Responses to Comments

APPENDIX COM
Written Comments on Draft SEIR, Coded

This appendix contains copies of all written comments received on the Draft SEIR, including comments submitted either by letter, fax, or email. Transcripts of oral comments presented at the public hearing on the Draft SEIR are included in a separate appendix, Appendix PH.

Written comments are grouped under one of three categories: public agencies, non-governmental organization, or individuals. Tables summarizing all of the commenters in each of these three categories are presented in Chapter 11 of the Comments and Responses document and are repeated in this appendix at the beginning of each of the three groups of comments. Within each category, commenters are organized in alphabetical order by code.

To facilitate the commenter in locating the responses to his or her comments, the SEIR assigns a unique comment code plus one or more topic code to each individual comment, as explained below. Both the comment and topic codes are shown in the margin of each written comment, with the unique comment code shown first and the topic code(s) in square brackets beneath the commenter code. This information shown in the margins of each written comment serves as the cross-reference guide for the comment and topic codes.

Comment Codes

This document assigns a code to each comment letter, email, comment card, and public hearing transcript based on the name of the agency, organization, or individual submitting the comment. Comments submitted by mail, email, facsimile, comment card, or orally at the public hearing (as transcribed in the official public hearing transcript) are all coded and numbered the same way. Each commenter code has three parts. It begins with a prefix indicating whether the commenter represents a public agency (A), a non-governmental organization (O), an individual (I), or a speaker at the public hearing (PH). This is followed by a hyphen and the acronym of the agency or organization, or the individual's last name. The third part of the comment code is the sequential numbering of individual comments within a letter or email that represents a distinct topic. The first two parts of the comment codes is shown in bold at the top of each page of every written comment, and the third part is shown in the margin alongside the individual bracketed comment. Only substantive comments received on the Draft SEIR are bracketed; for example, comments that describe an agency's or organization's mission or that describe an individual's biographical background are not bracketed.

As an example of the comment coding system, the comment letter from the California Department of Transportation is coded A-Caltrans, and the first comment in the letter is coded A-Caltrans-1, the second comment on a different topic is coded A-Caltrans-2, etc. If a single agency, organization, or individual submitted comments more than once (e.g., a person spoke at the public hearing in addition to submitting written comments), a number is inserted at the end of the identifying initials. For example, an individual (John deCastro) submitted comments both at the public hearing and in a letter; the written comment set is coded as I-deCastro1, and the public hearing transcript is coded PH-deCastro2. The subsequent sequential numbers denote the individual comments from that commenter (e.g., I-deCastro1-1, I-deCastro1-2, I-deCastro1-3, etc.).

Topic Codes

The prefixes for the topic codes used in the organization of Chapter 13, Responses to Comments, are shown below:

General Comments (GEN)
Environmental Review Process (ERP)
AB 900 Process (AB)
Project Description (PD)
Plans and Policies (PP)
Impact Overview (IO)
Land Use (LU)
Cultural Resources (CULT)
Transportation and Circulation (TR)
Noise and Vibration (NOI)
Air Quality (AQ)
Greenhouse Gases Emissions (GHG)
Wind and Shadow (WS)
Recreation (RE)
Utilities (UTIL)
Public Services (PS)
Biological Resources (BIO)
Geology and Soils (GEO)
Hydrology and Water Quality (HYD)
Hazards and Hazardous Materials (HAZ)
Energy and Mineral Resources (EN)
Alternatives (ALT)

Within each topic area, similar comments are grouped together, and Chapter 13 provides a comprehensive response to those related comments under one topic code. Topic codes are numbered sequentially using the topic code prefix and sequential numbering for each subtopic. For example, General Comments [GEN] are listed as [GEN-1], [GEN-2], [GEN-3], and so on. Under each topic code in each section of Chapter 13, all of the comment codes that are addressed under each topic code as a cross-reference. As described above, topic codes are shown in this appendix in the margin of each written comment in square brackets underneath the comment code.

Supplemental Materials Submitted During Review Period

Several comment letters included attachments that did not address the adequacy or accuracy of the SEIR, such as background reports, reference lists, or resumes. These supplemental materials are not coded as comments and are not included in Appendix COM, but they are listed in the table below. The complete comment letters with all attachments are included in Appendix COM2.

TABLE COM-1
SUPPLEMENTAL MATERIALS SUBMITTED ON THE DRAFT SEIR

Commenter Code	Exhibit or Attachment	Description of Supplemental Materials
O-MBA7S2	Exhibit A	Resume of Patrick S. Sullivan, CPP, REPA; Resume of John Henkelman

San Francisco, CA 94103

Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 – Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the project referenced above. The proposed project, located on an approximate 11-acre site, would construct a multi-purpose event center and a variety of mixed uses including office, retail, open space, and parking within the Mission Bay South Redevelopment Plan Area of San Francisco. The project site is approximately one half mile from the Interstate 280 (I-280) ramps at Mariposa Street, 18th Street, and Pennsylvania Avenue. Our comments seek to promote the State's smart mobility goals that support a vibrant economy and build active communities rather than sprawl. We have reviewed the Draft Subsequent Environmental Impact Report (SEIR) and have the following comments to offer.

Forecasting

Please clarify why there is only minor difference in volumes at Study Intersections 9, 10, 11, 12, and 13 between Cumulative Project-No Event and Cumulative Project-With Basketball Game Conditions, as shown in Figures 13a and 15a (SEIR, Appendix TR, pgs. TR-156, TR-152). Additionally, Study Intersection 12 shows greater southbound and eastbound volumes in Figure 13a than 15a. The volumes of inbound vehicle trips during the weekday 4-6 and 6-8 peak hour periods are estimated 379 & 2,489 respectively and 2,797 outbound vehicle trips during the 9-11 PM peak period (pg. TR-37). This would appear to show significant Cumulative volumes. Please clarify or revise the report. 1 [TR-2d] The report should identify traffic turning movements per study intersection under Basketball Game Only, Convention Only Conditions separately. 2 [TR-2a]

Parking

- Given the Project is located on AT&T Parking Lots B & E, please clarify if Mitigation Measure M-TR-11c, which provides additional off-site parking from the Project Plus 3 [TR-13]

A-CALTRANS

Overlapping Giants Evening Game Scenario, should be revised from 1,000 to 1,600 spaces to account for AT&T Park's displaced 600 parking spaces. Table 1-1, which presents the Summary of Proposed Project Facilities, shows the arena will have seating capacity of maximum 18,500 patrons. Approximately 950 vehicle parking spaces are proposed from the combined Blocks 29-32 and the existing off-site 450 South Street Parking Garage (SEIR, Vol. 1, pg. 1-7). Mitigation Measure M-TR-11c states the City shall identify one or more off-site parking lots to provide approximately 250 additional parking spaces for all events and up to approximately 750 additional parking spaces for use during dual events of 12,500 or more event center attendees, for a total of 1,000 additional offsite parking spaces (pg. 1-23). The AT&T Park Post-Game Event Traffic Plan, courtesy of the Mission Bay Transportation Management Agency, is available at the following webpage and identifies AT&T Parking Lots B & E: http://sanfrancisco.giants.mlb.com/sf/downloads/y2015/postgame_map.pdf. 3 [TR-13] cont.

- Please elaborate how the AT&T Park Post-Game Event Traffic Plan is incorporated within the Project's Transportation and Circulation analysis regarding parking impacts on the surrounding neighborhood and roadways. According to the Post-Game Event Traffic Plan and noted in the report, some streets near AT&T Park and its parking lots are closed beginning in the 7th inning to approximately one hour post-event. Given the Project's additional number of vehicles seeking parking, potential safety issues for all road users should be identified and fully mitigated. 4 [TR-2a] Project-related queuing impacts on nearby State facilities should be analyzed. 5 [TR-2b] The AT&T Park Post-Game Event Traffic Plan is available at the webpage above. 6 [TR-2a]

- Please quantify how many additional Parking Control Officers (PCOs) will be utilized when there are overlapping events. Mitigation Measure M-TR-11a, under Conditions With a SF Giants Evening Game at AT&T Park, states the Project's Transportation Management Plan shall be expanded to include additional PCOs that shall be deployed at some specific intersections (pg. 1-22). Mitigation Measure M-TR-2a, under Conditions Without a SF Giants Game at AT&T Park, states "four additional PCOs shall be deployed to intersection where the proposed project would result in significant impacts, as conditions warrant during events (pg. 1-15). 7 [TR-3b]

Interstate 280 Mitigation

Please explain the possible interventions on the I-280 Mariposa Street on-ramp, listed under Contraflow Lane Mitigation in Table 2-1 (pg. 2-17). 8 [TR-12a]

Transportation Management Plan

We commend the City's Transportation Management Plan (TMP) to encourage sustainable mode shares and reduce single vehicle occupancy trips. The Project's participation in the Waterfront Transportation Assessment reflects comprehensive early planning efforts and on-going coordination between agencies to assess the mobility needs of travelers and provide 9 [TR-3a]

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability"

A-CALTRANS

Mr. Brett Bollinger, City and County of San Francisco
July 20, 2015
Page 3

additional services within the Mission Bay Area. We agree the TMP should include documentation for monitoring vehicle trip reduction, including annual reports to demonstrate the ongoing reduction of vehicle trips while continuing to survey the travel patterns of residents and employees within the project area. We recommend the TMP elaborate future coordination between nearby proposed large-scale development projects and their associated Transportation Management Agencies and various Transportation Demand Management measures to ensure the TMP is thoughtfully planned. 9 [TR-3a] cont.

Transportation Impact Fees

Please identify any transportation impact fees to be used for project mitigation. Consider including information from the City's local and any relevant regional impact fee program and identify if those programs include improvements to alternative modes. Caltrans encourages the City to ensure sufficient allocation of contributions toward regional transit improvements in order to better mitigate and plan for the impact of future cumulative growth on the regional transportation system. We support projects and measures to reduce vehicle miles traveled and to increase sustainable mode shares. 10 [TR-3c]

Mitigation Responsibility

As the lead agency, the City and County of San Francisco is responsible for identifying and ensuring the coordinated implementation of all project mitigations. The project's fair share contribution, financing, scheduling, implementation responsibilities associated with planned improvements on Caltrans ROW should be listed, in addition to identifying viable funding sources per General Plan Guidelines. 11 [TR-12a]

Should you have any questions regarding this letter or require additional information, please contact Sherie George at (510) 286-5535 or by email at: sherie.george@dot.ca.gov.

Sincerely,

PATRICIA MAURICE
District Branch Chief
Local Development - Intergovernmental Review

STATE C_EARING HOUSE

August 3, 2015

File No.: 335.14995.12893

State Clearinghouse
1400 Tenth Street, Room 121
Sacramento, CA 95814

Thank you for the opportunity to review the "Notice of Completion" environmental document from the State Clearinghouse regarding the Golden State Warriors multi-purpose event center project, State Clearinghouse #2014112045. The California Highway Patrol is the primary agency that provides traffic law enforcement, safety and traffic management on Interstate 80, Interstate 280 and US 101 within the city limits of San Francisco, California. The San Francisco Area is responsible for these functions and will be affected by the implications of this project. To that end, we offer the following comment: 1 [TR-4]

Our concerns relate to the final design of the proposed 18,064 seat multi-purpose event center with regard to the potential increase in traffic congestion, changes in traffic congestion patterns and the additional enforcement demands on freeways and transition ramps at and near the proposed event center. A year-round event center of this magnitude could potentially affect emergency response times for Area personnel during peak commute times which may have a negative impact on departmental services. 2 [TR-2] Furthermore, in addition to a potential increase in overall traffic congestion, Area resources may also be negatively affected with a potential increase in the number protective service details associated with this event center. 3 [PS-1] Our recommendation would be to further analyze traffic patterns and schedule events appropriately with other event centers and/or city organizers in order to reduce traffic congestion to the greatest extent possible. 4 [TR-4]

If you have any questions, or wish to discuss this matter further, please contact Lieutenant R. Rios at (415) 557-1094.

Sincerely,

C. SHERRY, Captain
Commander

Dear Brett Bollinger:

The State Clearinghouse submitted the above named Supplemental EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on July 20, 2015, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. 1 [ERP-1]

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title	Event Center and Mixed-Use Development at Mission Bay Blocks 29-32
Lead Agency	San Francisco, City and County of
Type	SIR Supplemental EIR
Description	GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an ~11 acre site (Blocks 29-32) within the Mission Bay South Redevelopment Plan Area of San Francisco. The proposed event center would host the Golden State Warriors basketball team during the NBA season, as well as provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events cultural events, conferences and conventions. GSW has entered into an agreement to purchase the site. The project requires approval of amendments to the Mission Bay Plan Design for Development, among other approvals.

SCH#: 2014112045

Dear Brett Bollinger:

The enclosed comment (s) on your Supplemental EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on July 20, 2015. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project. 1 [ERP-1]

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2014112045) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

RE: **Comments on Warriors' San Francisco Event Center Draft Subsequent Environmental Impact Report "DEIR"**
<u>OCII Case No. ER 2014-919-97</u>

Dear Ms. Bohee:

Thank you for the opportunity to review and comment on the Draft Subsequent Environmental Impact Report ("DEIR") for the proposed Golden State Warriors' ("GSW") Event Center and Mixed-Use Development project (the "Event Center" or the "Project") located at Mission Bay Blocks 29-32. UCSF appreciates the City's and the GSW's commitment to creating an Event Center project that is successful for the Mission Bay neighborhood, as well as all of San Francisco. We also appreciate the City's and GSW's commitment to identify and mitigate negative impacts that could result from the Project. After a careful review of the DEIR, UCSF continues to be concerned about the Project's potential impacts on UCSF's Mission Bay campus and Medical Center, the greater Mission Bay area and its environs. 1 [ERP-9]

UCSF acknowledges and appreciates the efforts made by the City and GSW to date to address concerns that UCSF has expressed about the impacts of the proposed Event Center on UCSF patients, patient visitors, patient care givers, and emergency vehicles. In the spirit of cooperation that has marked those conversations between UCSF, the City and GSW, UCSF offers the following comments on the DEIR, with the understanding that the City will continue to work with UCSF, GSW, and neighbors to develop more detailed plans to address and mitigate the negative impacts of the Project. We understand that these more detailed plans will be included in the Final EIR and incorporated into the Event Center's conditions of project approval, which will result in a project that will fit well in the neighborhood, be supported by UCSF, and be an asset for the City. 2 [TR-3a]

A-UCSF

A. <u>Transportation Impacts</u>

Driven by its commitment to patient care and public safety, UCSF's primary goal is to ensure that patients, patient visitors and patient care workers, as well as emergency vehicles, have 24/7 unimpeded access to its Mission Bay hospitals. This goal may be impeded by traffic congestion and parking impacts of the proposed Event Center, especially when there are dual and/or overlapping large events at the Event Center and AT&T Park. The DEIR indicates that there would be an average of nine dual and/or overlapping large events at the Event Center per year, comprised of two basketball games and seven concerts with an average attendance of 12,500 or more (DEIR p. 5.2-171). As such, large dual and/or overlapping events at AT&T Park and the Events Center should be managed judiciously. In addition, the impacts of such events—particularly on traffic flow—should be monitored and the City should have the ability to employ additional mitigation measures to ensure traffic can be maintained at acceptable levels and access to the Mission Bay hospitals is assured. Should the City's efforts to maintain acceptable traffic levels fail and access to the hospitals be impeded, UCSF supports a trigger mechanism giving the City the ability to manage the scheduling of dual and/or overlapping large events until such time that traffic can operate during such events at acceptable levels. Further, UCSF encourages City efforts to ensure funding is secured to manage these impacts and to ensure a robust monitoring program. 3 [TR-3a]

Page 5.2-32, Table 5.2-8, and page 5.2-237, Table 5.2-68 of the DEIR assumes that four UCSF lots and garages, totaling 2,590 parking spaces, will be available to event attendees. UCSF has informed the City that it should not include any of UCSF's parking spaces in the baseline parking supply in the DEIR because UCSF's current use and projected demand demonstrate that UCSF needs its parking spaces for its staff, patients and visitors. UCSF's future parking demand is expected to increase over existing demand. We appreciate that the parking supply/demand analysis in the DEIR does include tables showing the parking surplus/shortfall when UCSF's garages are not included in the parking supply. 4 [TR-13]

We support the City's efforts to optimize public transit service to and from the Event Center. Toward that end, we offer the following comments: 5 [TR-3a]

> Page 5.2-51, funding of incremental event-only Mission Bay shuttles is left to the discretion of GSW. Please consider making it a requirement that GSW fund additional shuttles if the Mission Bay TMA requests such service.
>
> Page 5.2-52, Table 5.2-14, we suggest Mission Bay TMA shuttle hours be expanded to cover post-game as well as pre-game (6-8 pm) hours.
>
> Page 5.2-53, it is unclear whether GSW or the City will pay for the four additional light rail vehicles. The Final EIR should specify.

Page 5.2-56, we would appreciate the City/GSW consulting UCSF when the number and location of PCOs are refined after Year 1.

Page 5.2-57 through 58, the text indicates that the listed transportation management strategies would apply to concerts with more than 12,500 attendees, but Table 5.2-16 (footnote b) says more than 14,000 attendees. UCSF believes that the lower number should be used.

Page 5.2-64 through 68, it is unclear who will decide which TDM measures will be implemented. We recommend that this not be solely at the discretion of GSW. Please describe which City agency will have the authority to order specific additional TDM measures.

Page 5.2-67 through 68, UCSF appreciates the performance standards set forth in the TMP. Please describe how the City would enforce these measures. In addition, we would appreciate receiving copies of the monitoring reports upon their submittal to OCII. 5 [TR-3a] cont.

Page 5.2-68, third bullet, in addition to event traffic not blocking access to the UCSF emergency room entrance, please consider deploying PCOs to ensure vehicle queuing does not block access to the UCSF hospital and hospital garage for medical staff, patients and visitors.

Page 5.2-80, the TSP should apply to all large events (+12,500).

Page 5.2-130, we request that marquee events, such as National Hockey League regular season games, not be allowed to be regularly scheduled as overlapping events given the significant traffic impacts posed by such overlapping events and the unknown transportation mode profile of those attending such events.

Page 5.2-146 through 147 and 5.2-185, given the relatively high auto mode share by South Bay and North Bay event attendees, can funding be secured for additional South Bay and North Bay transit service needs? Mitigation Measures M- TR-5a and b require GSW to "work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate" with Caltrain, Golden Gate Transit and WETA to provide additional service; how can this mitigation measure be strengthened? 6 [TR-12b]

Page 5.2-167 and page 5.2-181, Table 5.2-50, the fact that the I-280 northbound off-ramp at Mariposa is projected at LOS F during the evening peak hour during overlapping events is significant. This off ramp is an important access path to the UCSF hospitals and to neighboring land uses, and cannot be in a failing condition on a regular basis. We request a mitigation measure requiring the City to investigate the reconfiguration of the I-280 Mariposa Street northbound off-ramp lanes to better segregate Event Center traffic from UCSF and other non-Event Center traffic. 7 [TR-12a]

Page 5.2.169, Improvement Measure 1-TR-10b, we request that the traffic engineering study for Mariposa Street be completed prior to, not after, certification of the Final EIR and that it be implemented and included as a condition of project approval, if determined feasible. 8 [TR-11]

Page 5.2-180, Mitigation Measure M-TR-11c, UCSF encourages efforts to avoid scheduling non-Warriors events at the Event Center of 12,500 or more attendees that start within 60 minutes of the start of events at AT&T Park, as stated in this mitigation measure. We suggest that the mitigation measure be modified to limit large overlapping non-GSW events to what was analyzed in the DEIR -- no more than seven large Arena concerts per year. In 2014, the City imposed a numeric limit on large concerts at the Masonic Auditorium, providing a precedent for this type of condition. 9 [TR-12a]

Page 5.2-249, we request that the City commit to the additional parking lots south of the Event Center in order to minimize traffic and parking impacts of overlapping events. The total projected shortfall of about 2,000 spaces in the cumulative condition during overlapping events is substantial. 10 [TR-12a]

Comments on May 2015 TMP

Section 10.2.8, UCSF surveys need not be limited to only emergency access, but also could include surveys of general patient and staff access to the UCSF campus and Medical Center. 11 [TR-3a]

Section 10.4.4, we request that this performance standard be expanded to require that event traffic not block patient, staff and visitor access to the UCSF hospitals, not just emergency room access.

B. **Impacts on UCSF Helipad Operations Have Not Been Adequately Addressed**

After a review of the DEIR, UCSF remains concerned about the projected impact on UCSF's medical helipad, and about the DEIR's analysis of this matter. UCSF's helipad provides access to critical emergency care for children and pregnant women in distress. UCSF undertook an extensive community process and received helipad and access route approval by various regulatory agencies, including the Federal Aviation Administration, the California Department of Transportation's Aeronautics Division, and the San Francisco Board of Supervisors. Any activities proposed by GSW that would render UCSF's flight paths unusable or that would compromise the safety of air medical access are unacceptable to UCSF. 12 [TR-14]

UCSF understands and appreciates that the City and GSW continue to work on addressing the impacts. Nonetheless, the DEIR identifies the following:

- There would be 5 construction cranes at the Event Center construction site (see DEIR Figure 5.2-28), which would extend over all streets surrounding the project site, Third Street, 16th Street, Terry Francois Boulevard, and South Street.

- One crane would penetrate the airspace of UCSF's primary flight path --the flight path over 16th Street that is most frequently used, which arrives from and departs to the east. The DEIR concluded that this constitutes a potentially significant impact.

- Other cranes could penetrate the airspace of one or more of UCSF's secondary flight paths.

12 [TR-14] cont.

We understand that GSW may have a revised plan that relocates the construction cranes so that no penetration of the UCSF flight path airspace would occur, and we appreciate GSW's efforts on this matter. However, there is no commitment to avoid penetration of the flight path airspace at this time. We would appreciate GSW working toward a commitment to avoid penetration of the UCSF flight path, which we want included in the Final EIR. Also, we have the following concerns about the DEIR analysis:

- Page 5.2-265, the mitigation measure calls for the development of a Crane Safety Plan. The DEIR provides that the safety plan would identify appropriate measures "to reduce, and where possible, avoid, potential conflicts", by, among other things, seeking to "minimize penetrations" or "the duration of penetrations" into helicopter flight airspace. As currently written, the mitigation measure would allow for construction cranes to penetrate the flight path's airspace, which potentially compromises the ability of the helipad to operate 24/7. Accordingly, UCSF does not concur that Mitigation Measure M-TR-9a reduces this impact to less than significant levels. Rather, UCSF requests that the mitigation measure be revised with the objective to ensure safe, 24/7 operation of the UCSF medical helipad by requiring GSW to locate their constructions cranes so that no penetrations of airspace occur during the construction of the Project. 13 [TR-14]

- Page 5.2-263, the discussion of impacts on the alternative flight path over South Street is unclear. The text states that the working radii of the two construction cranes over South Street are not located under any part of UCSF's alternative arrival/departure flight path. However, the text also identifies the minimum amount of vertical clearance anticipated between the cranes and the approach and transitional surfaces of the flight path. It is extremely important that the analysis of impacts be clear. 14 [TR-14]

- Page 5.2-270 through 272, while the DEIR does require GSW to develop an exterior lighting plan, it does not discuss the impact of laser pointers and drones which could present a real danger to helicopter pilots and passengers. Both UCSF's helipad consultant and pilots whom we have consulted agree that this is a real safety issue. 15 [TR-14]

Although incidents are rare, it seems that in an event/crowd atmosphere, especially if there were an outdoor activity at the Third Street Plaza, the likelihood would be increased that an incident could occur. UCSF requests that mitigation measures be identified to reduce or eliminate this potential. Mitigation Measure M–TR–9d does not go far enough. It promises to develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems "would not have an undue impact on helipad operations." Any impact to a helicopter pilot transporting a critically-ill patient should be considered an undue and unacceptable impact, and further mitigation should be imposed. 15 [TR-14] cont.

C. Noise Impacts Have Not Been Adequately Addressed

When UCSF planned and developed a large student housing complex along Third Street in 2002, it relied on the zoning districts in the South Plan, which called for commercial/industrial uses on adjacent blocks such as Blocks 29-32. Those uses would be primarily daytime uses, not uses that would disgorge up to 18,000 people after 10:00 p.m. on more than 100 days per year. 16 [NOI-5]

Page 5.3-26, Improvement Measure I-N0–3. UCSF requests that this measure be modified to expand the distance for notification of owners and occupants to include all occupants of the UCSF Medical Center at Mission Bay and the student housing on Third Street.

Pages 5.3–37 through 5.3-38, the DEIR indicates that the excessive noise would occur at the northbound Muni line platform adjacent to the UCSF student housing building on up to 105 evenings following basketball games, concerts and other major event. To address this impact, the DEIR indicates that the project sponsor will urge patrons to respect the quiet of the neighborhood as they leave the area and provide to all interested neighbors a contact agency and phone number that would be prepared to respond to complaints. We respectfully request that GSW and the City devise more effective mitigation measures to address this significant impact.

17 [NOI-6]

The land uses most affected are the UCSF Mission Bay Housing units on Block 20 that front onto Third Street and onto Gene Friend Way. These buildings have no air conditioning and rely on a passive ducting system for ventilation when windows are closed for noise control. At the time these structures were built, it was anticipated that adjacent development would consist of biotechnology or office uses. It was not anticipated that an arena and event center with over 200 events per year would be proposed directly across the street, of which up to 150 large events would generate crowd noise that, according to the DEIR, would be significant and unavoidable due to "the increase in noise levels from crowds gathering at the Muni T-line platform during quieter nighttime periods". The significant and unavoidable impact of crowd noise on the UCSF Mission Bay Housing complex would most acutely affect those units in Hearst Tower which contain bedrooms that face Third Street or Gene Friend Way (83 units), those units in the

South Building which contain bedrooms that face Gene Friend Way (63 units), and those units in the North Building which contain bedrooms that face Third Street (18 units). For these reasons, UCSF requests that the following mitigation measure be included in the Final EIR:

> To minimize the effect of crowd noise on nearby sensitive receptors at the UCSF Mission Bay Housing complex, the project sponsor will evaluate and implement feasible noise control measures to limit the significant increase in noise affecting the existing UCSF Mission Bay Housing complex on Block 20. The noise control measures will be submitted to the City for review and approval, and following City approval, will be implemented to reduce the significant and unavoidable noise impacts affecting UCSF Mission Bay Housing on Block 20.

17 [NOI-6] cont.

Page 5.3–41, the DEIR provides that construction-related vehicles and equipment will be required to use designated truck routes to travel to and from the project site, as determined in consultation with the SFMTA. UCSF requests that truck routes be designated in consultation and coordination with UCSF and other nearby developers. 18 [NOI-4]

Tables 5.3-2 and 5.3-4, the distance from the "project site" to the UCSF Medical Center at Mission Bay is listed as 560 feet, without any explanation of measuring points. Elsewhere in the DEIR it is listed as 300 feet. This distance needs to be confirmed because at page 5.3-14, summarizing Article 1, Section 47.2 of the San Francisco Police Code, the DEIR states that "except as permitted by the Entertainment Commission, [amplified] sound shall not be issued within 450 feet of hospitals." As GSW proposes noise sources and noise generating events in the outdoor plaza areas as well as within the Event Center, the Final EIR should be specific and consistent about the locations from which distances were measured and what those distances are. 19 [NOI-1]

D. Inadequate Mitigation Measures

"An EIR shall describe feasible mitigation measures which could minimize significant adverse impacts…" CEQA Guidelines section 15126.4(a)(1). "Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments." CEQA Guidelines sections 15126.4(a)(2).

Many of the Mitigation Measures contained in the DEIR, as summarized in Table 1–2, are conditioned upon language such as "if feasible." 20 [IO-2]

In addition, some Mitigation Measures lack implementation or enforcement mechanisms or performance standards include TR – 2 ("if feasible", "if available", "working in good faith", "make good faith efforts"), TR – 4, TR – 5, TR –9a, TR –11 ("make good faith efforts", "if feasible", "shall exercise commercially reasonable efforts"), NO-4, and WS –1.

A-UCSF

We suggest that the significance determination for each of these impacts be reassessed assuming a worst-case scenario in which the proposed mitigation measures are not feasible. Also, the Final EIR should identify whom at OCII or other City agencies will be responsible for determining "feasibility," "availability," "good faith," and "commercially reasonable efforts." We respectfully submit that GSW should not be allowed to make these determinations. 20 [IO-2] cont.

The adoption of an effective mechanism to fully fund the City's operating costs to manage impacts as described above for the life of the Event Center would help to eliminate funding as a criteria for determining the feasibility of the measures that are the responsibility of the City. 21 [GEN-1a]

E. Utilities and Service Systems

Page 5.7–2, the DEIR indicates that the Mission Bay FSEIR determined that the projected increases in wastewater generation and storm water flows could be accommodated by the planned infrastructure at Mission Bay, and that the Mission Bay Plan's effects on wastewater and stormwater collection and treatment facilities would be less than significant. The DEIR now states that wastewater capacity will be inadequate when Project flows are added to existing and planned flows. But the DEIR presents no evidence other than a letter to SFPUC from its consultant, Hydroconsultant Engineers, as to current demands on the wastewater and stormwater collection and treatment facilities at Mission Bay and concerning what happened to make the 1998 prediction untrue. The DEIR discussion suggests that UCSF development at Mission Bay is the reason why peak flows would exceed the capacity of the dry weather pump stations, but this contention is contradicted by the analysis recently conducted by UCSF's consultants, as described below. In response to the UCSF's review of the supporting studies listed in the DEIR on page 5.7-7 (SF-DPW / SF-PUC memos "Mariposa Pump Station (MPS) Dry Weather Flow Hydraulic Analysis" dated February 3, 2015, and "Hydraulic Assessment of Mission Bay Sanitary Pump Station" dated February 25, 2015), UCSF undertook sanitary sewer flow monitoring to address questions in those analyses of the actual sewage flow contributions UCSF has to the respective pump stations. This information was provided to the City, however the relevant information from this study does not seem to be incorporated into the DEIR. 22 [UTIL-4]

Page 5.7-7, the DEIR indicates that the SFPUC is performing interim improvements at the Mariposa Pump Station to accommodate planned and approved peak wastewater flow rates from UCSF that would exceed the Mariposa Pump Station's dry weather capacity. Also, at page 5.7-12, a similar statement is made that the peak flows from UCSF are contributing to peak dry weather flows from the Mariposa subbasin that now exceed the Mariposa Pump Stations dry weather capacity and therefore interim improvements are being made. The interim improvements described in the DEIR include connecting the existing 10-inch dry weather force to the 20-inch wet weather force main as well as upsizing the influent sewer to the pump station.

The February 2015 SF DPW memo did describe the same force main improvements, but the increases in dry weather flows were not attributed to UCSF. UCSF's consultants, Freyer & Laureta, Inc., prepared a May 15, 2015, memorandum presenting results of flow monitoring from Blocks 24a/b, 25a, and Phase I of the UCSF Medical Center. The memorandum concluded that the cumulative measured average and peak sanitary sewer flow rates from these UCSF facilities was generally less than both the Mission Bay Master Plan and 2014 LRDP estimated sanitary sewer flow rates. 22 [UTIL-4] cont.

Page 5.7-13 through 17, the discussion related to Impact C-UT-2 indicates that the projected peak flow rates from the UCSF planned development of Block 25b, Block 33/34, Block 40, and Phase 2 of the MCMB is 1.2 mgd. However, the 1.2 mgd projected peak flow rate includes both Phase 1 and Phase 2 of the Hospital construction. The correct projected peak wastewater flow rate from Block 25b, Block 33/34, Block 40, and Phase 2 of the Hospital should be 0.95 mgd based on the LRDP. 23 [UTIL-4]

Page 5. 7–16, the statement that UCSF flows to the Mission Bay Pump Station would be 6.63 mgd with full LRDP development is not accurate. See 2014 LRDP Draft EIR at page 7-99 (indicating that the estimated peak flow increase to the Mission Bay Block P15 pump station from UCSF's proposed growth under the 2014 LRDP would be 0.23 mgd, resulting in a need for P15 pump station capacity of 6.63 mgd.). 24 [UTIL-4]

Page 5.7-13 through 5.7-17, it is not clear why Impact C–UT–2 does not require mitigation involving a fair share contribution by the project sponsor; rather it states that no mitigation is currently available. 25 [UTIL-5]

Page 5.7–19, the DEIR indicates again that existing and planned UCSF development at Mission Bay would result in a major contribution to cumulative wastewater flows in the subbasin. (See responses above) 26 [UTIL-4]

F. Other Issues

1. Project Description

Page 3-36 through 37, UCSF appreciates the City and GSW's commitment to the improvements listed. UCSF requests the DEIR include documentation to confirm these improvements are fully funded. 27 [GEN-1a]

Page 3-49, as discussed in greater detail in Section B, above, contractor compliance with all codes, rules and regulations is not enough to ensure that tower cranes do not interfere with helicopter flight path. 28 [TR-14]

Again, thank you for the opportunity to comment on the DEIR. We acknowledge the City's and GSW's efforts to address our concerns about the potential impacts of the proposed project. UCSF is supportive of a successful Event Center project, and looks forward to changes to the Project's EIR mitigation measures that will bring about meaningful improvements in projected conditions in the area.

Should you have any questions about these comments, please contact me at (415) 476-8312.

Sincerely,

Lori Yamauchi

Associate Vice Chancellor

BAY AREA AIR QUALITY MANAGEMENT DISTRICT

July 20, 2015

Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 DSEIR

Dear Mr. Bollinger:

Bay Area Air Quality Management District (Air District) staff has reviewed the City and County of San Francisco's (City) Draft Subsequent Environmental Impact Report (DSEIR) prepared for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (Project). The Project applicant proposes to construct a multi-purpose 750,000 square foot event center and 605,000 square feet of office, 125,000 square feet of retail, 475,000 square feet of parking and loading use, and approximately three acres of open space. The Project site is approximately 11 acres. The site is within the Mission Bay South Redevelopment Plan Area of San Francisco. The event center would have a capacity of 18,064 seats and host the Golden State Warriors, and provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences and conventions.

Air District staff greatly appreciates the opportunity to work with the City to address the potentially significant air quality impacts estimated for this Project. Project design features and the mitigation measures identified in the DSEIR will substantially lessen the local and regional air quality impacts from construction and operation of the Project.

However, even with these Project design features and on-site mitigation measures, air quality impacts from the Project still exceed the City's thresholds of significance. Therefore, Mitigation Measure M-AQ-2b Emissions Offsets (M-AQ-2b) commits the Project applicant to providing funds to achieve additional emission reductions to reduce air emissions below the thresholds of significance. To this end, M-AQ-2b states that the Project applicant would provide funding of $321,646 to the Air District to fund emissions reduction projects in the region in order to 1 [AQ-7]

A-BAAQMD

offset the remaining criteria pollutant emissions generated by both the construction and operation activities from the Project.

However, as Air District staff previously has discussed with the City, the Project Applicant would need to contribute $620,922 to fully offset the remaining criteria pollutant emissions from this Project through the Air District's grant programs. The Air District recommends that the DSEIR MM-AQ-2b be updated to reflect this funding amount. 1 [AQ-7] cont.

Air District staff is available to assist the City to address these comments. If you have any questions, please contact Alison Kirk, Senior Planner, at (415) 749-5169 or akirk@baaqmd.gov.

Sincerely,

Jean Roggenkamp
Deputy Air Pollution Control Officer

Re: BART District Comments on the Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 (OCII Case No. ER 2014-919-97)

Dear Director Bohee,

The San Francisco Bay Area Rapid Transit District (BART) has reviewed the Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development at Mission Bay Blocks 29-32. BART appreciates the coordination with the City and County of San Francisco on this important project, and supports many of the transit-first actions proposed to encourage multi-modal access to the site.

For context, BART's Transbay service began in 1974, and the original planning horizon has been surpassed by more than a decade. Given strong job expansion in San Francisco, BART has experienced unprecedented ridership growth (~25% over the last four years), which creates a number of peak period capacity challenges. BART is in the process of replacing the existing rail car fleet, modernizing the train control system, and expanding train storage, which will allow BART to carry more San Francisco-bound patrons. However, as the Bay Area concentrates more growth around the region's rail systems, BART anticipates substantial ridership increases — beyond what the current system can safely and comfortably accommodate. The Metropolitan Transportation Commission's (MTC's) Plan Bay Area (2013) and Core Capacity Challenge Grant does partially fund several of BART's most important capacity projects serving San Francisco, but BART looks forward to partnering with the City to address cumulative impacts and funding solutions.

We understand that the development proposal is for a mixed-use project that features an 18,500-seat multi-purpose event center, along with open space, parking and retail uses in the Mission Bay South Redevelopment Area. BART submitted Scoping Comments in a letter dated January 23, 2013 based on the Notice of Preparation (NOP) issued by the City of San Francisco for the project (at the former location). We are submitting the following comments based on our review of the DSEIR to the City and County of San Francisco for your consideration in proceeding with the document.

1. System capacity improvements (i.e., rail car fleet expansion, stations, train control modernization, and additional shop & yard facilities) are needed to alleviate peak period constraints from projected ridership, but are unfunded. The BART Fleet Management Plan (FMP) (2010) service levels shared with the City in our January 23, 2013 Scoping Comments on the NOP are based on projected demand. The BART FMP indicates that BART will need to increase base service frequency from 15- to 12-minute headways, and have approximately 1,100 vehicles by 2025 in order to adequately serve the demand generated in San Francisco. BART's current funding, however, leaves us more than 300 rail cars short of this total. The DEIR should take this information into account in analyzing projected transit capacity and crowding. 1 [TR-5b]

2. BART should be represented on the Ballpark/Mission Bay Transportation Coordinating Committee. BART looks forward to working with the City to identify appropriate short-term and long-term mitigation strategies and operational actions to address identified transportation shortcomings. 2 [TR-1]

3. The proposed Transportation Management Plan's (TMP) objective is to mitigate surface traffic impacts by shifting trips from personal vehicles to other modes. Given the significant traffic impact of the project under all scenarios analyzed and the subsequent need for a successful implementation of the TMP, the impacts of the target mode shift to transit on BART capacity should be anticipated, quantified and closely monitored. 3 [TR-3a]

4. The DSEIR analysis does not sufficiently detail its methodology and assumptions to enable the reader to interpret the analysis and the extent of impact for both BART operations and station capacity. For all scenarios, assumptions should be documented, including numbers of trains, train capacity, transfer (station) locations and directions of travel, average travel times to each station (to better understand passenger arrival times at the stations and their impact on station and operation capacity), etc. 4 [TR-5b]

5. Timing of Central Subway Service: Currently, the arena is scheduled to open prior to commencement of Central Subway service. If that sequence holds, Warriors fans taking BART will rely almost solely upon the Embarcadero Station - with nearly 38,000 daily boardings, the most heavily patronized station in the BART system. BART currently experiences heavy congestion at both Embarcadero and Montgomery Stations (and is working with the City to develop capacity improvements to these stations). Embarcadero Station also has the narrowest platform width of the Market Street stations. To ensure that BART can safely deliver patrons to events (in addition to accommodating peak commute loads), the City should work with BART to mitigate the short-term impact to ridership at these stations. BART seeks mitigation measures in the both short and long term to divert trip generation at Montgomery and Embarcadero stations. 5 [TR-5b]

6. The project sponsor should work with regional transit providers to encourage inbound event patrons to consider AC Transit Transbay service during the Inbound PM Peak. In general, all transit information should be seamlessly integrated with proposed dissemination of parking information so patrons understand all travel options simultaneously, including transit. 6 [TR-3a]

A-BART

7. BART is concerned about Transbay operating capacity in the eastern direction during the late evenings after events, especially after simultaneous events throughout the city on Friday and Saturday nights. Analysis for this scenario (OUTBOUND from project site) was not included in the DSEIR. Given the timing of the ends of basketball games and large events, and the time required to travel to BART stations, event patrons may be using the last trains of the evening when stations and trains are already crowded. For this scenario, the DSEIR needs a broader definition of "simultaneous events" that are known to significantly increase BART ridership. This includes other events occurring and ending simultaneously throughout the city and along the Market Street Corridor (i.e. concert venues), as well as the "ambient" increase in ridership on weekend late evenings. At a minimum, the project should call for monitoring transit capacity during this condition (late evening OUTBOUND to East Bay on Fridays and Saturdays). 7 [TR-5b]

8. Station Capacity: BART's NOP comment letter stated that the City needs to work with BART to analyze the impacts of the proposed Project on peak period travel for station capacity as well as line haul capacity to ensure that BART can safely deliver patrons to and from events. However, there was no station level ridership forecast, or analysis, to determine the impacts to individual stations. 8 [TR-5b]

9. 16th Street Station: BART is particularly aware of station loading capacity constraints at the 16th St. station. It is unclear from the analysis how many patrons would need to transfer to Muni service at this station, or what impacts that could have at the station plazas. This station does not have faregates on the concourse level nearest the entrance on the north-east corner of Mission St. and 16th St. To accommodate passengers that will be dropped off at this entrance from either MUNI #22 buses or supplementary shuttles, a new fare area may need to be added, including faregates, station booth and support infrastructure such as CCTV. Staffing needs include a station agent, police and possibly staff to meter passengers at the concourse and platform level. 9 [TR-5b]

Thank you for the opportunity to comment on this Draft SEIR. Please call me if you have any questions.

Sincerely,

Val Joseph Menotti

A-CALTRAIN

Caltrain

July 27, 2015

Ms. Tiffany Bohee
OCII Executive Director
c/o Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Ms. Bohee:

Subject: Comments on the Draft Subsequent Environmental Impact Report for the Event Center & Mixed Use Development at Mission Bay

On behalf of the Peninsula Joint Powers Board (JPB) Caltrain is submitting the following comments on the Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 (the Project). Caltrain provides commuter rail service between San Francisco, San Jose and Gilroy, operating a mix of express, local and limited service. Today, Caltrain operates 92 trains per weekday, 36 trains on Saturday and 32 trains on Sunday. Caltrain also operates supplemental service for a variety of special events including extra trains after San Francisco Giants games.

The Project site is located 0.8 miles south of the Caltrain terminal at Fourth/King and 0.9 miles northeast of Caltrain's station at 22nd Street and the analysis in the DSEIR indicates that travel demand generated by the project on event days will result in a substantial addition of riders to the Caltrain system. Specifically Caltrain notes that Impacts TR-5 and TR-14 identify Caltrain service as being significantly capacity-impacted to and from the South Bay during the weekday evening, weekday late evening, and Saturday evening peak hours during both the "Basketball Game Scenario" (Impact TR-5) and the "Basketball Game with Overlapping SF Giants Game at AT&T Park Scenario" (Impact TR-14) evaluated in the DSEIR. 1 [TR-5c]

In response to the above impacts the DSEIR identifies mitigation measure M-TR-5a "Additional Caltrain Service," noting that implementation of this measure would reduce or minimize the severity of the capacity utilization exceedances for Caltrain and would not result in secondary transportation impacts. The DSEIR also notes, however, that the provision of additional Caltrain service is uncertain and full funding for the service has not yet been identified. Implementation of the mitigation measure thus remains uncertain and impacts TR-5 and TR-14 are found to be Significant and Unavoidable with mitigation.

PENINSULA CORRIDOR JOINT POWERS BOARD
1250 San Carlos Ave. – P.O. Box 3006
San Carlos, CA 94070-1306 650.508.6269

A-CALTRAIN

Caltrain agrees with the DSEIR's analysis of capacity impacts to our service, the conclusion that additional service has the potential to mitigate a portion of these impacts, and the statement that additional Caltrain service has not yet been defined, funded or agreed to. Caltrain understands the importance of the regional transportation services we provide and we look forward to working collaboratively with the City and County of San Francisco and the project sponsors to address the transportation challenges and opportunities presented by this unique project. As the project advances through the environmental process we encourage the City and the project sponsors to engage with us directly to more formally define, analyze and identify funding for any contemplated increase in Caltrain service. 1 [TR-5c] cont.

Subject: Caltrain contact information
Date: Wednesday, July 15, 2015 6:21:17 PM

Hi Brett,

It was nice talking to you this afternoon! Per our conversation, could you provide information on the following?

- Who at Caltrain (or Samtrans) was the notice of availability sent to? 1 [ERP-2]
- Did the EIR analyze capacity impacts to Caltrain inbound service during the PM (pre-event) condition? 2 [TR-5c]

Thanks!

re: Draft SEIR for case number: OCII: ER 2014-919-97; Planning Dept: 2014.1441E

Dear Sirs and Ladies:

I am writing on behalf of the Golden Gate Audubon Society in response to the Draft SEIR for the Event Center and Mixed-use Development project at Mission Bay Blocks 29-32. We were pleased to see that this SEIR included planned mitigations for possible impact to resident and migratory birds. Two specific areas are addressed: Mitigation Measure M-BI-4a: Pre-construction surveys for nesting birds; and Mitigation Measure M-BI-4b: Bird-Safe Building Practices (refer to details in table 1-2, biological resources, initial study section E13; vol 1 pages 1-58, 1-59). Also the project description in section 3 (page 3-28) mentions Bird-Safe Design: *"The project sponsor proposes to incorporate bird-safe design measures that would reduce the potential effects of the proposed buildings, signage and lighting on birds."* The bird-safe building codes are important regulations that San Francisco has adopted – making our city a national leader in environmental stewardship. **We hope that you will do your utmost to meet and even exceed the bird-safe building design codes.** 1 [BIO-6]

There are some open questions regarding the planned open space near the project (Bayfront Park, and Agua Vista Park). It is not clear if the scope of this SEIR includes those spaces. These are additional areas of possible impact to bird populations on the shoreline. For example, the old piers off the Bayfront Park area served as the last remaining sites in San Francisco where Caspian Terns had nested collectvely. Replacement nesting platforms were proposed to be built by the Port of SF as required mitigation for America's Cup (and hasn't been done as promised yet). The shoreline beach area is also used by birds on migration, so further development of this area could have deleterious impact on wildlife use. Part of the beauty and attraction of these areas is the waterfront, so to the extent that you can incorporate natural waterline and structures that sustain the presence of charismatic wildlife (such as birds), you are serving both the people and the health of the San Francisco Bay. We encourage you to consider native plantings and features that support native wildlife. To the extent that these natural resources are negatively impacted, it will be necessary to mitigate for those impacts. 2 [BIO-6]

Thank you for your consideration of comments on this project. We encourage project leaders to be familiar with the biological report which both Golden Gate Audubon had submitted a few years back pertaining to this general area. It is called, *A Summary Report of Avian Surveys Conducted in 2008 at Dilapidated Piers and Other Structures along the Port of San Francisco's Southern Waterfront Properties* which was provided to the Port of San Francisco. 3 [BIO-6]

Re: Comments On Golden State Warriors Arena Draft SEIR

Dear Ms. Bohee:

The undersigned small business owner/operators of trucks locally based in Bayview-Hunters Point want to thank you and OCII for giving us the opportunity to comment on the Draft SEIR for the proposed Golden State Warriors Arena at Mission Bay. Our group of highly qualified hazardous-certified truckers are made up of local minority truck owners who reside in and/or hire our drivers and other employees from the local community. We park our vehicles at the Port of San Francisco railyard off Third Street, which also hires exclusively from the local community. Our member truckers transport contaminated and hazardous waste to the railyard from remediation projects all over San Francisco and the Bay Area. The local truck-to-rail system offers the following benefits to projects like the Warriors Arena project: 1 [GEN-6, HAZ-3]

- Railyard is just a few blocks from arena site compared to 250 miles one-way for long-haul truck trip to Southern California landfills;
- Excavation phase impacts can be reduced months by using truck-to-rail option;
- Reduced fuel consumption by hundreds of thousands of gallons and reduced toxic air emissions (CO2) by millions of pounds per project;
- Reduced liability of hazardous waste at high speeds down public highways;
- Economic development dollars stay in our neighborhood.

With that in mind, here are our comments on the Draft SEIR:

1. We found no mention in the EIR documents about the geology or toxic contaimination at the proposed site. Our group of truckers hauled more than 100,000 tons of toxic soils from the Shorenstein office buildings site (formerly Union Oil tank farm owned by Chevron-Texaco) immediately adjacent to the south side of the proposed arena site. Our understanding is that the arena site has similar contamination, which should be discussed in the EIR. 2 [HAZ-1]

2. The project plans show the arena building being sunken down into the site, which means the soils currently there will need to be excavated and removed. Since the arena site is at least as big as the adjacent Shorenstein site, and since the fill material is likely similar, in excess of 100,000 tons of soils will likely need to be removed. The traffic, air and other impacts from this soil removal activity during the construction period should be discussed in the EIR. We believe using the same very successful approach as used on the Shorenstein project, mass excavation and 1-mile haul down Illinois Street to the railyard – would result in the least environmental impacts of all options. 3 [TR-10, HAZ-3]

3. We would like to see the direct excavation of all Class 1 toxic soils and use of our local truck-to-rail as the preferred remediation option because: 4 [HAZ-3]

   (a) any *on-site treatment* of toxic soils means double or triple-handling of the waste and airborne toxics spread into nearby neighborhoods and the Bay;

   (b) *long-haul trucking* has the ability to remove from the site only 500 tons daily maximum, and due to a shortage of hazardous trucks in the State, possibly far less. This means the excavation phase of the site preparation could take months more than the local rail option; would generate many times the amount of CO2 and other toxic air emissions as the rail option; and would have far greater risk of impacts on the driving public due to millions of high speed truck miles with toxic waste from the project.

   (c) *local truck-to-rail* option can remove 3,000 tons daily and reduce the period of construction (and impacts from construction) by months; offers a 1-mile one-way truck haul versus a 250-mile one-way truck haul to Southern California; offers significantly reduced fuel use and toxic emissions; offers the ability to use 100% local-based minority and women-owned truckers.

O-BCTA

Other projects that our team of local truckers have successfully hauled hazardous and contaminated soils to the railyard at the Port, in addition to the adjacent Shorenstein project, include: UCSF Medial Center at Mission Bay; Kaiser Medical Center @ Mission Bay; Transbay Terminal; Pac Bell Park; The Gap Headquarters; SFMTA Third Street Light Rail; Hunters Point Naval Shipyard; Equity Potrero –16th Street; Embarcadero Waterfront Improvement; Avalon Bay Communities; SFMTA Central Subway; and hundreds more that have chosen the local truck-to-rail option as the best option.

We would like that our community truckers be able to take part in this exciting and historic project using our successful truck-to-rail approach. And again, we appreciate the opportunity to comment on the EIR.

Importance: High

Hilde, good morning. We are reading through the Warrior's DEIR and encountering major heartburn with the noise and vibration analysis and mitigation. First, we see continuing reference to the MB Good Neighbor Policy and the SFEIR for MB completed in 1998. None of us in the MB life science community have seen those documents much less participated in the development of same. Life science and specifically sophistication of instrumentation and evolution of preclinical work has changed dramatically since 1998.

Could you please forward a copies of at least the Good Neighbor Policy as soon as is possible.

June 18, 2015

San Francisco Chronicle

Dear Sir or Madam:

Professor Richard Zitrin is absolutely correct in his June 18th op ed that the Warriors need to stay in Oakland. What he did not address is what one of my law professors said you always need to examine: "cui bono", to whose benefit. Moving the Warriors to San Francisco is all about getting more money for the out-of-state owner of the Warriors. Think luxury boxes and increased ticket prices. Just like Larry Ellison after extracting concessions for the America's Cup abandoned San Francisco and chose to go to San Diego for the next Cup, do you think the Warrior's owners are acting in the best interest of the Bay Area. The ads they have placed in the Chronicle using sports figures like Joe Montana to promote their scheme is pure hypocrisy. Where was Joe when the 49ers moved, looking to invest in real estate in Santa Clara. Remember how San Francisco felt when the Yorks moved the 49ners. Let's put a stop to such behavior. Maybe we should be talking about with public ownership of sports teams such as in Green Bay and demand the owners provide that as a condition of locating in a city. Over the 40 years between championships, the arena in Oakland has been sold out regardless of the Warrior's record. There is no reason to move the Warriors from Oakland. The Coliseum site has much better access, particularly to public transportation than the proposed Mission Bay site adjacent to a new hospital. One only needs to go to ATT Park and recognize the traffic problems when the Giants are playing. Hopefully, you do not need to see a doctor when the Warrior's are playing. Its about time that we see professional sports teams as a benefit to the entire Bay Area and that we plan for multiple venues so all cities can share the benefit and burdens. This is the true "sharing" economy. 1 [GEN-5]

Re: **Request for extension of comment period.** Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms. Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance, an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project").

I write to request a 45-day extension, to September 3, 2015, of the public comment period on the Draft Subsequent Environmental Impact Report ("DSEIR"), currently set to expire on July 20, 2015. This extension is necessary for the public, including my client, to meaningfully comment on the DSEIR.

The Project is a large, multifaceted sports, entertainment, and office complex situated in a densely populated metropolitan area. The Project vicinity is expected to experience large increases in traffic even without this Project. (See San Francisco Transportation Plan, 2040.) Also, the Project setting has a long history of industrial and chemical pollution, yet retains a wide diversity of environmental resources and amenities that are threatened by further development. 1 [ERP-4]

As a result, this DSEIR has a long and complex environmental review history under CEQA, including the 1990 FEIR for the Mission Bay Plan, the 1998 FSEIR for the Mission Bay North Redevelopment Plan and the Mission Bay South Redevelopment Plan, and nine addenda to the 1998 Mission Bay FSEIR (completed between 2000 and 2013) for specific developments within Mission Bay that required additional environmental review beyond the 1998 FSEIR. (See DSEIR, p. 2-4 - 2-

5.)

Consequently, 45-days is simply not enough time to meaningfully review and comment on the DSEIR. Indeed, in recognition of the depth and complexity of the environmental review needed for the Project, the City recently obtained a one year extension (from January 1, 2016, to January 1, 2017),[1] from the state legislature of the deadline by which the City must certify the Project's Final SEIR in order to qualify for the "super fast track" litigation schedule provided in AB 900 (codified at Public Resources Code section 21178 et seq.).

The City has been engaged in the environmental review of development in Mission Bay for over 25 years. The City has also been engaged in the environmental review of the Warriors Arena Project for over a year, since April 29, 2014,[2] or at least since preparing the June 24, 2015, Administrative Draft of the DSEIR. Further, with the comment period ending on July 20, 2015, the City will have almost a year and a half to respond to public comments and issue the Final SEIR, and process any appeal of the FSEIR certification to the Board of Supervisors and still take advantage of AB 900's "super fast track" litigation schedule.[3] 1 [ERP-4] cont.

These facts reveal an EIR preparation schedule that confers a vast advantage on the City over members of the public who do not share the City's strong desire to locate the Warriors arena in Mission Bay. In the interests of fairness and meaningful public participation in the EIR process, the City should extend the comment period on the DSEIR for at least 45 additional days, to September 3, 2015. Indeed, public participation in the EIR process is fundamental state policy:

> An EIR is an "environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." [citations omitted] The EIR is also intended "to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." [citations omitted] Because the EIR must be certified or rejected by public officials, it is a document of accountability. If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant

[1]See Public Resources Code section 21189.1.

[2]See April 29, 2014, CCII Agenda, Item # *.

[3]The deadline for filing the EIR appeal is 30-days after OCII certifies it. The clerk is required to schedule the hearing on the appeal no earlier than 21-days and no later than 45-days after the 30-day appeal period expires. (San Francisco Administrative Code § 31.16.)

> action, and the public, being duly informed, can respond accordingly to action with which it disagrees. [citation omitted] The EIR process protects not only the environment but also informed self-government.

Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 392.) 1 [ERP-4] cont.

Thank you for your attention to this matter.

Very Truly Yours,

Tom Lippe

RE: Notice Regarding Incomplete Record for Warriors Event Center Environmental Review

Dear Ms. Bohee and Mr. Bollinger:

This firm represents the Mission Bay Alliance with respect to the Warriors Event Center project. Under Public Resources Code section 21186, which pertains to preparation of the administrative record for projects under the AB 900 "Environmental Leadership" process:

> (a) The lead agency for the project shall prepare the administrative record pursuant to this division concurrently with the administrative process.
> (b) All documents and other materials placed in the administrative record shall be posted on, and be downloadable from, an Internet Web site maintained by the lead agency commencing with the date of the release of the draft environmental impact report.
> (c) The lead agency shall make available to the public in a readily accessible electronic format the draft environmental impact report and all other documents submitted to, or relied on by, the lead agency in the preparation of the draft environmental impact report. 1 [AB-2]

Upon review of the records posted at www.gsweventcenter.com it is apparent that all of the available documents that would be part of the record as defined by Public Resources Code section 21167.6, subdivision (e) are not included. For instance, references cited in the 2015 DSEIR, 2014 NOP/Initial Study, the 1998 Mission Bay SEIR and the 1990 Mission Bay EIR are not included. These references would fall under both Public Resources Code section 21186, subdivision (c) (documents relied upon by lead agency) as well as Public Resources Code section 21167.7, subdivision (e)(10) (materials relevant to compliance with CEQA). (See also CEQA Guidelines, § 15150, subd. (b)

("Where part of another document is incorporated by reference, such other document shall be made available to the public . . . .).)

As just one example, a cultural resources evaluation that was prepared for the 1990 Mission Bay EIR and referenced in the 2014 NOP/Initial Study that is the basis of the entire cultural resources section is also missing.[1] Since the 2015 DSEIR completely relies on analyses found in prior environmental review documents for analysis of cultural impacts (and several other resources), it is essential that the public have access to all of the documents that form the basis for this analysis. Additionally, some references in the 2015 DSEIR are not yet included on the website. For instance, the 2015 DSEIR cites to "54 Federal Register 38044, September 14, 1989." (DSEIR, p. 5.4-13, fn. 21.) This office has also already requested several reference documents cited in the NOP/Initial Study and other reference documents that are critical to analysis of seismic hazards for the site and appreciates your attempts to locate those documents. (See email attached as Exhibit A.) 1 [AB-2] cont.

Moreover, we believe that not all of the correspondence regarding the project has been posted. (See Pub. Resources Code, §§ 21167.6, subd. (e)(7), (10), 21186, subd. (c).) Specifically, all of the documents responsive to Mr. Spaulding's May 18, 2015 Sunshine Act/Public Records Act request would properly be included in the record and appear to not yet be posted on the record website.

AB 900 expressly mandates that a complete record be posted online at the time of release of the DSEIR in order to receive streamlining benefits. (Pub. Resources Code, § 21167.6, subd. (b).) As those documents already in existence that comprise the record have not yet been posted, the 45-day comment period has not properly commenced, and may only commence when all of the documents now in the City/OCII's possession that constitute the record are posted. The current comment deadline of July 20, 2015, will need to be extended accordingly. Until there is compliance with the record posting requirements of Public Resources Code section 21086, this project cannot proceed under the AB 900 process. 2 [ERP-4]

[1] "Cultural Resources Evaluation for the Mission Bay Project, San Francisco, CA" Dec. 1987, prepared by David Chavez & Associates. This report is cited at page VI.J.30 of the 1990 EIR and referenced on page 46 of the November 19, 2014 NOP/Initial Study. There is also a 1997 Archaeological resources review, also prepared by David Chavez & Associates, and referenced in the Initial Study that is not included in the online record.

O-MB2S1

Please feel free to call me to discuss proper resolution of the issue of the posting of a complete record as required under the AB 900 process. I also request immediate confirmation that the 45-day DEIR comment period will not commence until the necessary documents, as set forth above, are posted in compliance with AB 900. We look forward to your prompt response. 2 [ERP-4] cont.

Very truly yours,

Subject: RE: Request for EIR Reference Documents

Hi Brett,
Thank you for your call. The date of the report linked below is March 28, 2008, whereas the date of the document referenced on p. 3 of the April 11, 2014 Updated Phase I Assessment is March 7, 2008. The document title appears to be the same, but if there was a prior draft, we would request that as well.

Here are the additional source documents citations to references that my consultant has identified as essential to his review of the DSEIR:

1. The September 17, 1998 SEIR, Section V.H.5 cites a 1995 geotechnical investigation by Treadwell & Rollo, Inc. The reference listed "/15/" for that report cites to "The results of earlier geotechnical investigations are discussed in the 1990 FEIR, Volume One, pp. II.76-II.77, and Volume Two, pp. VI.K. 1-VI.K. 11, VI.K.24-VI.K.30.*"

   The 1995 Treadwell & Rollo report is needed for review.

2. Reference "/16/" cites to the following:
   Treadwell & Rollo, Inc., Environmental and Geotechnical Consultants, Lori A. Simpson, PE, and Frank L. Rollo, PE, Proposed UCSF Site, Mission Bay, San Francisco, CA, letter report to Kerstin Magary, Catellus Development Corporation, 31 October 1994, 2 pages accompanied by 38 figures; Treadwell & Rollo, Inc., Environmental and Geotechnical Consultants, Loft A. Simpson, PE, letter to EIP Associates, March 12, 1997, 1 page accompanied by 6 figures.

   The 1994 Treadwell & Rollo report letter report and 1997 letter report are needed for review. 3 [ERP-3]

3. Recent Geotechnical Reports: The only geotechnical report that is listed on the http://www.gsweventcenter.com/ site is a March 28, 2014 Preliminary Geotechnical Evaluation by Langan Treadwell Rollo. This letter report is lacking any site data or analysis. The report presents conclusions and recommendations based on unidentified previous site investigations. The supporting data/reports/analysis should be identified and presented for review.

4. According to the June 2015 Phase II ESA by Langan Treadwell Rollo, the following geotechnical reports have been completed for the site:

   Langan, 2011. Geotechnical Investigation, Blocks 29-32, Mission Bay, San Francisco, California. 21 December.

5. According to the April 11, 2014, Update Phase I, ESA by Langan Treadwell Rollo, the following geotechnical reports have been completed for the site:

   Treadwell & Rollo (T&R), 2007. Geotechnical Investigation, Block 30, Mission Bay, San Francisco, California. 17 October.
   T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 29-32, Mission Bay, San Francisco, California. 7 March.

O-MBA2S1

T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 33-34, Mission Bay, San Francisco, California. 29 May. 3 [ERP-3] cont.

I look forward to receiving the documents previously requested on July 3rd, as well as those listed above, as soon as possible as they are needed for our review and comment on the DSEIR.

