ambient air PM2.5 concentration greater than 0.3 $\mu g/m^3$.

The BAAQMD's October 2009 *Revised Draft Options and Justification Report*[19] outlines four ways of siting a new source and determining a significance threshold. Any project with the potential to expose people (receptors) to substantial levels of TAC is currently deemed to have a significant impact. The BAAQMD uses the following approach (Option 1) to determine significance:

> "Proposed development projects that have the potential to expose receptors to TAC in excess of the following thresholds from any source, mobile or stationary would be considered to have a significant air quality impact if the:
>
> - Probability of contracting cancer for the Maximally Exposed Individual (MEI) exceeds 10 in one million.
> - Ground-level concentrations of non-carcinogenic toxic air contaminants would result in a Hazard Index greater than 1 for the MEI" (p. 59).

The second option consists "of applying the current stationary source permitting thresholds to project-generated stationary, area-, and mobile-source TAC emissions" (p. 60). As previously stated, stationary sources of emissions are subject to BAAQMD's permit process per Regulation 2, Rule 5. The permitting process requires that all new or modified stationary sources that emit TACs perform modeling to determine what the concentration of TACs will be at the boundary of their property. This current permitting approach does not include area or mobile sources of emissions in the modeling or permitting assessment. If a proposed stationary source will have operational TAC concentrations from permitted equipment that result in an estimated 1 excess cancer risk in a million, the project is required to install Toxic Best Available Control Technology (TBACT) to minimize emissions of TACs. The TAC modeling must also demonstrate to BAAQMD that implementation of the proposed project would not result in additional incremental exposure of surrounding receptors to levels that exceed 10 in one million for excess cancer risk or a hazard index above one. The BAAQMD will not issue an authority to construct or permit to operate for any stationary source of TACs that would result in concentrations exceeding a 10 in one million threshold.

Option 2 expands on Option 1 by requiring the application of the one in a million threshold for stationary sources to install TBACT to projects that have TAC emissions from sources (primarily mobile) not currently required to obtain permits to operate. These non-stationary source type projects, such as the Warriors Arena Project, would be required to implement Toxic Best Practices (TBPs), such as site and circulation design, setbacks from roadways, air conditioning, and vegetation buffers, if their modeled cancer risks are above the one in a million threshold. The BAAQMD would identify a list of TBPs for non-

stationary sources to implement if they are above the one in a million threshold. The threshold of significant impact, thereby requiring implementation of all feasible on-site mitigation measures would be the 10 in a million excess cancer risk and a HI of 1.0.