Best regards,
Osha

Re: Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045: **EIR Tiering**

Dear Director Bohee and Mr. Bollinger:

The undersigned counsel for the Mission Bay Alliance write on the Alliance's behalf regarding a threshold procedural issue affecting the Draft Subsequent EIR ("DSEIR") for the Warriors Event Center & Mixed Use Development (the "Project"). The DSEIR unlawfully tiers to prior CEQA documents.

The Mission Bay Alliance objects to the improper use of "tiering" to avoid analysis of important environmental issues in the DSEIR. Both the NOP/IS and the DSEIR announce that they "tier" to the 1998 Mission Bay EIR pursuant to CEQA Guideline 15168(c). (NOP/IS, pp. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR exclude resource topics from the DSEIR based on standards CEQA provides to determine when a subsequent EIR is required under Public Resources Code ("CEQA") section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.) 1 [ERP-7]

Based on these predicates, the City prepared a focused EIR and conducted no environmental review regarding Biological Resources, Aesthetics, Land Use, Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. The exclusion of those topics from the DSEIR is erroneous as a matter of law and precludes informed public review.

"Tiering" under CEQA is not permitted where the later project is a separate project from the earlier project, where the EIR for the earlier project did not include an analysis of the environmental impacts of the later project, or where the later project is inconsistent with the "program, plan, policy, or ordinance for which an environmental impact report has been prepared and certified" or is inconsistent with "applicable local land use plans and zoning of the city, county, or city and county in which the later project would be located." (*Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156, 1173 (*Sierra Nevada Conservation*); *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318; CEQA, § 21094(b).) 1 [ERP-7] cont.

Here, as shown in the "Land Use" section of the July 26, 2015, letter from the Brandt-Hawley Law Group, the Project is not consistent with the Mission Bay Redevelopment Plan or with the land use plans and zoning controls that are subordinate to the Mission Bay Redevelopment Plan. None of them include, anticipate, or allow a 750,000 square foot Event Center! The 2015 DSEIR also states that the Project requires "amendments to the Mission Bay South Design for Development, and modifications to the Mission Bay South Signage Master Plan and Mission Bay South Streetscape Plan, and conditions of approval," among other changes, in the list of approvals required for the Project. (DSEIR, p. 3-51.) 2 [PD-1]

These major differences between the project described in the 1998 FSEIR (that evaluated the effects of developing the Mission Bay plan area as described in 1998 [see DSEIR Figure 3-7]) and the Warriors Event Center and Mixed Use Development now being proposed, preclude tiering under CEQA section 21094. Therefore, the City cannot use a "tiered" EIR and the DSEIR must be reissued in "non-tiered" form. 3 [ERP-7]

Further, the exclusion of resource topics from the DSEIR is not, as the NOP/IS and DSEIR presume, governed by CEQA section 21166 and Guideline section 15162 or their standards. Pursuant to section 21151, the DSEIR must analyze the Project's impacts on any environmental resource for which substantial evidence supports a fair argument of significant impact. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099 ["EIRs must "consider and resolve every fair argument that can be made about the possible significant effects of a project."]; see also, *Sierra Nevada Conservation, supra*, 202 Cal.App.4th 1156, 1173 ["If a proposed new activity is a separate project, the "fair argument" test should apply to an agency's decision whether to require a tiered EIR.] Sierra Nevada Conservation cited the holding of *Sierra Club v. County of Sonoma, supra*, 6 Cal.App.4th 1307, 1318, that under the fair argument test, "deference to the agency's determination is not appropriate and its decision not to require an EIR can be upheld only when there is no credible evidence to the contrary." (Ibid.) *Sierra Club* applied the fair argument standard to a proposed project that was not "either the same as or within the scope of" the program described in the EIR. (*Sierra Club, supra*, 6 Cal.App.4th 1307, 1321.)

3 [ERP-7] cont.

As discussed in comment letters submitted on behalf of the Mission Bay Alliance, evidence relating to these excluded resource topics meets the "fair argument" standard. Although CEQA section 21166 does not apply here, its standards are also met. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all Project-related environmental impacts. (Since this is a stand-alone EIR, the title 'Subsequent' is a misnomer.)

To the extent the City chooses to use data from the 1990 or 1998 Mission Bay EIRs, that information must be restated in the Revised Draft EIR in a manner that results in a single, cohesive, understandable document meeting CEQA's mandates for adequacy, completeness, and a good faith effort at full disclosure. (Guideline § 15151.)

O-MBA3

Thank you for your attention to this matter.

Sincerely,

Thomas N. Lippe	Susan Brandt-Hawley	Osha Meserve	Patrick Soluri

Re: Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045: **AB 900 and Litigation Streamlining**

Dear Director Bohee and Mr. Bollinger:

The undersigned counsel for the Mission Bay Alliance write on the Alliance's behalf regarding the Draft Subsequent EIR ("DSEIR") for the Warriors Event Center & Mixed Use Development (the "Project"). The City's failure to post online administrative record documents before starting the DSEIR comment period renders the Project ineligible for the litigation streamlining provisions of AB 900.

On July 9, 2015, the Mission Bay Alliance advised the City that it had failed to post available portions of the administrative record online as required by CEQA section 21186, subdivision (b), and as a result, the 45-day comment period on the DSEIR could not commence. The City responded on July 16, 2015, stating that the record was complete and that the documents alleged to be missing were not considered by the City in preparing the DSEIR. The City also extended the public comment period by a mere seven days, a decision it explained elsewhere was to "account for any time off that the public may have enjoyed over the Independence Day holiday." (July 15, 2015, Letter from OCII to Tom Lippe.)

1
[AB-2]

The City's position ignores CEQA's statutory language regarding the required content of the record. Under CEQA section 21186, subdivision (a), preparing the "administrative record pursuant to this division" means that the record posted must include all of the available documents that are part of the record as defined by section 21167.6, subdivision (e).[1] The 45-day public comment period cannot begin until all existing administrative record documents are posted to the City's record website.

Regarding specific documents the City has omitted from its record website, the City has taken the position that references cited in the 2015 DSEIR, 2014 NOP/Initial Study, the 1998 Mission Bay SEIR and the 1990 Mission Bay EIR are not part of the record and that the online record is complete. But this position is entirely at odds with the City's reliance on a tiered SEIR. Since the 2015 DSEIR relies completely on analyses found in prior environmental review documents to avoid analysis in the DSEIR of at least half the CEQA mandated resource areas, it is essential that the public have access to all of the documents that form the basis for these analyses.

1
[AB-2]
cont.

Additionally, the online record is missing additional categories of documents. For example, the City has failed to post correspondence among City employees and with consultants regarding the project. The Mission Bay Alliance understands that several different consultants and City agencies are involved in the project, yet there is not even a category on the record website for this correspondence. These materials are part of the record. (CEQA §

[1]The City cannot argue AB 900 implicitly repealed section 21167.6 because the Legislature is presumed aware of existing law when it acts (see, e.g., *Voters for Responsible Retirement v. Board of Supervisors* (1994) 8 Cal.4th 765, 779, fn. 3). This is especially true here, where the relevant definition is within the same statute the Legislature amended.

350 Rhode Island St. | Suite 240 San Francisco CA 94103 | 415.767.3681
MISSIONBAYALLIANCE.ORG

21167.6, subd. (e)(2).) The City has also failed to post agendas and staff notes from ongoing weekly City meetings regarding this Project and its environmental review.[2]

There has also been staff correspondence regarding the procedures applicable to the online record, such as a June 10, 2015, ESA memorandum entitled: AB 900 Administrative Record Update Procedures for the Golden State Warriors Event Center and Mixed Use Development at Mission Bay Blocks 29-32.

These are just a few examples of how the City has not carried out its obligation to post all available record documents online before commencing the 45-day comment period. Contrary to the position taken in the City's July 16, 2015, letter, which implies the public must identify the missing documents, it is the City's duty to locate, index, and post the documents comprising the record.

1 [AB-2] cont.

AB 900 requires the City to post all available record documents online when the DSEIR is issued in order to receive its litigation streamlining benefits. For this purpose, "record documents" is defined in CEQA section 21167.6, subdivision (e). The City cannot have it both ways. It cannot violate AB 900's record posting requirements and at the same time enjoy the benefits of AB 900's litigation streamlining provisions. Therefore, in order to take advantage of AB 900's litigation streamlining provisions, the City must post all existing record documents before commencing the 45-day comment period. Otherwise, the Project is ineligible for the streamlining provisions of AB 900.

[2]To the extent these documents are posted, they are not individually indexed as required. (See Cal. Rules Court, rule 3.2205.)

O-MBA4

Thank you for your attention to this matter.

Sincerely,

Thomas N. Lippe   Susan Brandt-Hawley   Osha Meserve   Patrick Soluri

Re: Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

I am writing on behalf of the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter. 1 [GEN-5, PD-1]

The Alliance opposes this Project because it will change the Mission Bay community and environment in ways never envisioned when the Mission Bay Redevelopment Plan was adopted in 1998, and because the City's Draft Subsequent Environmental Impact Report ("DSEIR") for the project does not present a good faith, adequate analysis of these impacts. 2 [ERP-6

The Alliance has retained several experienced CEQA attorneys to review and comment on the DSEIR, including Tom Lippe of the Law Offices of Thomas N. Lippe, Susan Brandt-Hawley

of the Brandt-Hawley Law Group, and Patrick Soluri and Osha Meserve of Soluri Meserve. Counsels' comments letters, and their retained consultants' reports, are being submitted to the City under separate cover. A complete inventory of these letters to date is presented at the end of this letter.

The DSEIR is noteworthy because it concedes the Project will cause numerous significant impacts on the Mission Bay community and environment (e.g., traffic, air pollution, noise pollution, and many others). Nevertheless, the Alliance's counsel have discovered many deep flaws in the DSEIR that obscure the true scope and severity of the Project's impacts. 3 [ERP-9]

For example, based on the incorrect premise that the DSEIR is permitted to "tier" to a seventeen year old prior EIR, the DSEIR fails to even discuss half of the environmental topics that an EIR would ordinarily include. One of these excluded topics is "land use." This is truly remarkable considering that the 1998 Redevelopment Plan to which this DSEIR attempts to tier never contemplated a major sports and entertainment center of this type and scale. Instead, the Arena will divert land and civic resources away from the land uses, i.e., health sciences and biotechnology, that the 1998 Redevelopment Plan was intended to promote. 4 [ERP-7]

In another example, the DSEIR's analysis of the Arena's severe traffic impacts is artificially and arbitrarily limited to the Mission Bay area plus a handful of additional intersections and freeway ramps. The Alliance's traffic engineers demonstrate, in a more objective analysis, that the Arena's traffic snarling influence will extend much farther into SOMA, Downtown, and Dogpatch areas. 5 [TR-2b] The DSEIR also ducks revealing more bad news about the Arena's cumulative impact on traffic in the years following its construction. Instead of projecting cumulative traffic effects 5 to 10 years out, the DSEIR offers up a virtually meaningless projection for the year 2040, fully 25 years in the future. 6 [TR-2h]

The DSEIR also offers no data to support its conclusion that Arena events will not interfere with emergency access to UCSF Hospital. Instead, it offers weak rationalizations, such as the idea that drivers are supposed to get out of the way of emergency vehicles. But it is common knowledge that in special event situations, and even on normal days in SOMA, 7 [TR-9]

350 Rhode Island St. | Suite 240 San Francisco CA 94103 | 415.767.3681
MISSIONBAYALLIANCE.ORG

vehicles are often queued bumper-to-bumper and pedestrians are swarming the crosswalks. In these situations, drivers often cannot clear the way for emergency vehicles. Regardless of the DSEIR's prevarications to the contrary, this scenario *will* occur during basketball games and ambulances *will* be delayed. 7 [TR-9] cont.

Even the DSEIR's assumptions made about the available parking supply present a stark departure from the reality of parking conditions at Mission Bay and underscore the high level of wishful thinking involved in selling a project wholly incompatible with this region. The project itself only includes 200 onsite parking spaces specifically dedicated for the arena's use. Yet, rather than concede the limited onsite parking, the DSEIR suggests that ample parking will be available to serve the arena's needs by listing all 9,135 possible parking spaces in the Mission Bay region, including street parking. Unfortunately, the vast majority of those spots are currently reserved by UCSF hospitals, UCSF facilities, the Giant's stadium and neighboring businesses, and the DSEIR lacks any evidence to support the assumption that any of these spaces - let alone the majority - will be available for use by arena patrons. It also fails to explore the impact on neighboring communities in the Dogpatch and Potrero Hill areas that will bear the burden of accommodating the thousands of additional cars seeking, but unable, to park in Mission Bay. 8 [TR-13]

These are but a few of dozens of legal defects the Alliance's counsel found in the DSEIR. The volume, scope, and depth of the DSEIR's legal flaws demand, and suggest, an explanation. It appears the Warriors and the City have been in such a rush to get this Project approved and built that they have ignored elementary principles of environmental analysis and CEQA law in the process. The sources of this haste are presumably the previous January 1, 2016, deadline, now extended to January 1, 2017, to certify the EIR in order to obtain the litigation streamlining benefits of AB 900, and the expiration, in late September of 2015, of the Warriors option to purchase the site from Salesforce.com. 9 [ERP-6]

Given the Arena's many severe environmental and community impacts, and the DSEIR's attempt to sweep many of these issues under the rug, the Alliance urges the City to slow down 10 [PD-1]

and carefully consider both the legality of siting the Arena in Mission Bay as well as the lack of wisdom in doing so. 10 [PD-1] cont.

A list of the Alliance's counsels' and consultants' comment letters follow. 11 [ERP-3]

Thomas Lippe, Susan Brandt-Hawley, Patrick Soluri, and Osha Meserve have jointly submitted the following comment letters on Alliance letterhead:

1. July 26, 2015, letter regarding EIR tiering; and

2. July 26, 2015, letter regarding litigation streamlining under AB 900.

Thomas Lippe has submitted the following comment letters and consultant reports:

3. July 24, 2015, letter regarding impacts on Hydrology, Water Quality, and Biological Resources, including:

    a. July 21, 2015, letter report authored by Matt Hageman, P.G., C.Hg., QSD, QSP; and

    b. July 21, 2015, letter report authored by Erik Ringelberg, B.Sc., M.Sc., Ph.D candidate; and Kurt Balasek, PG, CHg, QSD.

4. July 25, 2015, letter regarding impacts on Noise and Vibration, including:

    a. July 24, 2015, letter report authored by acoustic engineer Frank Hubach.

5. July 26, 2015, letter regarding impacts on Air Quality, including:

    a. July 19, 2015, letter report authored by Greg Gilbert; and

    b. July 20, 2015, letter report authored by Paul Rosenfeld, Ph.D, and Jessie Jaeger.

6. July 27, 2015, letter regarding impacts on Transportation, including:

a. July 23, 2015, letter report authored by traffic engineer Dan Smith; and

b. July 21, 2015, letter report authored by traffic engineer Larry Wymer.

7. June 29, 2015, letter requesting an extension of the public comment period on the DSEIR.

Susan Brandt-Hawley has submitted the following comment letter:

8. July 26, 2015, letter regarding impacts on Land Use, Aesthetics, Cultural Resources, and Project Alternatives.

Patrick Soluri and Osha Meserve have submitted the following comment letters and consultant reports:

9. July 26, 2015, letter regarding impacts on Geology and Soils, Recreation, Hazardous Materials, , Greenhouse Gases, Wind and Shadow, Utilities and Service Systems, Public Services, Energy and Urban Decay, including:

a. July 22, 2015, letter report authored by air quality professionals Patrick Sullivan, CPP, REPA, and Joh Henkelman, regarding Greenhouse Gas Emissions;

b. July 22, 2015, letter report authored by geotechnical engineer Lawrence Karp, CE, CEG, regarding Geology and Soils impacts;

c. July 22, 2015, letter report authored by engineering geologist Marin Cline, CEG, and hydrogeologist Kurt Balasek, PG, CHg, QSD, regarding Geology and Soils impacts);

d. July 22, 2015, letter report authored by geotechnical engineer Martin Cline, GEG and Kurt Balasek, PG, CHg, QSD, regarding Hazardous Materials; and

e. July 22, 2015, letter report authored by economist Philip King, Ph.D., regarding Urban Decay.

11 [ERP-3] cont.

10. June 29, 2015, letter regarding the City's failure to comply with AB 900 record keeping procedures and the resultant ineligibility of the Project for AB 900's litigation fast track procedures. 11 [ERP-3] cont.

The Board of Directors of the Mission Bay Alliance fully supports and endorses the comment letters and reports listed above, and respectfully urges the City to remedy the DSEIR's informational deficiencies and circulate a Revised DSEIR for a 45 day public comment period. 12 [ERP-5]

Thank you for your attention to this matter.

Sincerely,

Bruce Spaulding
On Behalf of the Mission Bay Alliance

Subject: Comments on the Draft Subsequent EIR
Warriors Event Center & Mixed Use Development
Mission Bay Blocks 29-32
OCII: ER 2014-919-97 Planning Dept.: 2014.1441E

Dear Director Bohee and Mr. Bollinger:

On behalf of the Mission Bay Alliance ("the Alliance"), please respond to these enumerated comments on the Draft Subsequent EIR vis-à-vis project alternatives as well as the analysis and mitigation of aesthetics, land use, and cultural resources impacts. Substantial omissions in these topic areas require revision and recirculation of the EIR to inform the discretion of the City and to apprise the concerned public. 1 [ERP-5, ERP-9]

1. The Mission Bay EIRs Did Not Consider an Event Center

EIRs, including the Draft Subsequent EIR ("the DSEIR"), are measured for "adequacy, completeness, and a good faith effort at full disclosure." (CEQA Guidelines, § 15151.) Whether the Event Center EIR analysis meets that measure presents a question of law. (*E.g., Vineyard Area Citizens v. City of Rancho Cordova* (2007) 40 Cal.4th 412, p. 435.)

An overarching problem with the DSEIR is its misapplication of CEQA via a conclusory reliance on earlier CEQA documents — the 1990 Mission Bay EIR and 1998 Mission Bay Subsequent EIR — prepared for the Redevelopment Plan for the Mission Bay South Redevelopment Project and its related Design for Development. The City cannot now rely on those EIRs because both the Redevelopment Plan and the Design for Development contemplated no uses comparable to the Event Center. Its environmental effects were *not* "adequately examined by an earlier EIR." (Pub. Resources Code, § 21094; Guidelines, § 15063.) 2 [ERP-6]

Every environmental issue that has potentially significant impacts must be addressed in a project-specific EIR for the Event Center, and feasible mitigations and alternatives must be identified. The City instead improperly "tiered" the DSEIR from the prior Mission Bay EIRs to evade full environmental analysis, as counsel for the Alliance have explained in a separate letter. Consequently, the DSEIR fails to analyze many of the potentially significant project-specific environmental impacts of the Event Center. As in *Center for Sierra Nevada Conservation v. County of El Dorado* (2013) 202 Cal.App.4th 1156, a revised stand-alone EIR must do so. 3 [ERP-7]

This letter will address the DSEIR's omitted analyses of critical project-specific impacts relative to land use, aesthetics, and cultural resources. 4 [ERP-9]

2. The Draft Subsequent EIR Must Address Land Use

The Notice of Preparation and Initial Study ("NOP/IS" or "Initial Study") acknowledges that, per the 1998 Mission Bay EIR, "the Mission Bay Redevelopment Plans and Design for Development documents … constitute the regulatory land use framework for the Mission Bay plan area." (NOP/IS, p. 30.) The Initial Study finds no need to address land use issues in the DSEIR, contending that the Event Center would not conflict with land use policy, divide a community, or substantially impact area character. (NOP/IS, p. 27). Without additional discussion, the DSEIR agrees, reiterating that project land use impacts are insignificant and that no environmental analysis is required. (DSEIR, pp. 1-49, 5.1.1.)

While clearly aware that CEQA requires revision of the DSEIR to address the project's conflicts with Mission Bay land use policies and significant adverse impacts to community character, the City simply kicks the can down the road: 5 [LU-2]

> As part of the project approval process, OCII, the San Francisco Planning Commission, and other relevant regulatory agencies *would determine* whether the proposed project is consistent with their respective plans as applicable to the proposed project. Thus, the proposed project would have a less-than-significant impact with regard to conflicts with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.

(NOP/IS, p. 31, italics added.) This statement implicitly acknowledges the requirements of

Appendix G of the CEQA Guidelines. Under Appendix G, Section X, a project's potentially-significant conflicts with land use plans that were adopted for environmental protection or mitigation must receive environmental review in an EIR. A rote finding by a lead agency that simply assumes that a project will comply with such land use plans via future action by involved regulatory agencies cannot substitute for the analysis contemplated by Appendix G. (*The Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903.)

The Event Center's Draft Subsequent EIR does just that; unlawfully deferring the analysis and enforcement of land use plan consistency. The DSEIR must be revised and recirculated to provide environmental analysis and mitigation. EIRs must "consider and resolve every fair argument that can be made about the possible significant effects of a project." (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099.) Here, the record illustrates many inconsistencies with land use plans and policies that have potentially significant environmental impacts:

5 [LU-2] cont.

a. *The Event Center is not 'Nighttime Entertainment' as Defined in the Mission Bay South Redevelopment Plan*. The primary objective of the Warriors Event Center is to "[c]onstruct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities […]" (DSEIR, p. 1-3.) The Mission Bay South Redevelopment Plan designates Blocks 29-32 as Commercial Industrial/Retail. While the mixed-use commercial/retail development portion of the project is an allowed primary use, the Event Center itself would have to qualify as "Assembly and Entertainment: Nighttime Entertainment" in order to be approved as an allowed "secondary use" under the Plan.

The Initial Study pronounces that the Event Center — the *primary* project use — is encompassed within the *secondary* "nighttime entertainment" use analyzed in the Mission Bay EIR and is thus allowed on the Commercial Industrial/Retail site. The City contends that the Event Center is a nighttime entertainment use per the 1998 EIR, although "the size and intensity of the event center use was not previously analyzed." (NOP/IS, p. 33.)

6 [PD-1]

This is not based on fact. Aside from being a "secondary" use of the site, the Warriors Event Center does not meet the plain language of the "nighttime entertainment" designation that anticipates and encompasses small-scale clubs, restaurants, and bars. (Mission Bay South Redevelopment Plan, p. 50.) At the time of the 1998 EIR, several small neighborhood bars occasionally offered nighttime entertainment. This minor "secondary" use that existed in the area thus appeared to be compatible with the 3rd Street Corridor and the waterfront. Nothing in the definition of "nighttime entertainment" anticipates or

allows a venue of the type or at the scale now proposed for the Event Center.

The 1998 Mission Bay EIR focused on entertainment-oriented commercial development in Mission Bay North, "intended to complement" the San Francisco Giants Ballpark. The 1998 EIR anticipated almost 400,000 square feet of related entertainment-oriented retail ancillary to the ballpark, including a theater complex of up to 25 screens. If a regional event venue had been anticipated in Mission Bay South, the 1998 EIR would have called it out. It is also telling that "entertainment-oriented retail" in Mission Bay South was projected at only 56,000 square feet, 15% of the size anticipated in Mission Bay North. (1998 Mission Bay EIR, pp. III.2, 10-11; *see also* 1998 CEQA Findings, Mission Bay Plan [projecting only 50,000 square feet of entertainment-oriented retail].)

6 [PD-1] cont.

And while professional basketball games are nighttime events, the Event Center also anticipates 31 annual events "related to conventions, conferences, civic events, corporate events and other gatherings," with an estimated attendance of between 9,000 and 18,500 patrons. (NOP/IS, p. 15.) "[T]he majority of events are expected to occur during day time hours." (*Ibid.*) The definition of "nighttime entertainment" cannot reasonably stretch to consider over a month of daytime events never contemplated or considered by the 1990 and 1998 Mission Bay EIRs.

In these many respects, the Event Center is inconsistent with the adopted land use plan and has potentially significant impacts that require revision of the EIR.

b. The Event Center Conflicts with Mission Bay South Design Criteria. Despite the Initial Study's contention that the Event Center would be consistent with adopted area land use policies established by the Mission Bay South Redevelopment Plan and the Design for Development, it concedes that the project sponsors seek material changes. The DSEIR anticipates amendments to the Mission Bay South Design for Development, the Mission Bay South Signage Master Plan, and the Mission Bay South Streetscape Plan. The Initial Study notes that the "unique nature of the proposed event center would require the sponsor to receive [City] approval of variations or amendments to some of these standards." (NOP/IS, p. 31.)

7 [PP-1]

The Mission Bay South Redevelopment Plan codifies objectives and policies for urban design that must be applied to the Event Center, including:

Objective 3: Emphasize in Mission Bay South the characteristic

San Francisco development patterns …

Policy 2: Design in consideration of protecting major views of the Bay, the Bay Bridge and the Downtown skyline from Mission Bay South … using street view corridors, open space, the careful placement of building forms and building massing.

Policy 3: Create a visual and physical access to San Francisco Bay and the channel of China Basin.

Policy 4: Recognize that buildings, open spaces and view corridors, seen together, will create the character of Mission Bay South.

Objective 4: Create a building form for the Mission Bay South area such that the scale of new development relates to the adjacent waterfront and to adjacent buildings.

Policy 1: Building heights should decrease as they approach water's edge.

The Event Center proposal creates at least 16 inconsistencies with the Design for Development (D4D), and its Appendix A recites amendments for:

- Raising maximum arena height limits from 90 to 135 feet
- Construction of a 160+ foot tower[1] close to another tower
- Increasing the bulk of the arena
- Changing arena setbacks, street wall heights, view corridors, public rights of way, and parking standards

The addition of large signage, electronic advertising, and nighttime light and searchlight effects that accompany basketball games and other large events also conflicts with design review standards and further impacts aesthetics/view corridors. The Commercial Industrial/Retail zone prohibits flashing signs, moving signs, and roof signs as well as business signs "above 1/2 of the base height of the building." (D4D, p.45.)

7
[PP-1]
cont.

[1] The tower heights exceed 160 feet with the 16-foot mechanical parapet.

Even if amendments to the Design for Development could avoid legal inconsistencies, the proposed removal of codified urban design protections significantly impacts the design of the Mission Bay community and aesthetic environment and requires EIR analysis and mitigation.

The Design for Development also delineates urban design concepts that protect the community character of Mission Bay South via view corridors and a planned street grid that extends "San Francisco's historic urban pattern of Spanish measure Vara blocks." (D4D, p. 39.) "A Vara is an early Spanish unit of measure equal to 2.75 feet." (D4D, p.16.)

> First is an urban street grid which builds off of the primary existing streets and a traditional San Francisco pattern of Vara blocks, to allow for the transformation of an industrial pattern to one which welcomes the buildings and open spaces of a living/working/shopping neighborhood. In the tradition of cities by the water, this same framework of streets serves as view corridors that visually connect Mission Bay to the Bay and the City's downtown.
>
> View corridors are based on the following principles: to preserve the orientation and visual linkages to the Bay and Channel; as well as vistas to hills, the Bay Bridge and the downtown skyline; to preserve orientation and visual linkages that provide a sense of place within Mission Bay.

(D4D, pp. 39, 47.) The Design for Development specifies that "no building or portion thereof shall block a view corridor." (D4D, p. 39.)

As explained in the statewide planning publication *California Planning & Development Report* in a 1998 article praising the Mission Bay South Redevelopment Plan, "a 'vara block' is the same dimension as the first 10 blocks of San Francisco laid out by Vioget in 1839." (*CP&DR*, 1 September 1998, *attached*.) The vara block is not only of historic importance but "has near-ideal dimensions for an urban block" and "helps clarify, if clarity were needed, what precisely makes San Francisco the most walkable city in America: the dimensions of the grid …" "This new plan … promises to extend the pedestrian experience of San Francisco to the newest part of the city."

7
[PP-1]
cont.

CP&DR marvels that the Redevelopment Plan takes a "giant canvas of largely undeveloped waterfront acreage" and uses vara blocks "to integrate this former railyard into the cultural and business life of the larger city." And "what is most remarkable about this scheme is how thoroughly the [UCSF] campus has been integrated into the grid … likened [] to residential blocks in Paris."

The Warriors Event Center proposes to eliminate four blocks, including two vara blocks and two smaller blocks, creating one large single block for the Event Center with structures that obscure both a north-south and east-west view corridor. The DSEIR must be revised to analyze and mitigate the environmental impacts of required amendments to adopted land use plans and policies, addressing the destruction of vara blocks and the related adverse impacts to aesthetics, view corridors, and pedestrian amenities. 7 [PP-1] cont.

While the Initial Study and the DSEIR rely upon Public Resources Code section 21099 to excuse the lack of analysis of aesthetics, claiming that such impacts of a mixed-use project on an infill site within a transit priority area are not subject to CEQA review, the DSEIR acknowledges that the Mission Bay South urban design standards apply to the Event Center project. The DSEIR must still consider aesthetic impacts that are addressed and protected by the City's design review ordinances.

These impacts are significant. The height and bulk of the project, sited directly on the waterfront, will disrupt views and alter the aesthetics and community character carefully planned for Mission Bay South for many years. The City's fundamental vision for Mission Bay would be forever compromised by dropping a tall, bulky sports arena at the water's edge, destroying planned vara blocks and historic view corridors. 8 [ERP-8]

The EIR must be revised to analyze and mitigate the project's inconsistencies with plans and policies in Mission Bay South adopted for environmental protection. 9 [PP-1]

c. The Event Center Will Destroy Planned Community Character.

Development of Mission Bay South has been the subject of intensive planning for 25 years, as reflected in the 1990 EIR, the 1998 EIR, and the Mission Bay Redevelopment Plans. The character of the community revolves around medical and biotechnology development. "Because a major UCSF site would likely be a magnet for biotechnology research, an emphasis on biotechnology is anticipated." (1998 Mission Bay EIR, p. IA.89.) 10 [LU-1]

The Warriors Event Center proposes a signature disruption in the long-planned development of Mission Bay South as a biotechnology and medical hub, and EIR analysis of that planned land use change is required. In comments on the Initial Study, research-based biotechnology company FibroGen, located adjacent to the project site, raised concerns about the Event Center's likely disturbance of the company's "operations, sensitive instrumentation, laboratories, and chemicals," all highly sensitive to noise and vibration. "… [G]iven the Project's significant scope coupled with the sensitivity of FibroGen's use and ongoing operations, … it is critical that the EIR thoroughly disclose and evaluate any potential land use incompatibilities with surrounding land uses."

This major planning detour requires EIR revision and recirculation. 10 [LU-1] cont.

3. The DSEIR's Analysis of Alternatives is Inadequate

Because the Event Center has significant impacts, it *cannot be approved* if feasible alternatives could reduce impacts and still accomplish most project objectives. (Pub. Resources Code, §§ 21002, 21081.) Our Supreme Court reiterated this substantive mandate of CEQA in *Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, pp. 123-134. The Court held that "[u]nder CEQA, a public agency must also consider measures that might mitigate a project's adverse environmental impact, and adopt them if feasible," due to "CEQA's substantive mandate that public agencies refrain from approving projects for which there are feasible alternatives or mitigation measures …"

Appropriately, EIRs explore ways for a project to meet as many applicant goals as possible while protecting the environment to the extent feasible. EIRs must evaluate project alternatives that accomplish most basic project objectives. (Guidelines, § 15126.6 (a).) The courts and the Guidelines require that EIRs analyze a "range of reasonable alternatives to the project, *or to the location of the project*" sufficient "to permit a reasoned choice" of alternatives "that would avoid or substantially lessen" any of the project's environmental impacts. (Guidelines, § 15126.6 (a), (c), (f), italics added.)

The Event Center EIR primarily focuses on three alternatives:

Alternative A: No Project
Alternate B: Reduced Intensity
Alternate C: Off-site at Piers 30-32 and Seawall 330 11 [ALT-1]

The EIR identifies significant project impacts relating to "traffic; wastewater treatment capacity impacts; crowd and amplified noise; UCSF hospital helipad safety; wind hazards; construction; water quality and hazardous materials; and bird collisions." (EIR, pp. 7-9). As already noted and as will be discussed further, there are other likely areas of significant impact as well. 11 [ALT-1] cont.

a. ***The No-Project Alternative Must Comply with Land Use Plans.*** The point of an EIR's analysis of a No Project alternative is "to allow decisionmakers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." (Guidelines, § 15126.6 (e)(1).) The DSEIR presents Alternative A as its No Project alternative, positing that the Warriors will temporarily remain at Oracle Arena in Oakland and will then likely rebuild or find another site. The EIR fairly assumes that Development at Blocks 29-32 would then occur according to the Mission Bay South Redevelopment Plan and the related Design for Development, without an arena.

However, the DSEIR's depiction of the No Project alternative assumes that without the Event Center the City would allocate most of the remaining development potential anticipated by the Mission Beach South Redevelopment Plan and Design for Development to this site at Blocks 29-32, thus prioritizing its development over other undeveloped sites in the same zone. The unsupported assumption that the site will host a second tower, among other things, overstates the No Project's environmental impacts. 12 [ALT-2]

The Design for Development dictates that three 160-foot towers can be permitted in Height Zone 5, where blocks 29 and 31 are located. (D4D, p. 23.) The No Project alternative assumes that construction of the final tower will be on Block 29. However, UCSF-owned Block 33 is also eligible. Even if the tower is appropriately-assumed to be sited on Block 29, the Design for Development requires that it not exceed 7% of developed area; to wit, 65,954 square feet. The No Project alternative assumes a tower of 208,000 square feet. Overstating impacts does not provide an adequate basis for comparing alternatives.

The No Project size is also inconsistent with other Design for Development requirements. Height Zone 5 permits a total developable area of 942,200 square feet. (D4D, p. 23.) The DSEIR assumes that the no project alternative would encompass 1,087,700 square feet. The DSEIR concedes in a footnote that its estimate of parking stalls exceeds the minimum required; another overstatement:

> Based on the requirements of the South Plan and the Design for Development, a minimum of 1,061 and maximum of 1,081 spaces would be needed for a proposed development of this size. With the inclusion of the 132 spaces at the South Street garage, the requirements for on-site parking would range from 929 to 949 spaces. Thus, the parking estimates used for the No Project Alternative exceed the requirements, though would likely be adjusted should an actual development proposal be submitted. 12 [ALT-2] cont.

(DSEIR, p. 7-21 n.2.)

By overstating its size and scope, the No Project alternative defeats the purpose of providing the public and decisionmakers with comparisons to the proposed project and other alternatives. The DSEIR must be revised to analyze a No Project alternative that complies with adopted land use plans and does not overstate the scope of development: a low-rise development using vara blocks and that does not include a new tower, does not block the views of UCSF patients, and complies with Mission Bay's development plans.

b. ***The DSEIR Must Analyze a Potentially-Feasible Alternate Site.*** In considering whether an EIR's range of project alternatives complies with the "rule of reason," CEQA anticipates consideration of an off-site alternative:

> The key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR. 13 [ALT-3]

(Guidelines, § 15126.6 (f)(2)(A).) In light of the admitted and wide-ranging significant impacts of the proposed Event Center, it is particularly critical that the DSEIR consider a potentially-feasible alternate site or sites "… capable of avoiding or substantially lessening significant impacts of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. …" (Guidelines, § 15126.6 (b).) Indeed considering an alternate location is one of the most important tasks for this DSEIR.

Instead, the DSEIR proposes just one off-site alternative, Alternative C, at Piers 30-32 and Seawall Lot 330 — a site already proven infeasible. The Warriors pursued and after considerable investment abandoned a plan to site the Event Center at this very location. The reason no doubt related to major City-wide public opposition based on significant traffic impacts, environmental harm to the San Francisco Bay during construction, blocked views of the Bay Bridge, and inappropriate use of publicly-owned waterfront property. The required vote of the San Francisco electorate that would be required for the project's excessive height was also problematic as increased heights on the northeast waterfront have been decidedly disfavored by City voters in multiple recent elections.

The project site also triggered extensive regulatory approvals from state and federal agencies, including the State Lands Commission, the San Francisco Bay Conservation and Development Commission, the Army Corp of Engineers, the U.S. Fish and Wildlife Service, and others. (DSEIR, pp. 7-17-18). And the project costs were substantially more than initially-projected, by many many millions of dollars, due to the need to replace crumbling piers and other unanticipated costs. 13 [ALT-3] cont.

CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (Pub. Resources Code, § 21061.1.) The City knows that Piers 30-32 do not provide a feasible site and its selection as the sole off-site alternative fails to meet the rule of reason required for EIR alternatives. CEQA is not a game; the DSEIR must select and study another location for the Event Center to fulfill its mandate to provide good-faith analysis of a range of potentially-feasible alternatives, including an alternate location.

4. The EIR must assess Cultural Resources

The Initial Study and DSEIR contend that cultural resources were sufficiently addressed in the 1990 and 1998 Mission Bay EIRs. The Alliance disagrees. The DSEIR should be revised to provide project-specific analysis and mitigation as well as an updated investigation of resources as part of the environmental setting. The DSEIR description of the environmental setting is critical to provide a baseline of physical conditions from which to measure the significance of project impacts. (Guidelines, § 15125.)[2] 14 [CULT-1]

[2] Inadequacies in the EIR environmental setting and baseline led to inadequate analysis of environmental issues that will be addressed in other Alliance comment letters, including the jurisdictional wetlands identified on the project site.

To address impacts to paleontological and archaeological resources, the DSEIR proposes adoption of the mitigation measures recommended in the 1998 Mission Bay EIR, and concludes that environmental impacts will thereby be mitigated via standard archaeological testing, monitoring, and data recovery. (DSEIR, pp. 1-51, 1-57.)

The 1998 Mission Bay EIR relied on the 1990 Mission Bay EIR that in turn consulted a *Cultural Resources Evaluation for the Mission Bay Project* prepared in 1987 by David Chavez & Associates. (1990 EIR, p. VI.J.30, NOP/IS, p. 46.) As reflected in the prior EIRs, the shallows of Mission Bay were filled beginning in the 1860s and the Event Center site at Blocks 29-32 is on that filled land. The Initial Study references the Chavez report as stating that the filled land in Mission Bay had "no substantial potential for archaeological resources." (NOP/IS, p. 46; 1990 EIR, pp. II.64, VI.J.1-30.) However, the 1990 EIR nonetheless concluded that development could cause "significant impacts to subsurface prehistoric or historic archaeological resources … within the vicinity of Blocks 29-32," and identified mitigation measures. (*Ibid.*) 14 [CULT-1] cont.

David Chavez and historian Jan Hupman subsequently prepared an *Archaeological Resources Review* report in 1997 for the 1998 Mission Bay EIR, concluding that "[t]he entire Mission Bay project area has at least some sensitivity for the presences of unknown archeological remains. Prehistoric cultural deposits could be encountered in three identified areas and *unknown historical features, artifact caches and debris areas could be located anywhere in the project area*." (Chavez & Hupman, *Archaeological Resources Review for the Mission Bay Project Subsequent EIR*, 1997, p. 7, italics added.)

Since then, geotechnical investigations at the project site in March 2014 identified a "medium dense to very dense sand, sand with clay, clayey sand, silty sand and sand with silt, known as the Colma Formation, [] encountered below the sand and clay in portions of the site." (Langan Treadwell Rollo Preliminary Geotechnical Evaluation, p. 2-3.) The Colma Formation involved sand between 5 and 35 feet thick, more than 19 feet below the ground surface. (Ibid.) That is a greater depth than the Event Center's projected excavations, but a 2014 report by ESA Associates Cultural Resources team suggesta pre-construction boring strategy as part of an Archaeology Testing Program ("ATP"):

> The ATP will need to include a pre-construction geoarchaeological boring strategy across the project area to determine: (a) whether the upper surface of the Colma Formation is intact or was eroded away in antiquity (and therefore whether there is even the potential for archaeological materials to be present); and (b) if the upper surface of the Colma Formation is intact, whether there are, in fact, any archaeological materials present.

The actual boring strategy is not known. A firm called Archeo-Tec made a proposal, but it was criticized by the ESA team: "The Archeo-Tec proposal only specifies trenching beginning at a depth of 10-15 feet below ground surface (after mass excavation has already started)." ESA noted that the Archeo-Tec plan did "not correlate with ERO standards" and was "not in line with Planning Department requirements for the project area." Further, "trenching will not address [City archaeologist Randall Dean's] specific concerns …"

14 [CULT-1] cont.

The 1987 Chavez report had conceded that "[w]ith the exception of some limited archaeological testing in sensitive areas" the "actual areal extent, specific nature and location of historic features and artifact caches, and depositional integrity of the archaeological deposits" in South Mission Bay are unstudied. Further, "specific information of that nature is important in determining the actual significance of archaeological resources and in developing appropriate mitigation plans." (Chavez, *Cultural Resource Evaluation For the Mission Bay Project*, p. 105.)

Years later, archaeologist Dean properly criticized the Initial Study's cursory review of archaeological impacts, pointing out that:

> … [w]e know a lot more than we did 20 years ago about both buried and submerged potential horizontal and vertical locations and types of prehistoric deposits that may be present throughout SF. The project site lies within the mudflats of Mission Bay subject to shallow tidal waters but well within the paleoshorelines of 5,000 B.P. [...] the type of prehistoric deposits that might be affected would be within the Middle Holocene epoch which would make them of significant scientific value.

Incomplete information regarding cultural resources conflicts with CEQA's requirements for an adequate environmental setting/baseline to provide "special

emphasis" on "resources that are rare or unique …" (Guidelines, § 15125 (c).) Mitigation measures proposed in the Initial Study and DSEIR, including the Archaeological Testing Program, must be preceded by updated analysis of affected resources and performance standards. Since the Initial Study and the DSEIR rely on outdated information from the 1990 Mission Bay EIR, there is a higher potential for subsurface archaeological resources at the site than previously evaluated. The EIR must be revised to include a current analysis of cultural resources, potentially significant impacts, and performance-based mitigation.

14 [CULT-1] cont.

The Power of Grid

1 September 1998 - 12:00am
Morris Newman | Places

Restraint is rarely touted as a virtue in urban design. Often, instructors in the History of Urban Design tend to treat the subject as a series of Greatest Hits - of grand interventions by such magnificently meddlesome people as Andre LeNotre or Baron Haussman or Robert Moses. Teachers in graduate seminars rarely show slides of, say, a Midwestern town and exclaim, "Look at how well the urban designers held themselves back!"

The blockbuster mentality makes the current master plan of Mission Bay, the 300-acre redevelopment area in San Francisco, all the more remarkable. Here, after all, is a giant canvas of largely undeveloped waterfront acreage in a major U.S. city. The first impulse (at least for eternal first-year design students, like myself) is to create a miniature city with a hierarchy of major and minor roads, a radial plan with diagonal streets, major and minor axes, formal green spaces with equestrian statues and topiary plantings - in other words, the whole nine yards of Beaux Arts planning, or its poor relation, the New Urbanism.

The current master plan, which is the fifth to be done in 20 years, resists the temptation to make a grand statement, however. Instead, the plan by Johnson Fain Partners opts to impose a more-or-less regular grid over the area that corresponds, in the dimensions of the blocks, to the original 10 blocks of downtown San Francisco. And while the restraint of this plan may or may not seem intuitively like the most exciting or most elegant solution, a close examination of the program suggests that this is the most urbane and best integrates this former railyard into the cultural and business life of the larger city.

Indeed, the history of planning efforts at Mission Bay shows the tensions between the need to integrate the area into the city, while creating a memorable place in itself. The site itself is also especially tempting for planners, because it sits at the crossroads of two grids: the commercial-industrial grid, on northeast-southwest coordinates, and a residential neighborhood, on north-south coordinates, immediately south of the commercial area.

The first four of the five plans done in the past 20 years, in fact, succumb to the temptation to bring the grids together in dramatic juxtaposition. The first plan, done 20 years ago by John Carl Warnecke envisioned a set of high-rise buildings (office and hotel) on either side of the Mission Bay Channel, which conforms to the commercial-industrial grid. The same plan pulled the north-

south grid north of 16th street, to bring housing into Mission Bay. The density and height of the scheme aroused public opposition.

In the I.M. Pei/WRT scheme of 1985, the designers attempted to maximize the waterfront by carving out an oval-shaped channel south of Mission Bay Channel; ingeniously, this channel, and the resulting island at its center, are the formal devices to divide the commercial grid from the residential grid. This plan was also opposed for its density. And like the Warnecke plan before it, the Pei scheme was largely lacking in open space along the precious bay waterfront.

The third scheme by the Mission Bay Planning Team, led by EDAW and Dan Solomon, is an elegant, Beaux-Arts design that provides a clear hierarchy of streets arranged around a linear park or "common." This scheme also sets aside some bayfront land for a linear park. Pleasing as a graphic design, the plan arguably may have created some confusion on the ground, however, because streets are frequently changing in direction. Those same diagonal streets also disturb the views of the bay that could otherwise be available with streets that run straight east and west. The subsequent Skidmore Owings Merrill plan of 1989 is an inelegant truncation of the Solomon-EDAW that reflects the consensus of public hearings. This plan offers a further elongation of the bay front linear park, while providing more space for commercial construction.

New uses at Mission Bay, including a new baseball stadium immediately north of the site and a new campus for UC San Francisco, occasioned the fifth and current plan, this time by Johnson Fain Partners. The campus plan, which conforms to the larger scheme, is by the East Coast firm of Machado + Silvetti. As part of a Willie Brown-endorsed ambition to create a "synergy" between a research university and bio-tech businesses in San Francisco, landowner Catellus donated 43 acres of Mission Bay to UC San Francisco. That acreage is located smack-dab in the center of the master plan.

The great achievement of the scheme is to knit Mission Bay into the existing fabric of the city, rather than setting it apart as a separate "campus" or miniature city of its own. Faced with the difficulty of planning around a centrally located campus, the Johnson Fain team, led by principal William Fain, chose to organize most of the site with the north-south (residential) grid; the diagonal streets are limited to either side of the channel. Medium-to-high-density residential blocks (with densities averaging 110 units per acre) can be found both north and south of the channel. Happily, the plan preserves the common of the Solomon/EDAW scheme. A small traffic circle at the far west is the anti-climactic device that connects the two grids.

What is most remarkable about this scheme is how thoroughly the university campus has been integrated into the grid. This contrasts with the typical University of California campuses, which are master planned as separate cities and communicate poorly with the cities that surround them. In a competition winning scheme, Machado + Silvetti, has responded with a very urbane, non-hierarchical scheme that uses open spaces as the landmarks, rather than big buildings. Jose Begazo, O-MBA6B1

Johnson Fain's project architect, has likened the campus design to residential blocks in Paris.

Importantly, the Johnson Fain designers chose to base the new grid on the historic "vara" block, the same dimension of the first 10 blocks of the city laid out by Vioget in 1839. A vara is a Spanish linear measure equal to 2.75 feet. The vara block is 100 by 150 varas, or 275 feet by 413 feet. Johnson Fain principal William Fain argues that the vara block, beyond its historic associations, has near-ideal dimensions for an urban block.

The use of the urban Vara block, in fact, helps clarify, if clarity were needed, what precisely makes San Francisco the most walkable city in America: the dimensions of the grid. No longer an abstract issue, the dimensions of grid here become elements in the sensuous enjoyment of cities - providing the energizing sense of movement through a regular tempo of streets and blocks.

This new plan, by relying heavily on the grid rather than special effects, promises to extend the pedestrian experience of San Francisco to the newest part of the city. In a sense, the Johnson Fain/Machado Silvetti scheme could be described as the scheme that resists the temptation to be grand, and in favor of being appropriate. Whether or not college lecturers add Mission Bay to their teaching syllabi remains to be seen. Even so, the scheme is a quiet but convincing argument about the power of the grid.

RE: Comments on Environmental Review for Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Dear Ms. Bohee:

This firm represents the Mission Bay Alliance, an organization dedicated to preserving the environment in the Mission Bay area of San Francisco. This letter is submitted on behalf of Mission Bay Alliance regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Project"), and provides comments on the following topical areas: Greenhouse Gases, Geology and Soils, Hazardous Materials, Utilities and Service Systems, Recreation, Energy, Wind and Shadow, Project Description, and Urban Decay. These comments are supported by five subject matter expert reports, attached as Exhibits A-E, which are discussed and summarized below. In addition to responding to this letter, please provide responses to the detailed comments contained in the reports that are incorporated by reference and attachment to this letter. (CEQA Guidelines, § 15132, subd. (d), 15088.)

The comments set forth in this letter and its attachments address deficiencies contained in the DSEIR's analyses as well as subject areas where the DSEIR impermissibly failed to provide any substantive analysis. The Notice of Preparation / Initial Study ("NOP/IS") for the Project determined that nine topical areas were adequately analyzed in the 1990 and 1998 EIRs prepared for the Mission Bay Redevelopment Plan, and therefore no additional analysis was required in the present DSEIR for these specific areas. A fundamental problem with this approach is that the Mission Bay Plan was 303 acres and lacked site-specific review of the current 11-acre site. In the Mission Bay Redevelopment Plan, the four-block Project area was designated as "Commercial Industrial (Mixed Use including Retail)." (DSEIR, Figure 3-3.) This land use was then analyzed at a very general level. As described in the letter as shown in the "Land Use" section of the July 27, 2015 letter from the Brandt-Hawley Law Group, the Project is not consistent with the Mission Bay Redevelopment Plan or with the land 1 [ERP-7] use plans and zoning controls that are subordinate to the Mission Bay Redevelopment Plan.

In addition to the Project itself being different, the conditions under which the Project is undertaken, as compared to 1998, have changed substantially. Changed conditions include both changes in standards and practices for analyzing impacts, changes in overall environmental conditions, and changes to the site itself. As described in the comment letter submitted by the Mission Bay Alliance regarding tiering, all of these changes, in combination with the massive and impactful Project now being proposed, require preparation of a new EIR that examines every resource area at project-level detail. The City's strategy of relying on a very general environmental review document that is over 17 years old for topics required to be analyzed *and* mitigated in detail does not work for the public, nor is it compliant with CEQA's most basic requirements. 1 [ERP-7] cont.

1. **<u>Greenhouse Gas Emissions are Not Adequately Analyzed – DSEIR Chapter 5.5.</u>**

Under AB 900, a "Leadership Project" receives an expedited CEQA review process and other streamlining benefits. (Pub. Resources Code, § 21178 et seq.) Leadership projects are supposed to create high quality permanent jobs and innovative measures to reduce environmental impacts, including greenhouse gas ("GHG") emissions. As a result of the certification received under AB 900, the DSEIR claims that the Project will "not result in any net additional GHG emissions." (DSEIR, p. 5.5-10.)

As explained below and in the attached technical comments by SCS Engineers, dated July 20, 2015 ("SCS" attached as <u>Exhibit A</u>), the AB 900 Application process does not meet minimum standards for calculation of GHG emissions, nor does it provide a substitute for CEQA's EIR process or substantive standards. The DSEIR relies entirely on the existence of the AB 900 certification for its analysis of the Project's contribution to the cumulative impact to GHG emissions. While the AB 900 certification is not subject to judicial review (Pub. Resources Code, § 21184, subd. (b)(1)), the content of the Application for AB 900 certification does not substitute for an adequate analysis of GHG emissions in the DSEIR. As a result, the DSEIR fails to meet minimum standards of disclosure and also incorrectly concludes that GHG emissions are less than significant. These flaws in the DSEIR require revision and recirculation of the DSEIR with an adequate GHG analysis. 2 [AB-1, GHG-2]

a. The AB 900 Application Conflicts with State GHG Policies.

As explained in the SCS Memo (pp. 4-6), the AB 900 Application severely underestimated the emissions from this Project. It did so by overestimating the baseline for comparison, and then by underestimating Project emissions. The AB 900 Application made several unsupported assumptions to minimize the baseline conditions against which the Project's GHG emissions would be compared, including:

- Assuming a 76 percent reduction in baseline GHG emissions from Oracle arena due to relocation of the team to San Francisco, potentially omitting emissions that would occur if Oracle continues to emit more than 24 percent of its current GHG emissions (SCS, p. 4); and
- Overestimating, possibly by a factor of two, the trip linking benefits provided by location of the arena adjacent to other uses (SCS, p. 5).
The AB 900 Application then underestimated the Project's GHG emissions by:
- Omitting from its analysis entirely the GHG emissions for structures other than the arena that are planned as part of the Project, including the two 160 foot office towers, the gatehouse, the food hall, Warriors Headquarters, and retail uses, which comprise approximately 730,000 square feet of new uses that clearly will emit GHG (SCS, p. 5; see also NOP/IS, p. 11). 3 [AB-1]

Additionally, the GHG mitigation offered in the AB 900 Application is not effective. After miscalculating the GHG emissions of the Project, the Application simply states that "with offsets purchased, there will be no net greenhouse gas emissions from the operation of the project." (Leadership Application, p. 9.) Yet, as explained by SCS Engineers (pp. 6-8), there are several flaws with this approach, including:

- Not requiring that any GHG emissions offsets be purchased unless the Project has a 90 percent utilization rate, raising the possibility that GHG emissions offsets would not be purchased at all (SCS, p. 7);
- The failure to require that purchased GHG emissions offsets are verified by the California Air Resources Board ("CARB"), consistent with California GHG reduction policies and AB 32, to ensure that they are real, permanent, quantifiable, verifiable, enforceable, and additional and thus will actually result in GHG emissions reductions (SCS, pp. 2-3, 8; see also Health & Saf. Code, § 38562, subd. (d)(1),(2)); 4 [AB-1]

- Not requiring that the emissions offsets purchased as mitigation for the Project be retired so that the offsets cannot be reused later to allegedly mitigate other projects' GHG emissions (SCS, pp. 2, 8);

- Only requiring that GHG emissions from the Project be offset for the first 30 years, ignoring GHG emissions that the Project would continue to produce after that point (SCS, p. 7);

- Using the faulty GHG inventory to estimate total GHG emissions from the Project over a 30-year period now, and allowing the applicant to purchase 30 years of GHG emissions offsets now, rather than continuing to use updated data regarding actual Project GHG emissions (SCS, p. 6); and

- Not including ongoing monitoring to ensure that estimated Project GHG emissions are similar to actual emissions and that purchased GHG offsets are actually effective in reducing GHG emissions (SCS, pp. 7-8). 4 [AB-1] cont.

In addition to these technical flaws (described in more detail by SCS Engineers in Exhibit A), the reliance on offsets to reduce GHG emissions is inconsistent with the intent of AB 900 to promote use of innovative measures to reduce GHG emissions. (Pub. Resources Code, § 21178, subd. (g).) Design features and/or mitigation measures could actually reduce the project's GHG emissions and create other environmental benefits. Instead, the Project simply plans to write a check to an unknown entity to supposedly "offset" GHG emissions.

Further, the deduction for GHG emissions based on the assumption that Oracle will only host 21 events into the foreseeable future is unwarranted in light of the City of Oakland's express plans to turn "Coliseum City" into an economically viable sports and entertainment hub. (See pp. 10-12 of July 19, 2015 Comments Regarding Air Quality Impact Analysis and Mitigation; Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32 by Autumn Wind Associates, Inc., attached as Exhibit 1 to the July 26, 2015 letter from the Law Offices of Thomas N. Lippe regarding the Project's Air Quality Impacts.

b. The Flawed AB 900 Application Cannot Substitute for an Adequate Analysis Under CEQA in the DSEIR.

5 [GHG-2]

The DSEIR simply refers to the result of the AB 900 certification process, providing no additional analysis or disclosure in the DSEIR itself regarding the expected GHG emissions of the Project or how those impacts would be mitigated. To the extent

the DSEIR intends to incorporate the faulty AB 900 Application into the DSEIR instead of setting forth the analysis in the DSEIR, it did not follow procedures required to do so. CEQA Guidelines section 15150 requires that "the incorporated part of the referenced document shall be briefly summarized where possible or briefly described if the data or information cannot be summarized." The AB 900 Application was not summarized or described in the DSEIR, nor was it included as an appendix. If the AB 900 Application is to be offered as environmental analysis in the DSEIR, it would have to be included as an appendix to the DSEIR so that the public could review it. (CEQA Guidelines, § 15147; *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 (where lead agency "relied on information not actually incorporated or described and referenced in the FEIR, it failed to proceed in the manner provided in CEQA").)

Nor can the DSEIR rely on analysis in the 1998 FSEIR. Though GHG emissions are briefly mentioned in the 1998 FSEIR (DSEIR, p. 5.5-1), this Project being proposed years later was not analyzed. Moreover, the approach to GHG emissions has changed dramatically in the intervening years.

The approach to calculating GHG emissions in the AB 900 Application is also inconsistent with basic CEQA principles as well as the DSEIR's approach to analysis of other impacts of the Project. As described above, large components of the Project to which the AB 900 certification and the "no net increase in GHG emissions" allegedly apply were simply omitted from the inventory, including over 700,000 square feet of retail and office uses. (DSEIR, Figure 3-5 and Table 3-1.) While there is no discussion in the DSEIR, the AB 900 Application claims that these other uses were "fully vested legal rights" permitted by the land use plan, and therefore did not quantify the GHG emissions from that part of the Project. (Leadership Application, p. 8.) 5 [GHG-2] cont.

The Leadership Project application process does not provide any direction to exclude aspects of the project from the Leadership Application. (Pub. Resources Code, § 21183, subd. (c).) Nor does it substitute the AB 900 certification for an adequate analysis under CEQA. Certainly if the Legislature had intended that an approved Leadership application could substitute for mandated analysis in an EIR, it would have so stated; it did not. As the certification is for the entire complex, including office and retail, there is no justification to exclude part of the project from the analysis. The result is an impermissible decrease of the GHG emissions calculated to occur as a result of the Project.

The notion that having a vested right to do something affects the obligation under CEQA to disclose the impact of doing it has been squarely rejected. (*Communities For A*

Better Environment v. South Coast Air Quality Management Dist. (2010) 48 Cal.4th 310, 323-25, citing Pub. Resources Code, §§ 21002.1, subd. (b), 21081, subd. (a)(1); CEQA Guidelines, § 14, §§ 15040, 15126.4, subd. (a)(2) [lead agency ability to condition project]; § 21081; CEQA Guidelines, § 15042 [lead agency ability to deny the project].) Moreover, consistency with a plan does not preclude the need for analysis. (See *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 354.) Notably, neither the air quality nor the traffic impact chapters of the DSEIR attempt to include credit for baseline development claimed as"vested." The completely different approach taken by the DSEIR with respect to analysis of GHG emissions is unsupported and must be corrected; the correct baseline is "no project."

The "mitigation" proposed for GHG emissions impacts is also contrary to CEQA's most basic requirements. Mitigation must be enforceable in order to be effective.. (CEQA Guidelines, § 15126.6, subd. (a)(2).) Here, as described above, the purchase of offsets may never occur, or if it does occur, may do nothing to reduce GHG emissions. The DSEIR's failure to identify enforceable mitigation measures is an error of law. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260–1262*; Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope. . . ."].) To the extent that the City intends to incorporate the purchase of offsets as a "design feature" or otherwise incorporate it into the project description, recent case law clarifies that this strategy violates CEQA's mandate to disclose project impacts and separately address feasible mitigation measures. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56 (incorporating mitigation measures for redwood trees into the project description violated CEQA "[b]y compressing the analysis of impacts and mitigation measures into a single issue . . ."].)

5 [GHG-2] cont.

As a result of the City's improper approach to analysis of GHG emissions from the Project, the GHG analysis is incomplete and must be rewritten. Moreover, the "less than significant" determination for the Project's GHG emissions is based on errors of law described above, including splitting the Project into smaller pieces and excluding several of these pieces from the GHG calculation and failing to identify enforceable mitigation measures. According to air quality experts versed in GHG emissions and the use of GHG offsets: "The GHG analysis provided and proposed MM I-C-GG-1 are not sufficient to demonstrate that the Project will result in no net increase in GHG emissions" and "the determination in the [DSEIR] that GHG emissions are a less than significant impact is erroneous." (SCS, p. 2.)

2. <u>The DSEIR Was Required under CEQA to Analyze Impacts Related to Hazardous Materials – 1998 FSEIR Chapter 5.J.</u>

The NOP/IS correctly identified hazards and hazardous materials as an impact area generally requiring analysis under CEQA. (NOP/IS, pp. 106-122.) However, the DSEIR did not address hazardous materials at all (DSEIR, p. 1-9) because the NOP/IS concluded that there were no new or more severe impacts within this category than addressed in the 1998 FSEIR (NOP/IS, pp. 106-107.) This approach fails under any standard of review because the currently-proposed Project is different than the project described in the 1998 FSEIR, the 1998 FSEIR relies on outdated data and methodology to analyze impacts, and conditions have changed such that the 1998 FSEIR does not even describe the present contamination at the site. The recirculated DSEIR will need to include a full analysis of this issue that includes a thorough review of the extensive history of contamination of this site, and the resulting potentially significant impacts and mitigation required in the context of this Project.

These comments are supported by expert analysis from the firm BSK Associates. BSK reviewed several documents, including the DSEIR, NOP/IS, 2006 Revised Remedial Action Plan ("2006 RRMP"), and 1998 SEIR, and prepared a report addressing the adequacy of these documents and the potentially significant impacts associated with existing contamination by hazardous materials within the Project site. The BSK HazMat Report is attached as <u>Exhibit B</u>.

6 [HAZ-1]

a. The 1998 SEIR Cannot be Relied Upon to Analyze Impacts Associated with Hazardous Materials.

The BSK HazMat Report explains that the 1998 SEIR cannot serve as a basis for any analysis of impacts associated with hazardous materials because that document relies upon long-outdated methodology for analyzing such impacts. (BSK HazMat Report, comment A1.) For example, the 1998 SEIR's analysis of risk to human health relied upon preliminary remediation goals developed by the EPA, and yet this methodology has been replaced by Environmental Screening Levels developed in 2013. Further, the 1998 SEIR relied upon averaged concentrations of chemical contaminants even though the total number of samples was too low to use such average values. (BSK HazMat Report, comment A2.) The BSK HazMat Report identifies further technical deficiencies that render the methodology followed in the 1998 SEIR inadequate for present use. (BSK HazMat Report, pp. 1-4.) It is telling that the NOP/IS never mentions the outdated methodology utilized in the 1998 SEIR, much less attempts to explain how applying current methodologies would achieve the same result.

b. Petroleum Hydrocarbon Contamination Has Always Been Just One Component of the Site's Overall Contamination.

Setting aside the issue of outdated methodology, the 1998 SEIR cannot serve as the basis for CEQA review because it does not adequately disclose current contamination at the Project site. Implicitly acknowledging that the 1998 EIR fails to disclose and analyze all contamination at the site in light of the characterization/remediation efforts following certification of the 1998 EIR, the NOP/IS purports to correct this admitted gap by providing a discussion entitled, "Actions Completed Since Publication of the Mission Bay FSEIR." (NOP/IS, p. 116.) However, this discussion misleads the public by suggesting that petroleum hydrocarbons are presently the only contaminant of concern onsite. The NOP/IS fails to adequately supplement the 1998 SEIR because it ignores contaminants other than petroleum hydrocarbons.

The NOP/IS asserts that there is no remaining soil and groundwater contamination at issue because, following the 1998 SEIR, remediation occurred in compliance with the San Francisco Bay Regional Water Quality Control Board ("RWQCB") Order R2-2005-028, which was ultimately rescinded in 2014. (NOP/IS, pp. 117-118.) What the NOP/IS fails to mention, however, is that Order R2-2005-028 and the subsequent remediation effort **solely addressed petroleum contamination, and no other contaminants onsite**. This limited scope is demonstrated with clarity in, for example, the RWQCB's subsequent Order R2-2014-0022 rescinding the prior order RS-2005-0028. Order R2-2014-0022 explained that the prior order only "address[ed] the existence of separate phase petroleum hydrocarbons products." Further, Order R2-2014-0022 explained that rescission of that prior order was appropriate because, "Post-remediation groundwater monitoring has shown that the residual petroleum products have very limited impact on the groundwater beneath the site." (Order R2-2014-0022.)

7
[HAZ-2]

The limited nature of this remediation effort is further demonstrated in the subsequently-prepared Revised Risk Management Plan dated August 2006 ("2006 RRMP"). As the BSK HazMat Report explained:

> [T]here was no discussion of the semivolatile organic chemicals that were detected in soil and groundwater at the site. Summary tables presented in Appendix A of the RMP indicate that polycyclic aromatic hydrocarbons (PAHs) were detected in the soil at various locations and in groundwater collected from MW-11. A possible source and significance of the PAHs was not presented in the RMP.

(BSK HazMat Report, comment B2.)

In other words, even though other contaminants were identified in the 1998 SEIR, the subsequent RRMP focused only on petroleum hydrocarbon remediation. While both the City and the applicant clearly understood this limited scope of the remediation efforts following the 1998 SEIR (NOP/IS, p. 118 [explaining that remediation "has effectively removed free petroleum products in the Pier 64 area . . ."]), this understanding was in no way communicated to the public in the NOP/IS. To the contrary, the NOP/IS, misrepresents the current status of contamination at the site by asserting in relevant part:

> While the completion of remedial actions described above would be considered substantial changes that have occurred at the project site, implementation of these actions has effectively removed free petroleum products in the Pier 64 area and reduced risks to human health and the environment in this area compared to conditions described in the FSEIR.

(NOP/IS, p. 118.)

7
[HAZ-2]
cont.

These statements mischaracterize the status of the Project site by ignoring the presence of other contaminants. As acknowledged in the NOP/IS, the site was previously used for "bulk fuel storage and distribution; railroad operations; a machine shop; boiler house; steel mill; well casing manufacturer; warehousing, shipping and receiving operations for a variety of products; fruit cannery, junk yards vehicle parking and maintenance facilities and a ready-mix concrete facility." (NOP/IS, p. 115.) Even the 1998 SEIR acknowledged that the Project site could contain other contaminants and that insufficient surveys at that time had been performed to characterize the contamination and resulting risk. (1998 SEIR, pp. V.J.1 – 110.) With respect to metals, for example, the 1998 SEIR stated, "All 17 metals that were included in the list of analytes tested . . . were detected in varying concentrations in soil throughout Mission Bay South." (1998 SEIR, p. V.J.36.) The same was true for asbestos and creosote as well. (1998 SEIR, pp. V.J.15 – 16.)

Thus, contaminants other than hydrocarbon were identified as early as 1998, which is not surprising based on the various historical uses of the Project site. Notwithstanding this, the only remediation identified in the NOP/IS relates to hydrocarbon contamination. The NOP/IS fails as an informational document because other contaminants that are contained in the soil have not been publicly disclosed. As discussed more fully below, these other contaminants create potentially significant impacts that must be addressed.

c. Activities Following the 1998 SEIR Have Increased the Project Site's Contamination.

The 1998 SEIR cannot be relied upon for environmental analysis of hazardous materials impacts of the Project because subsequent activities at the site have significantly altered the nature and scope of contamination. As explained in the BSK HazMat Report, a Phase II Environmental Site Assessment prepared by Langan Treadwell Rollo, dated June 2015 ("2015 Phase II Report"), identifies additional contamination following the 1998 SEIR that has been ignored in the present NOP/IS and DSEIR. (BSK HazMat Report, comments A3, A4, B3, B4.)

Based upon review of the 2015 Phase II Report, the BSK HazMat Report explains that additional hazardous waste materials were actually imported onto the Project site during petroleum hydrocarbon remediation activities in 2005. Specifically, contaminated construction debris and other hazardous waste were used as backfill in 2005 in violation of the Mission Bay remedial action plan ("RMP"). (BSK HazMat Report, comments A3, B5.) While the prior Mission Bay RMP may have allowed the movement and reuse of certain levels of contaminated soils, "DTSC's determination does not apply to building debris or waste soils or other waste materials for any necessary remediation activities." (BSK HazMat Report, comments A3.) In other words, while the occurrence of petroleum hydrocarbon contamination may have been reduced as a result of subsequent remediation activities, the occurrence and associated risk posed by other forms of contamination actually increased following the 1998 SEIR. While the 1998 SEIR could not have addressed this new contamination because it occurred in 2005, this does not excuse the omission of this critical information from the NOP/IS and DSEIR.

8 [HAZ-3]

The BSK HazMat Report also finds, based in the 2015 Phase II, that significant amounts of both previously-existing and subsequently-imported hazardous waste remain on the site today. The presence of this existing hazardous waste raises many unaddressed issues. First, it appears that this hazardous waste will need to be excavated and removed in order to construct the proposed Project. The BSK HazMat Report explains, "Significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase." (BSK Hazmat Report, comment C1.) According to the NOP/IS, "[T]he maximum depth of excavation on-site would be approximately 30 feet below San Francisco City Datum; this would require approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (NOP/IS, p. 17.) It is not clear how this estimate was derived or how it relates to the actual excavation needed for purposes of removing contaminated soils. The excavation, removal, transport, and disposal of this

massive volume of contaminated soil creates potentially significant impacts that have not been disclosed. (CEQA Guidelines, Appendix G, section VIII (a), (b), (c).)

Other serious questions arise if all or even some portion of the hazardous waste is not ultimately removed from the Project site. If not removed, what is the remediation plan to reduce risk of exposure to the public? How will workers be protected during construction of the Project? Does the 350,000 cubic yards include excavation associated with stormwater and other infrastructure remediation work, or will that construction occur in the contaminated soil that remains? Will any of this contaminated soil be used to create the 3.2 acres of open space, or the additional open space located across the street at the Bayfront Park? Will an impermeable cap be used to separate contaminated soil from at-grade landscaped open space? Since much of the landscaped open space appears to be elevated, is this a design feature intended to quietly address the human health risk associated with the contaminated soil? The DSEIR fails to address these important questions.

8 [HAZ-3] cont.

The presence of contaminated soil within the Project site cannot be swept under the rug. The contamination must be quantified along with its appropriate exposure risks. These risks and adequate mitigation measures must be disclosed to the public in a revised and recirculated DSEIR that complies with CEQA.

d. The DSEIR's Treatment of Hazardous Materials Fails under Any Applicable Standard.

As established above, the City's strategy of relying on the 1998 SEIR as supplemented with updated information from the NOP/IS violates CEQA.

First, this strategy fails to provide an adequate project-level informational document because the 1998 SEIR does not describe current conditions, and the supplemental information provided in the NOP/IS misleads the public by ignoring all hazardous constituents other than hydrocarbon contamination.

9 [HAZ-1, HAZ-3]

Second, the DSEIR is inadequate because substantial evidence supports a fair argument that constructing the Project on the existing contaminated soil will result in potentially significant impacts. The information contained in the DSEIR, together with the BSK Hazmat Report and the 2015 Phase II Report, demonstrate that the present contamination poses potentially significant hazards due to proposed construction in soil containing hazardous waste, and transport and disposal of the same hazardous waste.

Tiffany Bohee
Brett Bollinger
July 26, 2015

Third, even if the City were to rely on Public Resources Code section 21166, the subsequent remediation activities that increased the presence of certain hazardous waste constituents following the 1998 SEIR represents a change in circumstances that requires preparation of a supplemental EIR. The proposed site plan with several acres of landscaped open space also constitutes a change to the project that was described in 1998 (simply a land use plan for 303 acres) and significantly increases the potential public hazard by exposing people to hazardous waste in the soil even if the RMP is followed. A recirculated DSEIR must include a thorough analysis of hazardous materials using current methodologies.

9 [HAZ-1, HAZ-3] cont.

e. The City Cannot Rely on Mitigation Measures for Hazardous Materials without Analyzing the Impacts.

Seemingly in furtherance of an implicit goal to avoid substantive public disclosure of hazardous materials impacts in the DSEIR, the City takes the remarkable position in the NOP/IS that it can adopt mitigation measures without analyzing and disclosing impacts. This approach is employed with respect to risks associated with naturally occurring asbestos (NOP/IS, pp. 113-115) as well as risks associated with exposed contaminated soil prior to site development as regulated in the City by the Maher Ordinance (NOP/IS, p. 116). This approach is fundamentally flawed, however, because CEQA does not permit an agency to adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts. A mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123*; Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

10 [HAZ-1, HAZ-4]

The flaw in this approach is easily seen in both contexts. With respect to compliance with the Maher Ordinance, for example, section 2(b) of this letter explains that the NOP/IS fails to describe the existing heavy metals and other hazardous waste contained in the soil.[1] The DSEIR's failure to mention this contamination prevents public disclosure of its scope, its implications for future construction work onsite, and potential exposure to the public during occupancy of the Project. As a document of public information, the DSEIR cannot avoid meaningful disclosure of this information by announcing that compliance with the Maher Ordinance will fix everything. That strategy is the opposite of informed decision-making and public participation.

[1] It is noted that the NOP/IS does not attempt to make compliance with the Maher Ordinance an enforceable mitigation measure.

Tiffany Bohee
Brett Bollinger
July 26, 2015

The same analysis applies to the acknowledged asbestos-containing backfill material located onsite. First, it is not at all clear that California Air Resources Control Board's ("CARB") Asbestos Airborne Toxic Control Measure ("ATCM") even applies because this is not an instance where construction is occurring in an area of naturally occurring asbestos material. (Cal. Code Regs., tit. 17, § 93105, subd. (b).) As acknowledged in the NOP/IS, the material is processed (i.e., crushed) asbestos containing rock that was imported onto the site and used as backfill material. Accordingly, CARB's Asbestos ATCM does not apply here. Consistent with this misapplication of the Asbestos ATCM in the NOP/IS, the "no visible emission at property boundary" standard (NOP/IS, p. 114) does not apply because it is inadequate for both public and worker safety. Rather, the Project must comply with BAAQMD Regulation 11, Rule 2.

Second, even if the NOP/IS had identified the proper regulatory standard, the underlying strategy of relying on promises to comply with regulatory standards does not satisfy CEQA's informational disclosure mandates. The City has the duty under CEQA to investigate and disclose the extent of the potentially significant impact prior to setting forth potential mitigation measures. (*Galante, supra,* (1997) 60 Cal.App.4th at 1123.) Considering that many other flaws will require preparation of a Recirculated DSEIR, there will be ample opportunity to include the results of further study of contamination in that forthcoming document.

10 [HAZ-1, HAZ-4] cont.

3. <u>Geology and Soils – 1998 FSEIR Chapter 5.H.</u>

According to the NOP/IS, there are no new or more severe Geology and Soils impacts associated with the Project than were analyzed in the 1998 FSEIR. (NOP/IS, pp. 85-86.) Thus, the DSEIR did not address Geology and Soils. (DSEIR, p. 1-9.) The omitted analysis fails under any standard of review because the currently-proposed Project is different than the project described in the 1998 FSEIR and conditions have changed such that the 1998 FSEIR does not adequately describe it. The 1998 FSEIR also relies on outdated data and methodology to analyze Geology and Soils impacts. Moreover, the Project has never been subject to a thorough analysis regarding Geology and Soils Impacts in any document.

11 [GEO-1]

As described in the attached reports prepared by geotechnical engineer Lawrence Karp, CE, CEG ("Karp Geotech", attached as <u>Exhibit C</u>), BSK engineering geologist Martin Cline, CEG, and hydrogeologist Kurt Balasek, PG, CHG, QSD ("BSK Geotech", attached as <u>Exhibit D</u>), the 1998 EIR fails to provide adequate analysis of impacts related to Geology and Soils. In particular, the seismic and tsunami risks associated with the site and the Project have not been analyzed or mitigated to an acceptable level. As explained below, these unanalyzed impacts put the public at unnecessary risk and require that the

DSEIR be revised and recirculated for public review. The recirculated DSEIR must include a thorough review of geotechnical conditions of this site and the resulting potentially significant impacts and mitigation required in the context of this Project. 11 [GEO-1] cont.

a. Seismic Hazards.

i. The Seismic Standards for the Site have Changed Since 1998.

The NOP/IS claims that there are "no new or more severe effects," ignoring "[s]ignificant changes to the California Building Code and the standard of practice for analyzing ground motion and liquefaction evaluation have occurred since the 1998 SEIR was published." (BSK, comment B1.) At the time the 1998 EIR was written, the San Francisco Building Code was based on different maps and seismic design standards were much less stringent. (Karp Geotech, p. 3.) Later mapping by the State delineates the site as subject to liquefaction-induced ground displacement, and no analysis of the parameters used in 1998 and those applicable today has been prepared to support the claim that there are no new or more severe impacts than discussed in the 1998 FSEIR. The ground motion parameters required of a public assembly use are also much more stringent now, as described by Dr. Karp. (Karp Geotech, pp. 3-4.) 12 [GEO-1]

ii. A Complete Geotechnical Investigation Has Not Been Completed.

The proposed Project, which is a "public assembly use" for occupancy greater than 300 requires a different and more thorough analysis with respect to seismic hazards than the "Commercial Industrial (Mixed Use including Retail)" land use designation analyzed in 1998. (Karp Geotech, p. 1; see also DSEIR, Figure 3-3.) The site has not been properly classified for a public assembly use and the prior geotechnical reports prepared for the site underestimate public response. Public assembly uses for occupancies greater than 300 require a different approach to engineering than a typical project. 13 [GEO-1]

The evaluation reports prepared for the site after the 1998 EIR do not address the Risk Category III Importance under the Building Code[2] and the data underestimates site response to strong motion. (Karp Geotech, p. 1.) Moreover, later documents, such as the

[2] According to the California Building Code, § 1604.5: Risk Category III includes those "[b]uildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300."

2011 Langan Treadwell Rollo Geotechnical Investigation, were prepared for previously-proposed office buildings, not an arena. The other more recent report by the same firm states it is "Privileged and Confidential – For Discussion Purposes Only" (BSK Geotech, comment B.2; Karp Geotech, p. 1) and is not stamped by an engineer. In any case, neither the 1998 EIR or these more recent reports classify the current site use or address Risk Level III Importance requirements. 13 [GEO-1] cont.

iii. Seismic Risk Is Underestimated.

The site is subject to two geotechnical risks, liquefaction and amplification. (Karp Geotech, p. 2.) The liquefaction risks were not adequately analyzed in 1998 EIR for this Project type, and the 1998 EIR does not analyze amplification. Liquefaction and amplification "hazards are different but related; liquefaction potential (sand) can be mitigated but the structure must be designed to resist soft ground (clay) amplification from strong motion." (Karp Geotech, p. 2.)

With respect to liquefaction, the risk can be mitigated with various ground improvement techniques. (Karp, p. 5.) Techniques include overexcavation and compaction, however the extent of excavation needed to fully address liquefaction has not yet been determined. (BSK Geotech, p. 5.) According to the NOP/IS, excavation on-site would extend approximately 30 feet, requiring approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (NOP/IS, p. 17, 89.)[3] No explanation is provided, however, as to how this amount of excavation was determined, or how it relates to the amount of material that must be removed due to contamination, or for geotechnical purposes. (BSK Geotech, comment A5; see also *ante* section 2. regarding Hazard Impacts.) Additionally, once soils are excavated, the 1998 SEIR and the NOP/IS do not specify when or how engineered fill would be used as opposed to other types of fill. All of these details would be part of a complete seismic analysis. 14 [GEO-3]

iv. The Pile System is Not Adequately Developed and is of Limited Assistance to Protect the Public.

The 1998 EIR and the NOP/IS refer to the use of piles for structural stability. (1998 FSEIR, p. II.20, V.H.12; NOP/IS, pp. 17, 86, 87, 88-91.) Piles would be subject to 15 [GEO-4]

[3] See also comments on Air Quality submitted by Tom Lippe. The failure to accurately quantify the amount of soil excavation that will be required to address liquefaction and site contamination (see section 3. *infra*) also make the air emissions estimates and traffic impacts analysis unreliable. Additionally, availability of disposal sites cannot be analyzed without a reasoned estimate of needed excavation.

amplification, which was not studied in the 1998 DSEIR. (Karp Geotech, p. 5.) Moreover, piles are discussed only in the context of the arena structure. However, "[p]ile support systems do little to provide mitigation from liquefaction and settlement of surrounding utilities/roads and other support systems that may be damaged during a seismic event." (BSK Geotech, comment A1.) Settlement due to sand boils is a potential concern that has not yet been fully addressed in terms of impacts to supporting structures and necessary mitigation standards. (BSK Geotech, comments A10, A11.) These Project details must be studied in the context of an EIR. (See BSK Geotech, comment A4.) 15 [GEO-4] cont.

v. Impacts of Dewatering and Pile Driving Have Not Been Studied.

Dewatering necessary for construction has not yet been studied to the degree of detail needed to understand the required mitigation. A 2015 Langan Treadwell Rollo memorandum discusses dewatering, but does not address engineering effects of dewatering, such as the increase in effective stress that causes areal subsidence. (Karp Geotech, p. 6.) The NOP/IS unreasonably dismisses these risks with no analysis. (BSK Geotech, comment B6.) 16 [GEO-5] Vibrations from pile driving can also create additional risks, which have not been analyzed for this Project. (Karp Geotech, p. 6.) 17 [NOI-5] Test programs, dynamic analyses and site-specific engineering are needed, and have not yet been completed, to identify the nature and extent of the impacts and the necessary mitigation to address these impacts. (Karp Geotech, p. 6.) 16 [GEO-5] cont.

vi. Hazards of Lateral Spread and Liquefaction Induced Boils Are Not Addressed.

In 1998, mapping for lateral spread risk did not include the site. (BSK Geotech, comment B5.) Liquefaction-induced sand boils have also been identified as a hazard since 1998. (BSK Geotech, comment C4.) These hazards individually and jointly must be analyzed in the context of an EIR in order to fully inform the public regarding the potential impacts of the Project consistent with CEQA. (See generally Pub. Resources Code, § 21002.) 18 [GEO-1]

In summary, a thorough analysis of all seismic risks that utilizes the most current methodologies must be performed to adequately protect the public. Candlestick Park provides a relevant case study of the need to ensure thorough analysis and mitigation. In 1985, Lawrence Karp was involved in a study of how Candlestick Park would perform in a serious seismic event, and attended a summary meeting in City Hall with Norm Karasick, the City architect. The discussion was about the cost of rebuilding the deteriorated concrete bleachers to then-current standards. It was recognized that one or more sections could collapse in an earthquake. Mr. Karasick pointed out that the City

probably would not want to spend the money to strengthen the bleachers, stating, "What are the odds there would be an earthquake during a game?" The City ultimately decided to do the work, and on October 17, 1989 the Loma Prieta earthquake occurred during a World Series game. Nobody was injured at the game. Had the City not engaged in that updated study, and mitigated to current standards, the result might have been disastrous. The same practice must be followed here. The City must correct its outdated and deficient seismic analyses in the recirculated DSEIR. 18 [GEO-1] cont.

b. Tsunami Hazards Are Not Addressed.

According to the 1998 FSEIR, the "likelihood of tsunami inundation is very slight." (1998 FSEIR, p. II.20.) The 1975 model used in the 1998 EIR to determine potential tsunami hazards is outdated. (BSK Geotech, Comment A.6.) The current approach for assessing tsunami risk is to perform a Probabilistic Tsunami Hazard Analysis, which has not been done for this site. (BSK Geotech, comment A.6.)

Since 1998, part of the Project site was mapped as a Tsunami Hazard Zone established by the State of California (California Emergency Management Agency, June 15, 2009 Map). (BSK Geotech, comment A.2; see also Figure 1.) This updated map indicates that the tsunami hazard is now considered significant. (BSK Geotech, comment A.2.) 19 [HYD-8]

The 1998 FSEIR, NOP/IS and DSEIR do not address the tsunami hazard in the context of extreme high tides or sea level rise. (BSK Geotech, comments A7, B9, C1.) The 1998 FSEIR and the NOP/IS relied on "datum established in the 19th century," which has not been updated to reflect current sea level data. (BSK Geotech, comments A8, B8.) The 1998 FSEIR and NOP/IS minimize the tsunami hazard based on these outdated methodological approaches. Reliant upon these conclusions, the DSEIR discounts the risk of tsunami and provides no analysis of the impact. (BSK Geotech, comment C3.)

Currently, structures designated as Risk Category III <u>are specifically prohibited in a Tsunami Hazard Zone</u> under the California Building Code. (BSK Geotech, comment A9; see also Figure 1.) The NOP/IS and the DSEIR fail to mention this important fact. (BSK Geotech, comment C5.) The DSEIR must be rewritten and recirculated to address tsunami hazards.

c. Inadequate Mitigation is Provided for Geology and Soils Impacts.

i. There are No Effective Seismic Mitigation Measures.

No mitigation in the form required by CEQA is included for Geology and Soils Impacts despite the discussion of the need for mitigation measures identified in more recent site-specific geotechnical reports. (BSK Geotech, comment C2.) The NOP/IS relies on a combination of old and inadequate mitigation from the 1998 EIR, compliance with the Building Code, and future geologic and other investigations. All mitigation for the serious impacts associated with Geology and Soils has been impermissibly deferred.

While the NOP appears to point to mitigation developed in 1998 as applicable to the Project, DSEIR Appendix-MIT indicates that there are no mitigation measures listed that apply to the Project's Geology and Soils impacts. Yet the findings and conclusions of the geotechnical work completed for the site by Langan Treadwell Rollo identify numerous conditions requiring mitigation, including: "excessive static and dynamic settlements, liquefaction including sand boils, lateral spread, intense ground motion, shallow groundwater and corrosive soils." (BSK Geotech, comment C2.) 20 [GEO-1, GEO-6]

In 1998, the site's soils were identified as highly corrosive, which can damage concrete and metal used in foundation measures and other underground infrastructure. (See Karp Geotech, p. 5.) The NOP/IS states that Mitigation Measure H.7 from the 1998 FSEIR would require testing of the soil. (NOP/IS, p. 86.) Yet, Appendix MIT of the 2015 DSEIR states that this Mitigation Measure H.7 is not required. (DSEIR, MIT-22.)

With no site-specific or Project specific mitigation, the NOP/IS relies primarily on the Building Code to mitigate for seismic impacts. (NOP/IS, p. 87, 88, 90.) Yet reliance on a regulatory standard is inadequate when the underlying impacts have never been analyzed in the first place. While mitigation may properly be deferred in some instances (CEQA Guidelines, § 15126.4, subd. (a)(1)(B)), the "perfunctory listing of possible mitigation . . . [that] are non-exclusive, undefined, untested and of unknown efficacy," is inadequate. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 74, 93.) Here, the DSEIR's lack of seismic analysis addressing this Project and this site severely compounds the problem.

According to the IS/NOP (pp. 87, 93) future geotechnical investigations will disclose the conditions and the required mitigation. Neither the future study nor the alleged future mitigation are enforceable. Moreover, to the extent these references relate to the contemporary geotechnical evaluations and investigations, such as the 2011 Langan Treadwell Rollo report for office buildings, they are inapplicable to the building

type now proposed. These more recent reports also clearly state that they are not to be used for design purposes.

According to Dr. Karp, the current documents for the Project do "not include sufficient countermeasures to liquefaction" risks. (Karp Geotech, p. 5.) For instance, ground improvement measures also need to lessen the effects of strong motion in the underlying Bay Mud during earthquakes. (Karp Geotech, p. 5.) Countermeasures could include various actions, but those actions must be compatible with a piling system that would be subject to liquefaction loads and motion amplification from Bay Mud. (Karp Geotech, p. 5.) Specific measures to address differential settlement have not yet been developed. (BSK Geotech, comment B3, B6.) Mitigation must be developed in the context of a contemporary environmental review process. A test program should also be developed to evaluate these measures. (Karp Geotech, pp. 5-6.) 20 [GEO-1, GEO-6] cont.

In addition to proper design of the Project, mitigation must address public safety concerns regarding evacuation from an earthquake or tsunami. Even if overexcavation and fill and other measures could be effective to address liquefaction at the site, surrounding utility roads and emergency support systems would not be protected by the proposed supporting piles discussed in the 1998 DSEIR and the IS/NOP. (BSK Geotech, comments A1, A10.) Additionally, adequate escape routes from the area must be available in the event of an earthquake or a tsunami. A collapse of the Third Street Bridge was previously identified as subject to damage in a major earthquake and limiting escape routes out of Mission Bay. (1988 DEIR, Vol. II, Chapter VI.D.3, 9 and 44.) 21 [HAZ-8]

ii. No Mitigation is Provided for Tsunami Risk.

While the NOP/IS discusses possible mitigation for tsunami in the text, none of those measures are included in the Mitigation Measures. (BSK Geotech, comment B10.) Additionally, it is unclear why mitigation is being provided at all if the risk is indeed less than significant. (BSK Geotech, comment C1.) Additional mitigation in the form of design parameters that could assist in reducing the risk are not specified or required. (BSK Geotech, comment B11.) And flood improvements are a feasible mitigation measure required for the portion of Mission Bay subject to Addendum 9 to the 1998 FSEIR. (FSEIR, Addendum 9, Mitigation Measure K.06.) It appears that these measures would also be appropriate for the Project. 22 [HYD-8]

In conclusion, the United States Geological Survey forecasted a 67% probability that an earthquake of magnitude 7.0 or greater will occur on the San Andreas or Hayward faults by the year 2020. (Karp Geotech, p. 2.) This Project will draw up to 18,500 people into a zone subject to many risks. A full environmental analysis, with a testing program and adequate mitigation must be included in a recirculated EIR. Risks to the public from earthquakes and tsunamis are too dire to ignore or treat lightly based on decades-old environmental review and outdated models and standards. 22 [HYD-8] cont.

4. **The DSEIR's Analysis of Utilities and Service Systems Violates CEQA – DSEIR Chapter 5.7.**

The DEIR's analysis of utilities and service systems fails to comply with CEQA's mandates. First, the DSEIR relies upon a water supply assessment for an earlier, different project, in a different location, prepared before the City had its water rights curtailed. The DSEIR also fails to address necessary stormwater infrastructure issues and relies on the prior NOP/IS that affirmatively misrepresents the capacity of that anticipated system. Finally, the DSEIR impermissibly defers virtually all substantive analysis and mitigation regarding needed wastewater infrastructure. 23 [UTIL-2]

a. **Inadequate Analysis of Water Supply and Conveyance Facilities.**

The DSEIR impermissibly fails to consider whether the Project will result in the construction or expansion of any water conveyance facilities that may result in significant environmental impacts. This approach is based on the claim that the NOP/IS establishes that there are no significant impacts. (DSEIR, p. 5.7-9.) The NOP/IS, however, fails to provide sufficient information to make any conclusion in this issue by deferring any meaningful analysis. (NOP/IS, pp. 68-69.)

More specifically, the NOP/IS acknowledges: 24 [UTIL-1]

> If the water distribution system as approved under the Mission Bay Infrastructure Plan is inadequate to meet the project's demand, the project sponsor would be responsible for funding the construction of required new water mains and appurtenances. The construction of the new water mains and appurtenances would require excavation, trenching, soil movement, and other activities typical of construction of development projects in San Francisco.

(NOP/IS, p. 69.)

This analysis is flawed in several respects. First, having acknowledged that the infrastructure may not be adequate for the Project, and that construction of an unknown scope may be necessary to install this infrastructure, the SDEIR may not simply defer analysis of whether the infrastructure is adequate. And yet that is precisely what the City

purports to do, stating in relevant part: "As part of the standard permit review process, the Mission Bay master developer, in coordination with the project sponsor, would be required to request a hydraulic analysis of the SFPUC water distribution system to confirm that the existing and planned water distribution system is adequate to meet the project's water distribution demands, including fire suppression system pressure and flow demands." (NOP/IS, p. 69.) No explanation is given as to why this assessment could not have been made prior to the release of the DSEIR, which is the intended vehicle to provide public disclosure of these very issues. As a result, the decision-makers and the public are left completely in the dark about the very matter at issue, namely whether additional infrastructure is required and, if so, the scope of construction work that may be necessary to install that infrastructure. 24 [UTIL-1] cont.

The environmental impacts of construction may not be lightly dismissed as done in the NOP/IS. (NOP/IS, p. 69.) While construction of water conveyance facilities might, generally speaking, be "typical of construction of development projects in San Francisco," the Project site includes soil and groundwater contamination that make such construction activities anything but "typical." (<u>Exhibit B</u>, comments A1, A2, A3, B1, B3, B4, B5, B6, C1.)

The DSEIR fails as an informational document because it impermissibly defers any meaningful analysis of water conveyance facilities. Moreover, there is substantial evidence of a fair argument that construction of these facilities, if required, may result in significant environmental impacts. The recirculated DSEIR needs to address this issue.

Similarly, the DSEIR dismisses the question of adequate water supply without analysis, relying on the lack of potentially significant impacts identified in the NOP/IS. (DSEIR, p. 5.7-1.) The NOP/IS states that the City is relying on a water supply assessment ("WSA") prepared in May 2013 for the then-proposed arena site located at Piers 30-32 ("2013 WSA"). The DSEIR fails as in informational document with respect to water supply issues because it may not rely on the 2013 WSA. 25 [UTIL-2]

First, the DSEIR does not address how the proposed Project is a revision of the Piers 30-32 project for purposes of Water Code section 10910. While the two projects may share some common features of an arena, there are considerable differences. The projects are at different locations. Further, the prior project proposed 208,844 square feet of residential uses and 178,406 square feet of hotel uses, that are eliminated in the current Project that proposes 580,000 square feet of commercial uses. The basic site plans are different for the two projects.

Second, even if the proposed Project could be considered a revision to the abandoned Piers 30-32 project, the DSEIR may not rely on the prior WSA because there has been a significant change in circumstances since preparation of the 2013 WSA. (Wat. Code, § 10910, subd. (h).) Water Code section 10910, subdivision (h)(2) provides that a prior WSA may not be subsequently relied upon when there are "[c]hanges in the circumstances or conditions substantially affecting the ability of the public water system . . . to provide a sufficient supply of water for the project." The ongoing drought is a major change in circumstances that substantially affects the City's ability to provide water to the Project. On June 26, 2015 the State Water Board sent the City a notice curtailing its pre-1914 water rights. With no relief to the drought in sight, it is reasonable to expect further curtailments to the City's water rights. This change in circumstances prohibits the City from relying on the 2013 WSA for the project. And the DSEIR's failure to discuss this critical water supply issue renders it inadequate as an informational document. 25 [UTIL-2] cont.

b. The DSEIR Provides a Misleading Discussion of Stormwater Treatment Facilities.

The DSEIR also fails as an informational document with respect to its analysis of stormwater treatment because it provides both inconsistent and misleading information about the facilities intended to handle stormwater runoff.

First, the DSEIR is internally inconsistent with the NOP/IS, upon which it purportedly relies. With respect to stormwater facilities, the NOP/IS asserts that the impact is potentially significant (IS, p. 64 Table 11.c) and will be analyzed in the DSEIR (IS, p. 72.) The subsequent DSEIR, however, states that it is not providing a project level analysis of the issue, asserting in relevant part: 26 [UTIL-7]

> With respect to stormwater facilities, however, the stormwater system improvements already construction and currently under construction address both the near-term and long-term needs. . . . ***A separate project impact analysis is not provided***.

(DSEIR, p. 5.7-10 (emphasis added).)

The DSEIR violates CEQA because it fails to address the potentially significant impacts of project-level stormwater infrastructure. While the DSEIR provides some analysis of cumulative stormwater impacts, it concludes that the impact is less than significant with no need for any mitigation. (DSEIR, p. 5.7-18.) Thus, the NOP/IS and the DSEIR play a shell game with respect to analysis of stormwater impacts. It is unclear

what the DSEIR's ultimate conclusion is regarding project-level stormwater infrastructure impacts, and no substantial evidence supports this unknown conclusion. 26 [UTIL-7] cont.

Setting aside the internal inconsistency, the DSEIR's ultimate conclusion of less than significant cumulative impact is based on a misleading characterization of the Project's stormwater infrastructure. The DSEIR asserts:

> The project stormwater analysis completed for the project sponsor concluded that the capacity of the separated stormwater system as built is adequate to serve the project as well as other development projects that would be constructed at full buildout of Mission Bay South.

(DSEIR, p. 5.7-18.)

This representation is inaccurate and misleading. A technical report, referenced in a footnote but not actually attached as an Appendix to the DSEIR, describes the stormwater facilities very differently. (DSEIR, p. 5.7-18, fn 20 citing "BKF, Mission Bay Blocks 29-32 – Stormwater Memorandum, January 6, 2015" ("Stormwater Memorandum").) The Stormwater Memorandum provides a more accurate description of the stormwater infrastructure, and provides in relevant part: 27 [UTIL-8, HYD-6]

> The storm drain system and pump station are designed to handle runoff from a 5-year storm event. During larger events such as a 100-year storm event, runoff is conveyed through the streets to a controlled overflow to the Bay.

(Stormwater Memorandum, p. 6.)

Thus, the Project's stormwater system can in no way handle project-level stormwater runoff, much less the Project's runoff in combination with cumulative projects. This is because the system has the capacity to handle only up to five-year storm events, which is significantly smaller than the 100-year capacity typically required. Any storm larger than a five-year event will result in flooding the streets.[4] In light of this anticipated flooding, the Project, which includes multiple levels below grade, will "be

[4] The Stormwater Memorandum asserts that use of public streets to channel storm flows in this manner was analyzed in a *Revised Summary Drainage Study for the South of Channel Watershed for Mission Bay Project*, dated December 1, 2000, yet this document was not posted on the OCII as required for the project to comply with the streamlining requirements of AB 900.

sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment." (Stormwater Memorandum, p. 6.) The necessity to flood proof the Project due to inadequate stormwater facilities was never addressed in the DSEIR. Moreover, to the extent that increasing impervious surfaces on the Project site will result in additional flooding in the public streets that are shared by other structures, the DSEIR fails to address the need for additional flood proofing of other buildings in the area.

The analysis contained in the Stormwater Memorandum is also inconsistent with the DSEIR's analysis of flooding risks, which is based on the NOP/IS's analysis of Impact HY-4. Contrary to the information provided in the NOP/IS, the Project would result in exposing people and structures to a significant risk of loss and injury due to flooding for any event above the five-year event. (CEQA Guidelines, Appendix G, Section IX(i).) This is true for both the Project site as well as offsite. Finally, the strategy of relying on public streets as de facto spillways significantly contributes to substantial additional sources of polluted runoff. (CEQA Guidelines, Appendix G, Section IX(e).) This represents a new significant impact that was never addressed in the DSEIR. 27 [UTIL-8, HYD-6] cont.

The resulting public safety risk created by this situation cannot be overstated. The Project includes an 18,000-seat arena. In instances where arena events occur during moderate storm events (anything above a five-year event), thousands of visitors to the arena will exit onto streets that are serving as flood channels for stormflow. The combination of flooded streets, thousands of densely-packed pedestrians, at-grade transit cars and automobiles – all at night – presents a very dangerous situation that has never been discussed, analyzed, or mitigated in the DSEIR.

c. The DSEIR Deferred Analysis of Wastewater Impacts.

The DSEIR's analysis with respect to wastewater capacity and infrastructure is similarly flawed. After acknowledging that the City does not have sufficient wastewater capacity to address project-level impacts, the DSEIR very generally mentions vague "interim improvements to temporarily increase the dry-weather capacity" of the Mariposa Pump station. (DSEIR, p. 5.7-12) In failing to explain when these interim improvements will be completed or to analyze their environmental impacts, the DSEIR fails as an informational document. (*Ibid.*) 28 [UTIL-6]

The DSEIR's analysis of cumulative wastewater impacts also fails to provide necessary information to the public and decision-makers. While acknowledging that permanent improvements are necessary, the DSEIR fails to provide any information 29 [UTIL-3]

about the environmental impacts of these improvements. (DSEIR, pp. 5.7-13 – 14.) The DSEIR dismisses this deficiency because "SFPUC has not completed the planning and design of specific improvements," (DSEIR, 5.7-14), but this does not alleviate the duty of a lead agency to disclose available information. (CEQA Guidelines, § 15144.) One critical piece of information with respect to future construction activity, ignored in the DSEIR, is that a substantial amount of such construction would likely occur in areas of existing soil and groundwater contamination. (Exhibit B, comments A1, A2, A3, B1, B3, B4, B5, B6, C1.) The DSEIR's conclusory dismissal of the impacts associated with constructing necessary wastewater infrastructure fails to address that issue.[5] 29 [UTIL-3] cont.

5. The DSEIR Improperly Excluded Analysis of Impacts to Recreation – 1998 SEIR Chapter 5.M.

The DSEIR did not address the Project's impacts on recreational facilities because the NOP/IS determined that no new or more severe significant impacts would occur than previously identified in the 1998 SEIR. As set forth more fully below, the information contained in the DSEIR supports a fair argument that use of Bayfront Park by thousands of crowded arena visitors will accelerate its substantial deterioration, which will be a significant environmental impact. (CEQA Guidelines, Appendix G, section XV(a).) A fair argument exists that the Project's recreation-related construction,at Bayfront Park will result in significant environmental impacts through possible exposure to hazardous materials. Even if the Project is considered a "revision" to the project analyzed in the 1998 SEIR, the addition of a massive, 18,000-seat arena will have a significantly greater impact to Bayfront Park than disclosed in the 1998 SEIR requiring analysis in a recirculated DSEIR. 30 [REC-1, HAZ-9]

a. Crowds From the Project May Substantially Degrade Bayfront Park.

The DSEIR failed to include an analysis of impacts to recreation based on the NOP/IS's determination there would be no new or more severe impacts than identified in the 1998 SEIR. (NOP/IS, pp. 61-64.) This conclusion is in error because a fair argument exists that the Project will result in potentially significant impacts to recreation and recreational facilities.

The fundamental flaw in the NOP/IS's analysis is seen in the following statement: "The increase in demand for recreational facilities generated by the project would

[5] Further discussion regarding the City's abdication of its CEQA duties with respect to wastewater treatment is addressed in the July 26, 2015, letter submitted by Tom Lippe.

generally be consistent with that described in the Mission Bay FSEIR." (NOP/IS, p. 63.) This remarkable conclusion is unsupported by any citation or factual support. Rebutting this statement is the project description itself: an arena with a capacity of more than 18,000 seats holding up to 225 events per year. The expected huge crowds, and employees associated with the 580,000 square feet of commercial uses, would be crammed into an 11 acre parcel. The only respite to the congested arena environment would be 3.2 acres of alleged open space. While at first blush this might appear adequate, in reality this "open space" consists of small, disjointed spaces. Many of these spaces are located on the tops of buildings and unavailable to thousands of arena visitors.

In contrast to the functionally unusable "open space" within the Project site, immediately across the street from the Project is the planned Bayfront Park – a single, expansive, ground level, landscaped park of 5.5 acres. It is very likely that the near-daily crowds of congested arena visitors will use Bayfront Park to gather both before and after shows rather than the oddly disjointed "open spaces" located on top of various buildings throughout the site.

30 [REC-1, HAZ-9] cont.

These thousands of additional arena visitors are in addition to the people associated with the Project's 580,000 square feet of office space, the Project's 125,000 square feet of retail space, and all other people within the larger Mission Bay area who are anticipated to visit Bayfront Park. The open space needs of such arena crowds were nowhere contemplated in the 1998 SEIR. The Project will result in significantly accelerated physical deterioration of Bayfront Park, not disclosed in the 1998 SEIR, and is a significant impact under CEQA. (CEQA Guidelines, Appendix G, section XV(a).)

b. The Project Will Require Construction of Bayfront Park That May Have an Adverse Impact on the Environment.

The DSEIR acknowledges the development of the Project triggers development of Bayfront Park and must be completed prior to occupancy. (DSEIR, p. 3-37-38.) In other words, development of the Project requires construction of Bayfront Park. (See, e.g., CEQA Guidelines, Appendix G, section XV(b).) Accordingly, construction of Bayfront Park is a "reasonably foreseeable consequence of the initial project," and requires analysis in the DSEIR. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 396.) It may not, as occurred here, be dismissed as a separate project for purposes of CEQA. (DSEIR, p. 3-37.) Serious questions exist about whether construction of Bayfront Park will result in adverse physical effects on the environment due to the presence of hazardous materials on that site. (*Ibid*.)

As set forth above, the NOP/IS failed to disclose the present existence of hazardous waste in the soil within the Project site. The soil underlying the future Bayfront Park is similarly contaminated. (2006 RRMP, p. 2-5.) This contamination has not been disclosed in the NOP/IS or the DSEIR. Since it appears that Bayfront Park will be constructed along with the Project, the same questions are raised about hazardous materials impacts as discussed in sections 2(b) and (c) of this letter.

The potentially significant impacts regarding hazardous materials are exacerbated because Bayfront Park will be a ground-level landscaped park. Having failed to disclose that the soil underlying Bayfront Park is contaminated, the NOP/IS also fails to explain whether such contaminated soil will be left in place and thereby expose visitors to hazardous materials. There is no discussion of whether an impermeable cap will be used to protect future park visitors from the existing contaminated soil.

30 [REC-1, HAZ-9] cont.

The failure to address these critical issues supports a fair argument that the Project will require construction of a recreational facility (i.e., Bayfront Park) that will have an adverse effect on the environment by facilitating the exposure of contaminated soils to humans and the environment. (CEQA Guidelines, Appendix G, section XV(b)). The City may not dismiss this potentially significant impact based on its own failure to conduct a reasonable analysis of the issue. (*Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311 ("[t]he agency should not be allowed to hide behind its own failure to gather relevant data . . . . If the local agency has failed to study an area of possible environmental impact, a fair argument may be based on the limited facts in the record").) The recirculated DSEIR will need to analyze this potential significant impact.

6. <u>The DSEIR Failed to Disclose Energy Impacts.</u>

The DSEIR is fatally defective because it fails to provide information about the Project's energy requirements as mandated by Appendix F of the CEQA Guidelines ("Appendix F"). A California appellate decision recently reaffirmed the need for a detailed analysis of energy consumption and mitigation in EIRs, stating in relevant part:

31 [EN-1]

> Under CEQA, an EIR is "fatally defective" when it fails "to include a detailed statement setting forth the mitigation measures proposed to reduce wasteful, inefficient, and unnecessary consumption of energy." (*People v. County of Kern* (1976) 62 Cal.App.3d 761, 774.) The requirement to adopt energy impact mitigation measures "is substantive and not procedural in nature and was enacted for the purpose of requiring the lead agencies to focus upon the energy problem in the preparation of the final EIR." (*Ibid.)*

(*California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 209 (*CCEC*).)

The City failed to comply with this mandate to prepare a detailed statement in the DSEIR. In fact, the DSEIR fails altogether to address the issue of energy consumption because the NOP/IS inaccurately determined that the issue was sufficiently addressed in the 1998 SEIR. (DSEIR, 1-9; NOP/IS, pp. 122-125.) This did not happen.

As explained in *CCEC*, Appendix F lists the information that satisfies CEQA's mandate to "assure that energy implications are considered in project decisions." (CEQA Guidelines, Appendix F; *CCEC*, *supra*, 225 Cal.App.4th at 209.) As just one example, the list includes "total energy requirements of the project by fuel type and end use." (CEQA Guidelines, Appendix F, Section II(A)(2). The 1998 SEIR failed to prove this information. With respect to construction energy requirements, the NOP/IS concedes: "The FSEIR did not estimate energy consumption specific to the development of proposed on Blocks 29-32 or the amount of water that would be used during construction.") (NOP/IS, p. 123.) With respect to operational energy requirements, the NOP/IS concedes, "The amount of fuel use attributable to development on Blocks 29-32 was not specifically calculated in the FSEIR." (NOP/IS, p. 123.) Finally, with respect to transportation energy requirements, the NOP/IS concedes: "The amount of fuel use attributable to development on Blocks 29-32 was not specifically calculated in the FSEIR." (NOP/IS, p. 123.) 31 [EN-1] cont.

The 1998 SEIR thus failed to address the issue of energy demand and mitigation for the project proposed in 1998, much less for the very different Project now proposed. Contrary to the conclusion in the NOP/IS, the 1998 SEIR cannot be relied upon to avoid providing the analysis in the DSEIR.

The NOP/IS and DSEIR make much of the proposed LEED certification for the Project. While LEED certification may be relevant to a lead agency's duties under Appendix F, referencing LEED certification alone is inadequate. The *CCEC* decision addressed this point in the context of Title 24 building energy code standards:

> Although the Building Code addresses energy savings for components of new commercial construction, it does not address many of the considerations required under appendix F of the CEQA Guidelines. These considerations include whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope.

CCEC, *supra*, 225 Cal.App.4th at 211.)

The same analysis applies to LEED certification. While relevant, LEED certification does not end the discussion or obviate the lead agency's duty to comply with Appendix F. What is more, as explained in the context of GHG emissions a lead agency may not avoid its duty to disclose project impacts and mitigation measures by incorporating mitigation measures into the project description. To the extent that the City intends to incorporate the purchase of offsets as a "design feature" or otherwise incorporate it into the project description, recent case law clarifies that this strategy violates CEQA's mandate to separately disclose project impacts and feasible mitigation measures. (*Lotus*, *supra*, 223 Cal.App.4th 645, 655-56 (incorporating mitigation measures for redwood trees into the project description violated CEQA "[b]y compressing the analysis of impacts and mitigation measures into a single issue").) To the extent that LEED certification reduces the Project's energy demand, the DSEIR must disclose the Project's unmitigated energy consumption and show how LEED certification reduces that consumption. 31 [EN-1] cont.

In summary, the City's failure to address the Project's energy demands as required by Appendix F renders the DSEIR "fatally defective." (*CCEC*, *supra*, 225 Cal.App.4th at 209.)

7. <u>Wind and Shadow – DSEIR Chapter 5.6.</u>

a. Wind Impacts are Inadequately Analyzed.

According to the DSEIR, a wind impact would be significant if it would alter wind in a manner that would substantially affect public areas. (DSEIR, p. 5.6-6.) Thus, the wind analysis only addresses offsite areas. (DSEIR, pp. 5.6-10 to -13.) Yet, this Project is so large that it also contains publicly accessible areas within the Project. While the DSEIR includes a discussion of wind impacts in these areas, it does so only for "informational purposes." (DSEIR, p. 5.6-18.) This analysis shows that exceedances of the criteria will occur, yet no mitigation is required. Instead, the DSEIR discusses "refinements that could be incorporated into the project . . . ." (DSEIR, p. 5.6-19.) 32 [WS-1]

The City's approach to addressing wind impacts violates CEQA's mandates that an EIR identify potentially significant impacts and set forth with specificity all feasible mitigation measures. The DSEIR must identify potentially significant impacts to public spaces within the Project site, and cannot conflate public disclosure of that impact with the separate and distinct analysis of feasible mitigation measures. (*Lotus*, *supra*, 223

Cal.App.4th at 655-56.) Further, the DSEIR may not defer formulation such mitigation measures in the absence of any performance standards and explanation as to why deferral is necessary. (*Communities for a Better Environment, supra,* 184 Cal.App.4th at 93.) 32 [WS-1] cont.

b. Shadow Impacts are Undisclosed.

According to the DSEIR, the Project would have a significant shadow impact if it substantially affected a publicly-accessible open space area, such as Bayfront Park. (DSEIR, p. 5.6-6.) With respect to the methodology for assessing the Project's impacts, the DSEIR refers to the South Design for Development. (DSEIR, p. 5.6-8.) However, the land use designation in the Mission Bay Redevelopment Plan for the four-block Project area was designated as "Commercial Industrial (Mixed Use including Retail)." (DSEIR, Figure 3-3.) The proposed Project will require that the South Design for Development be modified to accommodate the arena and accompanying development, so it is not clear that the standards developed for the 1998 land use plan apply in this circumstance. Moreover, conditions have likely changed such that the South Design for development, which did not require any analysis of shadow for the months from October to February, no longer reflects current practices and values. Especially with the increased visitors to the area as a result of the Project throughout the year, shadow impacts on the very parks those people will use should be fully analyzed. 33 [WS-2]

The DSEIR's approach of ignoring the generally-applicable City standard is also inconsistent with the DSEIR's approach to analysis of wind impacts. With respect to wind, the DSEIR relies on Planning Code section 148 to determine what level of wind would constitute a substantial alteration, even though it is superseded by the South Design for Development Standards. (DSEIR, p. 5.6-6.) Yet the DSEIR does not mention the typically applicable standard – Section 295 of the Planning Code, also known as "Proposition K" and "the Sunlight Ordinance." The absence of a substantive standard for shadow is all the more reason to refer to Section 295 for purposes of analyzing shadow impacts.

> Section 295 mandates that new structures above 40 feet in height that would cast additional shadows on properties under the jurisdiction of, or designated to be acquired by the Recreation and Parks Department can only be approved by the Planning Commission if the shadow is determined to be insignificant or not adverse to the use of the park. Also, a recommendation from the Recreation and Parks Commission is required prior to the Planning Commission hearing.

(S.F. Planning Department Application Packet for Shadow Analysis, available at: http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=539.) Impacts to Bayfront Park should be analyzed according to Section 295 to ensure that shadow impacts are disclosed and mitigated.

In conclusion, the analysis in the DSEIR fails to adequately address the wind and shadow impacts of the Project under current conditions, using standards developed by the City to ensure public spaces are comfortable and enjoyable. The DSEIR should be revised and recirculated to provide a thorough analysis and incorporate all feasible mitigation. Such mitigation may include changes to the structures to address wind and shadow impacts both on and off the Project site. 33 [WS-2] cont.

8. <u>The DSEIR's Project Description is Inconsistent.</u>

The DSEIR is fundamentally flawed because the project description is internally inconsistent, thwarting intelligent public participation relating to the Project and its impacts. (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 197.) As described more fully below, the DSEIR appears to variously include and exclude the departure of the Warriors from the existing Oracle Arena. 34 [PD-2]

DSEIR section 1.1.2 (Project Objectives) provides in relevant part:

> The Golden State Warriors currently play their home games at Oracle Arena, located at 7000 Coliseum Way in Oakland, California and lease their management offices and practice facility at the Oakland Convention Center at 1011 Broadway in downtown Oakland. The proposed project would consolidate these facilities in one location.

(DSEIR, p. 1-3.)

Consistent with this approach, the Project's AB 900 Application expressly incorporates into the project description reduced events at the existing Oracle Arena in order to reduce the Project's greenhouse gas emissions. This strategy is depicted both textually and graphically in the AB 900 Application: 35 [AB-1]

> Though the Oracle Arena will no longer host GSW games, it is assumed that approximately 50% of the non-game events will still occur at the Oracle Arena, or 24% of a typical year's game and non-game events will still occur at the Oracle Arena. Thus, emissions calculations for the

remaining non-game events at Oracle Arena use a 24% scaling factor to account for this reduction in number of events.

(AB 900 Application, p. 63.)

Table 1. Project Description

Element	Oracle Arena and GSW Oakland Headquarters	Event Center Project
First Operational Year Considered	2017	2017
Oracle Arena	500 KSF	500 KSF
GSW Games [1]	100%, 47 games	No games
Non-game Events [2]	100%, 42 events	50%, 21 events
Mission Bay Event Center	-	750 KSF
GSW Games [1]	-	100%, 47 games
Non-game Events [3]	-	100%, 161 events
GSW Headquarters	Oakland	Mission Bay, 25 KSF

1. Number of GSW games in both scenarios is based on the 2013-2014 season. Averages for the previous years were skewed by the 2011 NBA lockout.
2. Number of non-game events at Oracle Arena is based on the schedule from recent years. In the Event Center Project scenario, half of the non-game events are assumed to remain at Oracle Arena while the other half are transferred to the Mission Bay Event Center.
3. Number of non-game events at Mission Bay Event Center is based on the Notice of Preparation dated 11/19/2014.

Consistent with the DSEIR's discussion of project objectives on page 1-3 as well as in the AB 900 Application, the DSEIR's analysis of greenhouse gas emissions incorporated event reductions at Oracle Arena for purposes of decreasing the Project's carbon footprint. (DSEIR, p. 5.5-11.) Page 5.5-11 of the DSEIR provides in relevant part:

As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits. Net additional GHG emissions would be

35
[AB-1]
cont.

calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the project.[6]

Thus, while not expressly stated in the text of the DSEIR's analysis of GHG emissions, the analysis nonetheless incorporates reduced events at Oracle Arena for purposes of calculating the project's net GHG emissions.

35
[AB-1]
cont.

While taking the environmental "benefit" of lower mobile-source GHG emissions resulting from reduced events at Oracle Arena, the DSEIR deftly avoids analysis of the environmental consequences of this component of the overall Project. For example, the project description includes continued operation of Oracle Arena even though it is predicted to host merely 21 events per year. (AB 900 Application, pp. 63, 81 of 155.) As explained by Ph.D. economist Philip King, it would be unreasonable for Oracle Arena to continue to operate with so few events. Dr. King concludes that one likely scenario is that Oracle Arena would need to close as a result of the reduced demand, which in turn creates the potential for urban decay at the Oracle Arena site. The DSEIR never analyzed the resultant potential for urban decay. Nor did the DSEIR analyze the impacts associated with demolition of the existing Oracle Arena as a result of its shuttering.

36
[PD-2]

37
[GEN-4,
IO-1]

The DSEIR is thus flawed because the project description is internally inconsistent. The project description includes reduced events at Oracle Arena when doing so helps to minimize the Project's environmental impacts, but excludes operation of Oracle Arena in order to avoid addressing its problematic environmental impacts. This inconsistency misleads the public about the Project and its impacts. (See, e.g., *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 655-656 ("By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading").)

The same analysis applies to the DSEIR's inconsistent treatment of the construction of Bayfront Park and realignment of Terry Francois Blvd. The DSEIR notes, consistent with the redevelopment plan, that both the Bayfront Park and realignment are triggered by the Project, which makes them "reasonably foreseeable consequence[s] of the initial project" requiring analysis in the DSEIR. (*Laurel Heights, supra,* 47 Cal. 3d at 396.) Even though these are components of the Project as a matter of law, the DSEIR purports to characterize Bayfront Park and the roadway alignment as

38
PD-2

6 Curiously absent from the DSEIR's discussion is any reference that the "net additional GHG emissions" from the AB 900 certification expressly relies upon credits from reduced events at Oracle Arena.

separate projects for purposes of CEQA. (DSEIR, p. 3-37.) As a result of this inconsistent project description, the DSEIR fails to address potentially significant hazardous materials impacts associated with construction and occupancy of Bayfront Park.

38 [PD-2] cont.

In summary, a lead agency may not concurrently expand and contract the described scope of a proposed project – and may certainly not do so when the result is to avoid analysis of potentially significant impacts. The recirculated DSEIR will need to provide a stable and consistent project description.

9. <u>The DSEIR Fails to Analyze Possible Urban Decay in Oakland.</u>

"Under CEQA, a lead agency must address the issue of urban decay in an EIR when a fair argument can be made that the proposed project will adversely affect the physical environment." (*CCEC*, *supra*, 225 Cal.App.4th at 188.) An EIR is to disclose and analyze the direct and the reasonably foreseeable indirect environmental impacts of a proposed project if they are significant. (CEQA Guidelines, §§ 15126.2, 15064, subd. (d)(3).) Economic and social impacts of proposed projects are outside CEQA's purview. (Guidelines, § 15131.) However, when there is evidence that economic and social effects caused by a project could result in a reasonably foreseeable indirect environmental impact, such as urban decay or deterioration, then the CEQA lead agency is obligated to assess this indirect environmental impact. (*CCEC*, *supra*, 225 Cal.App.4th at 188; *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1182; *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d 433, 446 ("The potential economic problems caused by the proposed project could conceivably result in business closures and physical deterioration of the downtown area").)

39 [GEN-4]

Here, substantial evidence supports a fair argument that the Project will result in economic impacts that would foreseeably lead to urban decay in Oakland. The DSEIR explains that the project include relocating the Warriors home games from the existing Oracle Arena in Oakland to San Francisco. (DSEIR, p. 1-3.) In addition to relocating all NBA games from Oakland to San Francisco, the Project description also includes relocating half of all existing non-NBA games from Oakland to San Francisco. (AB 900 Application; DSEIR, p. 5.5-11.) Thus, a direct economic impact of the Project is to reduce Oracle Arena events from 89 to 21 per year. As explained by economist Philip King, this is a severe direct economic impact from the Project. (See <u>Exhibit E</u>, a memorandum from Philip King, Ph.D., dated July 13, 2015 ("King Report"), pp. 6-7.)

Such a dramatic economic impact may reasonably be expected to have indirect impacts. Dr. King explains that revenues from a mere 21 events per year will not likely

justify the ongoing operational costs of maintaining such a facility. (King Report, pp. 7-8.) Accordingly, a likely indirect impact is the ultimate shuttering of Oracle Arena. Repurposing such a massive facility is difficult to impossible, and so it is very likely that the facility will likely stand dormant and invite the physical deterioration that is characteristic of urban decay. (King Report, pp. 8-9; *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 184, 1212 [urban decay characteristic of "long-term vacancies that deteriorate and encourage graffiti and other unsightly conditions"].)

39 [GEN-4] cont.

Despite acknowledging that the Project would have significant detrimental economic impacts in Oakland, which in turn may result in physical deterioration, the DSEIR ignores the issue of urban decay. It thus fails as an informational document on this issue. The recirculated DSEIR will need to provide an analysis of the economic impacts in Oakland resulting from the predicted reduction of events at Oracle Arena, the potential for physical deterioration to result, and feasible mitigation measures to address these potentially significant impacts. (*CCEC*, *supra*, 225 Cal.App.4th at 188-190.)

* * *

Thank you for the opportunity to provide comments on the Project. For the reasons discussed above, and in the attached expert reports, the Mission Bay Alliance objects to certification of this EIR and approval of this Project.

Very truly yours,

SCS ENGINEERS

July 20, 2015
File No. 01215159.00

MEMORANDUM

TO: Osha Meserve, Soluri Meserve

FROM: Patrick S. Sullivan, SCS Engineers
John Henkelman, SCS Engineers

SUBJECT: Greenhouse Gas Analysis for Golden State Warriors Event Center

SCS Engineers (SCS) has reviewed the greenhouse gas (GHG) analysis prepared for the proposed Golden State Warriors (GSW) Event Center (Project). The GHG analysis was performed to demonstrate that the GHG emissions from the proposed Event Center would meet the requirements under Assembly Bill 900 (AB900), including that it would result in "no net increase" in GHG emissions. SCS has performed many GHG analyses for purposes of permitting, mandatory reporting, verification, CEQA and other requirements. The resumes of Patrick Sullivan and John Henkelman are provided as an attachment.

The documents reviewed include the following:

- *Application for CEQA Streamlining: GHG Emissions Methodology and Documentation*, Environ 2015
- *Application for Environmental Leadership Development Project, Golden State Warriors, Event Center and Mixed-Use Development at Mission Bay Blocks 29-32*, Golden State Warriors 2015
- *ARB Staff Evaluation for Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32*, ARB Staff 2015
- *Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 Draft Subsequent EIR*, Office of Community Investment and Infrastructure 2015

SCS does not agree with the conclusion of the AB900 determination letter from the California Air Resources Board (CARB) dated April 20, 2015 stating that the Project would not result in any net additional GHG emissions for purposes of certification under AB900. The methodology used to conclude there would be no increase in GHG emissions is inconsistent CARB GHG policies such as the *First Update to the Climate Change Scoping Plan* (CARB 2014) and furthermore does not substitute for an adequate analysis of GHG under CEQA. 40 [AB-1]

The Project quantified the expected GHG emissions for the construction and operating phases of the Project. The construction emissions were quantified using the California Emissions Estimator Model (CalEEMod) with some site-specific inputs. Operational emissions analysis includes the emissions from the existing Oracle Arena, the existing GSW headquarters, and the proposed

Event Center in the analysis. The emissions from the Oracle Arena were quantified using some site-specific values and some intensity factors obtained from CalEEMod and projected electricity intensity factors from CalEEMod. GHG emissions for the proposed Event Center were calculated using a similar methodology, but all electricity and utility use must be projected using CalEEMod factors. The GHG emission calculations for the Event Center also include GHG reductions for energy efficiency and trip linking.

The Project proposes to achieve GHG neutrality through the acquisition of GHG emission offsets equal to the projected GHG emissions from the Project over a 30-year Project life. The Project includes Mitigation Measure (MM) I-C-GG-1, which requires offsets for GHG emissions from construction and operation of the proposed Event Center.

The GHG analysis provided and proposed MM I-C-GG-1 are not sufficient to demonstrate that the Project will result in no net increase in GHG emissions for the following reasons:

- GHG methodology includes inappropriate Project operational emission baseline
- Monitoring of GHG emissions is not sufficient to demonstrate that GHG emissions are net zero
- MM I-C-GG-1 does not require use of offsets consistent with California GHG policy

As a result, the determination in the Draft Subsequent Environmental Impact Report (DSEIR) that GHG emissions are a less than significant impact is erroneous.

40
[AB-1]
cont.

GHG OFFSETS BACKGROUND

GHG offsets are a critical element of the MM I-C-GG-1, which the GHG evaluation indicates would result in net zero GHG emissions from the Project. The concept behind a GHG offset is that a project developer creates GHG emission reductions above and beyond what is considered to be "business as usual" (BAU), meaning that the GHG reduction would not have occurred in the absence of the GHG reduction project. For a GHG reduction offset to be generated for use in the CARB Cap and Trade (C&T) program, the reduction must be *real, additional, quantifiable, permanent, verifiable, and enforceable*. The GHG reduction registries that may create GHG offsets under the C&T program, Climate Action Reserve[1] (CAR), the American Carbon Registry[2] (ACR), and the Verified Carbon Standard[3] (VCS), also adhere to similar principles when creating their GHG offset protocols.

The "Real" requirement for eligible offset sources means that reductions must result from demonstrable action and the methodology used to quantify that reduction must account for appropriate GHG emission sources, sinks, and reservoirs. "Real" assures that GHG generated by

[1] Climate Action Reserve Program Manual (CAR October 2011)
[2] American Carbon Registry Standard v4.0 (ACR January 2015)
[3] VCS Program Guide (October 2013)

GHG offset projects is accounted for and that projects emitting more GHG than they reduce do not generate offsets.

Offset "additionality" means that the GHG reduction activity must produce a result better than BAU. The activity cannot be the normal practice. For example, destruction of ozone depleting substances (ODS) by governments is common practice but that destruction is not commonplace for commercial or industrial facilities. Thus, destruction of ODS is not additional when the ODS is sourced from a government but it is additional when the ODS comes from a company facility.

Quantifiable, verifiable, and enforceable assure that the GHG reduction can be measured, that a third party can confirm the quantification, and that CARB can hold a party liable for performing the GHG offset activity if necessary. These principles provide assurance that GHG reductions are calculated accurately and the supporting data have been reviewed by CARB and a third party verifier.

The principles of real, additional, quantifiable, permanent, verifiable, and enforceable are critical to achieving the goal of reducing GHG in the atmosphere. The need for these assurances is shown by problems with some markets and programs, such as the Clean Development Mechanism (CDM) and Chicago Carbon Exchange (CCX), which have suffered from a lack of confidence in the legitimacy of the generated GHG reduction offsets.

40
[AB-1]
cont.

CARB currently allows GHG reduction credits for forest projects, livestock projects, ozone depleting substance (ODS) projects, and mine methane capture (MMC). CARB has proposed the adoption of a rice cultivation project type. The livestock, ODS, and MMC projects achieve GHG reduction through the destruction of gases with a high potential for global warming (methane or ODS). For forest projects, the carbon reduction occurs by setting aside forested land where trees remove carbon from the atmosphere and store it as wood and plant material.

When the GHG offset developer wishes make the offsets available for purchase on the market, the developer uses a third-party verifier to confirm that the project meets program requirements and that reductions have been accurately quantified. The offset registry (CAR, ACR, or VCS) then issues the offsets to the developer. If the protocol was one of those eligible under the C&T regulation, those offsets are traded in the CARB offset market and used for regulatory compliance under the C&T regulation. If those GHG offsets are not generated under a C&T protocol, as apparently intended with the Warriors Arena, they are traded through environmental offset brokers. Non-C&T GHG offsets can be retired at the request of the offset holder to remove those offsets from the market, thereby finalizing the GHG reduction.

FLAWS IN PROJECT OPERATIONAL EMISSIONS CALCULATION

The GHG analysis in the AB900 Certification by CARB and the *Application for CEQA Streamlining: GHG Emissions Methodology and Documentation* makes several assumptions about the Project operational emissions that are not appropriate, including an assumption that the number of events at the Oracle Arena will be limited to 21 and in the reduction of emissions from the Oracle Arena by a factor of 76 percent.

Unsupported Oracle Arena Emission Reductions

The GHG analysis underestimates GHG emissions from the Project by using the operation of the Oracle Arena as the baseline emissions (*Application for CEQA Streamlining: GHG Emissions Methodology and Documentation*, Environ 2015). The new arena Project emissions are then calculated by subtracting the projected Oracle Arena emissions from the proposed Project emissions. Operational emissions for the Oracle Arena in the Project scenario assume that all GSW games plus 50 percent of all non-GSW events that occur at the Oracle Arena will be held at the new arena location in San Francisco. This assumption results in a reduction of emissions from Oracle Arena by 76 percent (based on the current 47 GSW games and non-GSW 42 events per year).

No basis for the validity of this assumption is provided in the GHG analysis. The GHG analysis includes the Oracle Arena in the baseline condition then limits the number of events at the Oracle Arena in the Project scenario, providing the Project with a large and unenforceable GHG credit at the outset of the calculation.

40
[AB-1]
cont.

When assumptions are made that limit impacts from a Project, those assumptions must be the result of enforceable conditions. In this case, MM I-C-GG-1 does not limit the events at the Oracle Arena to a maximum of 21. With no enforceable condition limiting the number of events at the Oracle Arena, it is not appropriate to assume that the number of events will decrease. The GHG analysis has already assumed that arena events will be generated by the Project based on the 89 events at Oracle Arena in the baseline scenario and 229 events in the Project scenario (21 at Oracle Arena, 47 GSW games at the Event Center, 161 non-GSW events at the Event Center). The GHG Analysis provides no justification for the reduced number of events at the Oracle Arena while assuming that the total number of events will increase.

If an enforceable condition were to be added to limit the number of events at Oracle Arena to only 21, it would be appropriate to reduce GHG emissions in the Project scenario. However, the methodology used to calculate the reduction in emissions associated with the reduced number of events at the Oracle Arena is not appropriate.

The emissions from the Oracle Arena are also directly scaled using the 76 percent reduction factor based on the number of events. This is unreasonable because it assumes that no emissions occur when events are not scheduled. It is unlikely that the Oracle Arena will cease all energy and utility use while not holding an event. It is even more unlikely that the emissions from area sources (e.g. landscaping equipment) will directly scale with the number of events.

Application Omits GHG Non-Arena Buildings

The AB900 Application does not include any GHG emissions from the non-Arena buildings that are included in the Project. Only the GHG emissions from the proposed Event Center were

included in the AB900 Analysis. Emissions from other structures, including the two 160-foot office towers, the gatehouse, the food hall, GSW headquarters and retail uses for instance, are not included in the analysis, which are 730,000 square feet of space. (DSEIR, p. 2-18 to 2-19, Figure 3-5 and Table 3-1.) This omitted square footage is comparable to the square footage of the Event Center (750,000 square feet), and the emissions could equal or exceed the emissions from the Event Center. The AB900 analysis for the Project scenario omits any GHG emissions from these structures because they are assumed to be "fully vested legal rights" in the Project scenario. (Application, pp. 2, 8.)

This approach of omitting the GHG emissions from non-Arena facilities in the Project scenario because it is a "fully vested legal right" is inappropriate because those buildings have been included in the Project Description and they do not already exist. Excluding those buildings because of "fully vested legal rights" is inconsistent with CEQA requirements that impacts be evaluated based on the actual (i.e. existing) baseline condition, not a possible (i.e. permitted) condition. Also, since the AB900 certification is for the entire Project, GHG emissions from all project components must be included for the inventory to be complete.

Double Counting of Emission Reductions from Trip Linking

The Project includes a significant GHG emission reduction (7 percent of total before reductions) from trip linking. This GHG reduction accounts for some trips which would combine retail trips and trips to the arena. Some of the project operational GHG emissions were calculated with CalEEMod, and CalEEMod already includes factors for trip linking in its emission calculations for mobile sources. The GHG analysis offers no justification for why the trip linking described in the GHG analysis is not already accounted for in the CalEEMod emission calculation. This error overestimates the benefits of trip linking.

40
[AB-1]
cont.

Project Methodology is Not Rigorous and is Poorly Defined

The description of the Project in the AB900 Application performed by Environ and relied upon in the GSW AB900 Application is internally inconsistent. The Environ document describes the Project as "development of a new arena." (Application p. 1.) The Environ Project Description shows the proposed land uses near the proposed Event Center, but does not clearly include the buildings in the Project. The Environ AB900 Application then proceeds with the GHG analysis from only the proposed Event Center, omitting emissions from all other buildings and implying that the Project consists of only the Event Center. That Project described in the Environ Application does not discuss the two office buildings, a gatehouse, food hall, GSW headquarters, and retail uses, and consequently uses inappropriate boundaries when analyzing the GHG emissions from the Project.

The Project described in the DSEIR consists of the proposed event center as well as two office buildings, a gatehouse, food hall, GSW headquarters, and retail uses.

, That Project Description is consistent with the Project description in the CARB Analysis, and the GSW Application, which includes the Event Center plus several other buildings including the two office buildings, the gatehouse, food hall, and retail uses; however, no emissions from these other sources are included in the evaluation.

Throughout the AB900 Analysis, the boundaries of the analysis are poorly defined and no justification for the boundaries is provided. The CARB Analysis confirmed the GHG calculations are accurate but failed to analyze the appropriateness of the boundaries or the concept of "vested legal rights" used in the AB900 Analysis.

The baseline scenario includes the Oracle Arena, though the Project itself involves no modifications to the Oracle Arena. The Project scenario assumes a 76 percent reduction in the emissions from Oracle Arena without proposing modifications to the facility or limiting activity at the Oracle Arena. The Project excludes GHG emissions from towers included in the Project Description from the Project GHG emission calculation. All of these inconsistencies serve to increase the baseline scenario GHG emissions while reducing the Project scenario GHG emissions, resulting in an artificially small increase in GHG emissions from the Project. The actual GHG emissions increase is likely to be significantly larger than the projected increase due to these inconsistent boundaries.

THE ALLEGED PROJECT EMISSIONS REDUCTIONS LACK MONITORING AND ENFORCEABILITY

40 [AB-1] cont.

The AB900 Application and the 2015 DSEIR refer to mitigation in the form of the acquisition of GHG offsets. MM I-C-GG-1 requires that the Project acquire GHG offsets for the GHG emissions for a 30-year period. As described above, the GHG emissions methodology utilized relied on CalEEMod and projected emissions forward for 30 years. This mitigation is insufficient because it is based on modeled emissions rather than actual emissions, and GHG emissions are projected well into the future with no confirmation that predicted emissions are accurate.

30-Year Evaluation Period

The evaluation of the Project's operational emissions for purposes of offset purchases is for a 30-year period, which is too long to be consistent with California's GHG policy. Evaluating the GHG emissions for such a long period is not reasonable and not consistent with California's GHG offset program. GHG offsets generated for use in California's C&T program only have a ten year crediting period, with the exception of forestry offsets. This ten year accounting period is consistent with other GHG evaluation programs such as the CAR, ACR, and VCS. Similarly, the California GHG Scoping Plan requires updates every five years. Projecting GHG emissions 30 years into the Project lifetime, and then purchasing offsets for 30 years into the future from an unverified source is unreasonable and will certainly be inaccurate in terms of matching the actual GHG emissions of the Project.

While the 30-year evaluation period is too long to be consistent with accepted GHG accounting periods, there is no reason to arbitrarily end the Project's GHG emissions after the 30-year period. Oracle Arena opened in 1966, 49 years ago. The proposed Event Center should have a

similar operating lifespan of 49 or more years. The analysis of GHG emissions after 30 years is unaccounted for in the GHG evaluation. The conclusion that the Project results in no net GHG emissions is based on MM I-C-GG-1, which requires that the Project acquire GHG offsets for the GHG emissions for a 30-year period. Any GHG emissions after this 30-year period would not be offset, resulting in emissions greater than zero from the Project. The Project must include enforceable conditions to require offsetting of emissions beyond the 30-year period or require cessation of emission after that period.

Operational Mitigation Trigger Requirement too Lenient

As discussed above, MM I-C-GG-1 requires that operational GHG emissions be offset. The offset requirement is triggered when the Event Center reaches 90 percent utilization. Thus, it is possible that the offset requirement is never triggered. Oracle Arena currently holds 89 events per year. Even if every one of these events were moved to the proposed Event Center, it would be at only 42 percent of the number of events in the Project GHG evaluation. There is no mechanism in the Project or mitigation measures that would require that offsets from the Project be offset if the Project does not reach 90 percent utilization.

No GHG Monitoring Plan

40 [AB-1] cont.

Monitoring of the mitigation for GHG emissions is inadequate. It has been the experience of SCS that Projects that result in GHG emissions prior to mitigation should be required to submit GHG monitoring plans for relatively small periods of time, typically three to five years. Such periodic reevaluation of GHG emissions is consistent with the California Scoping Plan, which must be updated every five years. Such a plan must require quantification of GHG emissions since the previous GHG monitoring plan and a projection of GHG emissions until the next GHG monitoring plan. The quantification of historical GHG emissions in each plan must rely on as much site-specific data as feasible. At a minimum, those data must include the electricity use, natural gas use, other utility and fuel use, the number of events, and the event attendance or trip count.

Such monitoring is also needed to confirm that the energy efficiency assumed in the GHG evaluation due to the Leadership in Energy and Environmental Design (LEED) gold certification is accurate. By using actual measured electricity use to calculate GHG emissions, uncertainties in the actual energy efficiency of the structures would be removed. This monitoring is critical due to the failure of many LEED certified buildings to achieve expected energy use reduction predictions.

The GHG monitoring plan must also include all facilities included in the GHG emission calculations, including the Oracle Arena. If the Oracle Arena is included in the GHG monitoring plan, GHG emissions resulting from more than 21 events in a year would be then captured by the evaluation. An ongoing GHG monitoring plan would also resolve the issue of GHG emissions after the 30-year evaluation period.

MITIGATION APPROACH INCONSISTENT WITH STATE GHG POLICIES

The AB900 Application and MM I-C-GG-1 require that the Project proponents obtain GHG emission offsets for the GHG emissions resulting from the Project. However, there is no assurance that the GHG offsets will be consistent with CARB GHG reduction goals.

The Project is only required to purchase GHG offsets from a "qualified GHG emissions broker." To be consistent with state GHG policy, the offsets should meet California GHG reduction goals and be required to be real, additional, quantifiable, permanent, verifiable, and enforceable. The offsets purchased to meet mitigation requirements should also be thereafter retired and removed from circulation. As written, this "mitigation" allows the credits to be sold again, allowing those same offsets to be used again as mitigation on other projects. 40 [AB-1] cont.

Because neither the AB900 Document nor MM I-C-GG-1 require that the GHG offsets be obtained from a registry that demonstrates that the offset will result in real, additional, quantifiable, permanent, verifiable, and enforceable GHG offsets, and the language allows the GHG offsets to be sold after acquisition, the measure does not provide any assurance that the Project GHG emissions will be net zero or less than significant.

CONCLUSIONS

The GHG analysis used to support the determination that the Project met the requirements of AB900 is insufficient to demonstrate that the GHG emissions from the Project will be net zero and less than significant under CEQA for the following reasons:

- The GHG analysis makes unsupported assumptions about Oracle Arena, trip linkage, and energy use which artificially lower the expected GHG emissions from the Project and do not provide an accurate evaluation of the GHG emissions that can be expected to result from the Project. 41 [AB-1, GHG-2]
- The GHG analysis does not require project monitoring and periodic GHG reporting to assure the accuracy of the projected emissions.
- The GHG offsets proposed as a mitigation measure are not required to be consistent with California GHG reduction goals and policies, could be used for other projects, and may not ever be required for the operational emissions.

Subject: Draft Review
Hazardous Materials
Mission Bay Project
San Francisco, California

Dear Ms. Meserve:

At the request of Soluri Meserve, BSK Associates (BSK) reviewed the following documents:

A. **Mission Bay Subsequent Environmental Impact Report, Dated September 17, 1998, Sections:**
   - Chapter V.J.1 to V.J.109, Environmental Setting and Impacts, Contaminated Soils and Groundwater
B. **Risk Management Plan (RMP), Mission Bay Area San Francisco, California, Dated May 11, 1999, Prepared by Environ Corporation and Revised Risk Management Plan, August 2006 Prepared by BBL Environmental Services, Inc.**
C. **Notice of Preparation of an Environmental Impact Report, Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, Dated November 19, 2014**
   - Pages 106 to 122
D. **Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015**
   - Pages 1-60 to 1-62, Summary of Impacts and Mitigation Measures, Hazards and Hazardous Materials
   - Page 5-1
   - Page 6-5

The following section (A1 to A4) presents our comments based on a review of the Mission Bay Subsequent Environmental Impact Report, Dated September 17, 1998

A1. Section V.J.42, Under Existing Human Health Risks, states " ENVIRON compared the maximum concentration of chemicals detected in the soil anywhere in the Project Area to the risk-based preliminary remediation goals (PRGs) developed by U.S. EPA Region IX for the protection of industrial land uses (Region IX Industrial PRGs)." EPA PRGs are currently not considered appropriate for use in the San Francisco Bay Area as site screening levels. PRGs have been replaced by Environmental Screening Levels (ESLs) developed by the San Francisco Bay Regional Water Quality Control Board in 2013 (SFBRWQCB, 2013). The ESL user guide (SFBRWQCB, 2013) identified significant differences between EPA PRGs and SFBRWQCB ESLs, listed below:

"The U.S. EPA Regional Screening Levels or RSLs (formerly PRGs; U.S. EPA, 2013d) address human health concerns associated with direct exposure to chemicals in soil, but do not address ecological concerns. Exposure routes and receptors not addressed by the RSLs, but included in the ESLs are listed below:

- direct-exposure screening levels for construction and trench workers' exposure to subsurface soils;
- groundwater screening levels for vapor intrusion;
- groundwater screening levels for the protection of aquatic habitats/surface water quality
- soil screening levels for urban area ecological concerns;
- soil and groundwater ceiling levels to address potential presence of Non-Aqueous Phase Liquids (NAPL) and nuisance odor concerns
- soil and groundwater screening levels for Total Petroleum Hydrocarbons (TPH)."

Using PRGs would lead to significant gaps in determining the risks from impacts with respect to vapor intrusion, of aquatic habitats/surface water quality and urban area ecological concerns.

A2. Section V.J.43 first paragraph states: "The upper numerical limit of a calculated statistical average of the concentration of each COPIC in the exposed soils was compared with Region IX Industrial PRGs to determine if any PRGs were exceeded." The appropriate use of an averaged concentration typically involves a robust statistical analysis based on a statistically sufficient number of samples with respect to the area size and requires normally distributed values. The number of samples utilized in the analysis appears to be insufficient considering the large area of the project.

42 [HAZ-1]

A3. Section V.J.53 last paragraphs states: As discussed in more detail in "General Soil Movement and Transport During Construction," below, DTSC has determined that soils excavated during construction in the Mission Bay Project Area can be moved around and reused in the Project Area without triggering hazardous waste management requirements, provided the soils are managed in accordance with RMP measures. However, DTSC's determination does not apply to building demolition debris or waste soils or other waste materials from any necessary remediation activities. In the event these wastes contain levels of constituents that would result

43 [HAZ-5]

in their classification as hazardous waste, the hazardous waste regulations described above would apply to those materials."

Based on our review of the boring logs recent Phase II Environmental Site Assessment (Langan, 2015), it appears that soil with construction debris was used as fill during the 2005 remediation effort for the Pier 64 clean-up. Our review of the Langan 2015 report boring log soil descriptions indicates that near surface soils at boring locations LB-8, LB-12, LB-26 and LB-29 contain brick fragments. These borings were completed in the area of the Pier 64 clean-up that reportedly removed petroleum impacted soil to a depth of 9 feet and filled in the area (Langan 2015). Furthermore, as stated in B7 below, the area of fill from the Pier 64 clean-up may contain soil impacted with soluble lead that would classify it as a California Hazardous Waste.

The presence of brick, that is probably demotion debris, and soluble lead in the fill material placed during the Pier 64 clean-up effort, indicates that the Risk Management Plan (RMP) or implementation of the RMP, was ineffective and did not comply with the DTSC determination listed above.

43 [HAZ-5] cont.

A4. Section V.J.83 under Human Health Risk Assessment states: "The SSTLs were developed using methods consistent with the Risk-Based Corrective Action (RBCA) methodology, as developed by the American Society for Testing and Materials (ASTM) and described in ASTM E-1739, 'Standard Guide for Risk-Based Corrective Action Applied at Petroleum Release Sites, 1995'."

Use of the RBCA methodology may be valid for areas impacted with petroleum hydrocarbon related releases. In other non-petroleum release areas, chemicals-of-concern, such as metals and PAHs not related to petroleum hydrocarbons were detected in soil or groundwater. Use of SSTLs developed for petroleum site based RBCA for non-petroleum related constituents may not be a valid approach. Furthermore, 1995 ASTM E 1739-95 standard under Section 1.1 Scope states: "Ecological risk assessment, as discussed in this guide, is a qualitative evaluation of the actual or potential impacts to environmental (nonhuman) receptors."

44 [HAZ-1]

Summary of Review 1998 - Mission Bay Subsequent Environmental Impact Report

The Mission Bay Subsequent Environmental Impact Report (SEIR), dated September 17, 1998 utilized screening level methods (EPA PRGs) that would not be adequate for current site clean-up standards and would not be appropriate for use on non-petroleum related constituents. The number of samples utilized in the analysis appears to be insufficient considering the large area of the project. Risk Management Plan (RMP) or implementation of the RMP, was ineffective and did not comply with the DTSC determination. Furthermore, the methodology used to develop site risk screening values did not properly incorporate ecological receptors. Given these changes and deficiencies, with consideration of current site conditions, a re-evaluation using current methods and standards of the environmental impacts and risks is required.

45 [HAZ-1]

The following section (B1 to B7) presents our comments based on a review of the Risk Management Plan (RMP), Dated May 11, 1999 and Revised RMP dated August 2006. 46 [HAZ-1]

B1. Page 2-1, there was no discussion of the semivolatile organic chemicals that were detected in soil and groundwater at the site. Summary tables presented in Appendix A of the RMP indicate that polycyclic aromatic hydrocarbons (PAHs) were detected in the soil at various locations and in groundwater collected from MW-11. A possible source and significance of the PAHs was not presented in the RMP.

B2. Page 2-2, the RMP states "No chemicals were detected at concentrations that would pose a threat to human health or the aquatic ecosystem following the completion of the planned development, with the potential exception of the Free Product Area." Based on our review of the receptors presented in Appendix E, Tables E-1, E-2. E-3 and E-4, it appears that ecologic receptors were not included in the risk assessment.

46 [HAZ-1] cont.

B3. Page 3-2, Section 3.2 states: "In addition, mean chemical concentrations in surface soil (estimated by calculating the 95 percent upper confidence limit (UCL) of the arithmetic mean) were below the ITLs developed under assumptions of long-term (i.e., 25 to 30 years) direct contact pathways (i.e., soil ingestion and dermal contact)." The use of mean concentrations typically involves a robust statistical analysis based on a statistically sufficient number of samples with respect to the area size. The number of samples utilized in the analysis appears to be insufficient considering the large area of the project. Furthermore, the depth of soil sampling was limited to samples collected at less than five feet below the ground surface (bgs). Proposed developments may require excavating soil to depths significantly deeper than 5 feet bgs. This may expose receptors to soils that have not been adequately characterized. The recent Phase II Environmental Site Assessment (Langan, 2015) performed additional soil sampling at Blocks 29 to 32 and found "The fill unit was characterized as either a State of California Class I hazardous material based on soluble chromium, lead, and nickel concentrations or a Class II non-hazardous material, likely related to debris from the 1906 earthquake and resulting fire." Designation of the site soils as California Class I hazardous waste is a significant change from what was presented in the 1998 RMP. Additional impacts that would result from excavating and transportation of a large volume of soil for off-site disposal at a Class I disposal site were not evaluated in the 1998 Subsequent Environmental Impact Report (SEIR).

B4. Page 4-1, Section 4.1 states: "As described below in Section 4.3.11, additional sampling may be required on individual development parcels in order to comply with the Ordinance Requirements for Analyzing the Soil for Hazardous Wastes in Appendix F. Depending on the results obtained during any additional sampling, supplemental management measures, in addition to the management measures identified below, may be required on a parcel-by-parcel basis." The RMP specified a deferred sample and analysis protocol to a later date and as stated in section A4 above, deferred analysis may produce dramatically different results. Significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase.

47 [HAZ-3]

B5. Section 4.3.5.3 indicates that excavated soil may be re-used as fill on-site. There is no contingency for the handling of excavated wooden piles or railroad ties that may be treated with wood preservatives (creosote) that may be classified as a RCRA hazardous waste. Creosote

48 [HAZ-6]

BSK

often contains polycyclic aromatic hydrocarbons (PAHs), some of which are listed RCRA hazardous waste constituents.

48 [HAZ-6] cont.

B6. Section 4.3.5.3 allows for re-use of soils that may potentially be hazardous waste as fill inside the RMP. Based on our review of the recent Phase II Environmental Site Assessment (Langan, 2015), it appears that soil with elevated lead levels were used as fill during the 2005 remediation effort for the Pier 64 clean-up. Shallow soil samples collected from Langan Treadwell Rollo borings LB-12, LB-13, LB-26, LB-27, LB-28, LB-29 and LB-30 had results of soluble lead (California Waste Extraction Test) above the California Soluble Threshold Limit Concentration (STLC) that would classify the soil as hazardous waste. These soil samples were collected in the Pier 64 clean-up fill area (See Figure 2 of Langan 2015 report) at depths of less than 9 feet below the ground surface (bgs). The Pier 64 clean-up reportedly removed petroleum impacted soil to a depth of 9 feet and filled in the area (Langan 2015). The re-use of soil that is classified as hazard waste resulted in a significant volume of soil that, if excavated and removed from the RMP area will need to be transported off-site and disposed at an appropriate facility. These are new and additional impacts not previously incorporated into the impact analysis. These additional impacts must be incorporated into additional risks to receptors outside the RMP as well as additional traffic, noise, and air contaminants.

49 [HAZ-3]

B7. Page 4-22 states "If the levels are below the relevant health-based Site Specific Target Levels (SSTLs), and the RWQCB concludes that the potential for ecological impacts is insignificant and does not require mitigation, then soil removal activities will not be required and the soil may be temporarily stored elsewhere pending reuse in the RMP Area." Based on our review of the receptors presented in Appendix E, Tables E-1, E-2. E-3 and E-4, it appears that ecologic receptors were not included in the risk assessment.

50 [HAZ-1]

Summary of Review 1999 - Risk Management Plan

The Risk Management Plan (RMP), dated May 11, 1999 and Revised RMP dated August 2006 failed to properly identify possible sources and significance of the PAHs and did not have disposal protocols for PAH containing wastes. The site specific target levels developed for the site did not include ecological receptors. The RMP utilized an insufficient number of samples and questionable statistical analysis techniques considering the large area of the project. The RMP did not have developed protocols for addressing off-site disposal of large volumes of soil that is currently classified as California Class I Hazardous Waste.

51 [HAZ-1]

The following section (C1 to C2) presents our comments based on a review of Notice of Preparation of an Environmental Impact Report/Initial Study (NOP/IS), Dated November 19, 2014.

C1. Page 106 under Topics: 16. Hazards and Hazardous Material – Would the project: a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? Is listed as "No New or More Severe Significant Effects." As stated in A4 above this is in direct conflict with the findings of the recent Phase II Environmental Site Assessment (Langan 2015). Significant volumes of soil classified as hazardous waste will

52 [HAZ-3]

BSK

need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase. The transportation of hazardous waste off-site will increase the potential for items b) and c) on page 106. Excavation and transportation of soil to a Class I hazardous waste disposal site would significantly increase the potential for release of hazardous materials during the loading, excavation and transportation process. The additional trucking will cause additional exposures to exhaust fumes, traffic and noise. The additional impacts related to off-site transportation of hazardous waste will require further evaluation. 52 [HAZ-3] cont.

C2. Page 114 introduces Mitigation Measure M-HZ-1b: "Geologic Investigation and Dust Mitigation Plan for Naturally Occurring Asbestos." M-HZ-1b is a new mitigation measure for an impact that was not addressed in the 1998 SEIR. The new hazards associated with Naturally Occurring Asbestos (NOA) conflicts with the designation of "No New or More Severe Significant Effects" on items 16 a), 16 b) and 16 c) listed on page 106 of the NOP. 53 [HAZ-4]

Summary of Review 2014 Notice of Preparation of an Environmental Impact Report (NOP)

The Notice of Preparation (NOP), dated Novemeber 19, 2014 failed to identify new or more severe significant effects with respect to the large volume of soil classified as Class I hazardous waste that will require off-site disposal at a Class I Hazardous Waste Disposal Facility. New mitigation measures for naturally occurring asbestos were not properly identified as new or more severe significant effects. 54 [HAZ-4]

The following section (D1 to C4) presents our comments based on a review of the Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015.

D1. Page 1-61 under Hazards and Hazardous Materials, Initial Study Section E16, does not include the findings in the recent Phase II Environmental Site Assessment (Langan, 2015) with respect to significant volumes of soil classified as hazardous waste that will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase. These additional impacts were not previously included in the impact analysis. 55 [HAZ-3]

D2. Page 1-61 Impact HZ-2, under Mission Bay FSEIR Mitigation Measure J.2, the RWQCB is listed as the agency responsible for reviewing risk evaluations for a public school or child care facility. The Department of Toxics Substances Control (DTSC) School Property Evaluation and Cleanup Division is the responsible agency for assessing, investigating and cleaning up proposed school sites (DTSC, 2015). 56 [HAZ-7]

D3. Page 5.1-1 under 5.1.1 Scope of Analysis, Issues Scoped Out in the Initial Study, states "The Initial Study determined that the following topics were adequately analyzed in the Mission Bay FSEIR such that the proposed project would have no new significant impacts or no substantially more severe significant impacts than those previously found significant on these resources:… Hazards and Hazardous Materials;…" As stated in C1 above significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility 57 [HAZ-3]

causing significant additional impacts during the construction phase. These additional impacts were not previously included in the impact analysis. 57 [HAZ-3] cont.

D4. Page 6-5 under Section 6.3 Effects Found Not to be Significant under Hazards and Hazardous Materials states "The project would not cause risk of upset and accident conditions involving release of hazardous materials; emit hazardous materials within 0.25 mile of a school; be located on a site listed on a hazardous materials database; be located on airport or air strip land use areas; impair implementation of emergency response or evacuation plan; expose people or structures to fire risk; or create construction related hazards and hazardous materials impacts. As stated in C1 above significant volumes of soil classified as hazardous waste will need to be transported off-site and disposed at an appropriate facility causing significant additional impacts during the construction phase. These additional impacts were not previously included in the impact analysis. 58 [HAZ-3]

Summary of Review 2015 – Draft Subsequent Environmental Impact Report

The Draft Subsequent Environmental Impact Report (DSEIR), dated June 5, 2015 failed to identify new or more severe significant effects with respect to the large volume of soil classified as Class I hazardous waste that will require off-site disposal at a Class I Hazardous Waste Disposal Facility. The DEIR is inadequate by not accounting for additional impacts that from additional transportation of soil off-site that will cause additional exposures to exhaust fumes, traffic and noise. 59 [HAZ-3]

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with questions regarding the review comments presented this letter.

Subject: Proposed Golden State Warriors Arena
Mission Bay, Blocks 29-32, San Francisco
Geotechnical Engineering Review

Dear Ms. Meserve:

As authorized, this review is based on information necessary to update a 1998 EIR for a current project proposed within an area bordered by 3rd, South, and 16th Streets, and Terry Francois Boulevard located on Mission Bay fills over Bay Mud. The four blocks are mapped within a seismic hazard area (CDM&G 2000*a*) requiring investigation (CDM&G 2000*b*) and mitigation of potential liquefaction hazards (CGS 2008). The site is also subject to amplification of strong motion due to soft ground (2013 SFBC, ASCE 2013). None of the geotechnical engineering reports for the property classify the site as required by current codes and standards. The data in the existing geotechnical reports underestimates site response to strong motion required for risk to a structure whose primary occupancy will be public assembly with an occupant load greater than 300.

Proposed Project

The project considered, on Blocks 29, 30, 31 and 32, is an event center and parking for the Golden State Warriors basketball team. The project includes two 160 foot office towers, gatehouse, food hall, and retail spaces. 17 years ago an EIR for another project was prepared (C&CSF 1998) based on information for an unspecified location in Mission Bay as no subsurface investigation for the proposed arena site had been undertaken. Later, the four blocks were investigated and reported (Treadwell & Rollo 2007, 2008*a*, 2008*b*) for other projects. Composite reports for four commercial buildings for the four blocks was produced for Alexandraa (Treadwell & Rollo 2008*a*) and salesforce.com (Langan Treadwell Rollo 2011). Subsequent evaluation reports for the arena (LTR 2014*a*, 2014*b*), marked "...privileged...confidential...", have been issued but they do not classify the site nor do they address the Risk III Importance (ASCE 2013, 2013 SFBC) for a known project primarily intended for public assembly. The recent draft EIR (C&CSF 2015) does not address these issues and the current California requirements for mitigation of seismic hazards have not been followed.

Ground Conditions

Several years after the 1998 EIR was prepared, California's seismic hazard mapping program delineated the area of the proposed project (CMD&G 2000*a*) as being subject to liquefaction-induced ground displacement resulting from the shaking of saturated granular sediments that comprise the sands and other artificial fills placed in Mission Bay 100 to 150 years ago.

Exh C

The property, which was not the subject of a subsurface exploration program when the 1998 EIR was prepared, also includes deposits of Bay Mud of varying thicknesses under the fills that will produce ground amplification from strong motion generated by earthquakes. These hazards are different but related; liquefaction potential (sand) can be mitigated but the structure must be designed to resist soft ground (clay) amplification from strong motion. The data (exploratory boring logs showing materials, sampling, and testing) in the composite reports for the four block area (Treadwell & Rollo 2008a, Langan Treadwell Rollo 2011) verify that both potential hazards exist at the proposed project site.

Seismic Environment

The site is located in the earthquake active San Francisco Bay Area which is seismically dominated by the presence of the San Andreas Fault System. In the theory of plate tectonics, the San Andreas is the boundary between the northward moving Pacific Plate (west of the fault) and North American Plate (east of the fault) which is manifested by the San Andreas system. The faults in the system produce dextral horizontal shear movements resulting from the relative motion of the Pacific and North American plates. Based on history and theory, the land of the proposed project site (sand and rubble fill over Bay Mud)[1] will be subjected to strong shaking from earthquakes generated along both the active San Andreas (8 miles to the west) and Hayward (10 miles to the east) faults.

The northwestward movement of the Pacific Plate relative to the North American Plate persistently causes right-lateral slip across the major faults and deformation between the faults. In the Bay Area, this movement is distributed across a complex system of strike-slip, right lateral parallel and subparallel faults. The San Andreas fault ruptured on 4/18/1906 (estimated M = 8.0) and last severely shook the area on 10/17/89; other earthquakes that epicentered relatively recently along the San Andreas fault occurred on 10/1/69 (Santa Rosa, M = 5.7) and 3/22/57 (Daly City, M = 5.3). Maximum moment magnitudes (scaled size of earthquakes in terms of energy released)[2] are San Andreas $M_W = 7.9$, and Hayward $M_W = 6.9$.

The U. S. Geological Survey forecasted a 67% probability that one or more earthquakes of M = 7.0 (0.20 to 0.45g) or greater will occur on the San Andreas or Hayward faults by the year 2020 (Peterson 1996). Shortly afterwards, the Working Group on California Earthquake Probabilities concluded that the Hayward - Rogers Creek fault system has a 32% probability of generating a large earthquake (M = 6.7 to 7.4) by the year 2030. The average earthquake recurrence interval for the East Bay is roughly 220 years, give or take 100 years As for ground rupturing, there has been a quiescent period of seismic activity after the great 1906 earthquake on the San Andreas fault and there has been no rupturing along the Hayward fault for more than 100 years. The 1998 EIR does not cogently explain the seismic environment of the site.

60
[GEO-1]
cont.

[1] A layered sequence of soft, plastic, expansive sediments forming the bottom of San Francisco Bay (often referred to as "Younger Bay Mud"). Bay mud is a very weak, compressible soil, consisting of clay-sized and silt-sized particles interspersed with stringers and pockets of peat, fine sand, and minor amounts of gravel, and having a water content ranging from 30 to 92% (commonly 50 to 60% in the uppermost 50 to 100 feet of the deposit).

[2] The moment magnitude scale is used to measure earthquake magnitude M_W taking into account the size of the fault rupture, the stiffness of rock, and the amount of the movement of the fault using values that can be estimated from the size of several types of seismic waves; while the older Richter scale is a numerical scale used to measure the magnitude M of an earthquake using values based on the size of the earthquake's largest seismic waves.

Research, including trenching by the USGS at the Mira Vista Country Club in the Berkeley Hills, indicates that the northern segment of the Hayward fault is overdue for a characteristic major earthquake (Schwartz & Lettis 1998). On 8/24/14, in not unusual ground conditions, a damaging M = 6.0 earthquake occurred off the northern segment in Napa.

Liquefaction (cyclic mobility, which occurs when loose granular soils that are saturated undergo a rapid loss in shear strength as a consequence of ground shaking, and movement amplification of the Bay Mud due to strong motion, will occur at the proposed project site (and nearby sites) during significant earthquakes. This is the reason why California mapped the seismic hazard zones in the state in 2000 and requires mitigation of the seismic hazards.

Ground Motion Parameters

The National Earthquake Hazards Reduction Program ("2009 NEHRP") document "Recommended Provisions for Seismic Regulations for New Buildings and Other Structures" (FEMA 450-1) feeds into the ASCE (American Society of Civil Engineers) 7-10 "Minimum Design Loads for Buildings & Other Structures" (ASCE 2013) development process, and ASCE 7 in turn serves as the primary referenced standard in the 2012 International Building Code (2012 IBC). The 2013 San Francisco Building Code (2013 SFBC) is the City's iteration and adoption of the 2013 California Building Code, which is the State's iteration and adoption of the 2012 IBC. At the time the 1998 EIR was written the San Francisco Building Code was based on superficial maps in the Uniform Building Code (ICBO 1998) when seismic design standards were much less stringent than those of today.

60
[GEO-1]
cont.

Ground motion parameters, for this review of data in reports of subsurface investigation for the project site, all of which were gathered and presented after the 1998 EIR, were determined for the site using USGS ASCE 7 (2013) based calculation tools derived from published ground motion maps. Seismic ground motion values for use in characterizing and classifying the site for the current project are as follows:

General:

Site Location (USGS):	Latitude 37.7678°N Longitude -122.3875°W
Risk Category (2013 SFBC Table 1604.5)[3]:	III
Seismic Importance Factor I_e (ASCE 7 Table 1.5-2):	1.25

Mapped Acceleration Parameters (2013 CBC §1613.3.1):

Determination of Maximum Considered Earthquake (MCE) spectral response accelerations, mapped at short (0.2 second) period S_s and at a full second (1.0 second) period S_1, for the site:

Determined Site Classification (input Latitude/Longitude):	E
Short period (0.20 second) mapped spectral acceleration S_s:	1.500g
Site Coefficient F_a (2013 SFBC Table 1613.3.3(1); function/Site Class E & S_s):	0.900
Adjusted MCE 0.20 second period spectral response acceleration $S_{MS\text{-}B} = F_a S_s$:	1.350g

[3] "Buildings and other structures that represent a substantial hazard to human life in the event of failure."

O-MBA7S2
Exh C

One second period mapped spectral acceleration S_1:	0.600g
Site Coefficient F_v (2013 SFBC Table 1613.3.3(2); function/Site Class E & S_1):	2.400
Adjusted MCE one second period spectral response acceleration $S_{M1\text{-}B} = F_v S_1$:	1.440g

Design Spectral Response Acceleration Parameters (2013 SFBC §1613.3.3):

Site Classification definitions are dependent on geotechnical data (2013 SFBC §1613.2.1; ASCE 7 §§20.3.2, 20.3.3(3) [softer soil category to be used due to differing criteria][4]).

Defined Site Classification (2013 SFBC §1613.3.2 & ASCE 7 Table 20.3-1):	E
Site Coefficient F_a (2013 SFBC Table 1613.3.3(1); function/Site Class E & S_s):	0.900
Adjusted MCE 0.20 second period spectral response acceleration $S_{MS\text{-}D} = F_a S_s$:	1.350g
5% damped short period design spectral acceleration $S_{DS} = 0.67 S_{MS\text{-}D} = 0.67(1.350)$:	0.905g
Site Coefficient F_v (2013 SFBC Table 1613.3.3(2); function/Site Class E & S_1):	2.400
Adjusted MCE one second period spectral response acceleration $S_{M1\text{-}D} = F_v S_1$:	1.440g
5% damped one sec. period design spectral acceleration $S_{D1} = 0.67 S_{M1\text{-}D} = 0.67(1.440)$:	0.965g

60
[GEO-1]
cont.

Seismic Design Categories (SDC); Risk Category III, $S_1 \geq 0.75$ (2013 SFBC §1613.3.5, ASCE 7 §11.6):

Determination of Seismic Design Category (SDC) is based on occupancy or use and level of expected soil/rock-modified seismic ground motion at the site (adjusted per ASCE 7 §11.6).

Short period response acceleration SDC_{DS} (2013 SFBC Table 1613.3.5(1) adjusted):	E
One second period response accel. SDC_{D1} (2013 SFBC Table 1613.3.5(2) adjusted):	E

Mapped MCE Geometric Mean Peak Ground Acceleration PGA (ASCE 7 §11.8.3, 2013 SFBC §1805.5.12(2)):

PGA (USGS output):	0.523
Site Coefficient F_{PGA} (Site Class E, ASCE Table 11.8-1, PGA ≥ 0.50):	0.900
Peak Ground Acceleration adjusted for site class effects $PGA_M = F_{PGA} PGA$:	0.471g

The above ground motion parameters, reporting just recently required per ASCE 7 (ASCE 2013) where applicable under 2013 SFBC §1805.5.12, and calculated for a structure having an occupant load greater than 300, must be used for analysis in a new EIR. Lateral force resisting systems must meet seismic detailing requirements and limitations set forth in ASCE 7 (2013 SFBC §1604.10).

[4] Langan Treadwell Rollo 2011 (ASCE 7 Table 20.3-1):
B 29-8 8/31/11 Bay Mud, soft-wet 12-35' (21'>10')
B 32-1 5/1/07 Bay Mud, soft-wet 11-42' (31'>10'), MC=57% (>40%)
B 30-4 5/5/07 Bay Mud, soft-wet 25-50' (25'>10'), MC=63-74% (>40%)
B 31-4 9/1/11 Bay Mud, soft-wet 12-35' (23'>10'), s_u=400 psf (<500 psf)
Treadwell & Rollo 2008*a* (ASCE 7 Table 20.3-1):
1030 (AGS) 3/1/00 Bay Mud, moist-soft 22-51' (29'>10'), PI=58% (>20%)
1031 (AGS) 2/29/00 Bay Mud, moist-soft 16-55' (39'>10'), PI=38-62% (>20%)

Mitigation of Seismic Hazards

California's Special Publication 117A (CDM&G 2008) mandates countermeasures to liquefaction because liquefaction has been a major source of damage during past earthquakes where deposits of saturated sands were present. The risk of liquefaction and associated ground deformation can be reduced by various ground-improvement techniques, but consideration of also lessening the effects of strong motion in the underlying Bay Mud (from transient porewater pressure increases) during earthquakes must also be part of mitigation. The EIR of 17 years ago (C&CSF 1998) contains no mitigation measures, and the newest draft EIR (C&CSF 2015) does not include sufficient countermeasures. 61 [GEO-3]

The latest composite report for the site (Langan Treadwell Rollo 2011) anticipated four buildings. Alternative mitigation measures were recommended in the report for those buildings including "rapid impact compaction" ("RIC") "stone columns" and "compaction grouting". A more appropriate countermeasure, deep soil mixing of slurry at depth, has been suggested (Langan Treadwell Rollo 2014*a*). Gravel drains in backfilled bored holes to dissipate pore pressures are an effective counter-measure to liquefaction (Seed & Booker 1977). However, the proposed arena would probably be supported by piles arranged in concentric circular or elliptical patterns, and those piles will be subject to not only liquefaction loads from saturated relatively loose granular materials in the sand and rubble fill but from strong motion amplification of the relatively soft cohesive materials of the Bay Mud. 62 [GEO-1]

By embedding the piles into a mat capping the piles, and strengthening the liquefiable sand in the fill (not by "compaction grouting" but by permeation grouting using microfine cement or Portland cement slurry mixed with the sand), and socketing the piles into the Colma (or bedrock near the south end of the site), the effective length of the prestressed concrete piles will be reduced considerably by fixing end conditions and shortening the effective lengths of piles within the Bay Mud. The undersigned believes a program of combination of techniques should be modeled and tested before project approval. 63 [GEO-1]

Arena Foundation System

The latest composite report for the site (Langan Treadwell Rollo 2011) was for four separate buildings, one on each of the four lots. The proposed arena (Langan Treadwell Rollo 2014*a*) will be the principal structure in a complex that includes other structures. The 2011 report provides foundation alternatives for each building mainly because the Colma formation (dense to very dense sand, silty sand, clayey sand) is thin at the southeastern part of the site. Structural steel piles should not be used as the Bay Mud is highly corrosive and cathodic protection systems are problematical (Karp 1977).

If the proposed arena project were to proceed, it is more than likely that the foundation system, arranged in a pattern of concentric circles or ellipses. would be comprised of either precast prestressed concrete piles or cast-in-place concrete piles that are drilled through casing that is part of the machinery with the piles concreted as the casing is withdrawn. Piles would derive their support from the Colma formation, except at the southern part of the site bedrock would be the supporting medium. For embedment in the Colma formation or very stiff to hard clay and bedrock where the Colma formation is not present, depth-limited augered piles could penetrate dense materials or precast prestressed concrete piles could be driven with steel stingers and where the Colma formation is not present, the piles could be piloted into the very stiff to hard clay or bedrock. Although various deep foundation alternatives are theoretically possible, the proposed current project, which is particularly sensitive due to its public assembly nature, should have a testing program instituted to test alternatives. 64 [GEO-4]

Vibrations During Construction

Driving displacement piles causes noise and vibrations from impact that are transferred though dense subgrade materials to nearby structures. As the configuration of the proposed arena will likely be circular or elliptical and vibrations, particularly driving those at the western side of the project, would likely affect the UCSF Medical Center building at 1650 3rd Street. Prior to project approval, an indicator pile test program must be implemented to monitor vibrations and verify the suitability of the intended foundation system for the area.

Drilling and casting-in-place reinforced concrete shafts, if feasible to required depths, may be an appropriate suitable alternative to driven piles. As noted below for shoring, shafts are augered and spoils removed through casing contained in the rig that is withdrawn as concrete is placed. Using tremie methods, concrete displaces water in the hole so it rises and is pumped out with low ground-water loss. Before the project is approved, a test program should be implemented to ascertain the feasibility of using cast-in-place piles or where appropriate, a combination of drilled and driven piles. 65 [NOI-5]

Shoring & Groundwater

As an underground parking garage would be part of the project, secant piles, drilled in a circular or elliptical pattern to form a tension ring, would likely be the shoring, but drilling/concreting operations will encounter and displace groundwater that would have to be continuously tested for contaminants and otherwise managed under an advance plan. A Memorandum (Langan Treadwell Rollo 2015) suggests "Construction Dewatering Discharge Options" which may be helpful for that problem but the actual engineering effects of dewatering (increase in effective stress that causes areal subsidence) was not addressed. The effects upon surface improvements from dewatering in the area of the project must be studied before project approval.

Shoring of the excavations for the intended subgrade portions of the proposed current project, the appropriate method would be, as noted above, secant piles. Secant piles are sequentially drilled shafts that intersect each other to form a solid wall. Primaries (soft piles) are drilled apart in rows (or curves) closer together than the pile diameter. Primary shafts are augered and spoils removed with low water loss. Secondary shafts (hard piles) are augered between and arched into both of adjacent primaries, and wet-set reinforced with steel. In the saturated sand, it would be at this stage (casing/augering, and reinforcing) and afterwards (tolerance deviation from verticality, joints between overlapping piles, and movement) when groundwater and sand will be lost. 66 [GEO-5]

Depending on depth below groundwater level, hydrostatic pressures (head) are about one-half psi which will allow water and sand to migrate into the excavation. Pressure is only reduced if groundwater level drops outside the wall. When water is lost, increases in effective stress with vibrations from hard pile installations will densify the sand with differential settlement of improvements. The only methods to minimize water and sand flowing into the excavation with simultaneous drawdown of the groundwater level is to recharge outside the wall or construct the shoring in a circular pattern with large overlaps acting in ring compression.

Under current codes and standards, below grade walls for the proposed underground structures will require dynamic analysis (2013 SFBC §1803.5.12(1)) as well as engineered design to protect surface improvements, wall backdrainage, groundwater collection, piping, and discharge facilities.

O-MBA7S2
Exh C

Contamination

Although it is understood that others will discuss contamination, the subject is a very important environmental and geotechnical engineering concern for reasons that include intended subgrade excavation and construction. Mission Bay was used for many years as a dump and then a railroad yard. Bayward of the site there were fuel terminals that included tanks and pipelines which are known contributors to contamination. The Pier 64 area has received past attention under the auspices of developers (Langan Treadwell Rollo 2014*b*) but the extent and sufficiency of actual clean-up is not really known from second hand information. The report of geotechnical investigation produced for salesforce.com (Langan Treadwell Rollo 2011), 327 pages, contains no contaminant sampling, testing, or even recognition of the potential problem.

Contamination seems to have been dismissed as a thing of the past, but contaminants in groundwater do not simply go away without complete ground remediation. The 1998 environmental document is vague so "change" from then to now cannot be quantified. For instance, the "2001 Phase I Remedial Excavation" resulted in a record that "Soil containing residual oil below the target zone was left in place." (Langan Treadwell Rollo 2014*b*, pg 9). The observance of living birds congregating where water has ponded is not a reliable yardstick for declaring a site free of contamination. Hands-on testing by an independent laboratory would be appropriate measures that should be undertaken before a public assembly project at this site is approved.

- Pages 1-59 to 1-60, Summary of Impacts and Mitigation Measures, Geology and Soils
- Pages 5.9-9 to 5.9-29, Flooding
- Page 6-5, Effects Found Not to be Significant

Our review was limited to Geology, Engineering Geology and Seismic related aspects of the subject documents. The following section (A1 to A14) presents our comments based on a review of the Mission Bay Subsequent Environmental Impact Report (SEIR), Dated September 17, 1998.

A1. Section II.20 Summary-Seismicity, fourth paragraph indicates that structures would be supported on piles between 30 and 200 feet deep to reduce the effects of groundshaking and liquefaction. This type of structural support may provide mitigation of liquefaction hazard of the main building structure, however pile support systems do little to provide mitigation from liquefaction and settlement of surrounding utilities/roads and other support systems that may be damaged during a seismic event. Due to the shallow occurrence of the liquefiable layers, sand boils may develop during a seismic event. Ground settlements due to development of sand boils can be large and unpredictable. Design of these surrounding systems, not proposed to be supported on piles, cannot withstand the effects of sand boils and can lead to excessive and differential settlement without further technical analysis, and mitigation measures such as recompaction. 68 [GEO-2, GEO-3]

A2. Section II.20 states "the likelihood of tsunami inundation is very slight." The fact that portions of the proposed facility are located in a Tsunami Hazard Zone established by the State of California (California Emergency Management Agency, June 15, 2009 Map) indicates that the tsunami hazard is significant. 69 [HYD-8]

A3. Section V.H.12 states that "To reduce potential effects in the Liquefaction Hazard Zone, Catellus has committed to construction of major structures in the Project Area on foundations supported by piles driven into dense sands, stiff clays, or bedrock in areas where such materials are too deeply buried by unengineered fill and/or Bay mud to provide adequate support for foundations." The conditions that trigger use of piles and areas where they are needed were not delineated and the method for determining the requirement criteria was not provided. Futhermore, as stated in section A1 above, piles alone may not provide sufficient mitigation for areas surrounding the building structures.

A4. Section V.H.13 states that "If not mitigated as described in Chapter VI of this SEIR, the above-described risks to people posed by seismically induced groundshaking and liquefaction would be significant impacts of the project." Many risks described in Section V.H.13 are from structures/facilities located outside the project area. The mitigation measures presented in Chapter VI of the SEIR are for structures/facilities located in the project area. It is not possible to mitigate hazards to structures located outside the project area by mitigation measures that were developed for structures located inside the project area. 70 [GEO-2]

A5. Section V.H.16 states "Some grading of the Project Area, including the excavation of some potentially liquefiable materials and replacement with engineered fill, would occur prior to the construction of underground infrastructure to ensure that the systems could be designed to accommodate expected settlement along their specific routes, and to prevent liquefaction damage." This is vague with respect to which areas will require regrading and how deep the fill replacement extends. The technical criteria that is to be used to determine if an area requires replacement was not provided.

A6. Section V.H.17 first paragraph utilizes U.S. Army Corp of Engineers (ACOE) 1975 run-up model for 100-year and 500-year events to estimate potential tsunami hazards. The indented use for ACOE 1975 report was for determining 100-year and 500-year flood levels for the purpose of requiring flood insurance. The ACOE report considered the probabilities of tsunami sources from Alaska and the Aleutian trench alone, assuming that the 100-year and 500-year events are not strongly affected by events from other regions of the Pacific. They did not address the possibility of locally generated tsunamis (Borrero. et al, 2006). More recent studies used to develop the 2009 Tsunami Inundation Map uses multiple seismic sources including local faults (Point Reyes Thrust Fault, Rodgers Creek-Hayward Fault and San Gregorio Fault) and other distant sources such as the Cascadia Subduction Zone.

It should be noted that for designing structures against structural collapse the 2013 California Building Code uses a ground motion values from a Risk-Targeted Maximum Considered Earthquake (MCEr). The MCEr is defined as the ground motion from an earthquake at the 1% in 50 years (4975 year return interval) hazard level.

The most technically accurate method for assessing tsunami risk to a site is to perform a Probabilistic Tsunami Hazard Analysis (PTHA). The computational method in PTHA generally follows the Probabilistic Seismic Hazard Analysis (PSHA) method that is widely used in assessing seismic hazards (Geist, 2006). Given that the tsunamis are caused by earthquake events, the analysis should use the same standard hazard level as earthquakes (1% in 50 years), not the flood insurance risk return interval. Using an analysis based on 100-year or 500-year return intervals may not capture the controlling seismic event that may cause the maximum Tsunami run-up. 71 [HYD-8]

A7. Section V.H.17 first paragraph references an "extreme high tide crest condition" of an additional 2.95 feet above mean sea level. The reference source for the "extreme high tide crest condition" was not provided. Our review of the nearest tide station (Yerba Buena Island Tide Station 914782, NOAA Website) station information data sheet indicates that the Mean High Water (MHW [1]) level is 2.31 feet above mean sea level (msl) and the Mean Higher-High Water (MHHW[2]) is 2.91 feet above msl. The proponent assumes that the "extreme high tide" is a rare event with low probability of occurrence. The 2.95 feet above msl that is assigned to the assumed low probability event is not significantly different from the average event, Mean High Water of 2.31 feet above msl. The difference between what the proponent assumes is a low probability event value based on an "extreme high tide" and the Mean High Water value is probably less that the uncertainty in the model that was used. The analysis provided in the DSEIR attempts to minimize the apparent risk from a tsunami that occurs during a high tide through confusing and unsubstantiated statistical analysis.

[1] MHW - Mean High Water: The average of all the high water heights observed over the National Tidal Datum Epoch. For stations with shorter series, comparison of simultaneous observations with a control tide station is made in order to derive the equivalent datum of the National Tidal Datum Epoch.
[2] MHHW - Mean Higher High Water: The average of the higher high water height of each tidal day observed over the National Tidal Datum Epoch. For stations with shorter series, comparison of simultaneous observations with a control tide station is made in order to derive the equivalent datum of the National Tidal Datum Epoch.

The tsunami run-up analysis presented in the SEIR also failed to account for future sea level rise due to climatic change. Estimate of future sea level rise in the San Francisco Bay Area range from 3.1 feet to 5.5 feet in next the 90 years (Nation Research Council, 2015). Tsunami run-up elevation analyses should incorporate future sea level rise.

A8. Section V.H.17 utilized the local San Francisco City Datum (SFCD) for the analysis. Page V.H.20 defines the SFCD as "For surveying purposes in San Francisco, a local datum was established, in the 19th century, at 8.66 above mean sea level, approximately higher high tide at the time." It is not clear what national datum the SFCD is related to since there is no citation. The proponent asserts the SCFD is the 8.66 above MSL in the 19th century, however, they fail to identify how this elevation relates to the current datum, used in other parts of their analysis. Current mean sea level data is referenced to the North American Vertical Datum of 1988 (NAVD88) that was established in 1991. NAVD88 replaced the National Geodetic Vertical Datum of 1929 (NGVD29). Tidal datums such as the Mean Sea Level (MSL), Mean High Water (MHW) and Mean Higher High Water (MHHW) are referenced to Geodetic Datums such as NAVD88 or prior to 1991, NAVD29 (NOAA 2015). To calculate flood levels, data that uses a consistent Geodetic Datum must be used (FEMA 2015). For example, MSL using NAVD88 is not the same as MSL using NAVD29. Using a local datum such as the SFCD, that uses an unknown Geodetic Datum and relating to tidal data that uses a known Geodetic Datum such as NAVD88 would produce erroneous results. 71 [HYD-8] cont.

A9. Section V.H.17 last paragraph attempts to minimize the tsunami hazard. As shown on the attached Figure 1, portions of the site are located in a California State Designated Tsunami Hazard Zone. According to Appendix M, Section M101.4 of the 2013 California Building Code (CBC): "Construction within the Tsunami Hazard Zone - Construction of structures designated Risk Category III and IV as specified under 2013 CBC Section 1604.5 shall be prohibited within a Tsunami Hazard Zone."

Category III Risk Category includes: "Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:

- Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
- Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250.
- Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500.
- Group I-2 occupancies with an occupant load of 50 or more resident care recipients but not having surgery or emergency treatment facilities.
- Group I-3 occupancies.
- Any other occupancy with an occupant load greater than 5,000.
- Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Risk Category IV.
- Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that: Exceed maximum allowable quantities per control area

as given in Table 307.1 (1) or 307.1 (2) or per outdoor control area in accordance with the California Fire Code; and Are sufficient to pose a threat to the public if released."

The proposed structures are probably located in an area that conflicts with the requirements specified in Appendix M, Section M101.4 of the 2013 California Building Code. 71 [HYD-8] cont.

A10. Section VI.88, Table VI.8, K.2b refers to designing connections between pile-supported structures and unsupported sidewalks and driveways to reduce the likelihood of separation due to settlement. This analysis identifies unknown, but high settlements that may occur due to liquefaction and development of surface sand boils. Sand boils occur when liquefied units reach the ground surface and sand is ejected from the ground surface. Settlements due to sand boils can be large and unpredictable and greater than what was presented in the report. Without adequate mitigation for these high unknown settlements, the impacts would be significant.

A11. Section VI.89, Table VI.8, K.2c refers to using flexible connections for utilities serving pile-supported buildings to accommodate the settlement expected. This analysis identifies unknown, but high settlements that may occur due to liquefaction and development of surface sand boils. Without adequate mitigation, the impacts would be significant. 72 [GEO-2]

A12. Section VI.89, Table VI.8, K.4 indicates that leveling jacks should be used on buildings with shallow foundations. This measure would not be effective to mitigate differential settlements due to liquefaction or dry seismic shaking settlements. High differential seismic settlements may cause building collapse or the over-turning of structures rendering leveling jacks useless.

A13. Section VI.91, Table VI.8, K.15 states that "As deemed necessary by geotechnical studies, make sandy materials more dense to reduce the potential for liquefaction." This appears to conflict with the requirement of pile-supported foundations. The requirement is vague with respect to criteria to be used to determine how deep the densification should extend and is not adequate to mitigate a significant impact. Furthermore, the densification methods are not identified nor how this unknown process would work as mitigation.

A14. Appendices Section A.49 under Tsunami and Seiche states "Although the Project Area is relatively close to sea level, historical records indicate little likelihood of inundation by tsunami or seiche." In the next sentence it is stated that the portions of the project area would be below the level of inundation predicted by the U.S. Army Corps of Engineers computer models. It was also stated that techniques for reducing the inundation, tsunami and seiche hazards would be presented in the SEIR. The only mitigation measure against tsunami hazards presented was a vague reference to setbacks from the Bay and Channel made in Section V.H.17. As stated above in A9, the type of proposed structure would not be allowed according to Appendix M, Section M101.4 of the 2013 CBC. 73 [HYD-8]

Summary of Review 1998 - Mission Bay Subsequent Environmental Impact Report

The Mission Bay Subsequent Environmental Impact Report (SEIR), dated September 17, 1998 relied on an inadequate Tsunami hazard analysis, relied on out dated methodology and failed to provide adequate mitigation measures for Tsunami Hazard impacts. 74 [HYD-8] The SEIR failed to fully address high ground settlements and provide mitigation measures for impacts from sand boils. The SEIR failed to properly 75 [GEO-3] identify impacts and provide mitigation measures for areas of the project that may be impacted from liquefaction induced lateral spread hazards. The mitigation measures presented to address the impacts from high settlements due to liquefaction would not be effective in all areas of development, in particular with respect to impacted areas located outside building footprints. 75 [GEO-3] cont.

The following section (B1 to B11) presents our comments based on a review of the Notice of Preparation of an Environmental Impact Report/Initial Study (IS), Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, Dated November 19, 2014.

B1. Page 84 Topics: 14 Geology and Soils - lists the impacts for all subsections of the Geology and Soils Impacts as "No New or More Severe Significant Effects." Significant changes to the California Building Code and the standard of practice for analyzing ground motion and liquefaction evaluation have occurred since the 1998 SEIR was published. Geotechnical reports showing details of older analysis versus analysis based on newer ground motion criteria were not available for review. Without a comparison of the two analyses, it cannot be concluded that there are no new or more severe significant effects. 76 [GEO-1]

B2. Page 86 last paragraph: identifies the Langan Treadwell Rollo, Preliminary Geotechnical Evaluation Report, dated March 28, 2014 as the preliminary geotechnical evaluation for the project. Our review of that report indicates that the letter report carries the stamp "Privileged and Confidential – For Discussion Purposes Only" Furthermore, the geotechnical evaluation report states in the last paragraph "The conclusions and recommendations presented herein are preliminary and should not be relied upon for design." Other detailed geotechnical reports providing data and analysis were not referenced in the IS or available to review. 77 [GEO-1]

B3. Page 87 second paragraph states "On the basis of the preliminary geotechnical evaluation for the project, recommended measures for addressing these effects include improving the soil to resist liquefaction and lateral spreading as well as use of flexible utility connections, utility hangers, and hinged slabs to address differential settlement." As stated above in Section A10, high settlements may occur due to liquefaction and development of surface sand boils. Without adequate mitigation for these high unknown settlements, the impacts would be significant. 78 [GEO-3]

B4. Page 87 third paragraph states "As indicated by the project-specific geotechnical evaluation, no substantial changes have occurred nor has new information become available that would result in new or more severe project impacts related to seismic hazards including fault rupture, seismic groundshaking, seismically induced ground failures, or landslides." The referenced 2014 geotechnical report is insufficient in content and analysis to support this statement. A comparison of current and the 1998 derived ground motion design criteria, static and dynamic settlement values was not provided in the geotechnical report or the IS. 79 [GEO-1]

B5. The 2014 Langan Treadwell Rollo report also identified the potential hazard from lateral spread as high. The 1998 SEIR presented lateral spread as a hazard within several hundred feet of China Basin Channel. Due to the distance of the Site from from China Basin Channel (>2,000 feet), the lateral spread hazard identified in the 1998 SEIR would not have included blocks 29-32. This new hazard was not identified or acknowledged in the IS. A mitigation measure for the impact of lateral spread in the area between the proposed structure and San Francisco Bay was not presented in the IS or in the 2015 DSEIR. 80 [GEO-3]

B6. Page 88 under Settlement states "The Mission Bay FSEIR addressed settlement issues related to differential settlement of the underlying geologic materials that are relevant to the project site, but it did not address impacts related to settlement associated with excavation or dewatering. 81 [GEO-5]

BSK

However, these impacts would all be less than significant, as described below." As stated above in Section A10, high settlements may occur due to liquefaction and development of surface sand boils for which mitigation has not been provided. 81 [GEO-5] cont.

B7. Page 90 third paragraph states: "In addition, noise and vibration concerns could limit the use of driven piles." The structure foundation mitigation measures specify the use of driven piles and no other foundation mitigation method alternative was provided. 82 [GEO-5]

B8. Page 98 under Mission Bay Plan Effects Related to Tsunami and Seiche. As stated in A6 above, the U.S. Army Corp of Engineers model is outdated and has been replaced with other modern methods of analysis.

B9. Page 103 under Inundation by Seiche or Tsunami. This section provides conflicting values. The older values from the FSEIR and newer values from the 2011 Tsunami Response Annex report by the City and County of San Francisco. It should be noted that on page 24 of the 2011 Tsunami Response Annex report states: "The map is intended for use as evacuation planning tools (Attachment B). The Tsunami run-up zone information are approximations due to limitations in modeling and baseline coastal data." The IS provides a tsunami and seiche run-up values of "approximately 6 feet" based on the 2011 Tsunami Response Annex report. Our review of the report indicates that that value is referenced to mean sea level. The 6 foot value does not account for diurnal high tides that may reach approximately 7 feet and sea level rise due to climatic change that may reach approximately 5 feet. To estimate Tsunami run-up elevations, the maximum run-up is calculated as a sum of the Tsunami run-up (6 feet), the tide level at the time of the Tsunami (may be as high as 7 feet) and sea level rise (may reach 5 feet). Not accounting for all the ocean level variables may cause a significant underestimation of Tsunami run-up. 83 [HYD-8]

B10. Page 104 under Inundation by Seiche or Tsunami. This section provides mitigation measures such as 1) Set Back, although no distance is given 2) Raise occupied portions, no elevation is given and 3) Tsunami Warning System, for hazards that were determined to be less than significant. If the hazard is less than significant, then mitigation measures would not be required. This presents an improper analysis by providing mitigation measures for an impact that was previously identified to be less than significant.

B11. Page 104 under Structures states: "Although some damage to the structures could occur, the improvements constructed under the proposed project would be resilient to tsunamis or seiches." A reference to the building code that provides design parameters for tsunamis resilient structure needs to be provided.

Summary of Review - 2014 the Notice of Preparation/Initial Study

The Notice of Preparation (NOP) of an Environmental Impact Report/Initial Study (IS), dated June 5, 2015 did not fully analyze the Tsunami hazard, relied on out dated methodology and failed to provide adequate mitigation measures for the area that is located in a State Tsunami Hazard Zone. The mitigation measures for Tsunami impacts provided in the IS were developed without performing a proper Tsunami hazard analysis. The IS failed to properly analyze, identify and address new or more severe significant effects. Recent Geotechnical reports (Langan 2014) identified new and significant impacts (lateral spread for example) that were not addressed in the IS. 84 [GEO-1]

The following section (C1 to C5) presents our comments based on a review of the Draft Subsequent Environmental Impact Report, Blocks 29-32, June 5, 2015.

BSK

C1. Pages 1-47, Table 1-2 Summary of Impacts and Mitigation Measures, Hydrology and Water Quality list Impact HY-5 "The project would not expose people or structures to a significant risk of loss, injury or death involving inundation by seiche or tsunami" as LS or Less-Than-Significant Impact (no mitigation required). Portions of the site are located in a State Identified Tsunami Hazard Zone, furthermore as stated in A6 and B9 above, the Tsunami hazard has not been adequately analyzed using current standards. The designation of LS or Less-Than-Significant Impact (no mitigation required) conflicts with the IS listing Tsunami mitigation measures, see B10 above. 85 [HYD-8]

C2. Pages 1-59 to 1-60, Table 1-2 Summary of Impacts and Mitigation Measures, Geology and Soils lists Impacts GE-1 through GE-5 and C-GE-1 with significance determinations of LS or Less-Than-Significant Impact (no mitigation required). This is contrary to the findings, conclusions and recommendations found in previous geotechnical evaluations (Langan 2014 and Langan 2011). The Langan geotechnical evaluations identified numerous conditions at the site requiring mitigation measures. The items included excessive static and dynamic settlements, liquefaction including sand boils, lateral spread, intense ground motion, shallow groundwater and corrosive soils. The Langan 2011 report presented numerous mitigation measures requiring extensive ground improvement modifications, specialized foundation design, dewatering and excavation shoring. 86 [GEO-1]

C3. Page 5.9-29 states " … and flooding as a result of failure of a levee or dam; and inundation by seiche, tsunami, or mudflow (Impact HY-5). Therefore, no further analysis of these subjects is presented in this section." As stated in A6 above, the Tsunami hazard methodology presented in the 1998 SEIR is dated and requires and updated analysis and evaluation. 87 [HYD-8]

C4. Page 6-5 under Section 6.3 Effects Found Not to be Significant in the Geology and Soils states "The project would not expose people or structures to geologic hazards; cause soil erosion or loss of topsoil; be affected by the presence of unstable soils or geologic units; be affected by the presence of expansive soils or soils incapable of adequately supporting wastewater disposal systems; or cause a substantial change of topography." This is in conflict with the newly identified hazards (Lateral Spread) and inadequately analyzed hazards (liquefaction induced sand boils). 88 [GEO-3]

C5. Page 6-5 under Section 6.3 Effects Found Not to be Significant in the Hydrology and Water Quality states: "The project would not deplete groundwater supplies; alter drainage patterns, resulting in erosion; place housing and/or structures within a 100- year flood zone; expose people and structures to hazards associated with flooding, failure of a levee or dam, seiche, tsunami, or mudflow; or cause construction-related water quality impacts." The portions of the site are located in a State-Identified Tsunami Hazard Zone and as stated above in Section A6 and B9, the Tsunami hazard was evaluated in the 1998 SEIR and 2014 IS using dated and/or inappropriate methodologies. 89 [HYD-8]

Summary of Review - 2015 Draft Subsequent Environmental Impact Report

The Draft Subsequent Environmental Impact Report (SDEIR), dated June 5, 2015 did not fully analyze the Tsunami hazard, relied on out-dated methodology and failed to provide adequate mitigation for portion of the site that are in a State Tsunami Hazard Zone. The SDEIR failed to address and provide mitigation for newly identified significant hazards such as lateral spread. Much of the SDEIR relies on analysis from the IS and 1998 SEIR without fully addressing newly identified hazards, data gaps and the need to apply current methodologies to analyze project impacts. 90 [GEO-3]

BSK

Our review was limited to the Geology, Engineering Geology and Seismic related aspects as they relate to the development as described in the reports made available for review.

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with questions regarding the review comments presented this letter.

Respectfully submitted,

Memo

To: Patrick Soluri, Attorney at Law

From: Philip King, Ph.D.

Re: Urban Decay Analysis of Proposed Relocation of Golden State Warriors from Oakland to San Francisco

Upon your request I examined the Environmental Review[1] prepared in conjunction for the proposed relocation of the NBA franchise Golden State Warriors from Oracle Arena in Oakland to San Francisco. The project description for the AB900 Application included significantly reduced events at Oracle Arena in order to take advantage of GHG reductions. However, the project's EIR took an inconsistent approach to the scope of the project, and did not analyze the potential for urban decay resulting from these significant event reductions, which has been recognized as an environmental impact that should be analyzed under the California Environmental Quality Act (CEQA).

My analysis (Table A below and described in more detail in this memo) indicates that the move from Oakland to San Francisco would lead to a direct loss of $44.9 million and 494 jobs. When one also includes the indirect and induced impacts, this impact increases to $86.6 million and 805 jobs.

91 [GEN-4]

Although Oakland has benefited from the recent economic recovery, it's well known that the City suffers from high crime rates as well as high levels of blight and urban decay. Indeed, the Oracle Arena is located in a former Redevelopment Area (RDA) that the City declared blighted. Removing these jobs and this economic activity will exacerbate existing urban decay and seriously impact the City's ability to respond to this decay.

[1] See Application for Environmental Leadership Development Project Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 ("AB900 Application").

Table A: Economic Impact of the Golden State Warriors in Alameda County

Economic Impact in Alameda County

Impact Type	Employment	Labor Income	Output
Direct Effect	494.3	$28,490,621	$43,900,000
Indirect Effect	110.8	$6,084,031	$13,153,869
Induced Effect	200.6	$10,746,179	$29,546,005
Total Effect	**805.6**	**$45,320,831**	**$86,599,874**

The Economics of Moving a Basketball Team

A convenient starting point to examine the economic impact of the Golden State Warriors' relocation to San Francisco from Oakland is the Seattle Supersonics' relocation to Oklahoma City. An economic report prepared in conjunction with the move indicated that the departure of the team would result in the loss of 1,200 – 1,300 jobs and $188 million in economic activity, slightly larger than the $170 million that the City of Oklahoma projected it would gain from the arrival of the team. Contrary to both of these projections, a sports economist for the Supersonics testified to the broad consensus within the economics literature that the departure or arrival of a professional sports team has no significant economic impact whatsoever upon the larger metropolitan area as a whole. When pressed by the city's legal team, this economist did, however, concede that the arrival, departure or relocation of a professional sports team can have a measureable effect upon the *distribution* of economic activity within the larger metropolitan area.[2]

91 [GEN-4] cont.

There are two primary reasons given within the sports economics literature for why the presence of a professional sports team within a metropolitan area has no significant economic impact: substitution and leakage.

> "Promotional impact studies ignore or underestimate the effects of consumer substitution and leakages from the local economy connected to sports facilities… These studies rely largely on the assumption that all (or much of the) spending on sports teams is new to the local economy and that this spending has a similar effect on the local economy as spending on other consumption goods and services. Both of these assumptions are false." [3]

When a sports team relocates to a city, the money that is spent at its games does not come from outside the metropolitan area, but instead generally comes from money that is already being spent on leisure activity within that same metropolitan area. Similarly, when the team departs, the money that was previously being spent at the games will

[2] http://sports.espn.go.com/nba/news/story?id=3452509
http://www.seattletimes.com/sports/nba/sonics-argue-team-has-little-economic-impact-on-seattle/
http://www.forbes.com/2008/06/25/seattle-supersonics-nba-biz-sports-cx_mw_0625seattle.html
[3] Siegfried, John and Zimbalist, Andrew, "A Note on the Local Economic Impact of Sports Expenditures" Journal of Sports Economics, Vol. 3 No. 4, November 2002, 361-366, http://web.centre.edu/johnsonb/eco406/Apr%2021/seigfried.pdf

now be spent on other leisurely activities within the same area. The amount of money that people spend on leisurely activity is relatively fixed and spending at a sports venue only comes as a substitute for and thus at the expense other venues within the area. "The net effect on spending within the metropolitan area then is zero, or very close to zero. While sports teams may rearrange the spending and economic activity in an urban area, they are not likely to add much to it." [4]

In addition to the high degree of substitution associated with spending on professional sports, a high degree of economic leakage is also cited as a reason for the low impact that a professional sports team has upon a metropolitan area. The professional sports industry involves almost always involves the large transfer of money from local spectators to highly paid athletes and investors whose households typically do not reside and thus do not frequent businesses within the same metropolitan area. This outward flow of money typically cancels out whatever economic activity the team might bring from outside the metropolitan area.

91 [GEN-4] cont.

The high degrees of economic substitution and leakage associated with the professional sports industry are responsible for the negligible economic impact that results from the relocation of a professional team from one metropolitan to another. **However, the same cannot be said for the relocation of a professional sports team within the same metropolitan area as in the case of the Golden State Warriors.**

> "Even though it is difficult to justify new stadium construction on economic growth grounds, it is possible that such construction would facilitate efforts to redevelop an urban core… [I]t is possible for sports facilities to reposition economic activity within a metropolitan area." [5]

Since the Warriors are relocating *within* the larger San Francisco/Oakland metropolitan area we can reasonably assume both substitution and leakage will remain constant before and after the move. Whereas we could not say that Oklahoma City was taking economic activity from the City of Seattle since the same fans would no longer be attending Supersonic games, we can, however, say that the City of San Francisco will take economic activity from the City of Oakland since the same fans will continue to attend Warriors games.

Reversing Directions across the Bay Bridge

After the relocation of the Warriors from Oakland to San Francisco, spectators from the East Bay will then choose between finding a local substitute within the East Bay and traveling to the West Bay to watch the Warriors games. While it is the case that leisured spending has a high substitution effect over a large community such as a metropolitan area, the same cannot be said for more narrowly deigned areas, such as the East Bay industrial area.

> "A stadium or arena will have more added effects on a very narrowly defined community than on a largely encompassing community. The reason for this is that the more narrowly the host community is defined, the more of the spending at the stadium and the nearby restaurants, bars, and hotels will come from outside the community. However, that spending will come largely at the expense of the home communities of the fans that travel into the stadium from outlying areas. The substitution effect for the broadly defined area is quite large, but for the narrowly defined stadium community it is much smaller. What this points out is that stadiums and sports teams may be a tool for redistributing income in which the people from suburbs subsidize businesses in the city."[6]

91 [GEN-4] cont.

Consequently, we can expect that most Warriors fans will continue attending games after the relocation rather than seeking local substitutes. The relocation of the Warriors, then, constitutes a significant redistribution of economic activity within the larger Bay Area.

During the Warriors' 2014/15 season 803,436 fans attended home games in Oakland (34% more than the Supersonic their last season in Seattle) and took in $168 million dollars in total revenue.[7] Table 1 (below) shows that, assuming that the distribution of Warriors spectators is proportionate to the distribution of residents within the larger metropolitan area, $99 million in Warriors revenue came from the East Bay while $69 million came from San Francisco and the Peninsula. It is worth emphasizing, however, that the Warriors relocation to San Francisco does not merely entail that the $69 million will cease coming into the East Bay from the West, but that the additional $99 million that was being spent by local East Bay residents will be lost to San Francisco. Spending in Oakland will decrease by $168 million regardless of where the fans actually reside.

[6] Coates, Dennis and Humphreys, Brad R., "The Stadium Gambit and Local Economic Development" Regulation, Volume 23, No. 2, July 2000, 15-20, http://object.cato.org/sites/cato.org/files/serials/files/regulation/2000/7/coates.pdf

[7] http://www.forbes.com/teams/golden-state-warriors/
http://www.census.gov/popest/data/counties/totals/2013/CO-EST2013-01.html

Table 1. Attendance and Revenue for Warriors' 2014/15 Season

Attendance and Revenue for Golden State Warriors Home Games (2014/15 Reg. Season)			
	Total	East Bay (59%)	West Bay (41%)
Attendance	803,436	475,538	327,898
Spending	$168,000,000	$99,435,935	$68,564,065

Leakage

In the last section we discussed where the money that is spent on Warriors games comes from within the larger Bay Area. In this section we will briefly consider where the money goes after these games, as well as the effect of economic leakage.

Table 2. The Redistribution of Economic Activity due to the Warriors' Relocation

The Redistribution of Economic Activity due to the Golden State Warriors' Relocation			
	Total (millions)	**Percent**	**Redistributed** (millions)
Operating Income:	$44.9	0%	$0.0
Players' Salary:	$78.0	10%	$7.8
Other Expenses:	$45.1	80%	$36.1
Total:	**$168.0**	**26%**	**$43.9**

Table 2 (above) divides up the Warriors' $168 million in total revenue into three categories: operating income, players' salary and other expenses. $44.9 million in operating income is the money that goes to the owners and investors of the Warriors. Since we have little reason to assume that these people live within the larger metropolitan area, let alone the East Bay, we can assume that relocating the team will not redistribute this money to any significant degree. Similarly, only 29% of NBA players live within the same larger metropolitan area as the team they play for[8]. We can also expect a large amount of the $78.0 in Warriors players' salary to be spent outside of, and thus "leak" from the larger San Francisco/Oakland metropolitan area leaving 10%, or $7.8 million to be redistributed within the Bay Area. This leaves $45.1 million that went to other expenses (wages, inventory, etc.) during the 2014/15 season. We assume that 80%, or $36.1 million, was spent within the larger metropolitan area.

91
[GEN-4]

[8] Siegfried, John and Zimbalist, Andrew, "A Note on the Local Economic Impact of Sports Expenditures" Journal of Sports Economics, Vol. 3 No. 4, November 2002, 361-366, http://web.centre.edu/johnsonb/eco406/Apr%2021/seigfried.pdf

While $168 million was spent by fans within the Bay Area on Warriors games, we estimate that only 26% or $43.9 million stayed within the area. It is this $43.9 million that will be redistributed from the Easy Bay to the West with the Warriors' relocation. Table 3 (below) lists the most popular professions among the 3,432 Bay Area residents that are employed within the sports spectator industry and gives a general idea regarding how a professional sports team such as the Warriors spend their money[9].

Table 3. Occupations within the Sports Spectator Industry

Employed	Sports Spectator Industry within the San Francisco/Oakland Metropolitan Area	Hourly Wage	Annual Salary
878	Personal Care and Service Occupations	$12.06	$25,080
572	Arts, Design, Entertainment, Sports, and Media Occupations	$31.60	$65,730
559	Entertainment Attendants and Related Workers	$11.32	$23,540
455	Entertainers and Performers, Sports and Related Workers	$33.10	$68,850
402	Athletes, Coaches, Umpires, and Related Workers	*	$72,060
324	Sales and Related Occupations	$15.70	$32,660
285	Office and Administrative Support Occupations	$16.91	$35,170
258	Protective Service Occupations	$15.76	$32,790
251	Food Preparation and Serving Related Occupations	$10.28	$21,380
243	Other Protective Service Workers	$15.26	$31,730
243	Animal Care and Service Workers	$12.49	$25,980
233	Ushers, Lobby Attendants, and Ticket Takers	$10.21	$21,230
3,432	**Industry Total**	**$20.45**	**$42,540**

Economic Impact

In addition to the direct loss of $43.9 million in economic activity to the City of Oakland, there are also indirect and induced effects which are associated with this loss. However, in addition to this direct spending, there are indirect and induced impacts, often referred to as "multiplier effects" –since arena and team spending also generate other jobs and economic activities in the region, and without the Warriors' spending other economic sectors of the Alameda County would shrink as well.

IMPLAN is standard Input/Output software specifically design to project the indirect and induced multiplier effects associated with the Warriors' direct spending in Alameda County. Table 4 (below) lists the economic impact of the Golden State Warriors within Alameda County by impact type. With indirect and induced impacts included, the Warriors generate 805 jobs and $86.6 million in economic activity. Table 5 (below) lists 10 most impacted industries within the county. In addition to the 547 jobs and $48.6 million in economic activity created within spectator sports industry, food and drinking

Urban Decay

Although the EIR ignores the issue in the context of urban decay impacts, the EIR and AB900 Application conclude that that Oracle Arena will continue to operate with approximately 21 events per year. This is an impractical assumption from an economic perspective. As a practical matter, one of two outcomes will occur. The first possible outcome is that the Oracle Arena will continue to operate by attracting more than 21 non-NBA events per year.

The second possible outcome is that Oracle Arena will close without the Golden State Warriors. I spoke with Alexander Michael, an expert on the business and financing of

O-MBA7S2
Exh E

sporting arenas. Based on that information, a strong argument exists that the Oracle Arena (or indeed any similar venue in a similar situation) will not be viable without the Golden State Warriors and there are no other sports teams in the offing for this venue. A similar case is the IZOD center located in East Rutherford, New Jersey. The IZOD center housed the New Jersey Devils hockey team Nets NBA basketball team until they left in 2007. The IZOD arena also hosted the New Jersey Nets basketball team, who left in 2010. The State of New Jersey attempted to keep the Izod arena open for many years. However, the demand for other events such as concerts, ice shows, etc., was insufficient. As with the Oracle arena in Oakland, the Izod arena is located near a number of other sports venues and near Manhattan, which offers a wide variety of venues. The Izod arena shutdown earlier this year after an official forecast that the center would lose $8.5 million a year.[10]

It is difficult to determine which outcome is more likely since the EIR ignored the issue of potential urban decay associated with reduced events at Oracle Arena. The EIR should have included an economic impacts analysis that would have provided more information about the ultimate fate of Oracle Arena and, by extension, impacts to the physical environment.

91
[GEN-4]
cont.

Once the Oracle arena has been shutdown, it would be extremely difficult and expensive to repurpose the arena for other activities and thus it will almost certainly be shuttered and perhaps demolished at some future date. A closed arena will be a magnet for graffiti, crime, drug deals and other signs of urban decay. The City of Oakland can mitigate for this urban decay, but it would involve a costly increase in police and other public safety officials.

The City of Oakland and Alameda County are obligated to a $79.7 million dollar Lease Revenue Bond that must be paid or default. Without revenues from the Oracle Arena the bond would either go into default or the City/County would have to pay the principal and interest on the bond. If the City County pay out of their General Fund dollars, it will reduce their ability to fund other needed public services. If the default it could damage their credit rating and make it more difficult to finance other future (non-sports) projects which could enhance the welfare of the City and County

Oakland was rated the third most dangerous City in the Country in 2012.[11] According to the FBI, Oakland had the highest crime rate of any major City in California[12] and this year (2015) homicides in Oakland are on track to exceed 2014.[13]

[10] See http://www.nytimes.com/2015/01/16/nyregion/deserted-by-devils-nets-and-profits-izod-center-in-north-jersey-is-to-close.html?_r=0.

O-MBA7S2
Exh E

The City declared the area blighted and formed a redevelopment area (see Figure 1 below). Although Redevelopment Areas have been disbanded, the blight issues remain. Indeed, the suspension of RDAs eliminates a funding stream for the City to help ameliorate urban decay and blight.

The reduction in economic activity also significantly reduces the tax base for the City that reduces its ability to mitigate for urban decay and provide police and other public safety officials.

In my professional opinion, this issue (urban decay) should have been identified in any environmental analysis and mitigated where possible. A number of mitigation options are available including: (1) paying a mitigation fee to the City of Oakland, (2) preserving some of the jobs for Oakland residents; (3) shifting some of the taxes/fees to the City of Oakland. Without any kind of urban decay analysis none of these mitigation options are possible.

Re: **Air Quality Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter. 1 [GEN-5]

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 19, 2015, letter report authored by Greg Gilbert (attached as Exhibit 1) and the July 20, 2015, letter report authored by Paul Rosenfeld and Jessie Jaeger (attached as Exhibit 2).

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to Air Quality Impacts.

A. Dust: the DSEIR's impact assessment for construction-related dust pollution is based on legal errors and not supported by substantial evidence. 2 [AQ-2]

Regarding dust pollution, the DSEIR states:

The site-specific Dust Control Plan would require the project sponsor to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of

> wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project sponsor would be required to designate an individual to monitor compliance with these dust control requirements.

(DSEIR, p. 5.4-30.)

The Dust Control Plan is either part of the project description, or a mitigation measure, or both. Either way, what the Project Sponsor is actually going to do to control dust - on the ground - must be described. Otherwise, the DSEIR violates CEQA.

2
[AQ-2]
cont.

If the Dust Control Plan is part of the project description, the DSEIR fails to present a complete project description, making it impossible for the public or other agencies to comment on the potential environmental impacts of this part of the project.

If the Dust Control Plan is a mitigation measure, the DSEIR defers the development of this mitigation measure until after Project approval, without meeting CEQA requirements for doing so, because (1) Article 22 B specifies a suite of measures but does not require the adoption of any in particular, (2) the DSEIR does not specify a performance standard by which the success of the Dust Control Plan can be judged, and (3) there is no evidence it is impracticable to develop and include the Dust Control Plan in the DSEIR, before project approval. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*CBE*); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

Also, by failing to identify the Dust Control Plan as a CEQA mitigation measure, the DSEIR throws the enforceability of the Plan under CEQA into doubt. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope..."].)

B. Criteria air pollutants: the DSEIR's impact assessment for construction and operational criteria air pollutants is based on legal errors and not supported by substantial evidence.

1. The City cannot use the DSEIR's thresholds of significance for criteria air pollutants until it formally adopts them in a rule--making procedure.

The DSEIR's thresholds of significance are:

> For the impacts analyzed in this section, the project would have a significant impact related to air quality if it were to:
> - Conflict with or obstruct implementation of the applicable air quality plan;
> - Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
> - Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
> - Expose sensitive receptors to substantial pollutant concentrations; or
> - Result in a cumulative air quality impact in combination with past, present and reasonably foreseeable future projects in the vicinity.

3
[AQ-1a]

(DSEIR 5.4-23.)

For criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the Bay Area Air Quality Management District ("BAAQMD") for ROG (54 lbs/day); NOx (54 lbs/day); Exhaust PM10 (82 lbs/day); Exhaust PM2.5 (54 lbs/day).

> The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NOx, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day). These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

(DSEIR p. 5.4-25; see also p. 5.4-31.)

The City uses these numerical thresholds of significance for virtually all land use development projects in the city that require CEQA review. This is shown by the following sample of excerpts from recent Environmental Impacts Reports and Negative Declarations attached hereto as Exhibits 4 through 16. All of them use the BAAQMD numbers as the thresholds of significance for these pollutants.

Therefore, the City is required to undertake its own rule-making proceeding to adopt these thresholds as its own and determine in a public process that they are supported by substantial evidence.

> (b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence.
> (c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

(CEQA Guideline, § 15064.7.) Since the City has not formally adopted the air quality significance thresholds in a public process supported by substantial evidence, it cannot use these thresholds on an ad hoc basis as it has done in this EIR.

3 [AQ-1a] cont.

2. The DSEIR's numerical thresholds of significance for criteria pollutants (ozone precursors, PM10, PM2.5) borrowed from the BAAQMD are invalid.

As noted above, for its impact assessment and mitigation strategy for criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the BAAQMD. But the DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.

The result of using these thresholds is a deeply misleading impact assessment and mitigation strategy because using these invalid thresholds allows the DSEIR to avoid finding impacts are significant, and it allows the DSEIR to understate the severity of impacts deemed "significant" because it implies that most of the quantity of emissions below the thresholds are not "significant." Also, using these invalid thresholds underestimates the degree of mitigation required to reduce significant impacts to less then significant, and therefore, the DSEIR curtails its consideration of the feasibility of additional mitigation measures that could further substantially reduce emissions.

The numerical thresholds borrowed from the BAAQMD are logically and legally invalid, and

4 [AQ-1b]

O-MBA8L2

they are not supported by substantial evidence. The thresholds are contained in the BAAQMD's "CEQA Air Quality Guidelines."[1] But neither the DSEIR or the BAAQMD CEQA Air Quality Guidelines describe any evidence that might support the use of these thresholds. The same is true of BAAQMD's other publications relating to these thresholds, i.e., Appendix D of the BAAQMD CEQA Air Quality Guidelines, BAAQMD's Revised Draft Options and Justification Report, (October 2009), and the Bay Area AQMD Proposed Air Quality CEQA Thresholds of Significance, published May 3, 2010.

While these BAAQMD publications purport to include substantial evidence supporting the use of these thresholds for all criteria air pollutants for which the Bay Area is in non-attainment, they do not. Instead, the BAAQMD CEQA Air Quality Guidelines merely provide policy rationales for why it is a good idea to have thresholds of significance. Nowhere does the document actually provide evidence for why any number of pounds per day below, for example, 54 for NOx or ROG, is not "cumulatively considerable."

The BAAQMD's Revised Draft Options and Justification Report (October 2009) states the thresholds "are based on the trigger levels for the federal New Source Review (NSR) Program and BAAQMD's Regulation 2, Rule 2 for new or modified sources." (See page 2.) These New Source Review Program rules provides that any new source that will emit pollutants above the levels stated in the left hand column of Table 4 (e.g., 10 lbs/day of NOx and ROG) must impose "Best Available Control Technology ("BACT")." (Id. pp. 16-17.) These rules also provide that any new source emitting pollutants above the levels stated in the right hand column of Table 4 (e.g., 54 lbs/day of NOx and ROG) must offset all emissions. (Id. pp. 16-17.)

In addition to the inherent flaws in the NSR rules described above, it is inappropriate to base the EIR's significance determination for purposes of CEQA on the Air District's "triggers" for an entirely different regulatory program, i.e., New Source Review under the Clean Air Act ("CAA").[2] One of CEQA key purposes is to require "disclosure" of significant impact, and it allows agencies to approve projects where emissions exceed its thresholds of significance after feasible mitigations are first adopted and as long as the project's benefits outweigh the environmental harm. The CAA, in contrast, is not primarily concerned with public disclosure, and it provides absolute limits on emissions (i.e., the offset triggers in Table 4) that cannot be exceeded under any circumstances. A

4 [AQ-1b] cont.

---

[1] The BAAQMD CEQA Air Quality Guidelines were published May 2010, and updated May 3, 2011.

[2] The CAA establishes health-based ambient air quality standards and ranks air districts nationwide based on their level of attainment of those standards. The CAA also establishes a timetable for air districts to reach attainment, and authorizes specific penalties where a deadline is not met. CEQA, on the other hand, requires lead agencies to analyze and discuss significant impacts on air quality, and to continue to mitigate those impacts so long as they remain significant or no additional mitigation is feasible.

standard that shuts down economic activity (i.e., the CAA offset standard) is necessarily and appropriately different than a standard (i.e. a CEQA threshold of significance) that requires disclosure of the impact to the public and the adoption of feasible mitigation measures.

Indeed, if it is possible to borrow any CAA NSR standard for use as a CEQA threshold of significance, it would be the BACT triggers in Table 4 (i.e., when ROG or NOx emissions exceed only 10 lbs/day), because those standards force the adoption of feasible mitigation measures, similar to CEQA's thresholds of significance. 4 [AQ-1b] cont.

NSR Regulation 2, Rule 2 for new or modified sources requires that if ozone precursor emissions exceed 54 lbs per day (i.e., 10 tpy), the polluter must offset *all* emissions. In contrast, the DSEIR Mitigation Measure M-AQ-2b only requires offsetting emissions above 54 lbs per day (i.e., 10 tpy). This BACT standard is much lower than the NSR offset standard and the DSEIR's threshold of significance of 54 lbs/day. But, there is no parallel requirement in the DSEIR for imposing anything like BACT to this Project's construction or operational emissions that exceed 10 lbs/day.

Regarding NSR Regulation 2, Rule 2's offset standards (i.e., 54 lbs/day for ROG or NOx), the BAAQMD's Revised Draft Options and Justification Report (October 2009) observes: "These levels represent a cumulatively considerable contribution."[3] But there is no evidence that emissions below these thresholds are not also "cumulatively considerable."

Moreover, regardless of any evidence included in these other BAAQMD documents, no such evidence can overcome a fundamental logical and legal flaw in the EIR's assumption that these thresholds are appropriate for the purpose for which the DSEIR uses them. Using the DSEIR's logic, if the City finds that one project will add 53 lbs/day of ozone precursors, it is considered a less-than-significant impact, but if that project will add 55 lbs/day of ozone precursors, it is considered significant. Yet, if the City approved two new large projects in the area in the same 2- or 3-year period, or where operational impacts cause increased emissions, each emitting 53 lbs/day of ozone precursors, it is considered a less-than-significant impact even though the total of the two added together equals 106 lbs/day of ozone precursors! 5 [AQ-1b]

This scenario is not hypothetical; it is unfolding in San Francisco, and in the Mission Bay area now. (See Table 3, July 21, 2015, letter report by traffic engineer Larry Wymer, attached as Exhibit 2 to the July 27, 2015, letter from this office regarding impacts on Transportation for a list of project undergoing or about to undergo construction in this area of San Francisco.) As a result, the thresholds violate a fundamental CEQA principal that regardless of whether projects' incremental impacts are deemed insignificant in isolation, they may be cumulatively significant.

[3]Exhibit 4, p. 2.

The significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm. (*Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-721.)

This area is in "non-attainment" status under federal and state clean air laws for these criteria pollutants; and this project, along with many others, will substantially contribute to that existing significant adverse impact. There is no evidence to the contrary. The City's untenable position is that public agencies in the Air Basin can approve project after project, each emitting (in the case of ozone precursors) up to 54 lbs/day of new and additional ozone precursors, without ever causing a cumulatively considerable increase in air pollution. This approach runs counter to the reason for conducting cumulative impact analysis. If the City (and other agencies in the Air Basin) continues to find that projects that make air quality worse - when it is already significantly degraded - do not have a significant adverse cumulative impact on air quality, then the City will have no legal obligation to adopt feasible mitigation measures to reduce the significant cumulative impact. 5 [AQ-1b] cont.

Here, the BAAQMD CEQA Guidelines present ample evidence that the Bay Area's air quality is degraded and has been for a very long time. Therefore, the idea that agencies can forever approve multiple projects that each add 53 lbs of ROG and NOx to the air every day and never be deemed cumulatively considerable is absurd. Rather than explain why this is not true, the BAAQMD documents simply ignore the issue.

The DSEIR's use of the BAAQMD thresholds of significance is erroneous as a matter of law for several other reasons.[4] The DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards. The DSEIR uses BAAQMD's thresholds of significance uncritically, without any factual analysis of its own, in violation of CEQA.[5] This uncritical application of the BAAQMD's thresholds of significance 6 [AQ-1a]

[4] *Endangered Habitats League v County of Orange* (2005) 131 Cal.App.4th 777, 793 ("The use of an erroneous legal standard [for the threshold of significance in an EIR] is a failure to proceed in the manner required by law that requires reversal.").

[5] *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 [underscore emphasis added], citing *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 114 ("*CBE*"); accord *Mejia v. City of Los Angeles*

represents a failure of the City to exercise its independent judgment in preparing the DSEIR.[6] Just as disagreement from another agency does not deprive a lead agency of discretion under CEQA to judge whether substantial evidence supports its conclusions,[7] agreement from another agency does not relieve a lead agency of separately discharging its obligations under CEQA. The BAAQMD CEQA Guidelines do not provide any factual explanation as to why the 54 lbs. per day standard represents an appropriate threshold for judging the significance of project-level ozone pollution impacts. More importantly, the DSEIR also fails to include any such explanation, and is therefore inadequate as a matter of law.[8] It is well-settled that compliance with other regulatory standards cannot be used under CEQA as a basis for finding that a project's effects are insignificant, nor can it substitute for a fact-based analysis of those effects.[9] 6 [AQ-1a] cont.

Also, the DSEIR's reliance on information not contained in the DSEIR for purposes of showing these thresholds are supported by substantial evidence violates CEQA's informational requirements. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405 ["whatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what

---

(2005) 130 Cal.App.4th 322, 342 ["A threshold of significance is not conclusive...and does not relieve a public agency of the duty to consider the evidence under the fair argument standard."].)

[8] *Santiago County Water Dist. v. County of Orange*, *supra*, 118 Cal.App.3d 818.

[9] *See*, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford*, *supra*, 221 Cal.App.3d at pp. 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

is lacking in the report"]; *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 ["[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis'"], 443 ["The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project. That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant ... The question is therefore not whether the project's significant environmental effects *can* be clearly explained, but whether they *were*"] (emphasis in original).)

Finally, the attached report by Greg Gilbert and Paul Rosenfeld and Jessie Jaeger detail additional reasons why the DSEIR has not adequately supported its use of these thresholds.

3. The DSEIR's impact assessments for construction related criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.

DSEIR Table 5.4-8 shows construction-related daily emissions of the ozone precursor ROG at 47 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 49 lbs/day (mitigated by Tier 4 engines) and of the ozone precursor NOx at 144 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 73 lbs/day (mitigated by Tier 4 engines). 6 [AQ-1a] cont.

The DSEIR's impact assessments for construction-related ozone precursor emissions are invalid because the DSEIR uses the invalid thresholds of significance discussed above.

Because NOx construction-related emissions are reported as higher than the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day), the DSEIR concludes the Project's impact on ozone pollution is significant. While this conclusion is correct, it is also misleading because it understates the severity of the impact deemed "significant." The DSEIR implies that the only fraction of the Project's NOx emissions that are "significant" is the fraction above 54 lbs/day. But as discussed above, this threshold of significance is invalid. Using this invalid threshold implies that most of the quantity of emissions below the threshold are not "significant." (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].)

The DSEIR assumes that adoption of Mitigation Measure M-AQ-1, requiring use of off-road equipment with engines meeting Tier 2 or Tier 4 standards, will reduce construction-related ROG emissions to 47 or 49 pounds per day, respectively, which are both below the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day). (DSEIR, p. 5.4-33, Table 5.4-8.) But equipment meeting Tier 2 or Tier 4 standards are not sufficiently available to meet either requirement. (See Exhibit 2.) Therefore, the impact assessment must be recalculated to more realistically estimate the 7 [AQ-6a] percentage of construction equipment that will meet Tier 2 or 4 standards. 7 [AQ-6a] cont.

Also, the DSEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the California Emissions Estimator Model ("CalEEMod"), to determine the on-road hauling emissions that would occur during construction. Using this default value, rather than a site-specific trip length to the actual haul destination, results in an underestimation of the Project's construction emissions. Therefore, the impact assessment must be recalculated to realistically account for the actual haul destination of the excavation spoils. (See Exhibit 2.) 8 [AQ-3]

a. Mitigation Measure M-AQ-1 does not comply with CEQA's legal requirements.

Mitigation Measure M-AQ-1 (at DSEIR, p. 5.4-35) does not comply with CEQA's legal requirements. As discussed above, the requirement that off-road equipment meet Tier 2 standards is illusory, and therefore ineffective, because the Project Sponsor will not be able to obtain enough equipment meeting this standard. 9 [AQ-6a, AQ-6b, AQ-6c]

M-AQ-1 includes a limit on idling time of two minutes, and provides exceptions to this limit as provided in state law (DSEIR, p. 5.4-36), but utterly fails to describe what these exceptions are. The DSEIR must fully describe this measure in order for the public and City decision makers to assess its effectiveness.

M-AQ-1 requires the Project Sponsor prepare a Construction Emissions Minimization Plan, and the Project Sponsor must certify compliance with the Plan. (DSEIR, p. 5.4-36.) This is asking the fox to guard the henhouse. (See Exhibit 1.)

4. The DSEIR's impact assessments for operational criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.

The operational impact assessment for ozone precursor, PM10, PM2.5 and TAC emissions is invalid for many reasons.

DSEIR Table 5.4-9 shows operational daily emissions of criteria pollutants as follows: 10 [AQ-1b, AQ-4a]

ROG:	79 lbs/day [14 tpy]
NOx:	124 lbs/day [23 tpy]
PM10:	80 lbs/day [14.6 tpy]
PM2.5:	25 lbs/day [4.5 tpy]

(DSEIR, p. 5.4-39.)

The DSEIR's impact assessments for these criteria pollutants emissions are invalid because

they are based on the invalid thresholds of significance discussed above.

Because construction-related emissions of ROG and NOx are higher than the applicable (but invalid) threshold of significance for these pollutants, the DSEIR concludes the Project's impact on ozone pollution is significant. As discussed above, while correct, this conclusion is misleading because it understates the severity of the impact deemed "significant" by implying that the only fraction of the Project's NOx emissions is are "significant" is the fraction above 54 lbs/day.

The DSEIR's impact assessment for operational ozone precursor emissions is also misleading because it omits from its quantitative tally of criteria pollutants the emissions the Project will generate in San Francisco and the Mission Bay neighborhood from basketball game-associated "vehicle miles traveled" (DSEIR, p. 5-37.) The DSEIR's rationale for this startling omission is that moving the Warriors games from Oakland to San Francisco will reduce the same number of "vehicle miles traveled" in Oakland that the Project will generate in San Francisco and the Mission Bay neighborhood.

This rationale is based on the unstated, but incorrect, assumption that the environmental setting at Oracle Arena and the Mission Bay site are identical. These settings are very different, in many crucial respects. First and foremost, the Mission Bay neighborhood and the surrounding areas of San Francisco are populated by San Franciscans, not Oaklanders. The residents, citizens, and registered voters of San Francisco are entitled to know what the Project's air quality impacts will be *on them*, regardless of whether the residents, citizens, and registered voters of Oakland will experience an air quality benefit as a result of the move. 10 [AQ-1b, AQ-4a] cont.

Second, Oracle Arena sits in the middle of a vast parking lot. To the west is I-880, various commercial properties, wetlands, and the Bay. To the east is the Coliseum, railroad tracks, ABC Supply (provider of industrial equipment), East Bay Truck and Auto Repair, BART tracks and the Coliseum BART Station, and then, over 2,000 feet away to the northeast there is a group of apartment buildings. To the north and south stretch commercial properties for well over a mile without any residences. This stands in stark contrast to the dense residential population surrounding the Mission Bay site.

The DSEIR's suggestion that respiratory disease, heart disease, and cancer-causing air pollution is fungible and transferable, without regard to the location or environmental setting in which it occurs, is unsupported.

a. Mitigation Measure M-AQ-2b does not comply with CEQA's legal requirements.

Mitigation Measure M-AQ-2b requires the Project Sponsor pay a fee to the BAAQMD that the BAAQMD will use to purchase ozone precursor offsets. The purpose is to offset the amount by which the project's ozone precursors emissions exceed the numerical thresholds discussed in the 11 [AQ-7] previous section of this letter.

Therefore, to the extent the thresholds are invalid, as argued above, M-AQ-2b fails to reduce ozone precursor emissions to less-than-significant levels. Further, the DSEIR does not even consider the feasibility or effectiveness of more robust mitigation strategies that could reduce ozone precursor emissions further below the (invalid) thresholds. (See DSEIR, p. 5.4-39, Table 5.4-9, "Estimated Emissions Reduction Required".)

The amount of the offset fee required by M-AQ-2b is calculated by multiplying the total amount of *annual* criteria pollutant emissions exceeding the annual (invalid) thresholds by $18,030 per weighted ton of criteria pollutant emissions; then adding 5% of that product for BAAQMD's administrative fees, as follows:[10]

ROG tons	4.4
NOx tons	12.6
PM tons x 20	0
Subtotal	17
Fee per ton	$18,030.00
Subtotal	$306,510.00
Admin fee 5%	0.05
Admin fee	$15,325.50
Total Fee	$321,835.50

11 [AQ-7] cont.

The DSEIR indicates M-AQ-2b requires the Project Sponsor to pay only $321,835.50, which is the amount required to offset one year's worth of the Project's operational criteria pollutant emissions. (See DSEIR, p. 5.4-41.) But the sports and entertainment arena portion of this Project has an operational life of at least 50 years, probably much longer,[11] and the office towers will last even longer. In contrast, the life spans of offset credit sources are much shorter than the expected life span of this Project. (See Exhibit 1.) Therefore, the actual amount required to offset the Project's above-threshold ozone precursor emissions is much higher than $321,835.50. Therefore, the DSEIR's premise that M-AQ-2b will achieve a complete offset of the Project's above threshold construction and operational criteria pollutant emissions is misleading and false.[12]

To address this deficiency, M-AQ-2b must be amended. The DSEIR must disclose the

[10] 54 lbs per day of ROG emissions equals 10 tons per year.

[11] Oracle Arena was built in 1966, 49 years ago, and is still functional.

[12] The DSEIR indicates that construction-related criteria pollutant emissions are mitigated by including them in the operational period emission mitigation strategy. (DSEIR, p. 5.4-34.)

average life span of the offset credit sources the BAAQMD typically buys, then amend M-AQ-2b to require recalculation of the offset fee or other offset requirement after the average life span of such offset credit sources to account for their limited life span, changes in emissions, changes in attainment status, etc. In addition, M-AQ-2b must be amended to include a mechanism, in the event that BAAQMD does not spend the offset fee and returns it, to ensure the required offsets are purchased through another bona fide, verifiable offset program.

Accepting, *arguendo*, the validity of the 17 ton offset requirement, the DSEIR's discussion of Mitigation Measure M-AQ-2b leaves many questions unanswered regarding BAAQMD's offset program. For example, the effectiveness of the measure depends directly on the validity of numerous assumptions, including: (1) the assumption that $18,030 is enough to purchase a ton of criteria pollutant emissions; (2) the assumption that the offset market has 17 tons of criteria pollutant emissions that can be reduced by engine retrofits or other offset techniques; (3) the assumption the Project Sponsor will accurately measure actual construction and operational emissions for purpose of determining how many tons of criteria pollutants must be offset; and (4) the assumption that BAAQMD has and will have reliable verification procedures in place ensuring that 17 tons of offset will actually be achieved.

11 [AQ-7] cont.

5. The DSEIR's impact assessment for Project-caused increases in Toxic Air Contaminants (TACs) is invalid.

The DSEIR's impact assessment for operational Toxic Air Contaminants (TACs) - Impact AQ-3 - is invalid for a number of reasons, in particular because the DSEIR's use of thresholds of significance for Project-caused increases in cancer risk and $PM_{2.5}$ is inconsistent, confusing, and legally erroneous.

a. The DSEIR's health impact assessment for the Project-caused increases in cancer risk from TACs is invalid.

12 [AQ-1c]

The DSEIR uses a threshold of significance for the Project's impact of increasing cancer risk in the area of "100 in one million." As discussed above, for criteria pollutants the DSEIR borrows thresholds of significance from the BAAQMD to determine the significance of both the direct, incremental increase in emissions caused by the Project, and the Project's contribution to cumulative increase in emissions in the area.

In contrast, in its assessment of the Project's impact of increasing cancer risk in the area, the Project ignores BAAQMD's stated "Individual Project" threshold of significance "for Risk and Hazards for new sources and receptors" which is stated as "Increased cancer risk of >10.0 in a million." (Exhibit 1, p. 2-2.) Instead, the DSEIR uses BAAQMD's stated "Cumulative Project" threshold of significance "for Risk and Hazards for new sources and receptors" which is stated as "Increased cancer risk of >100.0 in a million." (DSEIR, p. 5.4-13; see, May 2011, BAAQMD

Updated CEQA Guidelines, p. 2-2.).[13]

The DSEIR estimates the Project's impact of increasing cancer risk for children living at UCSF's Hearst Tower as either 91 or 46 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 1, based on DSEIR, p. 5.4-49, Table 5.4-11.)

Table 1

Total	66.48	66	63.68
less background		26	26
Project incremental impact		40	37.68

[13] This is also a City criterion for defining "Air Pollutant Exposure Zones" (APEZ). (DSEIR, p. 5.4-12.) An APEZ is "an area in which modeled air pollution exceeds "either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter (ug/m3) (including ambient).... Since the Project is not in an APEZ, the subsequent criterion of significance is whether or not the Project will create an APEZ." (DSEIR, Appendix-TR, Air Quality Appendix, p. 9.)

The DSEIR estimates the Project's impact of increasing cancer risk for adults living at UCSF's Hearst Tower as either 45 or 42 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 3, DSEIR, p. 5.4-49, Table 5.4-11.)

12
[AQ-1c]
cont.

As discussed above, the DSEIR's premise that the Project Sponsor can obtain a substantial quantity of off-road construction equipment meeting Tier 2 and NOx VDECS standards is illusory. Therefore, the only relevant numbers are the three higher numbers, i.e., 91, 40 and 45. But even using the lower numbers, i.e., 46, 38, and 42, all of them exceed the BAAQMD's "Individual Project" threshold of significance for increased cancer risk of 10 per one million." (Exhibit 1, p. 2-2.) Instead of explaining why, after using BAAQMD's thresholds of significance for all criteria pollutants, the DSEIR does not use the BAAQMD's "Individual Project" increased cancer risk threshold of significance of 10 per one million, the DSEIR simply ignores this threshold.

Thus, the DSEIR uses at least two strategies to avoid disclosing a significant increase in cancer risk: using BAAQMD's cumulative standard instead of its individual project standard, and assuming the Project Sponsor can obtain a substantial quantity of off-road construction equipment meeting Tier 2 and NOx VDECS standards. Dropping either of these unwarranted predicates reveals the Project's impact of increasing cancer risk is significant.[14]

The DSEIR explains its choice of a threshold of significance for cancer risk from TAC's of

[14] See e.g., DSEIR, p. 5.4-49 ["With the minimum level of compliance with this mitigation measure (Tier 2 plus NOX VDECS), increased cancer risk as a result of project construction activities at the maximally impacted receptor would be approximately 9.2 in one million and cumulative excess cancer risk at all receptor locations would be reduced to below the significance threshold of 100 per one million. ¶ While unmitigated increased cancer risk at the maximally impacted receptors would exceed the threshold of 100 in one million, with implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization), increased cancer risk at the maximally impacted receptors would be below the threshold of 100 in one million"].)

100 per one million persons as follows:

> The 100 per one million persons (100 excess cancer risk) criterion discussed above is based on USEPA guidance for conducting air toxic analyses and making risk management decisions at the facility and community-scale level. As described by the BAAQMD, the USEPA considers a cancer risk of 100 per million to be within the "acceptable" range of cancer risk. Furthermore, in the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking, the USEPA states that it "…strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately one in one million and (2) limiting to no higher than approximately one in ten thousand [100 in one million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years." The 100 per one million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on BAAQMD regional modeling.

12 [AQ-1c] cont.

(DSEIR, p. 5.4-13.)[15]

The City's reliance on the EPA's judgment of "acceptable" cancer risk is legally flawed for several reasons. First, the City relies on a simplistic misrepresentation of actual EPA policy. Second, even if EPA policy is what the City implies it is, the DSEIR errs as a matter of CEQA law by using the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts.

The EPA's actual policy is to assess increased cancer risk based on a host of site-specific factors within a range of values from 1 in one million to 100 in one million. This policy reflects the agency's attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (See e.g., Starfield, L.E., "The 1990 National Contingency Plan: More Detail and More Structure, But Still a Balancing Act"; Environmental Law Reporter, June 1990, pp. 10222-10251, attached hereto as Exhibit 3.)[16]

---

[15] Footnote 21 cites to "54 Federal Register 38044, September 14, 1989." As of July 6, 2015, this document was not included on the City's AB900 mandated web page dedicated to preparing the administrative record concurrently with its CEQA review of the Project. (See Pub. Res. Code § 21186 (a), (b), and (c).)

[16] "In the proposed NCP [Superfund National Contingency Plan], the Agency [EPA] had defined the acceptable risk range as being from 10^{-4} to 10^{-7}, meaning that when the excess risk to an individual of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 [100 in one million] and 1 in 10 million, it is judged to be an acceptable exposure. As a measure of additional protection, the proposal provided that there should be a "point of departure" of 10^{-6}, toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range. ¶ The final rule maintained the point of departure of 10^{-6}, but narrowed the risk range to 10^{-4} through 10^{-6}. This action was taken in response to public comment and concerns that the Superfund range went below the accepted de minimis level used by other EPA programs and those of other federal agencies. ... the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below 10^{-6}. The use of a range of acceptable risk is general practice for most government programs. As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the balancing phase of the remedy selection process." (Id., 20 ELR 10237 [footnotes omitted].)

Instead of following this analytic approach, the DSEIR selects one value at the least environmentally protective end of the EPA's "acceptable risk" range and uses it to determine the significance of the Project's impacts, but without regard to the Project's site-specific considerations. Again, the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's cancer risk impact significant.

Also, CEQA neither requires nor allows the City to use the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. The City's discretion to decide that significant environmental harm is "acceptable" in light of the project's benefits arises at the end of the CEQA analysis, in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant.

12 [AQ-1c] cont.

> A statement of overriding considerations is required, and offers a proper basis for approving a project despite the existence of unmitigated environmental effects, only when the measures necessary to mitigate or avoid those effects have properly been found to be infeasible. (Pub. Resources Code, § 21081, subd. (b).) Given our conclusion the Trustees have abused their discretion in determining that CSUMB's remaining effects cannot feasibly be mitigated, that the Trustees' statement of overriding circumstances is invalid necessarily follows. CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's

> benefits, unless the measures necessary to mitigate those effects are truly infeasible. Such a rule, even were it not wholly inconsistent with the relevant statute (id., § 21081, subd. (b)), would tend to displace the fundamental obligation of "each public agency [to] mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so" (id., § 21002.1, subd. (b)).

City of Marina v. Board of Trustees of the California State University (2006) 39 Cal.4th 341, 368-69.

This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," the City is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether the City will allow an unknown number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined that 46 additional child cancer cases per one million persons is significant, whether or not the City would have found the Project's benefits outweigh its environmental and adverse human health effects.

12 [AQ-1c] cont.

The DSEIR also attempts to support its "100 in a million excess cancer cases" by stating: "The 100 in a million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on the District's recent regional modeling analysis." (DSEIR p. 5.4-13, citing the 2009 BAAQMD Justifications report, p. 67). Neither document, however, explains what this means. For example, how are "excess" cancer cases "consistent" with "ambient" cancer risk? What does "most pristine" mean? On a scale of 1 to 10, are Mission Bay and the "most pristine areas" separated by 1 unit, or 10 units, or somewhere in between? In short, this justification for the threshold is mere verbiage.

b. The DSEIR's health impact assessment for Project-caused increases in $PM_{2.5}$ invalid.

The DSEIR uses a threshold of significance for the Project's health impact of increasing $PM_{2.5}$ concentrations of "10 µg/cubic meter." As discussed above, for criteria pollutants, the DSEIR borrows thresholds of significance from the BAAQMD to determine the significance of both the direct, incremental increase in emissions caused by the Project, and the Project's contribution to cumulative increase in emissions in the area.

13 [AQ-1d]

In contrast, in its assessment of the Project's health impact of increasing $PM_{2.5}$ concentrations, the Project ignores BAAQMD's stated cumulative threshold of 0.8 µg/cubic meter. (See Exhibit 1, p. 2-2.) According to BAAQMD, "Cumulative emissions within the 1,000 foot evaluation zone would be considered significant where the increased average annual ground-level concentrations of $PM_{2.5}$ would be greater than 0.8 $\mu g/m^3$." (Exhibit 4, p. 5.)

Obviously, there is a huge discrepancy between the 10 µg/cubic meter threshold used in the DSEIR compared to the 0.8 ug/cubic meter threshold recommended by BAAQMD. This discrepancy is particularly troubling given that the DSEIR reports Project-caused cumulative increases in $PM_{2.5}$ concentrations just below the 10 µg/cubic meter threshold, but well above the 0.8 µg/cubic meter threshold.

13 [AQ-1d] cont.

It would appear, once again, that the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's health risk impact from increases in $PM_{2.5}$ significant.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Comments Regarding Air Quality Impact Analysis and Mitigation

Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32

Draft Subsequent EIR (San Francisco, CA)

Autumn Wind Associates, Inc.
Newcastle, CA

Prepared for Tom Lippe, Attorney

July 19, 2015

I. Introduction

Autumn Wind Associates provides the following comments regarding air quality analysis and mitigation measures identified in the Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32 (hereinafter referred to as "Events Center" or "project") DSEIR at the request of Tom Lippe, Esq.

This review and commentary focuses on the DEIR's use of flawed construction mitigation measures that will not deliver purported emission benefits; a failure to provide substantive discussion on whether wastewater improvement-related emissions made necessary for completion of the Event Center project should have been reviewed in the DSEIR; failure to meaningfully evaluate and mitigate with effective alternatives to diesel equipment and diesel fuel, including requirement to use zero-emission electric options when appropriate; the unjustified use of trip-related emissions of major sports events from the Oracle Arena for application to the project's sports arena; failure to evaluate the use of the latest available OEHHA health risk guidance known to be under discussion during the preparation of the DSEIR; the Lead Agency's reliance on thresholds of significance that have not been adopted in compliance with CEQA Guidelines; and the use of emission offsets with substantially less lifetime mitigation value than that relied upon by the Lead Agency in the DSEIR. 14 [AQ-8]

II. Construction Emissions From Wastewater Improvements Have Not Been Adequately Reviewed in the DSEIR

At DSEIR pg. 1-9, significant environmental impact areas in the Event Center environmental review process are identified. One of those includes sewer processing plant and related utility improvements made necessary for the Events Center and associated development of the 11 acre project area: 15 [AQ-3, UTIL-3]

> "As indicated on Table 1-2, the SEIR determined that the proposed project would result in significant and unavoidable impacts in the areas of....utilities (construction of new or upgraded wastewater facilities, and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand)."

Based on the language noted above, it appears the DSEIR's project at Mission Bay Blocks 29 – 32 cannot proceed without sewer and associated utility improvements. However, at DSEIR pg. 1-43 it appears that the project is considered by the Lead Agency to not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities. Then, at DSEIR pg. 1-44 information from measure M-C-UT-4 shows that the project sponsor must pay for "fair share" improvements to the Mariposa Pump Station:

> The project sponsor shall pay its fair share for improvements to the Mariposa Pump Station and associated wastewater facilities required to provide adequate sewer capacity within the project area and serve the project as determined by the SFPUC. The contribution shall be in proportion to the wastewater flows from the proposed project relative to the total design capacity of the upgraded pump station(s). The project sponsor shall not be responsible for any share of costs to address pre-existing pump station deficiencies.

However, at DSEIR, pg. 5.7-13, it appears the wastewater improvements are made necessary by the project and that it cannot proceed without them:

15 [AQ-3, UTIL-3] cont.

> "Therefore, permanent improvements to the pump station and a long term increase in capacity would be needed to accommodate the proposed project in combination with other proposed and planned development in the Mission Bay South Plan area. In addition, as discussed in Section 5.9, Hydrology and Water Quality, the increased wastewater flows from **the proposed project** (emphasis added) in combination with other foreseeable future projects could increase the volume of combined sewer discharges (CSDs) from the Mariposa Pump Station which could necessitate improvements to the Mariposa wet weather pump station."

If the DSEIR project necessitates the improvements to local wastewater treatment facilities and related utility improvements, the associated construction emissions should be analyzed and mitigated as appropriate within the DSEIR and not piecemealed to some other review process or ignored altogether. No information is found in the DSEIR's Air Quality element that shows that construction-related emissions from the necessary wastewater utility improvements were recognized and evaluated within the DSEIR.

III. Air Quality Thresholds of Significance Used in the DSEIR Are Based On Outdated, Non-Scientific NSR Values

16 [AQ-1b]

BAAQMD (District) is regionally responsible for attaining or maintaining healthy air quality in the 9-county Bay Area that includes the proposed Event Center and Mission Bay Blocks 29 -32; the District implements a number of programs for attainment of regional air quality, including

issuance of CEQA guidance used by Lead Agencies in the review and mitigation of air quality impacts and specified emissions of new development. The District has historically acted under CEQA as a commenting agency for new developments subject to CEQA review not otherwise subject to District regulations. CEQA thresholds, used by the City as Lead Agency and applied to the DSEIR (see Table 5.4-6 Criteria Air Pollutant Thresholds), were developed by the BAAQMD many years ago, well prior to the last Ozone Attainment Plan issued by the District in 2001.

How the District's air quality CEQA thresholds were developed is relevant to whether they are appropriate and effective for use in evaluating the potential significance of air impacts of the proposed event center and other land use types anticipated within the DSEIR. While CEQA encourages the use of thresholds (Guidelines section 15064.7) to promote consistency and integration of environmental review activities across regulatory and planning disciplines and programs, the Lead Agency's air quality thresholds must reflect the true significance of the environmental impact for which they act as an impact or mitigation measuring device. Moreover, the courts have found that use of regulatory thresholds must not be applied "in a way that forecloses the consideration of any other substantial evidence showing there may be a significant effect" (CBE v. CA Resources Agency; 126 Cal. Rptr. 2d. 441, Cal.App.3 Dist., 2002).

16 [AQ-1b] cont.

In this case, the Lead Agency's use of District thresholds ignores air pollution nonattainment and ambient air quality monitoring evidence that they have not been adequately effective in reducing land-use related mobile source emissions in the air basin. Importantly, the BAAQMD's CEQA threshold increments (expressed in lbs/day or tons/yr of specified pollutants) were based decades ago on NSR (New Source Review) quantitative increments intended solely for ensuring that the region's stationary source emissions, regulated under permits issued by the BAAQMD, would not cause the region to fall out of "attainment" status for complying with federal air quality ozone standards. NSR increments were established decades ago within federal Clean Air Act programs, aimed exclusively at regulating stationary (not mobile) sources of air pollution, and were keyed quantitatively to an area's air quality designations; worse air quality invokes use of more restrictive NSR daily or annual emission limits.

Surprisingly, there is no scientific basis for how NSR values were established, nor is there any substantive information regarding their formulation or formation left in the historical record; we have researched this issue extensively and have been unable to find written material or anyone in regulatory air agencies (CARB, EPA) who is intimately familiar with or is still alive who can recall how NSR increments were established nearly fifty years ago.

In the DSEIR, BAAQMD's CEQA thresholds of significance were used; those thresholds were established by borrowing NSR values intended to ensure that the BAAQMD's stationary sources would not lead to regional air pollution "nonattainment" episodes. As a practical matter, the region's failure to attain the federal ozone standard is evidence of the lack of scientific credibility in how the BAAQMD's CEQA thresholds were established, as well as their lack of efficacy—had they been scientifically tied to land use growth and the mobile source emissions they create, it would be easily argued that the Bay Area would not now be designated "marginal nonattainment" for ozone air pollution after years of nonattainment.

Use of NSR values that were never scientifically designed, to establish current BAAQMD CEQA thresholds, makes even less sense when comparing the emissions inventory of stationary sources in the Bay Area to emissions resulting from mobile sources (vehicles) that routinely emit regulated pollutants traveling to or from new land use developments. Quite simply, there is no rational nexus between the two categories since stationary source emissions equate to typically less than one-sixth those emitted by the basin's mobile sources.

16 [AQ-1b] cont.

A more effective method for use by BAAQMD in designing CEQA threshold levels would have been to base them on growth in vehicle emissions expected to occur from projected land use growth in the basin---this method was developed and used in 2002 by the Sacramento Metropolitan Air Quality Management District (SMAQMD) to establish CEQA thresholds logically and arithmetically based on estimated increments of mobile source emissions of new development. The increment of new development-related emissions was derived from careful review of five years of immediately-prior building permit records obtained in the nonattainment area, and then adjusted to account for processes (such as ongoing development of rapid transit in the basin) expected to reduce vehicle-miles-travelled from new developments. CEQA threshold emission quantities (expressed as lbs/day or tons/yr) were then set at levels that would account for---and mitigate---only that new land use portion of the basin's total emissions determined by modeling and inventory analyses as necessary to achieve attainment of air quality standards under federal Clean Air Act requirements.

Under this "nexus analysis" approach, CEQA thresholds are scientifically established by correlating increased mobile source emissions from projected land use growth in the nonattainment area to the number of tons of related reductions needed for attainment by CAA-specified date(s). Such an approach greatly reduces the risk of under- or over-mitigating, and provides far more certainty that the estimated tons of emission reductions to result from their use, and critical to ensuring attainment of ambient air quality standards, will be realized. BAAQMD CEQA thresholds were not established scientifically, and the region has continued to violate ambient air quality standards for ozone for many

years now—both act as potent evidence to call into serious question the effectiveness of BAAQMD's NSR-based CEQA thresholds in the DSEIR for Event Center/Mission Bay Blocks 29 – 32. Further, they suggest that air quality impacts are likely underestimated, and mitigation values are overestimated in the DSEIR.

16 [AQ-1b] cont.

IV. Construction and Operational Mitigation Options Have Not Been Thoroughly Reviewed for Diesel Alternatives

Mitigation Measure M-AQ-1 at DSEIR pg. 5-4.36 under item B requires reporting of alternative fuel quantities used to power construction vehicles and equipment at the project site during its 26 month duration. M-AQ-1 should be revised to require the use of low-emission and/or low-CO2 alternative fuels unless costs are substantially (~100%) greater than routine diesel fuel costs. One such product that should have been carefully evaluated in the DSEIR is "Diesel HPR", made from 98% renewable content (a rate about 4 times greater than regular B-20 biodiesel) and currently marketed at 18 locations throughout northern CA and the Bay Area. The price for this ultra-low carbon-intensity diesel, said to have better performance characteristics than traditional petroleum diesel fuel, is competitive with standard onroad and offroad diesel available in CA (as advertised recently in the Sacramento area at $2.89 a gallon).

17 [AQ-6d]

Fossil diesel has a cetane rating of 40. The HPR Diesel product, or similar, has a cetane rating of 74. That level of higher cetane results in lower PM and NOx---which are needed reductions for the project. Because the density of the fuel is slightly lower, so is the chemical energy per unit volume (3%). But because the cetane rating is so much higher PM otherwise not emitted is converted into productive energy, with tractive horsepower (per unit volume) slightly higher than fossil diesel (1%).

Onroad project-serving construction vehicles that cannot otherwise operate without diesel fuel should also be required to use the very low carbon-intensity "Diesel HPR" or similarly effective product, with receipts proving purchase and use provided to the independent, onsite construction mitigation manager (referred to inappropriately as an "Air Quality Specialist" in the DSEIR, as noted elsewhere in this letter) for regular, weekly relay to the OCII. ("Similarly effective" does not mean use of B-20, since its proportion of bio-derived fuel will not exceed 20%, whereas the Diesel HPR product or similar will come almost entirely from renewable sources.)

Additionally, the project will rely on several emergency diesel gensets---these power units will produce emissions during regular testing, and are very likely to emit far greater quantities of emissions during any actual power outages. Those units should be operated on an alternative, low-emission non-diesel fuel. If not possible, those diesel units should be operated solely on the "Diesel HPR" or similar product. No information is found in the DEIR that discusses whether the diesel (and not alternatively fueled) genset option is critically necessary, whether lower-emitting options are available for them, and why those options are or are not permissible for use at the project.

17 [AQ-6d] cont.

See http://www.sacbee.com/news/business/article15203738.html for more information on the Diesel HPR product, and particularly its locations for purchase, costs, and emission benefits over traditional diesel fuel.

V. Construction Mitigation Is Unenforceable and Places Inappropriate Reliance on Project Sponsor for Interpretation and Compliance Determinations

At DSEIR pg. 5.4-35, Mitigation Measure M-AQ-1 is identified and discussed for reducing project-related construction equipment emissions. Under this measure's Item A, a Construction Emissions Minimization Plan is required:

> "**Construction Emissions Minimization Plan**. Prior to issuance of a construction permit, the project sponsor shall submit a Construction Emissions Minimization Plan (Plan) to the OCII or its designated representative for review and approval by an Air Quality Specialist."

18 [AQ-6e]

The measure then goes on to lay out "Compliance Alternatives" that require use of specified types of engines with prescribed emission standards (known as Tiers) utilizing VDECS (Verified Diesel Emission Control Strategies) to reduce equipment NOx emissions and particulates.

Because the project's construction emissions are estimated to exceed the BAAQMD's NOx threshold of significance, and due to the serious nature of diesel particulate matter (DPM) as a toxic air contaminant subject to EPA and CARB regulations resulting from PM2.5 emissions for which the region is designated nonattainment, it is essential that this measure be implemented and executed effectively for the duration of the project. As written, however, the measure lacks enforceability because there is no recognized definition of or qualification process provided in the DSEIR for "Air Quality Specialist" who will pass judgment on the adequacy of construction equipment and emissions levels to be submitted by the project sponsor for approval.

While the BAAQMD has agency positions designated "Air Quality Specialist", those positions possess skillsets exclusive to their particular area of expertise, ranging across the sub-specialties of air quality planning, permitting, compliance and enforcement, stationary source inspection, engineering, air monitoring, incentive programs, etc. There is no generic "air quality specialist", as implied in the DEIR's use of the term, and the DSEIR fails to identify the necessary skillsets for this important position. Ensuring compliance with the components of M-AQ-1 will require an individual experienced with CEQA mitigation requirements; air quality regulations and VDECS technology options and functionality; construction site operations and safety issues; a wide variety of offroad and onroad construction equipment and vehicle engines; hands-on engine and VDECS experience to ensure daily compliance with the applicable Compliance Alternative; and precise, effective record-keeping skills, across the 26 month construction duration. The "'Specialist" must be present during all work hours at the site for each day of construction work across the two-plus years of work that would involve operations of construction engines and vehicles at the 11-acre site.

Because of the importance of the role of the "air quality specialist" in ensuring compliance with M-AQ-1 across the many phases and months of the Arena's construction, this position must be independent, full-time on the project site, and required to provide weekly report submittals to OCII. At pg. 5.4-36, reporting to OCII is required on a quarterly basis. This is without doubt too long a duration since equipment will come and go on a daily basis, and as written now M-AQ-1 can (and probably will) permit a project sponsor "Specialist" to creatively develop post-hoc equipment compliance records that may appear legitimate but are, in fact, not. Considering that there are no checks and balances built into the Measure, the Lead Agency cannot ensure that compliance with the essential objective of the mitigation measure will actually occur.

18 [AQ-6e] cont.

Because of the unusual nature of the duties of the Measure's "Specialist", and as a result of the need for independence from the Applicant to prevent conflict of interest, the EIR must discuss filling the position with a capable, qualified BAAQMD employee under contract to OCII. Should this not be possible, the position must be filled by a qualified, independent contractor chosen by and subject only to the authority of OCII.

Further, M-AQ-1 specifies numerous sub-part requirements (A 1 through 5) to be included in the Construction Emissions Mitigation Plan, and in each case compliance with those sub-parts is left to the "project sponsor". So, too, is compliance with the Measure's additional duties required under M-AQ-1 items B and C. This is not appropriate when considering the extent, complexity, and costs that will be incurred for effective mitigation measure compliance across the 26-month construction period; permitting the project sponsor to create, implement, report, and determine compliance with the Measure is akin to having the fox guard the henhouse and must not be allowed.

As written, the measure is not enforceable due to the subjective, undefined nature of "Air Quality Specialist" who will approve the project sponsor's Construction Emissions Mitigation Plan. Further, it is unacceptable that the Measure will permit the project sponsor to determine compliance with each of the measure's components, record and report information signifying compliance, and then, under part C certify their own compliance with the Plan and its various requirements.

We have inspected construction project sites, under air district contract, to determine compliance with air district-imposed construction equipment mitigations and have found uniformly poor compliance; to exemplify, at one residential subdivision project in south Sacramento County we determined that only one offroad construction vehicle out of nearly twenty were actually compliant with the mitigation requirements that had been imposed on the project by the Lead Agency. This is because there has traditionally been very little, if any, post-EIR follow-through to verify mitigation compliance by Lead Agencies or by the local air district after the CEQA project has been approved for development and construction has started. Knowing this, construction and development firms commonly let air quality mitigations go unmet, although records purporting to show compliance can be easily formulated and submitted post hoc in order to fulfill a paper requirement. Without an independent, qualified 3rd party contractor onsite each day to track, verify, and record emissions- and activity-related information on construction vehicles used at the project site to ensure the EIR's mitigations are implemented effectively, the project is very unlikely to produce more than a token of the emission reductions claimed in the DSEIR.

18 [AQ-6e] cont.

Similarly, M-AQ-2a begins with "The project sponsor shall implement the following measures as feasible:"... The introduction of "as feasible" is a poison pill, since the measure does not conclusively identify the party responsible (and liable) for determining sub-component measure feasibility. This determination must not be left to the project sponsor, but, rather, vested with a qualified independent contractor chosen by and reporting solely to the OCII, or to the BAAQMD on behalf of OCII, to ensure measure implementation at every truly "feasible" turn. Without specifying duties for the accurate determination of what constitutes "as feasible", and then ensuring that those duties are actually implemented by a non-conflicted 3rd party (which, as

19 [AQ-6c, AQ-6f, AQ-7]

written currently, the project sponsor cannot possibly fulfill without potential for conflict of interest), M-AQ-2a lacks necessary enforceability and cannot be expected to produce those real, quantifiable, surplus mitigated emission benefits claimed in the DSEIR.

Finally, M-AQ-2b leaves it to the project sponsor to calculate the amount of emission offsets required to satisfy the project's estimated ozone precursor burden of 17 tons per year, after they have decided what is feasible for Tier 4 equipment to be used at the site and what then to report to OCII under the requirements of M-AQ-1. In total, the construction mitigations proposed in the DEIR are riddled with potential conflicts of interest by leaving the determination of compliance and feasibility to the very party that must identify, implement and pay for them. As written, they cannot be relied upon to deliver the emission benefits that the DEIR assumes will actually occur. The DEIR must be revised to place a qualified, independent, 3rd party entity at the project site daily for the 26 month project duration, making them responsible and liable for accurate, weekly (not quarterly) verifications of equipment emission rates and reductions in reports to the City.

19 [AQ-6c, AQ-6f, AQ-7] cont.

VI. Operational Mitigation Measure for Electrical Outlets is Vague and Unenforceable

Mitigation Measure M-AQ-2a at DSEIR pg. 5.4-42 is designed to reduce the project's operational emissions, requiring the project sponsor to provide outlets for electrically powered landscape equipment "as feasible." As written, this measure is unenforceable since it permits the sponsor to determine feasibility. There is no doubt that the measure will be feasible, since electric power will be ubiquitous across the project site in built structures, at their exteriors, and in power supplied to lighting and other exterior improvements across the project's eleven acres.

Additionally, the mitigation measure should be revised to require that the project sponsor and any future property owners or tenants require in any landscaping contracts the requirement that landscape maintenance firms at the project use only electrically powered landscape equipment. Merely requiring outlets without mandating their use for landscaping onsite renders this portion of M-AQ-2a entirely unreliable for producing actual emission benefits.

20 [AQ-7]

VII. Offsets for Operational Emissions from Warriors Games Appear to be Double-Counted

At DSEIR pg. 5.4-37, new operational emissions from vehicle trips generated by Warrior games are, for the purposes of mitigation, discounted based on the assumption that those emissions have already been counted in the CEQA-review process conducted for Warriors' games at the Oracle Arena (Oakland). This approach is used in the DSEIR to justify the purchase of fewer

21 [AQ-4a]

emission offsets from BAAQMD necessary to reduce the project's onroad emission impacts to less-than-significant levels, and it is predicated on the assumption that no new large sports events will occur at the Oakland Coliseum/Oracle Arena once large-venue sports games move across the Bay to the proposed Arena in San Francisco. From pg. 5.4-37:

> "Some of the motor vehicle trips that would be generated by Golden State Warriors basketball games at the proposed event center would be regional trips similar to those currently generated by basketball games occurring at the Oracle Arena in Oakland, and as a result, the emissions associated with these regional trips would not represent new emissions to the air basin."

At the bottom of the same page, additional material reinforces the crediting strategy:

> "It is unlikely that there would be another NBA franchise in the Bay Area, so all of the professional basketball games occurring in the region would likely be played at the new event center. This assumption is consistent with that of the City of Oakland in its CEQA related analyses."

For the purposes of estimating vehicle trip emissions from large Warriors game-style sporting events that will be held at the proposed San Francisco Events Center, the Lead Agency has assumed that existing (Oracle Arena-based) Warriors game-related vehicle trip emissions will shift from Oakland to the new San Francisco Events Center. Under this DSEIR perspective, there would be no net increase in vehicle trips (and related emissions) since game attendees are expected to drive the same distance (25 miles on average) to the new facility in San Francisco that they are assumed to currently drive to attend a Warriors game (or similar large-venue sports event) at the Oracle Arena in Oakland. Crucial to this perspective is the notion that there would be no new, large-venue sporting events at the Oracle arena which would then act to backfill the loss of Warriors games---otherwise there must be a net gain in total, large-venue sporting event emissions created between the two arenas. In fact, the "no net gain" perspective taken by the Lead Agency in the DSEIR is used to justify deducting those Warriors game "existing trip" emissions from the project's emissions modeling so that fewer emission offsets would be required for the project. Based on our review of information contained in a recent Oakland EIR, this appears to be inappropriate.

21
[AQ-4a]
cont.

For the above-referenced approach to be viable for use in the DSEIR, the vehicle-trip emissions resulting currently from the large-sports venue games held at Oracle must transfer to the proposed San Francisco Event Center *and must then not be backfilled with new, large-sports venue games at Oracle*—otherwise there will be a net gain in emissions not accounted for in either the new Events Center DSEIR or the EIR conducted for the expanding Oracle Arena.

In contradiction to the DSEIR's claim is this statement from Oakland's Coliseum Area Specific Plan DEIR1, Vol. I, pg. 1-1:

> "The Project seeks to retain Oakland's three major professional sports franchises with three new venues and an accompanying mixed-use residential....."

On the next page, this information further clarifies that Oakland will backfill with large sports venues that will continue the emissions currently associated with the Warriors operation at the Oracle Arena:

> "The development of Sub-Area A and a portion of Sub-Area B (the "Coliseum District") is based on the Coliseum City Master Plan, which calls for three new sports venues (a new football stadium and a new baseball park in Sub-Area A plus a new basketball arena and multi-purpose events center in Sub-Area B)..."

At Coliseum Area Spa DEIR, pg. 4.2-59, mobile source emission impacts were modeled based on three scenarios:

21
[AQ-4a]
cont.

- Existing criteria pollutant emissions from the Coliseum District area ("Existing No Project", or "2013 Baseline"),
- Future 2035 criteria pollutant emissions from the Coliseum District if the Project were not developed (i.e., future no Project, or 2035 Baseline), and
- Future 2035 criteria pollutant emissions from the Coliseum District (i.e., future plus Project, or 2035 plus Project).

By logical inference from the first- and second-bulleted points noted above, large sports venue-related emissions currently attributed to Warriors games appear to remain "on the books" for Oracle. Correspondingly, at pg. 4.2-60, existing emissions quantities associated with the Warriors games are retained:

> "Table 4.2-7 shows estimated average daily and annual maximum criteria emissions under current conditions (2013 Baseline), as well as the emissions projected from current land uses at the Coliseum District as they would occur in 2035 (2035 Baseline). These projected 2035 baseline emissions are based on a continuation of existing land uses, vehicle trips, and VMTs."

[1] City of Oakland; Coliseum Area SPA DEIR Vol I; SCH #2013042066; August 2014

Based on the information cited above, it is clear that the City of Oakland anticipates retention of mobile source emissions generated by the equivalent of Warriors games at their Coliseum/Oracle Arena. Further, it appears that the Coliseum/Oracle EIR was certified prior to issuance of the Warriors NOP---thus the claim in the Warriors EIR that large sports venue-related emissions can be transferred from Oakland to San Francisco, and with credit applied to compliance with Mitigation Measure M-AQ-2b (Emission Credits) shown at pg. 5.4-41, is likely neither applicable nor appropriate under CEQA. 21 [AQ-4a] cont.

VIII. Project Health Risks May Be Underestimated Using Older Guidance

The DSEIR provides analysis and discussion of the project's potential to cause significant health risks from project-related toxics, with specific details on health risks and PM2.5 calculations and methodology found in Appendix AQ. Exposure parameters presented in Section 3 of Appendix AQ do not appear to reflect current methods for calculating excess cancer risks, and as a result it is likely that the HRA underestimates Warriors Arena's potential excess cancer risks.

Table 3 lists daily breathing rates referencing BAAQMD's Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines released in January 2010.[2] These breathing rates are consistent with rates recommended by the California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Risk Assessment Guidelines released in 2000.[3] After publicly working on revisions during 2014, OEHHA released updated Risk Assessment Guidelines in early 2015 that outline risk calculations for specific age groupings. The new methods incorporate higher daily breathing rates than those listed in the BAAQMD's 2010 Guidelines and used in the HRA. To comply with the latest OEHHA Guidelines, the inhalation intake factors should be re-calculated for the EIR using the updated 95% daily breathing rate for children of 1,090 L/kg-day.[4] 22 [AQ-5]

Additionally, the screening approach taken in the HRA to evaluate operational cancer risks should be revised to include a refined, site-specific analysis of impacts using the USEPA AERMOD

model. With respect to the number of years of data to model, the USEPA Guideline on Air Quality Models states:

> "Five years of representative meteorological data should be used when estimating concentrations with an air quality model. Consecutive years from the most recent, readily available 5-year period are preferred.[5]"

The DSEIR used meteorological data from 2008; updated AERMOD results, employing five years of the most recent meteorological data, should be used with exposure parameters and methodology in compliance with the 2015 OEHHA Risk Assessment Guidelines to calculate excess cancer risk. 22 [AQ-5] cont.

IX. CEQA Air Quality Thresholds of Significance Have Not Been Adopted By the Lead Agency

At Page 5.4-25 the DSEIR establishes criteria pollutant thresholds adopted by the Bay Area Air Quality Management District (BAAQMD). Following their adoption by the BAAQMD, the City of San Francisco has used these numerical thresholds for virtually all land use development projects undertaken in the City and requiring CEQA review.

However, CEQA Guidelines, § 15064.7(b) requires that "[t]hresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence." Without exception, this Guidelines section requires that, prior to application of thresholds in actual CEQA environmental reviews, the City undertake its own rule-making proceeding to adopt these thresholds as their own after determining in a public process that they are supported by substantial evidence. Since the City has not formally adopted the air quality significance thresholds in a public process, supported by substantial evidence, their ad hoc application to the DSEIR is inappropriate. 23 [AQ-1a]

X. Mobile-Based Emission Offsets Are Unlikely To Produce Needed Project-Lifetime Reductions

Mitigation Measure M-AQ-2b at DSEIR pg. 5.4-42 identifies the use of emission offsets for the project, requiring the project sponsor pay a mitigation-offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division. The measure is designed to 24 [AQ-7]

[5] USEPA, November 9, 2005, Guideline on Air Quality Models. 40 CFR 51, Appendix W, Section 8.3.1.2.a.

offset operational project emissions that have been estimated to exceed the DSEIR's air quality thresholds of significance. As noted at pg. 5.4-42:

> "...the project sponsor shall pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division in an amount not to exceed $18,030 per weighted ton per year of ozone precursors plus a 5 percent administrative fee to fund one or more emissions reduction projects within the San Francisco Bay Area Air Basin (SFBAAB). This fee is intended to fund emissions reduction projects to achieve reductions of 17.0 tons per year of ozone precursors."

There is a serious, fundamental flaw in the logic applying to the measure's requirement to purchase emission offsets, since emission reductions developed through the BAAQMD's Strategic Incentives Division are based on mobile source emission reduction projects with limited and intentionally impermanent lifetimes. These projects typically operate for several years before they are rendered obsolete by new vehicle emission control standards and technologies, and thus they must not be expected to produce the 17 tons per year of ozone precursor offsets, year in and year out, across what is at least a 30 year project planning lifetime.

24 [AQ-7] cont.

Accordingly, M-AQ-2b must be revised to require emission offsets for project operations for, at a minimum, the aforementioned 30 year life of the project. To exemplify, if the BAAQMD purchases mobile emission offsets with an emission reduction life of less than 10 years, the project sponsor must then pay mitigation-offset fees for mobile emission reductions until emission offsets are realized for the minimum 30 year period. Without such protection the project can be expected to offset its significant ozone precursors for no more than one-third of its lifetime; this is clearly inconsistent with CEQA's interest in mitigating the project's significant impacts across its planned lifetime.

** ** **

In summary, we believe the project DSEIR's treatment of air quality impact analysis and mitigation has inaccurately characterized certain project emissions, applied mitigation measures which are unenforceable or will simply not be implemented effectively if they are substantively implemented at all, failed to use thresholds of significance previously adopted by the Lead Agency's Board of Directors pursuant to CEQA Guidelines, and has incorrectly assumed the transfer of Warriors game-related operational emissions established for the Oracle Arena to apply to the project arena to be built in San Francisco.

San Francisco, CA 94105

Subject: Comments on the Event Center and Mixed-Use Development Project at Mission Bay Blocks 29-32

Dear Mr. Lippe:

We have reviewed the June 5, 2015 Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development Project ("Project") at Mission Bay Blocks 29-32. GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an approximately 11-acre site on Blocks 29-32 within the Mission Bay South Redevelopment Plan Area of San Francisco. The proposed event center would host the Golden State Warriors basketball team during the NBA season, and provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences, and conventions.

Our review concludes that the DSEIR fails to adequately assess the Project's air quality impacts.

1. The FEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the *California Emissions Estimator Model* ("CalEEMod"),[1] to determine the on-road hauling emissions that would occur during construction; however, utilizing this default value, rather than a site specific trip length, results in an underestimation of the Project's construction emissions. 26 [AQ-3]
2. The DSEIR attempts to mitigate the Project's criteria air pollutant emissions by limiting the off-road equipment used during construction to machinery equipped with, at a minimum, Tier 2 engines with 40 percent NOx verified diesel emission control strategies (VDECS), and at a maximum, Tier 4 or Tier 4 interim engines (Volume 2, p. 5.4-32). However, the DSEIR does not demonstrate the feasibility of this proposed measure. The Project will need to acquire approximately 195 pieces of equipment outfitted with Tier 2 and/or Tier 4 engines. Due to the 27 [AQ-6a]

[1] CalEEMod website, *available at*: http://www.caleemod.com/

limited supply of cleaner-burning off-road equipment, the implementation of this measure, in its entirety, is highly unrealistic. As a result, the proposed Project should not rely on this mitigation measure to reduce emissions; rather the Project should pursue additional, feasible mitigation measures other than Tier 2/Tier 4 construction equipment to reduce the Project's criteria air pollutant emissions. 27 [AQ-6a] cont.
3. The DSEIR does not assess the Project's individual excess cancer risk to the Bay Area Air Quality Management District's (BAAQMD) 10 in one million significance threshold.[2] Rather, it determines the Project's significance by comparing the cumulative cancer risk (background risk plus Project risk) to BAAQMD's cumulative risk threshold of 100 in one million. 28 [AQ-1c]
4. The DSEIR also fails to utilize BAAQMD's cumulative PM2.5 threshold of 0.8 µg/m^3. 29 [AQ-1d]

A revised DSEIR should be prepared to address these inadequacies and to incorporate mitigation to reduce impacts which otherwise would affect regional air quality, and health impacts from toxic air contaminants. 30 [AQ-8]

Inadequate Use of CalEEMod Default Values

31 [AQ-3]

The DSEIR calculates the emissions from on-road haul trucks during Project construction by assuming a trip length of 20-miles, which represents the default hauling trip length provided by CalEEMod (Volume 3, Appendix AQ, p. 6). This default trip length, however, does not represent the actual haul trip length that would occur. Therefore, in an effort to accurately estimate the actual haul trip length, we conducted an independent analysis using the best resources available.

The DSEIR "estimates that the maximum depth of excavation on-site would be approximately 30 feet below San Francisco City Datum; this would require approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (Volume 3, Appendix AQ, p. 17). In order to transport this soil off-site, the DSEIR anticipates that approximately 39,952 haul trips will be required over the course of approximately four months (Volume 3, Appendix AQ, Table 6.1-13, pp. 1243).

The DSEIR fails to disclose where this excavated soil will be transported to. According to the DSEIR, in 2006, the City of San Francisco adopted the Construction and Demolition Waste Ordinance[3], which mandates that 75 percent of construction and demolition debris be recycled (Volume 3, Appendix AQ, p. 70). Therefore, it can be assumed that 75 percent of the approximately 350,000 cubic yards of construction debris will be transported to a registered construction and demolition (C&D) debris recovery facility, and the remaining 25 percent will be transported to a registered landfill. The Construction and Demolition Waste Ordinance requires that C&D materials be transported to a registered recovery facility, and provides a list of the facilities currently approved by the City.[4] The

[2] "California Environmental Quality Act Air Quality Guidelines." Bay Area Air Quality Management District, May 2011. *Available at:* http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines_May%202011_5_3_11.ashx, p. 2-2
[3] San Francisco Ordinance No. 27-06, *available at:* http://sfenvironment.org/sites/default/files/fliers/files/cd_ordinance.pdf
[4] San Francisco Ordinance No. 27-06, List of Registered Transporters and Registered Facilities, *available at:* http://sfenvironment.org/sites/default/files/fliers/files/sfe_zw_cd_registered_facilities_list.pdf

permitted daily capacity of each facility is not disclosed in the DSEIR; however, due to the large amount of debris that will have to be transported off-site over a very short period of time (four months), it can be assumed that this material will most likely be transported to multiple recovery facilities. Again, because the DSEIR does not disclose where this material will be transported to, we measured the distance of each recovery facility to the Project site, and then used the average distance of these facilities to represent the one-way hauling trip length (see table below).

Recovery Facility Name	Distance From Project Site (miles)
Big for Hauling and Demolition	2.1
Marin Resource Recovery Center	25.6
Smart Demolition	3.1
Blue Line Transfer, Inc.	12.1
Premier Recycle	55.3
West Contra Costa Sanitary Landfill	21.1
Certified Blue Recycling, Inc	19.6
Recology San Francisco	5.0
Windsor Materials Recovery Facility	70.6
Davis Street Transfer & Recycling Center	19.5
SF Recovery Inc	5.5
Zanker Materials Processing Facility	58.5
Average Distance From Project Site	**25**

31
[AQ-3]
cont.

Using this method, we can assume that approximately 29,964 haul trips will transport 262,500 cubic yards of material approximately 25 miles one-way.

The remaining 25 percent, or approximately 87,500 cubic yards, of C&D material will most likely be transported to a landfill. San Francisco currently has a contract with Waste Management, Inc., to transport waste to the Altamont Landfill, which is approximately 53 miles away from the Project site.[5] Once the Altamont Landfill contract expires in 2016, the City of San Francisco is proposing to enter a new agreement with Recology's Hay Road Landfill, which is located approximately 70 miles away from the Project site.[6] According to the DSEIR, construction activities are anticipated to occur starting in 2015, with full Project build out in 2018 (Volume 3, Appendix AQ, p. 5). For that reason, depending on when construction activities actually start, there is the possibility that C&D materials will be transported to the Hay Road Landfill. Therefore, we estimated total haul emissions assuming that 25 percent of C&D material would be transported to the Altamont Landfill (Scenario 1), and then we estimated emissions

[5] "Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County." Notice of Availability of and Intent to Adopt a Negative Declaration, March 4, 2015. *Available at:* http://sfmea.sfplanning.org/2014.0653E_NOA.pdf

O-MBA8L2
Exh 2

from an alternative scenario, where we assumed that 25 percent of C&D material would be transported to the Hay Road Landfill (Scenario 2).

The tables below summarize the results of our analysis for each scenario.

Scenario 1: Current Contract with Altamont				
Location		One-Way Distance (miles)	Total One-Way Haul Trips	Total Vehicle Miles Traveled
75%	Recovery Facilities	25	29,964	744,106
25%	Altamont Landfill	53	9,988	527,366
100%	-	-	**39,952**	**1,271,472**

Scenario 2: Proposed Contract with Hay Road Landfill Approved				
Location		One-Way Distance (miles)	Total One-Way Haul Trips	Total Vehicle Miles Traveled
75%	Recovery Facilities	25	29,964	744,106
25%	Hay Road Landfill	70	9,988	695,165
100%	-	-	**39,952**	**1,439,271**

31
[AQ-3]
cont.

When we compared the total vehicle miles traveled (VMT) from each of the above scenarios to the VMT from the CalEEMod default trip length of 20 miles, we found that Scenario 1 would result in a 37 percent increase in VMT, and found that Scenario 2 would result in a 44 percent increase in VMT (see table below).

Scenario	Vehicle Miles Traveled (VMT)
1 – Altamont Landfill	1,271,472
CalEEMod Default	799,040
Net Increase in VMT	**472,432**
Percent Increase in VMT	***37%***
2 – Hay Road Landfill	1,439,271
CalEEMod Default	799,040
Net Increase in VMT	**640,231**
Percent Increase in VMT	***44%***

[6] "Agreement for Disposal of San Francisco Municipal Solid Waste at Recology Hay Road Landfill in Solano County." Notice of Availability of and Intent to Adopt a Negative Declaration, March 4, 2015. *Available at:* http://sfmea.sfplanning.org/2014.0653E_NOA.pdf

We derived emission factors from the California Air Resources Board's (CARB) EMFAC2011 model to estimate the increase in emissions when site specific hauling trip lengths are used.[7] We specified a 2015 calendar year for Scenario 1, which assumes that the Altamont Landfill contract is still active, and we specified a 2016 calendar year for Scenario 2, which assumes that the Altamont Landfill contract has expired, and has been replaced by a new contract with Hay Road Landfill. Additional parameters used to derive these emission factors are specified in the table below.

EMFAC2011 Parameter	Input
Region Type	Air Basin
Region	San Francisco Bay Area
Season	Annual
Vehicle Class	T7 Tractor
Model Year	Aggregated
Speed	Aggregated

EMFAC2011 does not provide emission factors for CH_4 and N_2O, which are mobile-source greenhouse gases that contribute to the effects of climate change. Therefore, we used heavy duty diesel truck emission factors from the Environmental Protection Agency's (EPA) *Emission Factors for Greenhouse Gas Inventories,* which specifies a CH_4 emission factor of 0.0051 grams per mile (g/mile), and a N_2O emission factor of 0.0048 g/mile.[8] We applied Global Warming Potentials (GWPs) to each of these pollutants in order to convert these emissions to carbon dioxide equivalents (CO_2e).[9] 31 [AQ-3] cont.

According to the DSEIR, the CalEEMod default vehicle type for hauling is a mix of all heavy-heavy duty trucks (HHDT), labeled as a T7 vehicle type (Volume 3, Appendix AQ, pp. 1244). Furthermore, the CalEEMod emissions estimates take into account idling emissions, starting exhaust, evaporative emissions, and running losses, as well as emissions from road dust (Volume 3, Appendix AQ, pp. 1245 – 1248). Because our analysis is a bit more simplistic than the emissions calculated in CalEEMod, we estimated the emissions, using the methods and input parameters described above, from a 20-mile default hauling trip length. In an effort to demonstrate consistency, we used 2015 emissions factors to estimate the net increase in emissions for Scenario 1, and used 2016 emission factors to estimate the net increase in emissions for Scenario 2. The results of our analyses are summarized in the table below (see attachment for calculation details).

31 [AQ-3] cont.

Our simple analysis indicates that the use of a CalEEMod default hauling trip length results in an approximate 37 – 44 percent underestimation in mobile-source, hauling emissions. CalEEMod default values should only be relied upon when site specific information is not available. As indicated by our analysis above, hauling destinations can be derived very easily. If site specific information is used to determine hauling trip lengths, the emissions increase significantly. As a result, an updated DSEIR should be prepared to adjust the hauling trip length to reflect site specific distances. Furthermore, worker and vendor trip lengths, which we were not able to determine due to a lack of information disclosed in the DSEIR, should also be adjusted to reflect site specific distances.

Incorrectly Presumed the Use of Tier 2 and Tier 4 Interim Engines

In this updated analysis, it is presumed that all off-road construction equipment will be outfitted with, at a minimum Tier 2 engines with 40 percent NOx verified diesel emission control strategies (VDECS), and at a maximum, Tier 4 or Tier 4 interim engines (Volume 2, p. 5.4-32). There is no substantial evidence, however, to support the assumption that the roughly 195 pieces of off-road equipment utilized during Project construction will meet these standards. Furthermore, it may not be technically feasible to acquire machinery with Tier 2 or Tier 4 engines for the Project's entire construction equipment fleet. As a result, this mitigation measure should not be relied upon to reduce the Project's construction emissions to below levels of significance. Rather, the Project should pursue additional mitigation measures that are more technically feasible to implement. 32 [AQ-6a]

The United States Environmental Protection Agency's (USEPA) 1998 nonroad engine emission standards were structured as a three-tiered progression. Tier 1 standards were phased-in from 1996 to 2000 and Tier 2 emission standards were phased in from 2001 to 2006. Tier 3 standards, which applied to engines from 37-560 kilowatts (kW) only, were phased in from 2006 to 2008. The Tier 4 emission standards were introduced in 2004, and were phased in from 2008 – 2015. [10] These tiered emission standards, however, are only applicable to newly manufactured nonroad equipment. According to the United States Environmental Protection Agency (USEPA) "if products were built before EPA emission standards started to apply, they are generally not affected by the standards or other regulatory requirements."[11] Therefore, pieces of equipment manufactured prior to 2000 are not required to adhere to Tier 2 emission standards, and pieces of equipment manufactured prior to 2008 are not required to adhere to Tier 4 emission standards. Construction equipment often lasts more than 30 years; as a result, Tier 1 equipment and non-certified equipment are currently still in use.[12] It is estimated that of the two million diesel engines currently used in construction, 31 percent were manufactured before the introduction of emissions regulations.[13] Furthermore, in a 2010 white paper, the California Industry Air Quality Coalition estimated that approximately 7% and less than 1% of all off-road heavy duty diesel equipment in California was equipped with Tier 2 and Tier 3 engines, respectively.[14] It goes on to explain that "cleaner burning Tier 4 engines…are not expected to come online in significant numbers until 2014." Given that significant production activities have only just begun within the last year, it can be presumed that there is limited availability of Tier 4 equipment. Furthermore, due to the complexity of Tier 4 engines, it is very difficult if not nearly impossible, to retrofit older model machinery with this technology.[15] Therefore, available off-road machinery equipped with Tier 4 engines are most likely new. According to a September 20, 2013 EPA Federal Register document, a new Tier 4 scraper or bulldozer would cost over $1,000,000 to purchase.[16] It is also relatively expensive to retrofit a piece of old machinery with a Tier 3 engine. For example, replacing a Tier 0 engine with a Tier 3 engine would cost roughly $150,000 or more.[17] Therefore, before applying mitigation measures of this caliber to a Project, the applicant should consider both the cost of the proposed equipment as well as determine the

probability of obtaining an entirely Tier 2 or Tier 4 construction fleet. Unless the Project applicant can demonstrate to the public, either through budget or through a signed contractual agreement with a contractor or supplier, that they will purchase/rent exclusively Tier 2 or Tier 4 construction equipment, this mitigation measure should not be relied upon as a feasible way of reducing Project emissions.

32
[AQ-6a]
cont.

Failure to Assess Individual Health Risk from Proposed Project

The DSEIR fails to assess the individual health risk that construction of the Project may have on nearby sensitive receptors. According to the DSEIR, because "both the PM2.5 and cancer risk assessments account for background (existing) concentrations and risk levels," the Project's contribution to PM2.5 concentrations and excess cancer risks are instead combined with background concentrations, and are then compared to cumulative significance thresholds (Volume 2, p. 5.4-45). Instead, the DSEIR uses the individual project cancer risk threshold of 10 in one million to determine the significance of emissions from the proposed emergency generators, exclusively (Volume p. 5.4-46). This application of the 10 in one million threshold is inconsistent with CEQA thresholds set forth by BAAQMD. As a result, the significance of the Project's toxic air contaminant (TAC) emissions during construction is not adequately determined. An updated DSEIR should be prepared to accurately assess the Project's individual health risk according to CEQA guidance set forth by BAAQMD.

The DSEIR does not apply the project risk threshold of 10 in one million to the Project as a whole (stationary, area, and mobile sources of TACs); rather, the DSEIR applies this threshold to stationary sources, exclusively, to the proposed emergency generators that will be used during Project operation (Volume 2, p. 5.4-46). The DSEIR explains this application by stating the following:

33
[AQ-1c]

> "The permitting process under BAAQMD Regulation 2, Rule 5 requires a Health Risk Screening Analysis, the results of which are posted on the District's website. Per its Policy and Procedure Manual, the BAAQMD requires implementation of Best Available Control Technology for Toxics and would deny an Authority to Construct or a Permit to Operate for any new or modified source of TACs that exceeds a cancer risk of 10 in one million" (Volume 2, p. 5.4-46).

The requirements and thresholds set forth in BAAQMD's Regulation 2, Rule 5, as referred to in the DSEIR, however, apply only to stationary sources. As a result, the TAC emissions from on- and off-road mobile sources, such as construction equipment and heavy duty diesel trucks, are not held to any sort of significance threshold. This application of the 10 in one million threshold is inconsistent with CEQA thresholds set forth by BAAQMD. According to the BAAQMD's May 2011 *Recommended Methods for Screening and Modeling Local Risks and Hazards*, "the thresholds for local risks and hazards from TAC and PM2.5 are intended to apply to all sources of emissions, including both permitted stationary sources and on- and off-road mobile sources, such as sources related to construction, busy roadways, or freight movements."[18] Therefore, an individual project would be considered significant if the total project's TAC

[18] "Recommended Methods for Screening and Modeling Local Risks and Hazards." Bay Area Air Quality Management District, May 2011. *Available at:* http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20Modeling%20Approach.ashx

emissions, including exhaust from construction equipment, heavy duty diesel trucks, and diesel-powered generators, would result in an increased cancer risk greater than 10 in one million, or would result in an increased ambient air PM2.5 concentration greater than 0.3 μg/m^3.

The BAAQMD's October 2009 *Revised Draft Options and Justification Report*[19] outlines four ways of siting a new source and determining a significance threshold. Any project with the potential to expose people (receptors) to substantial levels of TAC is currently deemed to have a significant impact. The BAAQMD uses the following approach (Option 1) to determine significance:

> "Proposed development projects that have the potential to expose receptors to TAC in <u>excess of the following thresholds from any source, mobile or stationary</u> would be considered to have a significant air quality impact if the:
> - Probability of contracting cancer for the Maximally Exposed Individual (MEI) exceeds 10 in one million.
> - Ground-level concentrations of non-carcinogenic toxic air contaminants would result in a Hazard Index greater than 1 for the MEI" (p. 59).

The second option consists "of applying the current stationary source permitting thresholds to project-generated stationary, area-, and mobile-source TAC emissions" (p. 60). As previously stated, stationary sources of emissions are subject to BAAQMD's permit process per Regulation 2, Rule 5. The permitting process requires that all new or modified stationary sources that emit TACs perform modeling to determine what the concentration of TACs will be at the boundary of their property. This current permitting approach does not include area or mobile sources of emissions in the modeling or permitting assessment. If a proposed stationary source will have operational TAC concentrations from permitted equipment that result in an estimated 1 excess cancer risk in a million, the project is required to install Toxic Best Available Control Technology (TBACT) to minimize emissions of TACs. The TAC modeling must also demonstrate to BAAQMD that implementation of the proposed project would not result in additional incremental exposure of surrounding receptors to levels that exceed 10 in one million for excess cancer risk or a hazard index above one. The BAAQMD will not issue an authority to construct or permit to operate for any stationary source of TACs that would result in concentrations exceeding a 10 in one million threshold. 33 [AQ-1c] cont.

Option 2 expands on Option 1 by requiring the application of the one in a million threshold for stationary sources to install TBACT to projects that have TAC emissions from sources (primarily mobile) not currently required to obtain permits to operate. These non-stationary source type projects, such as the Warriors Arena Project, would be required to implement Toxic Best Practices (TBPs), such as site and circulation design, setbacks from roadways, air conditioning, and vegetation buffers, if their modeled cancer risks are above the one in a million threshold. The BAAQMD would identify a list of TBPs for non-

[19] "Revised Draft Options and Justification Report." Bay Area Air Quality Management District, October 2009. *Available at:* http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/revised-draft-ceqa-thresholds-justification-report-oct-2009.pdf?la=en

O-MBA8L2
Exh 2

stationary sources to implement if they are above the one in a million threshold. The threshold of significant impact, thereby requiring implementation of all feasible on-site mitigation measures would be the 10 in a million excess cancer risk and a HI of 1.0.

The more stringent Option 3 involves application of a tiered CEQA threshold. New sources of TACs locating in impacted communities, as identified by the BAAQMD's Community Air Risk Evaluation (CARE) Program, would have to install TBACT and/or TBPs and would be subject to a significance threshold of 5 in one million (after consideration of TBACT and/or TBPs). New sources of TACs locating in a community other than an impacted community would be subject to a significance threshold of 10 in one million. Finally, Option 4 proposes a no net increase inhalation cancer risk. Option 4 does not define a "substantial change" because any increase would be considered significant. 33 [AQ-1c] cont.

The first two options suggest that projects with the potential to expose receptors to TACs greater than 10 in one million excess cancers, from any source, mobile or stationary, should be considered significant. The third option suggests a more stringent significance threshold of 5 in one million, and the fourth option suggests an even more stringent threshold, which deems any increase in TACs as significant. Regardless, all four options specify that emissions from both stationary and mobile sources be included when determining project significance. As a result, the maximum threshold that could reasonably apply to the Project's stationary and mobile source TAC emissions is the BAAQMD's individual project threshold of 10 in one million.

Failure to Use District's PM2.5 Cumulative Threshold

To evaluate the cumulative impacts of the Project, the DSEIR implements criteria used to define an Air Pollutant Exposure Zone (APEZ). The DSEIR states:

> "an APEZ [is] defined as an area in which modeled air pollution exceeds 'either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter (μg/m^3) (including ambient)'" (Volume 3, Appendix AQ, p. 9).

The cancer risk cumulative threshold of 100 in one million, used in the DSEIR, is consistent with the cumulative cancer risk threshold set forth by the BAAQMD, but not, as explained above, with the individual project cancer risk threshold. However, the PM2.5 threshold of 10 μg/m^3 is inconsistent with the BAAQMD's cumulative threshold, and represents a value that is far greater than the BAAQMD's recommended value. According to the BAAQMD's May 2011 CEQA Guidelines, "a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius (or beyond where appropriate) from the fence line of a source, or from the location of a receptor, plus the contribution from the project, exceeds the following: 34 [AQ-1c, AQ-1d]

- Non- compliance with a qualified Community Risk Reduction Plan;
- An excess cancer risk levels of more than 100 in one million or a chronic hazard index greater than 10 for TACs; or

O-MBA8L2
Exh 2

- 0.8 μg/m^3 annual average PM2.5."[20]

BAAQMD suggests that a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius would result in an annual average PM2.5 concentration greater than 0.8 μg/m^3. This threshold is much more stringent when compared to the 10 μg/m^3 threshold used in the DSEIR. As a result, the DSEIR should implement the recommended cumulative threshold set forth by BAAQMD, rather than the 10 μg/m^3 threshold.

Furthermore, the DSEIR uses BAAQMD thresholds to determine the significance of other air quality impacts, but then uses APEZ criteria to determine health risk significance, even though BAAQMD suggests significance thresholds for cumulative health risks. For example, the DSEIR uses BAAQMD's average daily emissions construction thresholds to determine significance of construction emissions on air quality (Volume 2, p. 5.4-25). As is apparent, there is a huge discrepancy between the 10 μg/m^3 threshold used in the DSEIR and the 0.8 μg/m^3 cumulative threshold recommended by BAAQMD. Using an alternative threshold, rather than the one set forth by BAAQMD, demonstrates that the Applicant is picking and choosing the thresholds that apply to the Project to determine significance.

34 [AQ-1c, AQ-1d] cont.

Sincerely,

Paul Rosenfeld

Re: **Noise Impacts** - Comments regarding on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter. 1 [GEN-5]

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 22, 2015, letter report authored by acoustical engineer Frank Hubach (attached as Exhibit 1).

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to Noise Impacts.

A fundamental defect in the DSEIR's analysis of noise impacts is its use of thresholds of significance that do not actually measure the impacts that matter. This is readily demonstrated by comparing the two impacts that relate to the consistency of the Project with governing noise standards or plans (i.e., Impacts NO-2 (construction) and NO-4 (operations)) with the two impacts that relate to how noise affects people (i.e., Impacts NO-1 (construction) and NO-5 (operations)). Even in its discussion of the impacts that affect people, the DSEIR uses thresholds of significance that conflate compliance with non-CEQA regulatory programs with less-than-significant impacts under CEQA. This is error. 2 [NOI-2a]

The DSEIR uses several general thresholds of significance for noise impacts:

- Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

(DSEIR, p. 5.3-16.)

2 [NOI-2a] cont.

Impact NO-1 is described as "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR 5.3-20.) For construction impacts, the DSEIR uses several more specific thresholds of significance, including:

- Non-impact equipment. The impact is considered less than significant as long as construction noise from non-impact equipment is less than 80dba at 100 feet from the noise generating equipment.[1]

- Impact equipment. The impact is considered less than significant as long as the 1-hour Leq is less than 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses,

[1] DSEIR, p. 5.3-16 - 5.3-17 ["Proposed construction activities would be required to comply with the San Francisco Noise Ordinance and the Mission Bay Good Neighbor Construction Noise Policy. The San Francisco Noise Ordinance prohibits construction activities between 8:00 p.m. and 7:00 a.m. and limits noise from any individual piece of construction equipment, except impact tools approved by the Department of Public Works, to 80 dBA at 100 feet. The Mission Bay Good Neighbor Construction Noise Policy limits pile driving or other extreme noise generating activity (80 dBA at a distance of 100 feet) to 8:00 a.m. to 5:00 p.m., Monday through Friday. As long as project construction activities comply with the noise ordinance, construction noise impacts from non-impact equipment would be considered less than significant. If construction activities using non-impact equipment would exceed these standards and the restrictions of the Mission Bay Good Neighbor Policy, then the noise effects would be potentially significant and mitigation measures would be required."]

and 100 dBA for commercial and industrial uses.[2]

The DSEIR then rigidly adheres to the regulatory scheme of the San Francisco Noise Ordinance in assessing the significance of noise from non-impact equipment, erroneously assuming the noise ordinance's regulatory scheme provides an appropriate threshold for determining whether impacts are significant under CEQA. Subdivision (d) of section 2909 of the San Francisco Noise Ordinance establishes thresholds for determining significance of noise impacts on nearby residents of 45 dBA nighttime/55 dBA daytime noise, stating:

> Fixed Residential Interior Noise Limits. In order to prevent sleep disturbance, protect public health and prevent the acoustical environment from progressive deterioration due to the increasing use and influence of mechanical equipment, no fixed noise source may cause the noise level measured inside any sleeping or living room in any dwelling unit located on residential property to exceed 45 dBA between the hours of 10:00 p.m. to 7:00 a.m. or 55 dBA between the hours of 7:00 a.m. to 10:00p.m. with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

2 [NOI-2a] cont.

These standards (i.e., 45 dBA nighttime/55 dBA daytime noise) are based on the actual health and welfare of people. But the DSEIR does not use them for construction noise or operational traffic or crowd noise because this provision of the City's noise ordinance only applies to fixed noise sources. The DSEIR thus conflates compliance with the noise ordinance for less-than-significant impacts under CEQA.

The EIR's assumption in this regard violates CEQA, because compliance with regulatory standards cannot be used as a substitute for a fact-based analysis of whether an impact is significant. While San Francisco is free to adopt a noise ordinance that exempts specific noise sources from its regulatory effect, it is not free, under CEQA, to fail to disclose the significance of noise that exceeds these interior noise limits.[3]

[2] DSEIR, p. 5.3-17 ["The San Francisco Noise Ordinance does not identify any quantitative noise limit standard for impact equipment. To assess the potential impacts related to rapid impact compaction, this analysis employs the general construction noise assessment methodology and criteria suggested by the Federal Transit Administration (FTA). This guidance identifies a 1-hour Leq of 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses. Commercial and industrial land use exposure to construction noise of 100 dBA is suggested as an assessment criterion."]

[3] *See*, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not

Because the DSEIR did not use the thresholds stated in section 2909(d), the noise impact assessment does not present relevant information that is necessary for determining whether the impact is significant. Instead, we have an impact assessment that is constrained by a series of arbitrary distinctions (i.e., the source fixed or not, the equipment impact or non-impact, the receptors are located in residences or hospitals) that have nothing to do with whether the affected community will suffer significant noise impacts.

The DSEIR refers to the World Health Organization (WHO) as "perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency all but eliminated its noise investigation and control program in the 1970s." (DSEIR, p. 5.3-4.) The DSEIR also cites WHO's Guidelines for Community Noise and its thresholds for adverse effects of noise on people. 2 [NOI-2a] cont.

> In contrast to many other environmental problems, noise pollution continues to grow and it is accompanied by an increasing number of complaints from people exposed to the noise. The growth in noise pollution is unsustainable because it involves direct, as well as cumulative, adverse health effects.

(WHO, Guidelines for Community Noise, p. vii.)

Specific effects to be considered when setting community noise guidelines include:

---

and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 ["the fact that a particular environmental effect meets a particular threshold cannot be used as an automatic determinant that the effect is or is not significant ... a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant"]; *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

> interference with communication; noise-induced hearing loss; sleep disturbance effects; cardiovascular and psycho-physiological effects; performance reduction effects; annoyance responses; and effects on social behaviour.

(WHO, Guidelines for Community Noise, p. v.)

> The scope of WHO's effort to derive guidelines for community noise is to consolidate actual scientific knowledge on the health impacts of community noise and to provide guidance to environmental health authorities and professionals trying to protect people from the harmful effects of noise in non-industrial environments.

(WHO, Guidelines for Community Noise, p. iii.)

As discussed by Mr. Hubach:

> WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA. 2 [NOI-2a] cont.

(Exhibit 1, p. 3.) Yet, despite citing the WHO Guidelines, the DSEIR fails to use these standards as its thresholds of significance, and finds that "ambient plus project" noise levels much higher than the WHO's standards for harmful noise are less than significant.

Another human health and welfare based standard is provided by the State of California:

> State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are collectively known as the California Noise Insulation Standards and are found in Title 24 of the California Code of Regulations.
>
> The State of California updated its Building Code requirements with respect to sound transmission, effective January 2014. Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) 13 rating of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. The previous code requirements (before 2014) set an interior performance standard of 45 dBA from exterior noise sources. This requirement will be re-instated in July of 2015.

(DSEIR, p. 5.3-10.) DSEIR does not tell us what buildings in area comply with this code. (See DSEIR § 5.3.3.4 [Sensitive Receptors], and Table 5.3-4.) However, as Mr. Hubach observes:

> Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq).

(Exhibit 1, p. 4.) Since the Project's noise, when added to background or ambient noise, exceeds the above health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code.

3 [NOI-4]

For operational traffic noise, the DSEIR states:

> Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA18 and the Federal Interagency Committee on Noise (FICON)19 that thresholds should be more stringent for environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase.

(DSEIR, p. 5.3-19.)

> Operational noise from non-transportation sources such as egress of patrons from events or sound amplification equipment in common areas are assessed based on noise increases of 8 dBA (for noise generated by commercial uses) over existing ambient (L90) levels and any applicable restrictions of the City's noise ordinance and Police Code. Although these operational noise increases would be of limited duration, they would be expected to occur throughout the life of the project and are therefore considered permanent changes in noise conditions.

(DSEIR, p. 5.3-19.)

As described by Mr. Hubach, for operational noise impacts (Impact NO-5), the DSEIR uses

4 [NOI-2b]

O-MBA9L3

a series of "ambient plus increment" thresholds. As discussed by Mr. Hubach, using "ambient plus increment" thresholds where existing noise levels are already high:

> disregards the fact the Project will make severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

(Exhibit 1, p. 5.)

By ignoring the severity of existing noise levels and only looking to the "de minimis" nature of the Project's incremental effect, the DSEIR's noise impact determinations violate CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"].)[4] *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

4 [NOI-2b] cont.

With respect to vibration impacts, as Mr. Hubach states:

> The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration.

5 [NOI-5]

---

[4] *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].)

O-MBA9L3

In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:

"As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA." (DSEIR, p. 5.3-25.)

The DSEIR cannot omit an analysis of potentially significant effects by the simple expedient of arbitrarily defining the receptors of such effects as non-sensitive.

5 [NOI-5] cont.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

Dear Mr. Lippe,

You requested that I review the analysis of this Project's noise impacts in the Draft Subsequent EIR dated 5 June 2015, Chapter 3.5. This letter report responds to your specific questions. My CV is attached.

1. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-1 and Impact NO-5.

Impact NO-1 is "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR, pp. 5.3-20 to 5.3-23.)

Impact NO-5 is "Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project vicinity. (Significant and Unavoidable with Mitigation)." (DSEIR, pp. 5.3-32 to 5.3-39.)

In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-1 or NO-5 is significant.

6 [NOI-3a]

The DSEIR omits important information about the environmental setting.

For example, to judge the noise impact on residents of the Hearst Tower, it is important to know whether these residents typically open their window to get fresh air or, conversely, whether the building is subject to any requirements to keep windows closed. This is because closed windows provide significant sound transmission loss.

It also important to know what kind of windows nearby buildings have, because standard windows provide much less sound transmission loss than acoustically-rated windows.

California State Building Code Section 1207 requires an interior performance standard of 45 dBA DNL. Given that windows in the Hearst Tower, and adjacent residences, are operable and ostensibly used for ventilation, achieving 45 dBA interior may be in jeopardy. It is unknown if the Hearst Tower has mechanical ventilation to allow the windows to be closed for noise control. Even if they do already have mechanical ventilation, their windows may not have sufficient sound transmission loss for the predicted increased noise levels.

The Title 24 compliance for Hearst Towers may have permitted windows to be open and not have required mechanical ventilation systems. If that is the case, they would need to keep windows open for fresh air and then suffer the increased noise.

I tried to find out if there is a ventilation system mandated by code for Hearst Tower. This is Section 1207.11 of the California State Building Code, which says in noisy settings, windows must be closed to achieve the state's 45 dB interior standard, in which case a mechanical ventilation system must be installed. I searched for an acoustical report typically filed with Planning and/or Department of Building Inspection (DBI) to see what original design requirement were in place. I visited DBI and spoke with Dwayne Farrell who said they had no record of Hearst Tower at 1560 3rd St, and only a crane permit for the parking garage on the opposite corner. He suggested I visit the inspectors and planners in the building to see if they could find a permit number or block and lot information. I did, to no avail. However, it was suggested that perhaps since it is a State building, the State Architect might have all records. So I contacted Luke Molinar, DSA, who did a records search but came up empty on this topic (See Attachment 1 [email exchange with Luke Molinar].) 7 [NOI-2a] cont.

Nevertheless, I visited the Project site on 8 July 2015, to make visual and aural observations. I walked along 3rd St from South St to 16th St, and South St to Terry Francois Blvd. The predominant noise is due to traffic – largely Muni, trucks and the occasional motorcycle. It was noticeably quieter away from 3rd St approaching the waterfront to the east. I spent some time in the pedestrian mall along Gene Friend Way.

I observed many of the windows in Hearst Tower and adjacent Mission Bay Housing were open. (See Attachment 2 [a photograph I took on 8 July 2015, showing part of the Mission Bay Housing building on the left and part of the Hearst Tower on the right], and Attachment 3 [a photograph I took on 8 July 2015, showing part of the Hearst Tower on the right].)

Therefore, regardless of whether the buildings are required to keep windows closed. The residents are opening them, presumably for fresh air.

For Impact NO-1 and Impact NO-5, the DSEIR uses a threshold of significance of the "ambient plus increment" type. For Impact No-1, the "ambient plus increment" threshold of significance is whether the "the increase in noise levels over existing conditions would be less than 10 dBA." (DSEIR, p. 5.3-23.)

This type of threshold discounts the significance or severity of pre-existing noise levels and treats them as if they are irrelevant to whether the incremental change caused by the Project is "significant." The DSEIR finds that "Peak cumulative construction activities would occur during a 3-month period in 2015–2016 and during this time, the increase in noise levels over existing conditions would be less than 10 dBA (without mitigation). All other periods of construction would similarly be under 10 dBA. Therefore, this impact would be less than significant." (DSEIR, p. 5.3-23.)

This conclusion is based on Table 5.3-8, which shows that all three receptors chosen for analysis have pre-existing ambient noise levels that are very loud already (i.e., Madrone Residential Tower is at 70.1 dBA (hourly Leq), Hearst Residential Tower is at 71.2 dBA (hourly Leq), and UCSF Hospital is at 67 dBA (hourly Leq). 8 [NOI-2b]

As a point of reference for these noise levels, the World Health Organization's (WHO) standards for harmful noise are much lower than these pre-existing noise levels. WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA.

Another point of reference for the pre-exiting noise levels a the three "sensitive receptor locations" selected by the DSEIR is the San Francisco Noise Ordinance. As the DSEIR describes it, section 2909(d) provides "maximum noise levels at any sleeping or living room in any dwelling unit located on residential property must not exceed 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m" where source of the noise is "fixed sources of noise, such as building mechanical equipment and industrial or commercial processing
machinery." (DSEIR, pp. 5.3-13, 14.)

The DSEIR does not use the WHO standards at all. With respect to the San Francisco Noise Ordinance, the DSEIR does not use the 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m standard for any aspect of the Project's noise except the fixed machinery (e.g. generators) because the noise ordinance does not use this standard to regulate the Project's noise from construction equipment or operational noise from increased traffic, crowds, concerts, etc.[1]

This approach may be useful to the City for Impacts NO-2 and NO-4, which assess the Project's consistency with other applicable plans and laws, but it does not makes sense for assessing the construction or operational impacts of the Project on actual people.

8 [NOI-2b] cont.

Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq). Since the Project's

The DSEIR's use of compliance with the San Francisco Noise Ordinance as a threshold for judging the significance of the Project's construction noise impacts (see DSEIR p. 5.3-17) appears to reflect a policy decision, because it is not based on science.

[1]The DSEIR states that: "The HUD regulations also include a goal (not a standard) that interior noise levels not exceed 45 dB DNL" (DSEIR, p. 5.3-9.) But HUD's goal of 45 DNL interior, is 10 dB greater than the 35 dB Leq level the DSEIR cites as a threshold for sleep disturbance (see DSEIR, 5.3-2), and 15 dB greater than the 30 dB Leq guideline given by WHO.
noise, when added to background or ambient noise, exceeds these health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code standard.

The same is true of the DSEIR's use, for operational noise impacts, of a threshold of 8 dBA or 8 dBC above ambient noise, based on the San Francisco Noise Ordinance. (DSEIR, p. 5.3-13). The same is true of the DSEIR's use, for mobile sources of operational noise impacts, of "ambient plus increment" thresholds of significance:

> "Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA18 and the Federal Interagency Committee on Noise (FICON)19 that thresholds should be more stringent for environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase."

(DSEIR, p. 5.3-17).

8 [NOI-2b] cont.

> "Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase."

(DSEIR, p 5.3-19)

Using these "ambient plus increment" thresholds where existing noise levels are already too high, as shown in Tables 5.3-9 and 5.3-10 (DSEIR, pp. 5.3-34, 36), disregards the fact that the Project will make already severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

Therefore, the operational impact assessment needs to be redone using valid, science-based thresholds that relate to actual human health and welfare effects of noise.

In my opinion, is the Project will cause a significant increase in Impact NO-1 and Impact NO-5 above levels existing without the project. 8 [NOI-2b] cont.

2. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-3?

Impact NO-3 is "Construction of the proposed project would not expose people and structures to or generate excessive groundborne vibration levels. (Less than Significant)." (DSEIR, pp. 5.3-24 to 5.3-26.)

In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-3 is significant.

The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration. 9 [NOI-3b, NOI-5]

In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:

> "As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA."

(DSEIR, p. 5.3-25.)

Since UCSF is a "research hospital" is it safe to assume that scanning electron-beam microscopes are used by researchers and pathologists. These devices are extremely sensitive to low level vibration. It is common for them to have environmental criteria specifically for vibration. If the specified vibration levels are exceeded the image will blur rendering the instrument useless. Therefore, in my opinion, the DSEIR should include users of vibration-sensitive equipment in the category of sensitive receptors, and then assess the Project's impact on the users.

Warriors Event Center in Mission Bay
Noise Impact
22 July 2015

For "Human annoyance" from groundborne vibration, the DSEIR uses a threshold of significance of : "For adverse human reaction, this analysis applies the "strongly perceptible" threshold of 0.1 inches per second PPV." (DSEIR, p. 5.3-25.) In my opinion, this threshold should be "perceptible, not "strongly perceptible."

In applying its "strongly perceptible" threshold, the DSEIR says:

> "The closest residence would be the UCSF Mission Bay Housing (Hearst Tower), approximately 200 feet from the project site while the nearest hospital would be approximately 560 feet away. A recent study of vibration induced by rapid impact compaction indicated that at a distance of 30 meters (100 feet), cumulative vibration energy results in maximum vibration level of 2.3 millimeters per second (0.09 inches per second). Because sensitive land uses would be more than 100 feet away, worst-case cumulative vibration levels generated by rapid impact compaction would be below the strongly perceptible threshold."

(DSEIR, p. 5.3- 25.) 9 [NOI-3b, NOI-5] cont

In my opinion, this conclusion is incorrect because the DSEIR's calculation of vibration does take into account the increased vibration on upper floors of this building. Soil attenuation varies with the type of soil and moisture content, and distance attenuation from 100 to 200 feet may only be a factor of 0.5, or less. Accordingly, actual PPV at the Hearst Tower is likely to be 0.045 ips, or considerably greater depending on site-specific parameters. In addition, the DSEIR's calculation does not take into account building resonance effects for above-grade floors which amplify vibration at certain frequencies. Recalculating to take this factor into account indicates vibration on upper floors would certainly be "perceptible" and likely "strongly perceptible."

Alternate Calculation:

rapid impact compaction - 0.09 ips PPV @100 feet
distance attenuation factor - x 0.5 from 100 to 200 feet
rapid impact compaction - 0.045 ips PPV @200 feet
soil attenuation variation - x 2 (6 dB) ground floor
result at Hearst Tower - 0.09 ips PPV @100 feet
resonant amplification - x 3 (10 dB)
result at Hearst Tower - 0.27 ips PPV upper floors
criterion for humans - 0.1 ips PPV "strongly perceptible"

Re: **Transportation Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter. 1 [GEN-5]

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 23, 2015, letter report authored by traffic engineer Dan Smith (attached as Exhibit 1), and the July 21, 2015, letter report authored by traffic engineer Larry Wymer (attached as Exhibit 2).

I. THE DSEIR IS NOT SUFFICIENT AS AN INFORMATIONAL DOCUMENT WITH RESPECT TO TRANSPORTATION IMPACTS.

A. The DSEIR Fails to Assess the Project Traffic Impacts on the Entire Affected Environment.

2 [TR-2b]

The DSEIR studies Project-induced increases in congestion and delay, for both incremental and cumulative impacts, at twenty-two (22) intersections and six (6) freeway ramps, as shown in Table 1.

Table 1

Incremental Impact Assessment (With Implementation of the Special Events Transit Service Plan)	Incremental Impact Assessment (Without Implementation of the Special Events Transit Service Plan)	Cumulative Impact Assessment
Intersections at DSEIR, p. 5.2-18, Table 5.2-34 p. 5.2-121, Table 5.2-35 p. 5.2-123, Table 5.2-36 p. 5.2-172, Table 5.2-47 p. 5.2-174, Table 5.2-48	Intersections at DSEIR, p. 5.2-192, Table 5.2-53 p. 5.2-193, Table 5.2-54	Intersections at DSEIR, p. 5.2-214, Table 5.2-59 p. 5.2-217, Table 5.2-60.
Freeway ramps at DSEIR, p. 5.2-133, Table 5.2-37 p. 5.2-133, Table 5.2-38 p. 5.2-134, Table 5.2-39 p. 5.2-181, Table 5.2-49 p. 5.2-181, Table 5.2-50	Freeway ramps at DSEIR, p. 5.2-198, Table 5.2-55 p. 5.2-198, Table 5.2-66	Freeway ramps at DSEIR, p. 5.2-221, Table 5.2-61 p. 5.2-221, Table 5.2-62

2 [TR-2b] cont.

Remarkably, the DSEIR fails to disclose the criteria the City used to select these intersections and freeway ramps. More importantly, the DSEIR fails to disclose the criteria the City used to *exclude* other intersections and freeway ramps. The omission of this fundamentally important information renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

Also, as shown in the attached report from traffic engineers Larry Wymer and Dan Smith, the DSEIR omitted from its area of study numerous intersections and freeway ramps that will also suffer potentially substantial increases in traffic congestion and delay. The omission of these intersections and freeway ramps from the DSEIR's analysis of the Project's effect on traffic also renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

How did this happen? The DSEIR simply states: "The traffic impact assessment for the proposed project was conducted for 23 study intersections and six freeway ramp locations in the vicinity of the project site" (DSEIR, p. 5.2-72),[1] with no further explanation. The same is true for

[1]The DSEIR actually studies 22 intersections, not 23, in the tables listed in footnote 1.

the six freeway ramps. (DSEIR, p. 5.2-74.)

The DSEIR does inform the reader that:

> The impacts of the proposed project on the surrounding transportation network were analyzed using the Transportation Impact Analysis Guidelines issued by the Planning Department in 2002 (SF Guidelines 2002), which provides direction for analyzing transportation conditions and in identifying the transportation impacts of a proposed project.

(DSEIR, p. 5.2-69.) These Guidelines provide:

> 2. Project Setting
> The setting information shall be presented immediately following the Project Description as a discrete chapter or report section. The goal is to provide a brief but complete description of existing transportation infrastructure and conditions in the vicinity of the project. Normally, the described vicinity is a radius between two blocks and 0.25 mile, however, a larger area may be determined in the scoping process. *The specific perimeters of the study area, for both setting and project impact analysis, are to be confirmed as part of the approval for the scope of work.*

2 [TR-2b] cont.

(Transportation Impact Analysis Guidelines (October 2002), pp.6-7 (italics added).) Based on this text, the reader would expect to find the criteria and rationale for delimiting "the specific perimeters of the study area" in the Scope of Work which the City approved pursuant to these Guidelines as a prerequisite to preparation of the DSEIR. Unfortunately, this expectation is disappointed, because the City-approved Scope of Work is also silent on the topic. (DSEIR, Appendix TR, pp. TR-8 to TR 14.)

Consequently, the City must revise the DSEIR to include an analysis of the Project's congestion and delay impacts on the excluded intersections and freeway ramps and then recirculate the Revised DSEIR for at least 45 days for public review and comment.

B. The DSEIR Fails to Disclose the Severity of the Project's Impacts on Intersections and Freeway Ramps which the Project Will Cause to Deteriorate to Level of Service (LOS) F.

3 [TR-2f]

As explained by Dan Smith in his attached report, the DSEIR fails to disclose the severity of the Project's congestion and delay impacts on intersections and freeway ramps which the Project will cause to deteriorate to Level of Service (LOS) F.

The DSEIR discloses the Project will cause significant congestion and delay impacts at numerous intersections and freeway ramps in the "study area," where Project-induced increases in congestion and delay will cause deterioration in Level of Service (LOS) to LOS E or F. (See intersections and freeway ramps listed in footnote 1.) For the intersections and freeway ramps in the "study area" where Project-induced increases in congestion and delay will cause deterioration to LOS E, the DSEIR provides a measurement of the degree of severity of the significant impact (i.e., average delay for intersections or average density for freeway ramps).

However, for the intersections and freeway ramps in the study area where Project-induced increases in congestion and delay will cause deterioration to LOS F, the DSEIR fails to provide a full measurement of the degree of severity of the significant impact. Instead, for intersections pushed to LOS F, instead of presenting a measure of average delay, the DSEIR provides a "greater than" measurement of "80 seconds per vehicle." (See 5.2-74 and Tables cited above.) For freeway ramps pushed to LOS F, instead of providing the average density, the DSEIR provides no measurement of "existing plus project" density. Instead, the severity of the Project's impacts at intersections and freeway ramps pushed to LOS F has no upper limit, and remains undisclosed, other than to note that "demand exceeds capacity." (See 5.2-75, Table 5.2-19 and Tables cited above.) 3 [TR-2f] cont.

Thus, the DSEIR fails to comply with CEQA because, beyond making the binary determination that the Project's impacts on these intersections and freeway ramps are significant, the DSEIR fails to disclose the severity of these significant impacts. (See *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].) Consequently, the City must revise the DSEIR to include this missing information, then recirculate the Revised DSEIR for at least 45 days for public review and comment.

C. The DSEIR Fails to Identify the Significance and Severity of the Project's Impacts on Intersections Where the Project Will Use Parking Control Officers.

In its impact assessment tables for "Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday PM and Saturday Evening Peak Hour" (DSEIR, p. 5.2-172, Table 5.2-47) and "Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday Evening and Late Evening Peak Hour" p. 5.2-174, Table 5.2-48), the DSEIR measures the significance of impacts by the use of Level of Service (LOS) and delay measurements. 4 [TR-2f]

But for two intersections, King and Third streets, and King and Fourth streets, the DSEIR provides no LOS or delay measurements, and therefore, no information on whether the Project's congestion and delay impacts on these intersections are significant, and if so, the severity of these significant impacts.

O-MBA10L4

Instead, the DSEIR indicates that the Project calls for posting Parking Control Officers (PCOs) at these intersections at the times indicated. But the adoption of a mitigation measure cannot substitute for disclosing whether the Project's impacts on these intersections are significant or their severity.[2] 4 [TR-2f] cont.

D. The DSEIR's Analysis of the Project's Construction-Related Traffic Congestion and Delay Impacts Is Legally Flawed.

The DSEIR's analysis of the Project's construction related traffic congestion and delay impacts is legally flawed because it is based on invalid criteria, it fails to lawfully assess the Project's cumulative construction period impacts, and it improperly defers the development of mitigation measures to reduce the Project's construction-related traffic impacts to less than significant.

The DSEIR states "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR, p. 5.2-46.) This statement is placed in the section describing the DSEIR's thresholds of significance. Therefore, it appears this conclusion reflects a policy decision rather than a fact-based assessment. 5 [TR-10]

In the impacts analysis section, the DSEIR states: "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR p 5.2-111). Elsewhere the DSEIR quantifies the construction period's "temporary and limited duration" as 26 months. (DSEIR, p. 5.2-112.) However, the notion that the DSEIR can determine the Project's construction related traffic impacts to be "less than significant" based primarily on their temporary duration is legally and logically flawed because from a cumulative standpoint, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco.

Indeed, the DSEIR's discussion of the Project's cumulative construction period impacts recognizes there are numerous other construction projects planned in Mission Bay and that the construction related traffic impacts of these projects will combine with this Project's construction related impacts. (DSEIR, p. 5.2-210 (Impact C-TR-1.) 6 [TR-10]

However, the DSEIR's discussion of the Project's cumulative construction period impacts

---

[2]CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56' *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123*; Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

is flawed because it is constrained by several artificial limits.

First, as discussed in section I.A above, the impact assessment is limited to impacts and intersections and freeway ramps within the artificially restricted geographic "study area."

Second, the impact assessment considers only construction projects within the Mission Bay neighborhood without regard to whether other "past, present, or reasonably foreseeable future projects" may be "closely related" because their impacts may combine with the Project's impacts.

Third, the DSEIR's analysis of cumulative traffic impacts for *construction* of the project only references a handful of foreseeable projects located very close to the Project, and the DSEIR's discussion of these projects is solely in terms of whether their construction periods overlap with construction of this Project, as if the operational impacts of other "past, present, and reasonably foreseeable future projects" are not "closely related." (See DSEIR, p. 5.2-10 and 11.)[3] This is incorrect because "closely related" simply means the other projects' impacts may combine with the Project's impacts.

6 [TR_10] cont.

Table 3 in the attached report by Larry Wymer shows that it is possible to include a broader range of projects - across both time and area - in the assessment of the Project's cumulative construction period traffic impacts, and that when this is done, there are many Projects that will be under construction or operational in the period before, during, and after construction of the Project whose effects will combine with those of the Warriors Arena construction. Therefore, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco and the DSEIR errs by basing its determination of significance on the "limited duration" of the construction period. (DSEIR, p. 5.2-212.)

The second basis for the DSEIR's less-than-significant determination is the DSEIR's statement that "construction activities would be ... required to be conducted in accordance with City

[3]These projects are:
- 1.13 million gsf of UCSF LRDP projects under construction at the Mission Bay Campus, including, the UCSF East Campus project on Blocks 33/34,
- Construction of Bayfront Park,
- realignment of Terry A. Francois Boulevard,
- construction of a neighborhood park on the north side of Mariposa Street east of Owens Street,
- the Exchange project on Mission Bay Block 40,
- the Family House project on Mission Bay Block 7 East,
- the Residential and Hotel project on Mission Bay Block 1,
- the 360 Berry Street project on Mission Bay Block N4/P3, and
- Caltrain's Peninsula Corridor Electrification Project.

requirements." (DSEIR, p. 5.2-212.) This vague assurance is meaningless because the DSEIR does not specify what these " City requirements" are, does not specify a performance standard that these City requirements would either impose or achieve, and presents no evidence that these unspecified "City requirements" are likely to avoid significant cumulative construction related traffic effects. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*CBE*); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

The third and final basis for the DSEIR's less-than-significant determination is "Improvement Measure I-TR-1: Construction Management Plan and Public Updates." The DSEIR suggests this Plan would help avoid significant cumulative construction related traffic effects. (DSEIR, p. 5.2-212.) But it is improper for the DSEIR to rely on Improvement Measure I-TR-1 to help reduce impacts to less than significant because it is not identified as a mitigation measure necessary to substantially reduce significant Project impacts; therefore, it is not enforceable. (CEQA Guideline 15126.4(a)(4).)

6 [TR-10] cont.

Finally, the DSEIR fails to quantify the Projects' construction period impacts, presumably based on its qualitative conclusion that unspecified "City requirements" and "Improvement Measure I-TR-1" will avoid significant impacts. This puts the cart before the horse.[4]

E. The DSEIR's Analysis of the Project's Operational Traffic and Transit Congestion and Delay Impacts Is Legally Flawed.

1. The DSEIR understates traffic and transit volumes in the PM peak period of 4:00 to 6:00 PM by using "time of arrival" at the Arena as a proxy measurement for "time of travel."

In modeling traffic and transit impacts, the DSEIR assumes only 5% of basketball game attendees will be traveling in the "study area" in the PM peak period of 4:00 to 6:00 p.m. Table 5.2-21 states that 5% of arrivals are expected before 6:00 p.m. for 7:30 p.m. weekday basketball games; another 11% will arrive between 6:00 and 6:30 p.m. (DSEIR, p. 5.2-83.) This data is based on turnstile counts of people entering the arena.

7 [TR-2d]

As explained by Dan Smith in his attached report, this proxy measurement does not provide reliable data as to when game or event attendees are actually traveling through affected intersections or freeway ramps or using affected transit routes:

> These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented

[4]See footnote 2 above.

> in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands. Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually traveling on the transportation system instead of the time they enter the event venue.

(Exhibit 1, p. 3.)

In his analysis, Mr. Smith found:

> it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

(Exhibit 1, p. 3.)

Even just applying common sense to the DSEIR's data indicates that many or most of the 11% that the DSEIR says arrive at the turnstile between 6:00 and 6:30 p.m. would be traveling to the event in the PM peak period of 4:00 to 6:00 pm. This minimal adjustment alone changes the assumption on which the modeling is based from 5% to 16% traveling in the "study area" in the PM peak period of 4:00 to 6:00 pm. As shown by Mr. Smith, this minimal adjustment more than doubles the Project's contribution of traffic to affected intersections, and would change the DSEIR's determination from less-than-significant to significant at some intersections. (Exhibit 1, p. 4.)

This issue was flagged in public scoping comments on the DSEIR. (DSEIR, p. 2-15.) Yet, somehow, the DSEIR did not adjust its reliance on turnstile data to develop a reliable metric to use instead. Instead, the DSEIR offers a series of weak or irrelevant rationales for its methodology, including:

> because basketball games typically start at 7:30 p.m. a higher percentage of inbound event attendees would travel to the event center during the 6:00 to 8:00 p.m. period than during the 4:00 to 6:00 p.m. commute peak period.

(DSEIR p. 5.2-71); and

7
[TR-2d]
cont.

O-MBA10L4

> the SF Guidelines do not include travel demand characteristics for the specialized uses (e.g., sports events, conventions, and other events) that would take place at the proposed event center. Similarly, standard trip generation resources, such as the Institute of Transportation Engineer's Trip Generation Manual, do not include sufficiently detailed trip generation data for such specialized uses. Therefore, the travel demand for the event center component of the proposed project was based on the estimated attendance, as well as information on current travel characteristics of Golden State Warriors basketball attendees at the Oracle arena in Oakland.

(DSEIR, p. 5.2-81); and

> The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR.

(DSEIR, p. 5.2-82.)[5]

7
[TR-2d]
cont.

---

[5] In the "Travel Demand Methodology and Results" section of Chapter 5.2, the DSEIR states:

> The Basketball Game scenario reflects the travel demand of the office, retail and restaurant uses, plus an evening basketball game. The transportation impact analysis of the Basketball Game scenario was conducted for four analysis hours (weekday p.m., weekday evening, weekday late evening, and Saturday evening), for conditions without and with an overlapping SF Giants evening game at AT&T Park.
>
> Table 5.2-21 presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR. Based on this information, it was assumed that approximately 5 percent of arrivals to a basketball game would occur during the p.m. peak hour (5:00 to 6:00 p.m.), and up to 66 percent of arrivals would occur during the evening peak hour (7:00 to 8:00 p.m.). Similarly, up to 70 percent of the departures would occur during the late evening peak hour (9:00 to 10:00 p.m.).

A discussion and summary of the data from other venues than Oracle is provided in DSEIR, Appendix TR, at pp. TR-21 to TR-25 and TR-37 [Appendix A, p. A-9]. The table at page TR-37 provides time of arrival data from, in addition to Oracle, six purportedly "comparable" venues, namely: Icon Venue Group, Houston, Phoenix, Sacramento, Brooklyn (2013-2014), and Brooklyn (2014-2015). An interesting fact about this table is that the data for 4:00 to 6:00 p.m. arrivals at four of these six venues (i.e., Icon Venue Group, Houston, Phoenix, Sacramento) is "included in" the data for later time periods. So, in fact, the only purportedly comparable venue for which the DSEIR presents supporting data is Brooklyn (2013-2014 and 2014-2015). The venue with the largest proportion of arrivals in the 4:00 to 6:00 p.m. period is Brooklyn (2014-2015), with 4.1%.

In short, the City and the Warriors failed to develop reliable accurate, reliable data on the key variable in the entire transportation analysis, i.e., the number of people traveling to events in the peak PM time period when traffic and transit crowding are at their worst. A lead agency "must use its best efforts to find out and disclose all that it reasonably can." (CEQA Guideline, § 15144.) 7 [TR-2d] cont.

The above quoted rationales do not excuse this failure. The scoping comments flagging this issue were submitted to the City between November 19, 2014, and December 19, 2014, during the middle of the basketball season. (DSEIR, p. 2-8 and 2-9, 2-15.) The Warriors played fifty-seven (57) games between December 19, 2014, through the close of the regular season on April 15, 2015.[6] There are thirty (30) teams in the NBA.[7] That means there were approximately eight-hundred and fifty five (i.e., 15 x 57 = 855) regular season games played in the 2014-2015 regular season after December 19, 2014. In the playoffs following the regular season, sixteen teams played a total of seventy-nine games after April 15, 2015.[8]

Therefore, both the Warriors and the City had ample opportunity to conduct market research by interviews and exit polling of a sample of the hundreds of thousands of fans attending these games to discover how far in advance of arriving at the turnstile they traveled through the traffic and transit impacted area surrounding the venue. The City's and Warriors' decision to pass up this opportunity after being informed of the issue does not satisfy their duty to use best efforts to find out

---

> Event staff for basketball games would be expected to arrive between 4:30 and 5:00 p.m. and would be on post prior to the gate opening time; event staff would leave between 11:00 and 11:30 p.m.

(DSEIR, p. 5.2-82.)

[6] http://www.nba.com/warriors/schedule,

[7] http://www.nba.com/teams/?ls=iref:nba:gnav

[8] http://www.nba.com/playoffs/

and disclose all they reasonably can.

Indeed, the City was fully aware of the need to gather information more relevant to fans "time of travel" than turnstile counts and made some efforts to do so. But it failed to disclose that there are alternative metrics for "time of travel" or the results of its efforts in this regard. For example, an email exchange dated January 12, 2015, between the City's EIR consultant (ESA) and City Planning officials includes data on arrivals before 6:00 p.m. at the Arco Arena parking lot for a 7:00 p.m. Sacramento Kings game and arrivals before 6:00 p.m. in buildings for other NBA venues. Thus, the City was aware of other measurements (e.g., parking lot entry rather than turnstile counts) that could more accurately predict peak PM period travel to games. 7 [TR-2d] cont.

Also, the arrival numbers cited in this email exchange show 14% arriving at the Arco Arena parking lot before 6 p.m. for one 7 p.m. game and 9% arriving before 6 p.m. in buildings for other NBA venues. These numbers indicate the DSEIR's assumption that 5% of fans will be traveling through the study area before 6 p.m. for 7:30 p.m. games is vastly understated. Yet the DSEIR fails to reference these numbers.

The DSEIR must be revised to provide accurate peak period traffic data and analysis

2. The DSEIR's Analysis of the Project's Cumulative Impacts Does Not Comply With CEQA.

a. The 5% threshold of significance for impacts at intersections and freeway ramps operating at LOS E or F violates CEQA.

For intersections operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F" (DSEIR, p. 5.2-73-74.) For freeway ramps operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes on the ramp." (DSEIR, p. 5.2-74.)[9] 8 [TR-2i]

No rationale for the 5% threshold is provided. Indeed, blind reliance on this number ignores the law governing the assessment of cumulative impacts, which requires a fact based assessment that takes into account the severity of preexisting impacts. A one-size-fits-all "ratio" violates CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*Communities*"); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d

---

[9] "The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project's contribution to the worsening of the average delay per vehicle." (DSEIR, p. 5.2-45.)

692, 720-21 (*Kings County*). *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm, and that focusing on the magnitude (i.e., "ratio") of the Project's incremental contribution to severe preexisting harm is inconsistent with the definition of cumulative impacts under CEQA.[10] 8 [TR-2i] cont.

b. The year 2040 baseline for assessing the significance of the Project's cumulative impacts violates CEQA.

The DSEIR assesses the Project's incremental traffic and transit impacts and its cumulative traffic and transit impacts pegged to the year 2040, which is 25 years in the future.[11] While the Alliance supports such long range forecasting in general, as used in this DSEIR the year 2040 baseline for assessing the significance of the Project's cumulative impacts is misleading, for two reasons. 9 [TR-2h]

First, this approach overlooks the Project's cumulative traffic and transit impacts pegged to its first 1 to 10 years of operations. This time period is of immediate interest to the citizens of San Francisco because the traffic mess predicted by the DSEIR will be upon them then. And who among them know whether they will even be in the City by the year 2040. Thus, while including a year 2040 baseline is not in itself objectionable, the omission of a baseline 5 to 10 years in the future

[10](*Communities,* 103 Cal.App.4th at p. 120 ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"]; *Kings County,* 221 Cal.App.3d at pp. 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].)

[11]"Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions." (DSEIR, p. 5.2-110.)

renders the DSEIR informationally defective. 9 [TR-2h] cont.

Second, by using a baseline projected to the year 2040, the DSEIR inflates the denominator in the 5% "ratio" it uses to determine the significance of Project cumulative impacts at LOS E and F intersections, thereby masking actual significant effects. (See Exhibit 2 (D. Smith), p. 25.) 10 [TR-2h]

c. The DSEIR's use of a "projection" based approach to the Project's cumulative impacts is misleading.

The DSEIR states that: 11 [TR-2h]

> Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. .... The 2040 cumulative traffic volumes take into account cumulative development projects in the project vicinity, such as the build-out of the Mission Bay Area, completion of the UCSF Research Campus and the UCSF Medical Center, the Mission Rock Project at Seawall Lot 337, Pier 70, etc., as well as the additional vehicle trips generated by the proposed project.

(DSEIR, p. 5.2-110.)[12]

The DSEIR presents no evidence supporting the DSEIR's assumption that the year 2040 projection is reliable for predicting future traffic and transit demand, other than the vague assertion that the "SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions ... has been validated to represent future 12 [TR-2h]

[12]In the section titled "Approach to Cumulative Impact Analysis" (DSEIR 5.1-6, § 5.1.5), the DSEIR asserts that the CEQA Guidelines provide "two approaches to a cumulative impact analysis ... (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area." (DSEIR, p. 5.1-7.) The DSEIR asserts that "The analyses in this SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed ... the Transportation and Circulation analysis relies on a citywide growth projection model that also encompasses many individual projects anticipated in and surrounding the project site vicinity, which is the typical methodology the San Francisco Planning Department applies to analysis of transportation impacts." (DSEIR, p. 5.1-7.)

transportation conditions in San Francisco." (DSEIR, p. 5.2-110.) But, as explained by Mr Smith, the SF-CHAMP model's margin of error is greater than the 5% threshold used to determine the significance of Project cumulative impacts at LOS E and F intersections. (See Exhibit 2 (D. Smith), p. 25.) Therefore, SF-CHAMP is the wrong tool for the task.

12 [TR-2h] cont.

Further, given the sheer number of developments in this area of the City (see table 3 of Mr. Wymer's report) and the breakneck pace of their approval and implementation, the projection approach is misleading, not informative. Therefore, the DSEIR's cumulative impact assessment must use a list based approach to forecast reasonably foreseeable travel demand, and do so in a meaningful time frame.

F. The DSEIR's Methodology for Analyzing Project Impacts on the Transit System Is Legally Flawed.

The DSEIR summarizes its methodology for analyzing Project Impacts on the transit system, as follows:

> The impact of additional transit ridership generated by the proposed project on local and regional transit providers was assessed by comparing the projected ridership to the available transit capacity at the maximum load point. Transit "capacity utilization" refers to transit riders as a percentage of the capacity of the transit line, or group of lines combined and analyzed as screenlines across which transit lines travel. The transit analyses were conducted for the peak direction of travel for each of the analysis time periods.

13a [TR-2g]

(DSEIR, p. 5.2-75.)

This methodology contains two flaws. First, it suffers from the same unwarranted and unsupported assumptions about basketball fans' time of travel to the arena for games described above. Second, the DSEIR's use of transit screenline and route capacities is also misleading and unsupported.

1. The DSEIR's use of transit screenline and route capacities is misleading and unsupported.

For its Project specific (or incremental) transit impact analysis, the DSEIR uses the following thresholds of significance:

> The proposed project was determined to have a significant transit impact if project-generated transit trips would cause downtown or regional screenlines, and, where applicable, directly affected routes, operating at less than its capacity

> utilization standard under existing conditions, to operate at more than capacity utilization standard. For Muni, the capacity utilization standard is 85 percent for conditions without an event at the project site, and 100 percent for conditions with an event at the project site. For regional operators, the capacity utilization standard is 100 percent for conditions without and with an event at the project site.

(DSEIR, p. 5.2-76, 77.)

For its cumulative transit impact analysis, the DSEIR uses the following thresholds of significance:

> Under 2040 cumulative conditions, the proposed project was determined to have a significant cumulative impact if its implementation would cause the capacity utilization at the Muni and regional screenlines and/or corridors within the screenlines to exceed the capacity utilization standard noted above for conditions without and with an event at the project site, or if its implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route). In addition, if it was determined that the proposed project would have a significant project-specific transit impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

13a [TR-2g] cont.

(DSEIR, p. 5.2-76, 77.)

For both Project specific (incremental) and cumulative impacts, the DSEIR uses "capacity utilization standards" as baselines against which to measure the Project's impacts. Capacity utilization standards are specific percentages of the theoretical maximum capacity of a transit screenline or transit line.

For Project specific (or incremental) thresholds of significance for Muni, the DSEIR uses two different capacity utilization standards against which to measure the Project's impacts. For conditions without an event at the Project site, the capacity utilization standard is 85 percent of maximum theoretical capacity of the transit screenline or line. For conditions with an event at the Project site, the capacity utilization standard is 100 percent of maximum theoretical capacity.

If the question to be answered by the transit impact analysis is whether the Project will inflict significant suffering on people riding Muni, why does the DSEIR use two different baselines for its impact assessment. If exceeding 85% inflicts suffering without an event, then exceeding 85% will inflict suffering with an event.

The DSEIR does not examine this use of inconsistent baselines. However, the June 21, 2013, Planning Department Memorandum "Transit Data for Transportation Impact Studies" (at Appendix-TR, p. TR-624) states:

> The SFMTA Board has adopted an "85 percent" capacity utilization standard for transit vehicle loads. In other words, transit lines should operate at or below 85 percent capacity utilization. The SFMTA Board has determined that this threshold more accurately reflects actual operations and the likelihood of "pass-ups" (i.e., vehicles not stopping to pick up more passengers). The Planning Department, in preparing and reviewing transportation impact studies, has similarly utilized the 85 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to the SFMTA lines.

13a [TR-2g] cont.

(DSEIR, Appendix-TR, p. TR-624.) Thus, the 85 percent capacity utilization threshold apparently has nothing to do with the suffering of Muni's passengers; it simply reflects the reality of Muni's operations. And even if 85% of capacity is the break point at which Muni drivers tend to refuse to pick up more passengers due to overcrowding, then using 100% of capacity as a threshold of significance is entirely unsupportable.

For its cumulative impact analysis, the DSEIR uses the same baselines and thresholds of significance discussed above plus one more if the Project "would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route)."

13b [TR-2i]

The 5% threshold for determining a Project's contribution to be "considerable" is stated at Appendix-TR, p. TR-625. No rationale for this number is provided. A Project contributing 1% more capacity utilization to a screenline that usually operates at 84%, resulting in a total capacity utilization of 85%, may not contribute considerably to a significant impacts, while a Project contributing 1% more capacity utilization to a screenline that usually operates at 94%, resulting in a total capacity utilization of 95%, may well contribute considerably to a significant impact. A one-size-fits-all "ratio" violates CEQA. (See *Communities, supra; Kings County, supra*.)

G. The DSEIR Unlawfully Defers the Development of Mitigation Measures.

14 [TR-12d]

The DSEIR sketches out a number of concepts for mitigating the Project's significant transportation effects where it defers the development of specific mitigation measure until a future date. The DSEIR's deferral all of the mitigation measures listed below in this section does not meet CEQA requirements to identify specific mitigation measures in the Draft EIR so the public may meaningfully review and comment on them. These measures violate CEQA's requirements for deferred mitigation because the DSEIR does not specify binding performance standards by which

the measures' success can be judged, there is no evidence it is impracticable to develop and include the specific measures in the DSEIR, there is no evidence the measures will be effective, there is no evidence the measures are feasible, there is no evidence the measures will be implemented because the Project Sponsor may deem them infeasible, and the measures are not enforceable. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*CBE*); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

The listed measures are qualified by language such as "if feasible" or "could include" (e.g., Measure M-TR-2b). Such qualifications render the measures illusory, unenforceable, and ineffective for purposes of the DSEIR's claim of substantial reductions in impact or reductions in impact to less-than-significant levels. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope..."].)

Even the listed measures that include performance standards (e.g., Measure M-TR-18) do not require they be achieved. For example, Measure M-TR-18 only requires that the Project Sponsor "work to achieve" the performance standards. CEQA requires that deferred mitigation measures include binding performance standards.

14 [TR-12d] cont.

- Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts. (DSEIR, p. 1-15.)
- Mission Bay FSEIR Mitigation Measure E.47: Transportation System Management Plan. (DSEIR, p. 1-17.)
- Mitigation Measure M-TR-5a: Additional Caltrain Service. (DSEIR, p. 1-18.)
- Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service. (DSEIR, p. 1-19.)
- Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction. (DSEIR, p. 1-20.)
- Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan. (DSEIR, p. 1-21.)
- Mitigation Measure M-TR-11b: Participation in the Ballpark/Mission Bay Transportation Coordinating Committee. (DSEIR, p. 1-22.)
- Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events. (DSEIR, p. 1-23.)
- Mitigation Measure M-TR-13: Additional Muni Transit Service during Overlapping Events.

(DSEIR, p. 1-24.)

- Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events. (DSEIR, p. 1-24.)

- Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring. (DSEIR, p. 1-25.)

14 [TR-12d] cont.

H. The DSEIR's Discussion of Transportation Impacts Is Incomplete.

The DSEIR analyzes transportation impacts in two broad scenarios: with and without implementation of the Special Events Transit Service Plan.

In the scenario "With Implementation of the Special Events Transit Service Plan" the DSEIR analyzes two narrower scenarios: with and without a Giants game. In each Giants game scenario, the DSEIR analyzes three narrower scenarios: no event, convention event, and basketball game. The result is six scenarios applied to ten different transportation resources, as shown in Table 2.

15 [TR-2a]

Table 2

<table>
<tr><td colspan="6">With Implementation of the Special Events Transit Service Plan</td></tr>
<tr><td colspan="3">Without Giants game</td><td colspan="3">With Giants game</td></tr>
<tr><td>No event</td><td>Convention event</td><td>Basketball game</td><td>No event</td><td>Convention event</td><td>Basketball game</td></tr>
<tr><td colspan="3">TR-1 Construction - Traffic LS
TR-2 Traffic - Intersections SUM
TR-3 Traffic - Freeway Ramps SUM
TR-4 Transit - Muni LS
TR-5 Transit - Regional - Caltrain SUM
TR-6 Pedestrian LSM
TR-7 Bicycle LS
TR-8 Loading LS
TR-9a Construction Helipad LSM
TR-9b Const. Lights Helipad LS
TR-9c Operation Helipad LS
TR-9b Operation Lights Helipad LSM
TR-10 Emergency Vehicle Access LS</td><td colspan="3">TR-1 Construction - Traffic LS
TR-11 Traffic - Intersections SUM
TR-12 Traffic - Freeway Ramps SUM
TR-13 Transit - Muni LSM
TR-14 Transit - Regional -All SUM
TR-15 Pedestrian LSM
TR-16 Bicycle LS
TR-17 Emergency Vehicle Access LS</td></tr>
</table>

In the scenario "Without Implementation of the Special Events Transit Service Plan"

the DSEIR analyzes only one narrower scenario: without a Giants game and with a basketball game. The result is one scenario applied to ten different transportation resources, but the omission of the other five scenarios, as shown in Table 3.

Table 3

Without Implementation of the Special Events Transit Service Plan	
Without Giants game	
Basketball Game	
TR-1 Construction - Traffic	LS
TR-18 Traffic - Intersections	SUM
TR-19 Traffic - Freeway Ramps	SUM
TR-20 Transit - Muni	SUM
TR-21 Transit - Regional	SUM
TR-22 Pedestrian	LSM
TR-23 Bicycle	LS
TR-24 Loading	LS
TR-25Emergency Vehicle Access	LS

15 [TR-2a] cont.

Since the scenario "Without Implementation of the Special Events Transit Service Plan" is likely enough to justify including it in the DSEIR, the DSEIR should include the other five omitted scenarios.

In addition, the DSEIR's cumulative impact analysis does not even inform the reader if it is performed for the "with" or "without" scenario for "Implementation of the Special Events Transit Service Plan." The cumulative impact analysis should include both scenarios, and should inform the reader which is which.

Thank you for your attention to this matter.

Very Truly Yours,

Thomas N. Lippe

SMITH ENGINEERING & MANAGEMENT

July 26, 2015

Mr. Tom Lippe
Law Offices of Thomas N. Lippe, APC
201 Mission Street, 12th Floor
San Francisco, CA 94105

Subject: Draft Subsequent Environmental Impact Report for Event Center and Mixed Use Development at Mission Bay Blocks 29-32. SCN:2014112045

P15003

Dear Mr. Lippe:

Per your request, I have reviewed the Draft Subsequent Environmental Impact Report (hereinafter "the DSEIR") on the above referenced Project in the City and County of San Francisco (hereinafter "the City"). The focus of my review is in regard to matters involving transportation and circulation. My qualifications to perform this review include registration as both a Civil and Traffic Engineer in California and 47 years professional consulting practice in these fields. I have prepared, reviewed, and commented on the traffic and circulation components of numerous environmental impact documents under the California Environmental Quality Act (hereinafter "CEQA"), working for Lead Agencies, Responsible Agencies and private citizens and organizations. I am familiar with the Project vicinity, having lived and worked in the Bay Area since 1967 and having been involved in numerous significant projects affecting the San Francisco Waterfront including a decade of planning studies for the Mission Bay development. My professional resume is attached. My comments follow.

The DSEIR's Transportation Impact Analysis Understates and Fails To Disclose and Mitigate Arena Event Impacts on PM Commute Peak Hour Travel Because It Fails to Consider the Time and Duration of Attendees Travel In Advance of Passing Through Venue Entry Turnstiles 16 [TR-2d]

The DSEIR considers turnstile data on time of arrival at the Golden State Warriors current venue site (Oracle Arena) and other basketball venues to

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

estimate how many attendees traveling to a game with a 7:30 PM start time would be traveling on the area transportation system in the 4 to 6 PM peak commute period versus in the 6 to 8 PM early evening peak shoulder period. However, it uses an overly simplistic relationship between turnstile arrival data and whether the attendee traveled in the 4 to 6 peak or in the 6 to 8 shoulder: If the attendee arrives at the turnstiles more than 1.5 hours before the 7:30 event start, they are assumed to have traveled in the 4 to 6 peak; if they hit the turnstiles less than 1.5 hours in advance of the event start, they are presumed to have traveled in the 6 to 8 shoulder. The problem with this is it fails to take into account the duration of each attendee's travel (which varies by where each person is coming from, the mode or modes they choose and the travel time on that mode or modes). It also fails to consider the substantial portion of attendees who, rather than passing through the turnstiles immediately, choose to remain outside for a while (such as stopping at a nearby restaurant / bar for a meal or drinks, or just waiting outside, as in the circumstance where 2 or more people are going to sit together but are traveling independently from different points and one person has all the tickets). Turnstile data is only a weak surrogate measure for end-time of trip for travel to stadium and arena event venues. It is weak and non-representative of the actual times attendees may be traveling on the transportation system for the following reasons. Many attendees at weeknight Warriors games will be coming from places where they will have to travel more than 45 minutes or an hour to get there. Many attendees, when they reach the area of the Project will choose to patronize nearby bars or restaurants or need to wait outside to meet up with others. In reality, someone who has traveled an hour to get to the Project site and passes through the turnstile directly on arrival at 6:30, say, will have actually completed a substantial portion of their trip within the PM peak hour. Another person who has only traveled for, say, 45 minutes but spends a half-hour in a nearby bar before passing through the turnstiles at 6:45 will also have completed most of their trip in the PM peak hour. These offsets of actual time-of-travel on the transportation system from time of passage through the turnstiles are not adequately considered in the DSEIR.

The DSEIR States that 5 percent of arriving 7:30 PM basketball event attendees arrive between 5:00 and 6:00 PM (per Table 5.2-21) which would be 903 person trips for 18,064 maximum attendance. However, Table 5.2-22 shows a total of 1,803 person trips within the 4-6 PM peak hour. Presumably, this discrepancy accounts for roughly 900 trips of the assumed 1100 day-of-game workers (ushers, ticket-takers, vendors, event-level security personnel and other day-of-game functionaries who generally need to be in place when the turnstiles open). Some 95 percent of the attendees are assumed to arrive in the 6 – 8 PM early evening peak shoulder per Table 5.2-21 with the maximum arrival hour between 7 and 8 pm involving 11,742 trips (65 percent of attendees per Appendix TR Table 3).

16
[TR-2d]
cont.

O-MBA10L4
Exh 1

But, considering the facts that:

- over 70 percent of the attendees will be coming from outside San Francisco (including 31.1 percent from the East Bay, 8.9 percent from the North Bay, 26.7 percent from the South Bay and 4 percent from completely outside the Bay Region)[1] meaning many of their trips to the Project site will take 45 minutes to an hour or more,
- many attendees will, after traveling to the vicinity of the Project site, stop in neighboring restaurants and bars for drinks or a meal, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles by 30 minutes to an hour or more. This would apply to attendees coming from points in San Francisco as well as those making longer trips.
- many of the attendees, after completing their trip to the site, may need to wait to meet with others before passing through the turnstiles, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles. While some waits to meet are of short duration, the arrivals may often be disparate by 30 minutes or more. This would apply to attendees coming from points in San Francisco as well as those making longer trips.

When all of these factors are considered, it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands.[2] Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually

16
[TR-2d]
cont.

[1] Per DSEIR Appendix TR Table 8 at page TR 25.
[2] This commenter has consulted regarding transportation issues related to many professional sports stadiums and arenas. In addition, by being an attendee at a very large number of professional sports events and concert events, this writer has observed with a professional eye the transportation and pre-event behavior of attendees at nearly 1200 major league stadium and arena events at various venues. The writer has held season tickets to the Giants at their current venue for 8 years, to the 49ers for 33 years, to the Oakland Raiders for 20 years and a quarter-share of season tickets to the San Jose Sharks.

traveling on the transportation system instead of the time they enter the event venue.

In order to illustrate how consequential is the DSEIR's failure to consider the time difference between the time when event attendees pass through the arena turnstiles and the time when they are actually travelling on the transportation system, we review a simplified scenario. Undisputedly, people who pass through the arena turnstiles in the half-hour between 6:00 AND 6:30 PM were traveling on the transportation system before 6 PM – that is, within the 5 to 6 PM peak period. DSEIR Table 5.2-21 at page 5.2-83 estimates that 11 percent of turnstile arrivals do so in the 6:00 to 6:30 PM half-hour, amounting to 1987 person trips at capacity basketball attendance of 18,064. When these trips are added to the 1803 trips the DSEIR already estimates are traveling in the 5 to 6 pm peak hour[3] , there would really be a total of 3790 Project basketball-related trips traveling in the pm peak hour. In other words, the Project's basketball-related trips in the PM peak hour would be more than doubled (actual factor 2.102).

The effects of a doubling of PM peak hour travel attributable to adding the Project with a 7:30 PM basketball game as compared to what the DSEIR estimates would be most evident at the intersection of Seventh Street with Mission Bay Drive where, instead of operating at LOS D as projected in table 5.2-24, it would operate at deficient LOS E, a significant impact. The effect on outbound MUNI lines T Third and 22 Filmore requires some special attention because Table 5.2-40 is obviously in error, showing the ridership on each of these lines as being *less* with a basketball game than without one. This is completely inconsistent with the text in the first bullet point on page 5.2-141 which states that a basketball game would add 681 new outbound transit trips to these lines in the PM peak hour. If we correct the table to be consistent with the text of the DSEIR analysis, the DSEIR's analysis of these two lines in the "with basketball" scenario should show a total outbound ridership of 3862 trips (or 81.3 percent of capacity).[4] If we add to that the riders who pass through the turnstiles in just the 6 to 6:30 PM period who, because of the offset between overall ride time and the 6-to 6:30 turnstile entry count, must have been riding on the transportation system in the 5 to 6 PM commute peak hour, the analysis would show an added ridership due to basketball of 1431, a net ridership in that situation of 4612, and a capacity utilization of 97.1, extremely close to crush capacity.[5]

16
[TR-2d]
cont.

[3] See DSEIR Table 5.2-24 at page 5.2-90.
[4] Regardless of whether the City agrees with our further analysis of the PM peak ridership with a basketball game, it must correct this table to make it consistent with the analysis findings in the text.
[5] Under the City's normal impact threshold, which is riders exceeding 85 percent of screenline capacity, this would be a significant impact on transit. However, because the City has improperly created a Project-specific impact threshold of 100 percent of screenline capacity for this Project, the ridership would fall just below the gerrymandered impact threshold. The impropriety of creating a specially relaxed threshold of impact for this one Project is discussed in a subsequent section.

Exh 1

The DSEIR Only Analyzes Impacts of Weeknight Basketball Games That Start at 7:30 PM, Not at Other Start Times Closer to the PM Peak.

The only scenarios analyzed involving weeknight basketball games assume a start time of 7:30 pm. But this is not the only times that weeknight basketball games start although it does account for a majority. In the three preceding full seasons to the time of the NOP, 6 percent of the weeknight home games started at 6 PM (average 2.5 games per season) and over the three seasons there were individual games starting at 5 PM and 7 PM. However, the recently completed season proves that earlier games than 7:30 PM start times are not likely to be just a rarity in future years. In the three regular seasons considered in the DSEIR, the Warriors team was mediocre to 'emerging'. However, after this year's excellent regular season, the team played 11 home playoff games, seven of which were weekday games that started at 6 PM. With an outstanding young team, the prospects are that the team could play similar numbers of home 6 PM weeknight playoff games (6 PM being the time nationally broadcast weeknight games normally start) for several seasons hence. Moreover, the national attention this team has attracted could result in several more national broadcasts of regular season home games (also normally starting at 6 PM). So there is a substantial likelihood that weeknight 6 PM games could become a frequent occurrence rather than a rarity. There might easily be 16 out of 54 or so combined regular season and playoff home games that start at 6 PM, or just under 30 percent of the total weeknight home games. Obviously, the 6 PM start puts more travel pressure on the 4 – 6 PM peak. The DSEIR should analyze this basketball start time as a separate scenario rather than dismissing it as an anomaly

17
[TR-2a]

The City's Process for Evaluating a Project's Impacts on Public Transit Evades Disclosure of Significant Impacts

The City's process for evaluating transit impacts for projects in the "greater downtown area" (the C-3, SOMA and Mission Bay districts) is to consider peak hour ridership on the routes that cross designated screen lines across portions of the City or, for regional routes, on its perimeters versus the aggregate capacity of the peak hour services crossing those screenlines. There are several problems with this procedure that result in failure to disclose impacts.

18
[TR-2g]

- Considering aggregate capacity across screen lines versus aggregate patronage does not reasonably disclose impacts. For the routes inside San Francisco served by the San Francisco Municipal Railway (MUNI), a standard has been established that there is significant impact when ridership crossing the screen line exceeds 85 percent of capacity on that screen line. But this standard of significance involves an underlying assumption that individual travelers could use any of the routes crossing a particular screen line to accomplish their trip. But in actual fact, an individual traveler's particular trip is most often only well served by one route. When some routes crossing a screen line are heavily patronized while others are less patronized, the excess capacity on the less popular routes does not cancel out the overcrowding on the most popular routes. It is noted that the City Planning Department can request that transit impacts be analyzed on an individual line basis. When this is done, if the individual line ridership exceeds 85 percent of capacity *and the project's contribution exceeds 5 percent of the total ridership at its maximum load point (MLP)*, then the project would be found to have significant transit impact.

- MUNI's capacity standards per vehicle involve percentages of standees above seating capacity ranging from 30% to 80% of seating capacity (depending on vehicle type); therefore, the above addition of 5 percent ridership to the impact threshold in analysis of individual lines represents a substantial crush loading.
- The capacity as considered in the analysis is the theoretical capacity of the services as scheduled. However, rarely, if ever, does MUNI deliver all of its scheduled service. San Francisco Municipal Transportation Authority statistics show that MUNI typically delivers an average of between 95 and 98 percent of scheduled services although on some days the percentage of missed runs can be much worse. MUNI's goal is to only deliver 98.5 percent of scheduled service. Principal causes of missed runs include driver unavailability, insufficient vehicle availability and in-service breakdowns. On the light rail lines, the percentage of weekdays when enough light rail vehicles were operationally available to deliver scheduled service averaged only 61.7 percent in fiscal year 2014 and was well under 50 percent in the two preceding years.
- Difficulty maintaining schedule reliability (on-time performance) exacerbates capacity problems. Muni's on-time performance is normally less than 20 percent. As a result, there is difficulty maintaining planned headways between vehicles on a given route. Bunching occurs. When that happens, the lead vehicle in a bunch becomes overcrowded while the one or more closely following vehicles in the bunch are underutilized. Muni experiences bunching on about 4 percent of its trips overall; in excess of 5 percent on its "Rapid Network".

18
[TR-2g]
cont.

If the threshold of impact were measured at 85 percent of the capacity of *actual effective service delivered* instead of *theoretical schedule-based service capacity*, more of the individual lines and screen lines would be found to be closely approaching or above the 85 percent of capacity criterion. And as a consequences of these circumstances in the City's procedures and policy criteria, it is rare for a project to be found to have significant impact on MUNI transit services despite the fact that the public perception is that MUNI is overburdened and dysfunctional.

We also note that for scenarios involving arena events at this Project, the DSEIR alters the City's normal criterion for evaluating transit impacts, changing the threshold of significant impact from 85 percent of capacity to 100 percent of capacity. Its basis for making this alteration, which tends to shield the Project from disclosure of significant transit impacts, is that event-goers accept a higher level of crowding than normal riders. However, "accept" is too generous a word. Nobody wants to ride in 'crush load' conditions. Event attendees grudgingly tolerate 'crush loads' as the least undesirable of their other options of a)walking long distances, b)paying much more for taxis or shared ride services, c) paying even much more to drive and park or d) (only in the post-event exit) waiting until the crowding has dissipated. Moreover, this shift in acceptability criterion is impactful of itself in that it imposes the values and tolerances of event-attendees upon normal riders who use the involved lines at that particular time of day. Furthermore, the DSEIR is unclear whether the change in impact criterion is operative only for lines directly serving the Project site, or system-wide, which would have a far greater impact on normal riders. The City's action to alter its normal thresholds of impact in the case of one particular project to lessens the chance of findings of significant impact and is not consistent with the good faith effort to disclose impact that CEQA demands. The City should faithfully disclose impacts as measured by its normal criteria, and, if it still wants to approve the Project, make findings of overriding considerations.

18
[TR-2g]
cont.

With regard to regional transit services, considering capacity versus ridership at San Francisco perimeter screenlines (North Bay, East Bay, South Bay) as the sole criterion of impact on the regional systems results in the analysis failing to address other significant impacts that are unrelated to corridor screenline ridership to capacity relationships. For example, in the case of BART, while Transbay capacity (the screen line analyzed) is a concern, an equal concern is the peak period platform capacity at the Embarcadero and Montgomery Street stations. These stations each individually serve 22 percent of all BART travelers and in the peaks are simultaneously serving peak-direction travelers to/from both eastbound and westbound corridors as well as serving contra-peak direction travelers in both directions. The platform congestion at both these stations is a serious operational and safety concern, has been documented in public[6], is visibly worse in the pm peak hour when the Giants have weekday night games scheduled and would presumably be similarly affected by weekday evening Warriors games and other large events at the Project. BART is actively developing designs for adding outboard platforms at both of these stations – a mitigation measure that the Project (and others) could make fair share contributions toward if the Project's impacts at these locations were properly

19
[TR-5b]

[6] See *BART Sustainable Communities Operations Analysis*, June 2013

analyzed. But for the present, the DSEIR's is deficient because it completely fails to analyze, disclose and mitigate the Project's impacts on this situation. 19 [TR-5b] cont.

The City's Selections of Intersections (and Freeway Ramps) Studied in the DSEIR Excludes Intersections it Knew or Should Have Known Would Potentially Be Significantly Impacted by the Project

Intersections selected for study in the DSEIR for the subject Project exclude a number of intersection that were to be subject to analysis in the DEIR for the prior proposal for essentially the same project but located on the Piers 30/32 site. Among the intersections slated for study in the prior edition of the project but not studied in the current work are the 9 major intersections along Embarcadero from and including that with Brannan all the way to that with Broadway, plus those at Main with Harrison, Main with Bryant, Beale with Mission, Beale with Bryant, Delancy and the 80 on ramp, Fremont with each of Mission, Harrison and Folsom/80 off, Third with Harrison, Third with Mission, Second and Bryant, Second and Brannan, Second and King, Second and Bryant, First with Harrison and the 80 on ramp, Fourth and Howard, Fourth and Harrison/80 on ramp, Fourth and Bryant/80 off ramp, Bryant with Sterling/80 on ramp. Virtually all of these excluded intersections are heavily congested in the pm peak.

Although the Project location is now shifted to a site approximately 6800 feet south, and the DSEIR has added study intersections in that direction, the excluded intersections are still on the likely paths of traffic coming from the Northbay, Eastbay and northern parts of San Francisco. . The project is fundamentally the same size and will generate fundamentally the same amount of traffic. The amount of traffic through the excluded intersections approaching from and departing to the Northbay, Eastbay and northern parts of San Francisco is essentially unchanged from the totals that would have occurred with the Piers 30/32 site. So there is no reasonable logic for excluding these intersections from the current DSEIR analysis. 20 [TR-2b]

That the excluded intersections are at risk to be impacted by the Project is demonstrated in the DSEIR's own analysis of Alternatives to the Project. One of the alternatives it analyzes is putting the Project back on the previously proposed Piers 30-32 /Seawall Lot 330 site. Appendix TR at page TR-783 analyzes the project on the alternate (or formerly proposed site) at the intersections formerly proposed for evaluation. It shows the Existing + Project with Basketball Event would have significant project-specific impacts at 8 intersections, 5 of which are intersections excluded from the current DSEIR analysis of the Project at its current site, and would make significant contributions to traffic at 4 intersections already at LOS E or F, 3 of which are among the intersections excluded from the analysis of the Project at its currently proposed site. We reiterate, it is clear that most of the traffic contributory to the impacted intersections with the Project on

the formerly proposed site would still pass through these intersections with the Project located at the currently proposed site. So the DSEIR is deficient for excluding these intersections from the analysis of the Project.[7]

We also note that DSEIR Figures 5.2-14 E and 5.2-14 F indicate that approximately 31 percent of Warriors game weekday and Saturday attendees would approach and depart two and from the northwest via 7th Street at times when there are no overlapping Giants games. Although the DSEIR does not specifically present usage of this corridor by Warrior's attendee traffic at times of overlapping Giants home games, it would doubtless be considerably greater. In both cases, this suggests that the capacity-challenged intersections of Seventh and Townsend, Seventh and Brannan, Eighth and Brannan and Eighth and Bryant should have been analyzed in the DSEIR. Please do so. 20 [TR-2b] cont.

There is a similar situation with the study of freeway ramps. The current DSEIR analyzes 6 ramps. The study for the prior site analyzed 12 ramps. Four of the six ramps studied in the current work are new (not considered in the analysis of the former proposed site). In other words, ten of the ramps to be studied in the analysis of the prior site, all problematic in peaks, are eliminated from consideration. There is no reasonable justification for their elimination.

The Transit Analysis Understates Impacts Because It Relies On Stale Transit Baseline Data

This DSEIR's Notice of Preparation was filed on November 19, 2014. The DSEIR's transit impact analysis relies upon transit ridership data published in a City Planning Department memo dated June 21, 2013 entitled *Transit Data for Transportation Impact Studies*[8]. However, the data published in that memo is from counts taken in the fall of 2010 and in 2011. Between 2010/11 and late 2014 when the NOP was filed there have been a large number of significant development projects that have been completed and occupied in the C-3, SOMA and Mission Bay and numerous others approved and placed under construction. These render the transit database collected in 2010/11 stale for evaluation of a Project whose NOP was filed in late 2014. Hence, the transit analysis is inadequate for relying on stale data. 21 [TR-2c]

Similarly, for the regional transit corridor screenlines, the cited *Transit Data for Transportation Impact Studies* memo relies on data from a SFMTA TEP Project

[7] Our colleague, Mr. Larry Wymer of Larry Wymer and Associates Traffic Engineering has provided a separate letter of comment on this DSEIR (dated July 21,2015) that concurs in the need for study of additional intersections and provides supporting data.
[8] *Transit Data For Transportation Impact Studies* is reproduced in DSEIR Appendix TR at pages TR-624 thru TR-632.

document produced in October, 2012. Obviously, the transit ridership data in that document reflects observations some time before October, 2012. Again, significant development has occurred in the C-3, SOMA and Mission Bay between whenever the data published in October 2012 was collected and the date of the NOP for the subject Project. This would result in significantly heavier loadings on the regional transit carriers in the peak periods at the time of the NOP than represented in the *Transit Data for Transportation Impact Studies* memo. For example, the data relied on in the DSEIR indicates BART's Transbay peak hour ridership is 19,716. *BART Sustainable Communities Operations Analysis* report[9] indicates peak hour Transbay ridership at 21,600 passengers in 2012 and projects 21,815 peak hour peak direction riders by 2015. BART's ridership values would respectively put BART at 98 percent of capacity in 2012 and at 98.9 percent currently. This leaves considerably less capacity for peak hour travelers to the Project to be accommodated without impact.

The DSEIR transit analysis should be redone based on updated estimates of baseline transit ridership, taking into account projections of transit use from the environmental documents for all projects known to the City to have been completed since the time of the actual transit ridership counts or known to be reasonably certain, at the time of this Project's NOP, of being completed by the estimated time of completion of this Project

21
[TR-2c]
cont.

The Traffic Analysis Underestimates Impacts Because It Relies on Stale Baseline Data

The traffic impact component of the DSEIR relies on a number of traffic counts taken in 2013 and others in June, 2014. It adjusts those counts to account for traffic from the UCSF Medical Center Phase 1 and the Public Safety Building that are located close to the Project site and were under construction when the counts were taken but were occupied about the time of the NOP. However, it seems likely that there was other development in C-3, SOMA and Mission Bay completed in the period between when the 2013 counts were taken and the date of the NOP that would logically affect baseline traffic at some of the intersections analyzed in the DSEIR and still more that is known to the City to be reasonably certain of completion by the time of completion of the subject project. Please list all such developments and adjust the baseline traffic used in the DSEIR analysis accordingly.[10]

22
[TR-2c]

[9] *BART Sustainable Communities Operations Analysis*, Bay Area Rapid Transit District, June, 2013.
[10] The aforementioned separate comment letter on this Project by Mr. Larry Wymer includes a spreadsheet reflecting, to the best of Mr. Wymer's ability based on culling the posting of environmental documents of development projects on the City Planning Department's web site, a listing of such projects and the traffic they would contribute to locations that were or should have been studied in this DSEIR's traffic analysis. However, responsibility for developing a comprehensive list of such projects and adjusting the baseline for their effects rests with the City Planning Department that is charged with generating and maintaining these records, not to an independent party attempting to do so from the outside.

O-MBA10L4
Exh 1

The DSEIR Fails to Evaluate Impacts at Intersections Under PCO Control

The DSEIR does not report LOS or delay at intersections that are under PCO control in certain situations, claiming that LOS cannot be calculated for intersections under PCO control. However, this interpretation evades the issue of why PCO control is employed in the first place. The reason is because it is assumed or known through experience that these locations would become gridlocked (deep LOS F conditions) if left to automated traffic control. In theory, the PCO or group of PCOs is/are smarter than an automated traffic signal in such circumstances. In particular, the human controllers can observe downstream blockages and give advantage to movements with unblocked downstreams and alter phase sequences to give green to movements as their downstreams become unblocked. But fundamentally, any intersection under PCO control should be regarded as being at LOS F. But this poses another issue. There is no determination of how much worse (more impacted) conditions are in the Existing + Giants game + Warriors game situation than in the Existing + Giants game alone scenario. This determination is an essential purpose of this DSEIR and it is not being evaluated.

23
[TR-2f]

The DSEIR Fails To Evaluate Quantitatively the Severity of the Project's Traffic Impacts at Locations That Are Already In LOS F Condition

The DSEIR tables reporting intersection delay and intersection LOS for the various locations and scenarios analyzed fail to report the actual delay at intersections experiencing delay at or above the threshold of LOS F. They merely report the delay as being greater than 80 seconds of delay per vehicle. This manner of reporting prevents the public from knowing the severity of the Project's traffic impacts when it affects intersections already in impacted condition.

Most commercially available intersection LOS/delay calculation programs do calculate the actual delay of intersections that are above the LOS F threshold. It is the analyst's option to display the actual value in the program output or to suppress reporting it and display the >80 symbol. Some analysts claim that once an intersection is in LOS F, the delay value is irrelevant. But that is nonsense. If an existing condition is, say, just at the 80 second delay LOS threshold and a project causes the delay value to increase to 81 seconds, in that instance the degradation caused by the project may be almost imperceptible. But if the computation shows that the project increases delay to, say, 120 seconds per vehicle, than the degradation caused by the project is clearly quite severe and seriously impactful. Since an essential objective of an EIR is to disclose how

24
[TR-2f]

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

adverse or severe a project's impacts are, the DSEIR is deficient in failing to disclose information relative to severity that it easily could have disclosed.

The same considerations apply to the freeway ramp analysis where, once a ramp has reached the average vehicle density threshold of LOS F operations[11], the DSEIR presents a special character symbol instead of the actual density compiled, thereby thwarting the ability of the public or professional reviewers to understand how severe and adverse the impacts of the project really are. We also note that DSEIR Table 5.2-2 contains an apparent error in the entry for the I-80 eastbound ramp at Sterling for the weekday evening (6-8 PM) period. It reports that vehicle density is 38 vehicles per vehicle lane-mile but a LOS of C. If the density really is 38, this ramp would be in the LOS E-F range; if the LOS really is C, the density would have to be less than 28. Please correct the error. 24 [TR-2f] cont.

Complex Interrelated Issues Are Not Addressed In the DSEIR

At present, persons traveling between BART or the MUNI LRT lines and the Project site can make a simple in-station transfer to/from the K-T line from any of the downtown Market Street stations. Once the Central Subway is completed, the T-Third line will no longer be directly inter-routed with the K-Ingleside line in the Market Street subway. Instead, access from BART and the Market Street LRT lines to the T line that serves the proposed Project site will only be via the Powell Street station and only via a 1,000 foot tunnel in the wrong direction that connects Powell to the Union Square station where T LRT trains can be boarded – an unattractive and slower transfer than at present. Although other MUNI LRT lines from the Market Street subway will continue to connect to 4th and King via the Embarcadero, passengers on those lines or those from BART who transfer to them at the Market Street stations will be faced with another transfer to the T-Third at that point or an walk of .8 miles to the Project site. These are less attractive options than what is available at present. With the rise of ride-share services like Uber and Lyft that can be summoned via a cell phone application – a new phenomenon, the percentage of persons who take ride share services or conventional taxi instead of transit all the way to the site may be far more than for AT&T Park events (which will continue to be served by LRT lines that stop directly in all the Market Street BART stations). This is detrimental as each time people use ride-share or conventional taxi services to 25 [TR-5a]

[11] Vehicle density, the number of vehicles per lane mile, is the logical measure of either congestion or high quality service on freeways and ramps in merge and diverge areas. In free-flowing conditions, vehicles operate with substantial space between them so the number of vehicles per lane mile is low. At highly congested conditions, stop-and-go or crawl speed operations, vehicles are closely spaced and the number of vehicles per lane mile is high. Per *Highway Capacity Manual 2000* the threshold for LOS E and F operations is 35 passenger car equivalents per lane-mile per hour. With true scientific caution, *Highway Capacity Manual 2000* counsels against reporting vehicle densities in the LOS E-F range because flow rates, a principle factor in calculating vehicle density, vary radically in LOS E-F situations. Nevertheless, the computed vehicle densities are what they are, and constitute the only reasonable way to measure weather the Project's effects on an already unacceptable ramp situation are significantly deleterious or not.

O-MBA10L4
Exh 1

access the Project, they cancel the environmental savings of direct transit access usage and double the number of motor vehicle trips to the area as compared to if they drove and parked in the area (because the ride-share or taxi vehicle drives away after dropping passengers off). The DEIR does not appear to address these considerations. Please do so. 25 [TR-5a] cont.

The DSEIR Cumulative Analysis Fails To Consider and Analyze the Project in the Context of the City's Proposal to Remove the Northern Portion of I-280 As Far South As the Mariposa Street Interchange

Since at least as long ago as 2012, the City has been actively considering a proposal to demolish the northern portion of I-280 as far south as the Mariposa Interchange, eliminating the on- and off -ramp connections to King Street and to Sixth Street[12]. If carried out, the I-280 truncation would shift much of the traffic that now uses those ramps to surface streets in the immediate vicinity (including two of the frontage streets) of the subject Project. Moreover, development of the site freed up would add to demands on the traffic and transit system. In view of the City's continuing active consideration and refined development of this proposed major change in transportation infrastructure[13] both well before and after the NOP for the subject Project, this DSEIR should have, at a minimum, in addition to the cumulative scenarios studied, analyzed the proposed Project in the context of an alternative transportation network scenario that reflects the truncation of I-280 as far south as the Mariposa Interchange. However, the DSEIR's only mentions the I-280 truncation project in two places. One is a single short background paragraph about ongoing projects in the vicinity of the site in the Appendix TMP introductory section. The other is a lengthier two-paragraph description at DSEIR pages 5.2-109 and 5.2-110. That section concludes by stating that the information on the 280 truncation is provided for information purposes only and that because that project is not fully designed, has not received the approval of other responsible agencies and is not funded, it is speculative and is not considered in the DSEIR cumulative 2040 analysis. However, since the City has already spent in excess of $ 1.7 million in design and feasibility studies, has already approached other responsible agencies for funding involvement and approvals and since it has such a vast potential consequence for the transportation network in the immediate area of the subject 26 [TR-2h]

[12] Evidence of this is the unveiling by the Mayor's Transportation Policy Director, Gillian Gillett, at a San Francisco Planning and Urban Renewal Association (SPUR) forum on January 10, 2013, releasing a City study deceptively named Fourth and King Street Railyards, Final Summary Memo dated December, 2012 and a related request dated January 7, 2013 by the Office of the Mayor to Steve Hemminger. Executive Director of the Metropolitan Transportation Commission.
[13] The City's continuing interest in the I-280 truncation is demonstrated by the initiation of the San Francisco Planning Department's *Railyard Alternatives and I-280 Boulevard Feasibility Study*, which began in June, 2014 and in the May 11, 2015 *San Francisco Chronicle* column by Matier & Ross lead by the statement "San Francisco Mayor Ed Lee is quietly shopping plans to tear down Interstate 280 at Mission Bay and build an underground rail tunnel through the area – complete with a station between the proposed Warriors arena and AT&T Park.".

Project by the forecast year of the cumulative analysis, and since that forecast year, 2040, is 25 years hence, it is evasive, irresponsible, improper for the City to have failed to at least considered an *alternative cumulative scenario* that assumes the latest design concept from the *Railyard Alternatives and I-280 Boulevard Feasibility Study* in *addition to* the cumulative scenario that was analyzed. The DSEIR should be revised to include such a cumulative alternative and recirculated in draft status for the 45 day review period. 26 [TR-2h] cont.

There Is No Evidence The DSEIR Considered the Disruptive Impacts of the At-Grade Rail Crossing of 16th Street on Intersection LOS at the Intersections of 16th and 3rd and 16th and 7th Streets.

The Caltrain rail mainline crosses Sixteenth Street in an at-grade crossing between the study intersections of Sixteenth with Third and with Seventh Streets. In the 5 to 6 PM peak hour, gate closure protection to allow train passage blocks Sixteenth Street traffic 10 times and another 10 times in the 6 to 7 PM early evening peak shoulder period. Increased rail traffic and increased train lengths will increase the blockage time. There is no evidence this blockage has been taken into account in the LOS calculations for the nearby intersections.
If it has, please explain how. If it hasn't, please adjust the calculations or explain why not. 27 [TR-2f]

The Project's Truck Loading and Truck Staging Provisions Appear Inadequate.

With regard to loading facilities, the Project Description narrative at DSEIR page 3-20 states: "*The loading and service areas, including 13 truck loading docks, would be located on the Lower Parking Level 1"*. After describing dimensions of those loading dock spaces, the narrative continues: *"In addition to the 13 on-site below grade loading area, 17 on-street commercial loading spaces would be provided on South Street (8 spaces), Terry A Francois Boulevard south of South Street (8 spaces) and 16th Street (1 space) …".* 28 [TR-8]

This statement in the Project Description has multifold inaccuracies:

- The accompanying scale drawing of Lower Parking Level 1 actually shows 14 off street truck loading spaces but about half of them cannot be accessed or egressed if trucks, especially the 70± foot tractor trailer rigs, are occupying nearby spaces.
- Other docks, if not completely blocked by vehicles in other loading docks, involve extremely difficult backing maneuvers.
- Some docks involve "blind" right hand backing turns from the "hammerhead" area that are ordinarily avoided in truck loading area design.
- The Project does not *provide* 17 on-street commercial loading spaces. It does not *provide* any. It simply asserts claim to enough on-street parking

area to park 17 large trucks, taking use of area that otherwise would be available for public parking.

- In addition to the above, the Project does not appear to have sufficient area for staging of trucks that have already been unloaded. Headliner rock concerts and family shows are often supported by large numbers of trucks. For instance, concerts for U-2's current tour are supported by 26 tractor-trailer rigs. The Rolling Stones are supported by about the same number. A national political convention would involve many more. It is obvious that this many trucks cannot be staged within the proposed site plan, especially since the loading docks also need to be used for the truck loading that is routine for any event (such as delivery of food. drink and souvenir supplies for the concessions, removal of garbage and support for the other uses in the proposed Project. It appears that the Project will either stash those trucks, when not actively loading or unloading, by preempting public on-street parking areas in the Project vicinity or by obtaining a formal off-site staging area. Which of these is planned and if a formal staging area is planned, where is it and what is its capacity? 28 [TR-8] cont.

Construction Impacts on Transportation and Circulation Are Not Adequately Addressed

In its section describing thresholds of significance, the DSEIR's transportation and circulation analysis declares that "Construction related impacts generally would not be considered significant due to their temporary and limited duration". This assessment by fiat rather than by a reasonable effort to measure or estimate the Project's construction impacts on the transportation and circulation system is inconsistent with the good faith effort to disclose impact demanded by CEQA. It also flies in the face of common sense. For example: 29 [TR-10]

- A project that is located on a heavily trafficked street, a street with high-volume transit service or a street with heavy pedestrian flows would tend to have much more construction impacts on transportation than a project on a minor street that has none of those characteristics.
- A project whose construction causes closures of traffic lanes or closures of continuous sidewalks or temporarily eliminates or relocates transit stops has more construction impact on transportation than one that does not. A project that does those things on busy streets has more construction impact on transportation than one on lesser-used streets.
- A project that is large tends to involve more workers commuting daily, more daily import of supplies and construction materials, more export of demolition and construction refuse and, as a consequence of its size, tends to be of longer duration, tends to have greater construction impacts on transportation than a smaller one.

These considerations that distinguish the severity of construction impacts on transportation can be defined or measured both qualitatively and quantitatively. The DSEIR is deficient in failing to do so.

Despite its "by fiat" finding that the Project's construction impacts on transportation and circulation are less than significant (LS in the Summary Of Impacts And Mitigation Measures), the DSEIR identifies "Improvement Measure I-TR-1: Construction Management Plan and Public Updates". This so called 'Improvement Measure' is a surrogate 'Mitigation Measure' and, by its very existence, is de facto admission that the Project does have construction impacts on transportation and circulation that should have been disclosed as such. 29 [TR-10] cont.

Unfortunately, the measure is in part, vague and yet to be defined (deferred mitigation that is improper under CEQA, and in other parts, defies common sense. We discuss these subjects in a subsequent section.

The DSEIR Concludes, Without Adequate Foundation, That the Project Would Not Have Adverse Impact on Emergency Access

The emergency entrance to the newly opened UCSF Benioff Children's Hospital is located on Fourth Street near its intersection with Mariposa, about 1050 feet (as the crow flies) from the nearest corner of the Project site. At two locations in the Transportation and Circulation section the DSEIR states that if a project were to result in inadequate emergency access, the project would be found to have a significant impact on the environment. Yet incredibly, it concludes that the subject Project would not result in inadequate emergency access when capacity events are taking place at the Project on weekday evenings, weekend afternoons or weekend evenings, regardless of whether or not the Giants or other events at AT&T park are taking place at overlapping times. The DSEIR offers no objective data to support its conclusion that emergency access would not be adversely impacted in event travel peaks – such as relative emergency vehicle travel time data with and without event traffic[14]. Instead, the DSEIR relies on its own rationalizations of why emergency vehicles might not be slowed during event travel peaks to justify concluding the Project would not have significant impact. 30 [TR-9]

The DSEIR notes drivers' obligations to get out of the way of emergency vehicles under the vehicle code. However, it fails to note that in special event access/egress situations, when vehicles are queued bumper to bumper and pedestrians are swarming the crosswalks, drivers abilities to clear the way for emergency vehicles are impaired and the emergency vehicles will inevitably be delayed more than in a

[14] Emergency responders ordinarily log the time calls are received by dispatch, the time the subject is reached and the time the subject is delivered to an emergency care facility. So there is an objective data base that could have been examined to assess the consequences when special events currently take place in the area versus times when special events are not taking place.

normal traffic situation. The DSEIR notes that the presence of PCOs will help clear paths or emergency vehicles through event traffic. PCOs can help, but when event traffic is jammed up with scant maneuvering space and pedestrians are swarming about, PCOs can only do so much and the emergency vehicle(s) will inevitably be delayed compared to normal traffic. The DSEIR also claims emergency vehicles can utilize the proposed exclusive transit lane on 16th Street to bypass normal vehicles in event jams. This will be fine until an emergency vehicle overtakes a transit vehicle, at which time a more confusing than normal maneuvering will have to take place. And not all the emergency vehicles will be approaching from points from which 16th Street is the best route. Finally, not all vehicles traveling in emergencies are official emergency vehicles equipped with emergency lights and sirens. Quite often, parents, caregivers or friends attempt to rush a person requiring emergency care to the emergency room in private vehicles. Private vehicles on an emergency mission are often not recognized as such by other drivers, pedestrians, or PCOs and consequently, it event traffic, suffer even more delay than official emergency vehicles. 30 [TR-9] cont.

Because of these considerations, the DSEIR's conclusions about emergency access impacts are not only unsupported by objective data but incorrect and implausible.

Mitigation Measures Are Vague, Insubstantive, Unresponsive to the Impact Purportedly Addressed or Do Not Qualify as Mitigation Under CEQA 31 [TR-12a]

A number of the mitigation measures (and de facto mitigation measures identified as "improvement measures") identified in the DSEIR are vague, insubstantive, unresponsive to the impact purportedly addressed or offer no basis for the DSEIR's conclusion. Measure having these characteristics, which disqualify them as adequate mitigation under CEQA, are not limited to those cited as egregious examples highlighted below.

<u>De Facto Mitigation Measure: Improvement Measure I-TR-1: Construction Management Plan and Public Updates</u> 32 [TR-11]

The first section of this measure states as follows:

> *Construction Coordination* – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit and vehicles at the project site, the project sponsor shall require that the contractor prepare a Construction Management Plan for the project construction period. The preparation of a Construction Management Plan could be a requirement included in the construction bid package. Prior to finalizing the Plan, the project sponsor/construction contractor(s) shall meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to include in the Construction Management Plan to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. This review should consider other ongoing construction in the project vicinity, such as construction of the nearby UCSF LRDP projects and construction on Blocks 26 and 27.

While expressing good intention, what will be done as the result of this measure is so vague and subject to future determination as to constitute deferred mitigation. To be an effective measure, it should commit to explicit features such as the following examples:

A continuous protected sidewalk will be maintained at all times on the Project's frontage on the east side of Third Street. Third Street will not be subject to lane closures at any time during the construction period. All access to the Project for workers, import of construction materials and equipment and export of demolition and construction debris shall be from the Sixteenth Street, South Street or Terry Francois Boulevard frontages. All connections to underground utilities shall be made from the Sixteenth Street, South Street or Terry Francois Boulevard frontages.

The second section of this measure states as follows:

32 [TR-11] cont.

Carpool, Bicycle, Walk and Transit Access for Construction Workers – To minimize parking demand and vehicle trips associated with construction workers, the construction contractor could include as part of the Construction Management Plan methods to encourage carpooling, bicycle, walk and transit access to the project site by construction workers (such as providing transit subsidies to construction workers, providing secure bicycle parking spaces, participating in free-to-employee ride matching program from www.511.org, participating in emergency ride home program through the City of San Francisco (www.sferh.org), and providing transit information to construction workers.

This section contradicts common sense and common knowledge. It is common knowledge that few construction workers will use a bicycle, walk or use transit to travel to and from work - for compelling reasons. Many workers carry their personal tools and equipment with them each day; it is impractical to do this while walking, bicycling or riding transit. Construction work often involves strenuous physical labor. Consequently, even if not carrying tools and equipment, construction workers are normally disinclined to walk or bike to and from work. Because of the physical labor aspect, construction workers are frequently dirty and sweaty on the homebound commute. Because of this, construction workers are themselves uncomfortable and make other riders uncomfortable if they ride transit. Because these considerations are well known, it is ridiculous and cynical for the City to pad the DSEIR with useless statements such as that reproduced above.

Mitigation Measure M-TR-2

This sequence of mitigation measures purportedly reduces the effects of Impact TR-2 (that the proposed Project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park) even though the impacts are still classified Significant and Unavoidable with Mitigation (SUM). While many of the measures sound potentially useful, close consideration reveals they do not have quantifiable effects, they affect conditions that are not part of the original

33 [TR-12a]

quantification of impact or they are ineffective in changing the behavior of the problem traveler population. We consider the mitigation measures for Impact TR-2 in sequence.

Mitigation Measure M-TR-2a: Additional PCOs during Events

This measure involves providing four more PCOs during events than the Project's proposed TMP and suggests 5 intersections where they may be deployed. The problem with this is that while PCOs can help prevent unnecessary degeneration of conditions (such as drivers 'blocking the box' or jaywalkers obstructing lanes on the green phase, they cannot cure fundamental LOS E or F conditions.

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts

This measure involves fourteen itemized strategies in four subgroups. The lead in states:

"The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies that could be implemented by the City or other public agency (e.g., Caltrans)."

33 [TR-12a] cont.

Critical words here are "if feasible". CEQA requires that "feasible mitigation" be developed. If there is any doubt at this point about the feasibility of the mitigation proposals, they cannot be presented in the DSEIR as mitigation.

Strategies to Reduce Traffic Congestion

 The City to work with Caltrans to install changeable message signs upstream of key entry points onto the street network, such as on I-280 northbound.

Variable message signing only helps LOS if there are uncongested routes to which traffic can be directed. The variable message signs placed on the freeway approaches to Candlestick Park when the 49ers still played there were noteworthy in their uselessness because there were no uncongested routes to which traffic could be directed.

 The City to provide coordinated outreach efforts to surrounding neighborhoods to explore the need/desire for new on-street parking management strategies, which could include implementation of time limits and Residential Parking Permit program areas.

Neighborhood parking conditions and parking permit programs have nothing to do with the LOS E and F conditions at major intersections that are the object of mitigation in this item. The proposal is irrelevant.

□ The project sponsor to offer for pre-purchase substantially all available on-site parking spaces not otherwise committed to office tenants, retail customers or season ticket holders, and to cooperate with neighboring private garage operators to presell parking spaces, as well as notify patrons in advance that nearby parking resources are limited and travel by non-auto modes is encouraged.

Preselling parking so that drivers have a fixed destination they can travel to directly instead of circling blocks looking for parking is a good idea. But it solves a problem not accounted for in the DSEIR's original measurement of impact. The DSEIR's underlying traffic assignments all assume drivers are destined for explicit destinations, not milling about looking for one. So this would not reduce the LOS impacts forecast.

□ The project sponsor to create a smart phone application, or integrate into an existing smart phone application, transportation information that promotes transit first, allows for pre-purchase of parking and designates suggested paths of travel that best avoid congested areas or residential streets such as Bridgeview north of Mission Bay Boulevard and Fourth Street.

The problem with this entry is similar to some of the prior entries. At event times, there really are no uncongested paths to the Project vicinity, pre-purchase of parking helps solve a problem unaccounted for in the intersection LOS computations, keeping people out of residential streets is inconsistent with the supposed objective of reducing congestion at major intersections and people driving and using the app to find parking or avoid most congested routes are likely inured to transit first promotional messages. 33 [TR-12a] cont.

□ The City and the project sponsor to work to identify off-site parking lot(s) in the vicinity of the event center, if available, where livery and TNC vehicles could stage prior to the end of an event.

This is a worthwhile action. But it avoids an on-street clutter of pick-up activity that was not accounted for in the original intersection LOS impact estimates. Hence, it does not mitigate the impact disclosed.

□ The City to include on-street parking spaces within Mission Bay in the expansion and permanent implementation of SF*park*, including installation of sensors, dynamic pricing, and smart phone application providing real-time parking availability and cost.

This is a worthwhile action. But again, it helps solve a problem that is not reflected in the DSEIR intersection LOS analysis – that of vehicles cruising the area searching for parking. The 'searching' traffic would be additive to the traffic that was considered in compiling the LOS impacts.

□ The City shall work to include the publicly accessible off-street facilities into the permanent implementation of SF*park*, and incorporate data into a smart phone application and permanent dynamic message signs.

The problem with this is the same issue as above – the 'searching' traffic it may reduce was never considered in the DSEIR's analysis. Hence, it does not reduce the LOS impacts as disclosed.

□ If necessary to support achievement of non-auto mode shares for the project, the project sponsor shall cooperate with future City efforts for active interventions to effectively manage and price the parking supply in the project vicinity to reduce travel by automobile, thus improving traffic conditions.

The problem with this proposed mitigation measure is twofold. First, the project sponsor does not control most of the parking event attendees may use in the Project vicinity. Hence, it cannot meaningfully "manage and price" the parking supply. Second, for the 2015-16 basketball season, Warriors individual game tickets at season ticketholder prices range from $30 to $60 in the upper deck and from $85 to $550 in the lower deck. Season ticketholder per game prices for the recent 2015 playoffs ranged from $100 to $165 (upper deck) and from $210 to $1050 (lower deck) in the first round to, in the final round, from $230 to $345 (upper deck) and $525 to $2000 (lower deck). At these ticket prices, very few of the attendees who haven't already chosen to ride transit for other reasons are going to be sensitive enough to parking pricing to change mode. So this strategy is unlikely to be effective. 33 [TR-12a] cont.

□ The project sponsor to seek partnerships with car-sharing services.

Given the above ticket pricing inference as to the economics of event goers, it is doubtful that car-sharing partnerships would have quantifiable effect on travel habits or the ultimate intersection LOS impacts. Hence, there is no mitigation.

Strategy to Enhance Non-auto Modes

□ The project sponsor to provide a promotional incentive (e.g., show Clipper card or bike valet ticket for concession savings, chance to win merchandise or experience, etc.) for public transit use and/or bicycle valet use at the event center.

Given the above ticket pricing inference as to the economics of event goers, it is doubtful that the suggested incentives would have any effect on travel habits or the ultimate intersection LOS impacts. Hence, there is no mitigation.

Strategies to Enhance Transportation Conditions in Mission Bay and Nearby Neighborhoods

 The project sponsor to participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and to notify at least one month prior to the start of any non-GSW event with at least 12,500 expected attendees. If commercially reasonable circumstances prevent such advance notification, the GSW shall notify the MBBTCC within 72 hours of booking.

The notification provided herein is useful to set the ordinary event traffic management procedures in place for the scheduled date. However, there is no inference that this would change the intersection LOS impacts disclosed in the DSEIR. Hence, there is no mitigative effect.

 The City and the project sponsor to meet to discuss transportation and scheduling logistics following signing any marquee events (national tournaments or championships, political conventions, or tenants interested in additional season runs: NHL, NCAA, etc.).

Again, the notification provided herein is useful to set the ordinary event traffic management procedures in place for the scheduled date. However, there is no inference that this would change the intersection LOS impacts disclosed in the DSEIR. Hence, there is no mitigative effect. 33 [TR-12a] cont.

Strategies to Increase Transit Access

 The City to coordinate with regional providers to encourage increased special event service, particularly longer BART and Caltrain trains, and increased ferry and bus service.

If the City really wanted to mitigate the significant impacts on intersection LOS, instead of just asking the regional service providers for more services, it should condition the Project to pay the regional providers for the incremental cost of such services over fare revenue generated. Otherwise, the measure as constituted is unenforceable and ineffective.

 The City to work in good faith with the Water Emergency Transportation Agency, the project sponsor, UCSF, and other interested parties to explore the possibility of construction of a ferry landing at the terminus of 16th Street, and provision of ferry service during events.

Discussing possibilities is not mitigation. If the City wants to have this measure as an effective mitigation, it must condition the Project to contribute a fair-share payment to the ferry landing, if developed, and to pay fair share incremental costs over fare revenues for ferry operations.

The next section of mitigation for Project Impact TR-2 counts on the Mission Bay FSEIR Mitigation Measure E.47: the Transportation System Management Plan. 34 [TR-12b, TR-12c]

However, the effects of those portions of that TSM Plan that have been implemented have been absorbed and are reflected in the existing baseline counts that underlie this DSEIR's disclosures of impact TR-2. To constitute effective mitigation for the subject Project, this DSEIR should identify the specific elements of the hypothetical Mission Bay FSEIR Mitigation Measure E.47 that have actually been implemented and what enhancements to it this Project needs to carry out. For instance, considering the elements of Mission Bay FSEIR Mitigation Measure E.47 the following observations can be made.

FSEIR Mitigation Measure E.47.a: Shuttle Bus - Operate shuttle bus service between Mission Bay and regional transit stops in San Francisco (e.g., BART, Caltrain, Ferry Terminal, Transbay Transit Terminal), and specific gathering points in major San Francisco neighborhoods (e.g., Richmond and Mission Districts).

To be effective mitigation, the DSEIR must disclose what additions to shuttle routes and times of service would be needed to alter conditions reported in Impact TR-2 and commit the Project to implement them.

FSEIR Mitigation Measure E.47.b: Transit Pass Sales - Sell transit passes in neighborhood retail stores and commercial buildings in the Project Area. 34 [TR-12b, TR-12c] cont.

The effect of this measure is not quantifiable as mitigation. It is doubtful that anyone who might use transit to and from the Project site is deterred from doing so for want of a convenient location selling transit passes.

FSEIR Mitigation Measure E.47.c: Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers.

While transit subsidies might alter the commute modes of some daytime employees at the Project, given the composition of uses proposed, it is unclear how many employers would be characterized as "major" and consequently, how many employees would be qualified for subsidies. Hence, the effect of this measure cannot be quantified.

FSEIR Mitigation Measure E.47.e: Secure Bicycle Parking - Provide secure bicycle parking area in parking garages of residential buildings, office buildings, and research and development facilities. Provide secure bicycle parking areas by 1) constructing secure bicycle parking at a ratio of 1 bicycle parking space for each 20 automobile parking spaces, and 2) carry out an annual survey program during project development to establish trends in bicycle use and to estimate actual demand for secure bicycle parking and for sidewalk bicycle racks, increasing the number of secure bicycle parking spaces or racks either in new buildings or in existing automobile parking facilities to meet the estimated demand. Provide secure bicycle racks throughout Mission Bay for the use of visitors.

This measure might change the mode of choice of a few daytime employees or visitors to the site who would otherwise not use bicycle but it is not likely to change the choices of event attendees, particularly in the evening or evening workers.

FSEIR Mitigation Measure E.47.f: Appropriate Street Lighting - Ensure that streets and sidewalks in Mission Bay are sufficiently lit to provide pedestrians and bicyclists with a greater sense of safety, and thereby encourage Mission Bay employees, visitors and residents to walk and bicycle to and from Mission Bay.

Since adequate lighting is a prerequisite of any modern urban development, it is unlikely that this measure would change the mode splits the DSEIR already projects in disclosing impact TR-2. The measure has no. quantifiable mitigation effect.

FSEIR Mitigation Measure E.47.g: Transit and Pedestrian and Bicycle Route Information - Provide maps of the local and citywide pedestrian and bicycle routes with transit maps and information on kiosks throughout the Project Area to promote multi-modal travel.

The amount of change in the mode choice pattern the DSEIR already projects that provision of this information would result in is not quantifiable. Hence, there is no clear mitigation of Impact TR-2.

34 [TR-12b, TR-12c] cont.

FSEIR Mitigation Measure E.47.h: Parking Management Strategies - Establish parking management guidelines for the private operators of parking facilities in the Project Area.

This measure is so vague that consequences of it are not quantifiable. Hence, there is no clear mitigation of Impact TR-2.

FSEIR Mitigation Measure E.47i: Flexible Work Hours/Telecommuting - Where feasible, offer employees in the Project Area the opportunity to work on flexible schedules and/or telecommute so they could avoid peak hour traffic conditions.

This FSEIR mitigation measure does nothing to address the Project's special event transportation impacts in the PM peak and Early Evening hours.

FSEIR Mitigation Measure E.49: Ferry Service - Make a good faith effort to assist the Port of San Francisco and others in ongoing studies of the feasibility of expanding regional ferry service. Make good faith efforts to assist in implementing feasible study recommendations.

As previously noted in the context of other mentions of ferry service, this item does not qualify as mitigation for the DSEIR subject project since the DSEIR has failed to determine that ferry service is feasible and since it does not condition the Project to take qualifying actions such as paying fair share contributions to development of a ferry landing serving the Project or paying a fair share of the incremental cost of ferry operations over revenue.

Impact and Mitigation Measure TR-5

The DSEIR finds that the Project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity and finds it significant and unavoidable with mitigation (SUM). However, many of the purported mitigations disclosed are fatally flawed as demonstrated below.

Mitigation Measure M-TR-5a: Additional Caltrain Service
As a mitigation measure to accommodate transit demand to and from the South Bay for weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

Coordination does not qualify as mitigation. Doing something substantial such as offering to pay for incremental cost of additional services over revenues is necessary to consider this as mitigation. And determining the need for special service should have been done in this DSEIR, not deferred to subsequent surveys.

35 [TR-12b]

Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service
As a mitigation measure to accommodate transit demand to the North Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Golden GateTransit and WETA to provide additional ferry and/or bus service from San Francisco following weekday and weekend evening events. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

The same comment as immediately above applies. M-TR -5b does not qualify as mitigation under CEQA.

In summary, as these examples demonstrate, the measures proposed in an attempt to mitigate the Project's significant impacts lack substance, and their feasibility is still undetermined. Hence, the attempt at disclosing feasible mitigation is inadequate under CEQA.

Excessively Distant Time Frame and Massive Development Assumptions Masks Significance of Project's Nearer Term Cumulative Impacts

36 [TR-2h]

The cumulative analysis of the Project's transportation and circulation impacts is done in the context of a Year 2040 (25 years hence) plan-based development scenario. That scenario assumes development in Downtown, the SOMA and

Mission Bay that would add 162,000 new PM peak hour trips over existing[15]. Per DSEIR Table 5.2-22, the Project, at its highest PM peak hour trip generation intensity (with an evening capacity basketball game scheduled) would generate some 4599 person trips. This is only 2.84 percent of the new downtown-SOMA-Mission Bay trips projected in the 2040 cumulative analysis. As previously noted, San Francisco transportation impact thresholds require a project to add 5 percent to critical movements at an intersection already at unacceptable LOS, 5 percent to vehicle density on freeway ramps already at unacceptable levels, and 5 percent to MUNI ridership on screen lines and specific routes already exceeding acceptable percentages of capacity. Because the Project comprises only 2.84 percent of the PM peak hour core area trip growth contemplated in the cumulative analysis, it is highly unlikely that this Project, or any project of similar size, or even nearly double its size, could ever be found to cause transportation impacts that are cumulatively significant, given the nature of the impact thresholds and the distant and bloated development scenario that is the context of the cumulative transportation impact analysis of the Project. A more reasonable cumulative analysis would consider a future analysis year of, say, 10 years forward, and consider other development projects and transportation infrastructure projects that are reasonably foreseeable in that time frame. The cumulative analysis should be redone in that or similar context. 36 [TR-2h] cont.

While on this subject, it is worthwhile considering the transportation forecast model relied upon in the cumulative analysis – SF Champ. This is a model that, by its nature, is intended to provide information guiding major planning development policy decisions and major transportation investment decisions. It is not intended, or suitable, for providing microscale information at the level of transportation impact assessment of individual development projects on intersections, freeway ramps, individual transit lines and so on. This is evident in the validation statistics of the model. On traffic *screenlines* its validation accuracy is within 10 percent on only 80 percent of the screenlines tested[16]. Its accuracy on individual roadways and intersections would be significantly less. Since the criterion of significant cumulative impact at unsatisfactory intersections and ramps is a 5 percent contribution to the traffic at that location, the accuracy of the model is less than the impact threshold that the environmental analysis is attempting to measure. So using this forecast model for an EIR type micro-analysis is like using a sledge hammer or pile driver to drive a common pin. The lesson in this is that the City should be using a project-based build-up analysis over a shorter term future to develop the cumulative scenario.

Conclusion

[15] *San Francisco Transportation Plan 2040, Appendix C, Core Circulation Study*, SFMTA, 2013.
[16] See *San Francisco Transportation Forecasting Model Final Report, Executive Summary,* San Francisco County Transportation Authority by Cambridge Systematics, October 1, 2002.

Due to all of the foregoing, the DSEIR transportation and circulation section is inadequate. The document must be completely revised, a revision that will involve 37 [TR-2j]
disclosure of significant new information. Hence, the document should be recirculated in draft status for a full 45 day review period. 38 [ERP-5]

Sincerely,

Smith Engineering & Management

RE: Draft Subsequent EIR Informational Sufficiency Review for Golden State Warriors Arena aka - Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (SCN:2014112045)

Mr. Lippe,

This letter summarizes the professional opinions of Larry Wymer, licensed California Traffic Engineer (#1955), on the informational sufficiency of the Draft Subsequent Environmental Impact Report (DSEIR) for the proposed Golden State Warriors Arena. Henceforth, "DSEIR" will refer to the arena project's DSEIR

Per your request, I reviewed specific aspects of the DSEIR focusing on transportation and circulation. My Curriculum Vitae is attached outlining my 26 years of consulting experience in traffic engineering/transportation planning.

My opinions are outlined below.

OPINION 1 - The DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development

39a
[TR-2b]

The defined study area for the DSEIR is taken to be a subsection of the study area identified for the "Mission Bay Final Subsequent Environmental Impact Report", from which the DSEIR was tiered. Since the Mission Bay FSEIR was completed in 1998, the assumptions included therein are presently 17 years old and require appropriate revisions, and possibly expansions beyond those assumed within that report, to provide a similar level of impact analysis as provided therein.

Numerous San Francisco regional planning documents conclude that auto trips within and adjacent to the DSEIR's study area will increase significantly up to the 2040 cumulative year horizon. Specifically, the "2040 San Francisco Transportation Plan" concludes that daily auto trips within the "SoMa/Mission Bay" (South of Market/Mission Bay) regions along roadways arena traffic would travel will grow by the following percentages between 2012 and 2040:[1]

- Overall SoMa/Mission Bay auto trips (2012-2040) = +82% (+125,000 vehicles)
- So/Ma between Downtown Core & I-80 (2012-2040) = +42%
- So/Ma (south of I-80) to Mission Bay = +174%

Source: "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" DSEIR (June 5, 2015)

The table above establishes that the arterials within the northern portion of the study area will experience significant increases in traffic volumes ranging from 9% to 32%. At issue for much of this traffic is where the traffic will originate.

Table 5.2-23 (page 5.2-85), and corresponding text on pages 5.2-84 to 5.2-86, describes expected trip distribution patterns to the project site from attendees arriving from the downtown area, with increased numbers on weekdays due to attendees traveling to the study area directly from their jobs downtown:

> *The origin/destination distribution range for a weekday basketball game reflects an adjustment for event attendees who would travel to the event center directly from work rather than from their place of residence. The adjustment was based on a survey of Golden State Warriors season ticket holders (see Appendix TR). As shown in Table 5.2-23, the number of trips starting in San Francisco on a weekday is projected to be about 7.5 percentage points greater than on a weekend, with the corresponding reductions in trips arriving from the East Bay (2 percentage points), North Bay (4 percentage points), and South Bay (1.5 percentage points) areas. The majority of visitor trips to a convention event, retail, office, and restaurant uses would be from within San Francisco (70 to 81 percent), followed by South Bay (9 to 10 percent), and then East Bay (3 to 9 percent) origins/destinations.*

Because these attendees will be arriving largely from the high employment areas in and near downtown, significant numbers of attendees would be required to pass through the SoMa area and northern portion of the DSEIR's defined study area to arrive at either the stadium or one of the ancillary land uses (i.e. restaurants) in the vicinity of the proposed arena. And because these attendees will be travelling to the arena directly from work, it can be reasonably assumed many (if not most) would initiate their trip within the later part of the PM peak period (i.e. 5:00/5:30 to 6:00

pm). Thus it can be expected many intersections north of those studied within the DSEIR (i.e. from north of Market Street to south of King Street) will experience large increases in PM peak hour traffic volumes as a result of this Project.

When these project volumes are combined with the 42% to 174% increases within this same area (from north of Market Street to south of King Street), the potential impacts are compounded necessitating the need to widen the study area northward towards downtown. Thus the increases in both cumulative background and project traffic volumes, particularly during weekday PM peak hour periods, requires widening the study area beyond that included within the Mission Bay Blocks 29-32 DSEIR, and beyond the study area within the 1998 "Mission Bay Final Subsequent Environmental Impact Report" from which the more recent DSEIR was tiered.

A revised SEIR should expand the study area northward to at least Market Street, an area henceforth referred to as the "expanded study area". For planning purposes, the expanded study area into north Mission Bay and SoMa is assumed to be northward from the existing study area within an area bounded generally by 8th Street to the west, Market Street to the north between 8th Street and The Embarcadero, northward along The Embarcadero to Broadway, and the San Francisco Bay to the east. A few additional intersections are included in the neighborhood east of the I80/US-101 interchange.

Further justification for expanding the study area northward is provided in Opinion 2 below.

The following opinion will almost exclusively focus on weekday PM peak hour conditions since that is the time period my proposed expanded analysis is assumed will largely experience the most significant impacts.

39a
[TR-2b]
cont.

OPINION 2 - The DSEIR's Transportation and Circulation analysis does not analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas, most notably those between Market Street and King Street

To assist in reviewing the adequacy of the DSEIRs study area limits, I reviewed the draft traffic study (in memorandum format) for the previous proposed arena site. That memorandum report was titled *"Travel and Parking Demand Estimates for the Proposed Event Center and Mixed Use Development at Piers 30-32 and Seawall Lot 330";* stamped "Draft-Subject to Revisions; dated August 9, 2013; submitted by Jose I. Farran of Adavant Consulting; and submitted to the San Francisco Planning Department (Brett Bollinger, Chris Kern and Viktoriya Wise), Orion Environmental (Joyce Hsiao), and Environmental Science Associates (Paul Mitchell). The traffic study for this earlier proposed arena will henceforth be referred to as the "2013 memorandum traffic study," or "2013 arena study" within tables.

Although the arena analyzed in the 2013 memorandum traffic study was also originally proposed to be located south of I-80 (same as the currently proposed arena), trip distribution patterns and intersections identified as critical intersections warranting study stretches significantly further northward into and through the entire SoMa area, with a few even included north of Market Street. Since both versions of the arena project are located south of I-80, traffic arriving at the respective arena sites would include traffic originating from the downtown areas as described in Opinion 1, traffic would travel southeastward along SoMa arterials and through SoMa intersections to both sites, and traffic would also pass through still more intersections within the first several blocks south of I-80. The original 2013 memorandum traffic study analyzed 12 intersections north of I-80 and 10 intersections between I-80 and King Street, whereas none of these 22 intersections were analyzed within the DSEIR. A review of trip distribution patterns for both versions of the project reveal that trip distribution and assignment patterns are not substantially different between the two, however the DSEIR fails to reflect this reality with a noticeable absence of much needed analysis of the critical intersections identified in the traffic study for the earlier site.

Table 2 provides a summary of 27 study intersections located within the SoMA area and blocks north and south of I-80 which were analyzed within the 2013 memorandum traffic study, and the PM peak hour levels of service which

O-MBA10L4
Exh 2

were established therein for Existing (No Project), Existing Plus Project, and Existing Plus "No Event" Project conditions. The table also notes that 10 of these 27 intersections were analyzed within the1998 Mission Bay DSEIR, yet only 5 of those 10 intersections (and 5 of the 27) were analyzed within the DSEIR. And finally, the table shows that 13 of the 22 intersections neglected in the DSEIR would operate at deficient level of service (LOS) E or F operations for no project and/or plus project conditions.

NOTES:

Deficient LOS E or F within 2015 DSEIR LOS analysis.

[1] = Analyzed in Original 2013 Arena Study - "Event Center & Mixed-Use Development at Piers 30-32 & Seawall Lot 330" (GSW P30-32 LOS_Table 052815_FP.xlsx)(pg TR-783)

[2] = Analyzed in 1998 "Mission Bay Final Subsequent Enviroronmental Impact Report"

[3] = Analyzed in 2015 "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" (SCN:2014112045).
Table only considers study intersections north of the proposed project site, thus study intersections #6 through #22 of the DSEIR are neglected herein.

[4] = Incomplete data from memoranudm traffic study indicates deficient LOS E &/or F but no specifics regarding intersection #, delays, and which scenarios are projected to experience LOS E/F.

The information provided in the Table above supports Opinion 1 that the DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development, and that by extension the DSEIR's Transportation and Circulation analysis also does not adequately analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas.

39a
[TR-2b]
cont.

Based on the deficient levels of service identified in the table above which the proposed project would potentially add significant traffic volumes, a revised SEIR should add (at a minimum) the following 13 study intersections from the expanded study area identified above.

1) Mission Street / The Embarcadero
2) Howard Street / The Embarcadero
3) Folsom Street / The Embarcadero
4) Harrison Street / The Embarcadero
5) Bryant Street / The Embarcadero
6) Townsend Street / The Embarcadero
7) King Street / Second Street
8) Harrison Street / Main Street
9) Bryant Street / Beale Street
10) Folsom Street / Freemont Street
11) Harrison Street / First Street
12) Bryant Street / Fourth Street
13) Bryant Street / Second Street

Further justification for adding these 13 intersections is provided below.

Table 3 (divided into 3 sections 3a, 3b and 3c) summarizes a review of all of the CEQA Documents and notices for non-SFPUC projects consisting of Environmental Impact Reports, Negative Declaration, NOPs, etc. which were listed on the City/County of San Francisco's Planning Department Website as of July 17, 2015.[2] Each of the projects were reviewed to establish the location of the project relative to the arena, and more importantly if traffic generated by the project would impact any intersections the arena might also impact.

39a [TR-2b] cont.

If a cumulative project is located both well outside of the expanded study area, and it can be reasonably concluded the project would add little to no traffic to potential study intersections within the expanded study area, the project was eliminated from further consideration and not included in Table 3.

If the cumulative project was located near the expanded study area with the potential to add traffic volumes to potential study intersections within the expanded study area, the project was reviewed further to make a determination whether or not it should be added to Table 3.

If a cumulative project was located within the general boundaries of the expanded study area, it was included in Table 3 regardless of whether an EIR had been prepared or the project was at the initial NOP stage with study intersections yet to be determined.

For those projects which have an EIR and corresponding traffic impact study, I reviewed the traffic impact study with particular attention to trip distribution and study intersection graphics, and LOS intersection and freeway ramp operations analysis tables. I noted any study intersections located within the expanded study area described in Opinion 1 which were found to operate at a deficient level of service for weekday PM peak hour conditions for any scenario whether it be existing, cumulative, no project, plus project, etc. These intersections, along with corresponding deficient delays and LOS E and/or F operations, are noted in Table 3.

If the proposed project was located within the expanded study area itself, it is included in Table 3 whether it has completed an EIR with corresponding LOS tables, or simply an NOP with no traffic analysis yet. They were included because the project will obviously add some level of (yet to be determined) traffic to (yet to be determined) study intersections in the expanded study area, some of which might be newly added study intersections for the arena

[2] http://www.sf-planning.org/index.aspx?page=3562

project. Cumulative NOP projects without an EIR or traffic impact study are included for future planning purposes with the assumption an EIR and traffic impact study might be ready when a review is initiated to establish a revised scope and study area for a revised DSEIR. In the meantime, Table 3 includes an "NA" (not applicable) notation in place of a list of intersections operating at deficient levels of service.

Note that Table 3 is considered a planning level tool. Because a more detailed analysis will need to be performed at a later time to establish trip distribution and assignment patterns through the expanded study area, there is at present some uncertainty regarding the complete list of intersections within the expanded study area which will warrant study. Although an initial list of additional study intersections is provided below which in my opinion satisfies that criteria, it is not comprehensive and requires additional planning level analysis to expand to a full list. Thus without foresight regarding what intersections may or may not be included within that final list, and in the interest of providing an initial list of potential study intersections, Table 3 simply lists any and all study intersections identified as operating deficiently within the expanded study area within any EIR or traffic study.

Table 4 (divided into tables 4a and 4b due to length) combines and refines information provided within Tables 2 and 3 to provide a better planning level focus on the selection of study intersections within the expanded study area. It includes all of the intersections identified and included within Table 2 and/or Table 3. The table is organized with intersections separated into five different categories with those within the top most section being those which in my opinion absolutely satisfy the criteria of requiring analysis within a revised DSEIR, and those at the bottom of the list not requiring analysis unless a future screening analysis included them. A full and complete list of additional study intersections should be determined through a planning level analysis which considers trip distribution and assignment through the SoMa and northern Mission Bay areas north and south of I-80.

For clarity, intersections are organized within Table 4 with a specific order. For example, intersection "A"/"B" is such that street "A" consists of the northwest-southeast street (i.e. The Embarcadero, 1st St, 2nd St, ... , 7th St, 8th St, etc.) and street "B" consists of the southwest-northeast street (i.e. Market St, Mission St, ... , Harrison St, Bryant St, Brannan St, Bryan St, King St, Berry St, etc.). Additionally, lists of intersections are ordered beginning in the northeast (i.e. The Embarcadero/Broadway) and ending in the southwest (i.e. 8th St/Berry St).

The first five intersections (included within Table 4a) were already included within the DSEIR and are assumed would be included within the revised DSEIR. They are included simply to provide a full list of the intersections included in the 2013 memorandum traffic study.

The second set of intersections (also included within Table 4a) are comprised of the same thirteen intersections identified above as those which a revised SEIR should add (at a minimum) into the traffic analysis, all of which were also included within the 2013 memorandum traffic study.

The third set of intersections (also included within Table 4a) are comprised of the nine remaining intersections analyzed within the 2013 memorandum traffic study which may or may not be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment process.

The fourth set of intersections (also included within Table 4a) are comprised of the eleven remaining intersections analyzed within the 1998 Mission Bay FSEIR excluded from the 2015 DSEIR which may or may not be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment process.

The fifth and final set of intersections (comprising the entirety of Table 4b) are all of the remaining intersections included within Table 3, some of which may be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment screening process.

OPINION 3 –The DSEIR's Transportation and Circulation analysis understates and fails to disclose and mitigate arena event impacts on PM commute peak travel because it fails to consider the time and duration of attendees travel in advance of passing through venue entry turnstiles

39b
[TR-2d]

I have reviewed Dan T. Smith Jr.'s opinion within his report dated July 15, 2015 regarding The DSEIR's failure to adequately consider PM peak hour impacts due to its failure to consider the time and duration of attendees travel in advance of their arrival at the turnstile. I agree particularly with his statement that:

O-MBA10L4
Exh 2

"many attendees will, after traveling to the vicinity of the Project site, due to their this stop in neighboring restaurants and bars for drinks or a meal, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles by 30 minutes to an hour or more."

I can personally attest to this dynamic. I have personal experience with 'time of arrival' issues pertaining to the NBA arena where the Sacramento Kings play, presently called 'Sleep Train Arena', but historically called (and still commonly called) 'Arco Arena'. I lived in Sacramento for sixteen years (1996-2012), and during seven of those years (1996-2003) I literally lived within 100 ft of the I-80/Truxel Road interchange. The I-80/Truxel Road interchange is presently 1 of 3 main interchanges providing primary access to the arena, and during the time I lived near the interchange I witnessed the building of the interchange (about 1998, which at the time became the 2nd main interchange providing primary access to the arena). I also witnessed and experienced the development of nearly ALL of the ancillary commercial developments (including restaurants, bars, shopping, etc.) surrounding the arena following the completion of the Truxel interchange. Throughout those seven years I commuted to/from work along the highways and arterials surrounding the arena, and frequented the commercial developments surrounding the arena during and immediately after the PM peak hour period. Thus on each and every game day, whether I personally went to a game myself or not, I experienced first-hand the increased trip generation to ancillary land uses during the later part of the PM peak hour (i.e. 5:00-6:00), experienced increased traffic volumes on I-80 and connecting arterials near the arena, and experienced worsening levels of service and increased delays. In addition to living for a time in the immediate vicinity of the arena, I also attended over 200 NBA games at the arena (as well as dozens of other special events at the arena) throughout the sixteen years I lived in Sacramento. Although I moved to and lived in the Rocklin area between 2003 and 2012, I continued to visit the arena for games, concerts, etc. and would often arrive early to meet with friends and/or frequent one of the many restaurants in the area. Through this experience, I can personally attest to the fact that the ancillary commercial uses surrounding the arena most definitely experiences a significant uptick beginning about 5:00/5:30 pm on game days (and other special events), and that this uptick most definitely increases traffic volumes along I-80, on I-80 freeway ramps to the three interchanges providing primary access to the arena, and along the arterials (and surface streets) surrounding the arena. As part of my research to provide opinions of the sufficiency of review for the proposed Golden State Warriors Arena in Mission Bay, I contacted one of the traffic engineers in the City of Sacramento's Department of Transportation to discuss this 'early arrival' dynamic. He was in agreement that the area most definitely experiences an uptick in traffic and resulting worsening in levels of service during the end of the PM peak period. 39b [TR-2d] cont.

Please feel free to give me a call if you have any questions.

Re: **Hydrology, Water Quality and Biological Impacts** - Comments on Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 (Warriors Arena Project); San Francisco Planning Department Case No. 2014.1441E; State Clearinghouse No. 2014112045

Dear Ms Bohee and Mr. Bollinger:

This office represents the Mission Bay Alliance ("Alliance"), an organization dedicated to preserving the environment in the Mission Bay area of San Francisco, regarding the project known as the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("Warriors Arena Project" or "Project"). The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter. 1 [GEN-5]

This letter incorporates by reference, as comments on the DSEIR, all of the comments on the DSEIR contained in the July 21, 2015, letter report authored by Matt Hageman (attached as Exhibit 1) and the July 21, 2015, letter report authored by Erik Ringelberg and Kurt Balasek (attached as Exhibit 2).

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Wastewater Treatment Infrastructure Impacts.

The DSEIR concedes the Project's cumulative wastewater flow , in combination with other approved projects, will exceed the Mariposa Pump Station's capacity, and therefore, the Project will have a significant and unavoidable impact because it "would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects." (DSEIR, p. 5.7-13 - 5.7-20 [Impact C-UT-2].) But the DSEIR's disclosure of the nature and severity of the potentially significant impacts of building these new wastewater treatment facilities falls far short of CEQA's requirements. 2 [UTIL-3]

The DSEIR generally describes the type of new wastewater treatment facilities that might be built, stating:

> the SFPUC anticipates that improvements might include actions such as complete pump station replacement, enlarging or realigning the existing sewer main on Mariposa Street between 3rd Street and the Mariposa Pump Station; upgrading and adding dry weather pumps with potential temporary wet weather pump modifications; upgrading or replacing the dry-weather sump in the pump station; constructing new connections to the transport and storage box structure and rehabilitating the structure; and improving the hydraulic capacity of the downstream gravity sewers, if needed. If a new dry weather pump station is required, it could potentially be constructed within approximately a quarter mile radius of the existing Mariposa Pump Station.

(DSEIR, p. 5.7-14.)

The DSEIR then identifies a number of potentially significant impacts of constructing new wastewater treatment facilities necessitated by the Project, stating:

> These construction activities would be expected to result in temporary increases in truck and construction employee traffic, noise, and air pollutant and greenhouse gas emissions. In addition, depending on the site-specific design and location, the pump station improvements could result in physical effects on cultural resources, biological resources, water quality, and hazardous materials.

(DSEIR, p. 5.7-14.)

The DSEIR then vaguely suggests that these impacts could be mitigated to less than significant levels by adopting "typical" mitigation measures, stating:

> Most, if not all, of these potential impacts can generally be mitigated to a less-than-significant level with typical mitigation measures, similar to those identified in the Initial Study and the SEIR for this project. Long-term operational impacts would likely be less than significant because operation of the pump stations would be similar to existing operations of these facilities.

(DSEIR, p. 5.7-14.)

These vague descriptions fail to discharge the City's legal obligations under CEQA to fully

2
[UTIL-3]
cont.

describe the Project, including its "reasonably foreseeable consequence" of necessitating the construction of additional wastewater treatment facilities, and to include an "analysis of the environmental effects" of this future action and the mitigation measures that may reduce those impacts. (See e.g., *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396 (*Laurel Heights I*) ["an EIR must include a analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects].)

As shown in both the DSEIR's analysis of mitigation measures and the Mission Bay Alliance's comments on many types of impacts that construction of additional wastewater treatment facilities will cause (e.g., air quality, noise, traffic), the "mitigation measures ... identified in the Initial Study and the SEIR for this project" do not ensure that "impacts can generally be mitigated to a less-than-significant level."

2
[UTIL-3]
cont.

Finally, the DSEIR states:

> In the event that additional future wastewater flows would exceed the pump station capacities before the needed wastewater system improvements could be completed, it is assumed that the SFPUC would make internal operational or piping changes to accommodate the additional flows in the interim in order to remain in compliance with RWQCB permit requirements. The interim system modifications would be subject to the approval of the RWQCB under the terms of the Bayside NPDES permit. Approval by the RWQCB would ensure that water quality of the Bay would be protected during the interim period. Any interim system modifications are assumed to be operational or internal to the existing pump stations and therefore would not result in any physical environmental effects.

This remarkable passage suggests that the City is prepared to approve and allow construction of this Project without ensuring the construction of additional, adequate, sewage treatment capacity required by the Project. This is the opposite of responsible planning. Moreover, the City is apparently poised to take this action based on several unsupported assumptions. First, the DSEIR assumes, without discussion or evidentiary support, that interim modifications will not have a significant effect on the environment.

Second, the DSEIR assumes the Project's wastewater impacts on the Bay will only be "interim" until the SFPUC builds or expands permanent new wastewater treatment facilities; and that in this supposedly "interim" period, the Regional Water Quality Control Board will mitigate any "interim" impacts to less than significant. But there is no evidence to support the assumption the Project's wastewater can be treated to avoid significant adverse effects on Bay water quality before the SFPUC builds or expands permanent wastewater treatment facilities. Nor is there evidence that

3
[UTIL-6,
HYD-3]

Regional Water Quality Control Board regulation during any purported "interim" period would avoid significant adverse effects on Bay water quality. Nor is there any evidence as to how long this purportedly "interim" period will last, or how many other projects that will cumulatively exceed the Mariposa Pump Station's capacity will commence operations during this purportedly "interim" period.

Indeed, this DSEIR's approach represents a total abdication of the City's legal responsibility under CEQA to identify the Project's significant effects, to identify mitigation measures that would substantially reduce those effects, and to adopt all feasible mitigation measures that would substantially reduce those effects. To put it colloquially, punting the problem to the SFPUC or Regional Water Quality Control Board does not pass muster under CEQA.

3 [UTIL-6, HYD-3] cont.

II. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Contaminated Stormwater Impacts on San Francisco Bay Water Quality or Biological Resources.

In the chapter on the Project's Water Quality impacts, the DSEIR evaluates the impact of Combined Sewage Discharges (CSDs or CSOs) to the Bay that exceed treatment capacity of the Mariposa Pump Station due to the combination of increased storm water flows combined with sewage wastewater flows. The DSEIR uses two thresholds of significance based on the City's NPDES permit, stating:

> ● Wet weather flows to combined sewer system: The impact analysis examines whether project related increases in wastewater flows would contribute to combined sewer discharges during wet weather. The impact is considered less than significant if the increased flows would not increase the frequency of combined sewer discharges above the long-term average specified in the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and Bayside wet-weather facilities.

4 [HYD-5]

> ● Effluent discharges from SEWPCP: For the analysis of impacts related to changes in the quality of effluent discharges from the SEWPCP, the analysis considers whether discharges of wastewater to the combined sewer system would cause effluent quality to exceed the discharge limitations of the NPDES permit for the SEWPCP. If not, the impact is considered less than significant.

(DSEIR, p. 5.9-30.)

Thus, for purposes of complying with CEQA's requirement that it identify the Project's significant impacts, the DSEIR makes two unsupported assumptions: (1) that City compliance with its NPDES permits will avoid significant impacts, and (2) that the City will in fact comply with its NPDES permits. The DSEIR must support these assumptions with evidence.

5 [HYD-4]

In addition, the first threshold quoted above only looks at "frequency of combined sewer discharges above the long-term average" and ignores increases in quantity and duration of overflows. (See DSEIR, pp. 5.9-34 to 5.9-36.) The DSEIR notes:

> The model analyzed the effects of discharging the average flows from the proposed project in combination with the existing average flows in the drainage area. Under this scenario, the frequency of CSDs would not increase, but the volume of the CSDs would increase from 5.34 to 5.63 million gallons and the duration would increase from 17.2 to 17.3 hours.

(DSEIR, 5.9-35.) The DSEIR finds this impact less than significant because it defines "significance" solely in terms of the *number* of CSD events and compliance with the City's NPDES permit, regardless of the *quantity* of sewage discharged, stating:

> Because average and peak wastewater flows from the project site would not increase the frequency of CSD events from the Mariposa sub-basin and would be consistent with the requirements of the NPDES permit, project level water quality impacts related to contributions to an increase in CSD frequency would be *less than significant.*

(DSEIR, 5.9-35, 36.) The DSEIR makes the same finding for the Project's cumulative impact based on the same evidence and the same rationale. (DSEIR, 5.9-35, 36.)

This is a legal error because the DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.[1]

6 [HYD-6]

---

[1] *See*, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city's general plan); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718

The 1998 Mission Bay FSEIR sets the stage for this legal error in its finding that CSO impacts on the Bay are less than significant, stating:

> The same conclusions for the proposed project apply to the cumulative effects of Bayside projects, in that the cumulative increase in pollutant mass load from these projects would have a less-than-significant effect on water quality. As shown in Table V.K.8, the project would represent less than 3% of the increased total pollutant load from the Bayside. The cumulative loads for pollutants would generally increase by 4-6%. Thus, the project would cause approximately half of this cumulative increase for the Bayside. To put this in context, City discharges are a very small portion of the region-wide discharges to the Bay. Compared to municipal dischargers in the Bay Area, the load contribution of the Southeast Plant represents about 12 % of all other municipal dischargers, and the Mission Bay project would represent less than 3 % of that 12% (or 0.36% of all municipal wastewater discharged to the Bay). In addition, besides municipal wastewater, other sources of pollutant loading to San Francisco Bay include riverine inputs, nonurban runoff, urban runoff, point sources, dredging/sediment disposal, spills, and atmospheric deposition. Of these sources, point sources, including municipal dischargers and other permitted industrial dischargers, represent about 1-6 % of the total load input to the Bay-Delta estuary. Regarding stormwater discharges, San Francisco Bayside stormwater flows are about 1.8% of the total regional urban storm flow to the Bay. Considering the contribution of the project and of the cumulative Bayside projects in the context of all the other pollutant inputs to the Bay, the cumulative pollutant loading from Bayside projects would be extremely small.

(1998 MB FSEIR, p. V.K.52.)

This logic reflects the "de minimis" and "ratio" rationales rejected in *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"], and *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent

6 [HYD-5] cont.

(agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].) *Communities* and Kings *County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

Therefore, accepting the Hydroconsult numbers at face value, the starting point for assessing whether adding 2.9 million gallons per year[2] of incompletely treated CSD pollution to the existing condition of San Francisco Bay is significant is the existing condition of San Francisco Bay.[3] The DSEIR says very little on the topic. The 1998 Mission Bay FSEIR provides some information, but the DSEIR does not discuss how much of the 1998 Mission Bay FSEIR's information may be outdated as a result of the passage of seventeen years, and is, therefore, unknown.

The 1998 Mission Bay FSEIR characterizes "municipal wastewater" as follows:

> Municipal wastewater is a relatively strong waste stream containing high concentrations of organic matter that will decompose (measured as biochemical oxygen demand because the decomposition requires oxygen), inorganic particulates (measured as total suspended solids), nutrients (measured as total nitrogen and phosphorus), and pathogenic microorganisms. It also contains oil and grease and small quantities of toxic metals, pesticides, solvents, and plasticizers (additives in plastics that maintain softness and pliability). Conventional secondary treatment, as employed by San Francisco at its Southeast Water Pollution Control Plant, greatly reduces the concentrations of most substances in municipal wastewater. On the other hand, dissolved metals and organic substances that are resistant to breakdown by bacteria, may pass through the plant relatively unaltered. This waste stream, after

6 [HYD-5] cont.

---

[2] 5.63 – 5.34 = 0.29 x 10 = 2.9.

[3] "If the rainstorm is a large one, and the capacity of the storage/transport box sewers is exceeded, treated combined sewer overflows (CSOs) occur at outfalls along the City's shoreline. When combined sewage is temporarily stored in transport/storage structures, floating materials are removed from the water surface and some solids settle to the bottom of the structures. The accumulated solids are then flushed to the treatment plant after the storm has subsided. The treatment that occurs within the structures is approximately equivalent to primary treatment." (1998 MB FSEIR, p. V.K.8-9.)

> treatment, is referred to as municipal wastewater effluent in this SEIR.

(1998 MB FSEIR, p. V.K.4.)

The 1998 Mission Bay FSEIR characterizes "urban stormwater " as follows:

> Urban stormwater is a large-volume wastewater stream. Pollutants contained in urban runoff include street litter, sediment (mostly inorganic particulates, measured as total suspended solids), oil and grease, oxygen-demanding substances, pathogenic microorganisms, toxic metals, and pesticides. The concentrations of oxygen-demanding substances, nutrients, and pathogenic microorganisms are much lower than in untreated municipal wastewater. CSOs exhibit a blend of the untreated characteristics of municipal wastewater and urban stormwater runoff.

(1998 MB FSEIR, p. V.K.4.)

The 1998 Mission Bay FSEIR characterizes the "impairment of Central San Francisco Bay" as follows:

6 [HYD-5] cont.

> The State Water Resources Control Board (SWRCB) has listed central San Francisco Bay as impaired on the basis of field surveys of the water column, sediments, sediment toxicity, bivalve bioaccumulation, and water toxicity. The determination relates to mercury, copper, selenium, diazinon, and polychlorinated biphenyls (PCBs).
> • Mercury. The main source of mercury in the Bay is erosion and drainage from abandoned gold and mercury mines. Other sources include natural sources, atmospheric deposition, and various industrial and municipal sources.
> • Copper. Copper enters the Bay through municipal sources, stormwater runoff (primarily through automobile brake pad dust), and other nonpoint sources (such as soils and abandoned mines). These are the three main sources, and they contribute roughly equivalent amounts.
> • Selenium. Selenium enters the Bay through industrial point sources (e.g., oil refineries), agriculture, and natural sources. Control programs are in place to address selenium discharges from oil refineries
> • Diazinon. Diazinon is a pesticide that enters the Bay as runoff from agriculture and, to a lesser extent, residential land uses. Diazinon is a primary component of insecticides. Homeowner pesticide use peaks in late spring and early summer.
> • PCBs. Although PCBs are no longer manufactured in the U.S., PCBs previously released to the environment enter the Bay through stormwater runoff and transport through the food chain. PCB levels in fish have resulted in health advisories for fish consumption.

(1998 MB FSEIR, p. V.K.8-9.)

The above information shows the existing environmental harm (or "preexisting cumulative effect" in the words of *Communities, supra*) is severe, and this Project will make it worse. Therefore, the DSEIR's finding that the Project's cumulative CSD impacts on the Bay are less-than-significant is erroneous as a matter of law. It is based on two legal errors: (1) the exclusion of CSD *quantity* from its threshold of significance, which reflects the "de minimis" and "ratio" rationales rejected in *Communities, supra* and *Kings County, supra*; and (2) the DSEIR's reliance on another agency's regulatory standards (i.e., the NPDES permit) to determine significance under CEQA. 6 [HYD-5] cont.

As discussed in the attached reports by Matt Hageman and Erik Ringelberg, the Project's CEQA documents (i.e., the 1998 Mission Bay FSEIR, 2014 NOP/IS, and 2015 DSEIR), fail to analyze or develop mitigation measures to reduce the Project's likely contribution of a suite of toxic chemicals, including PCBs, to San Francisco Bay in amounts deleterious to the Bay's biota. 7 [HYD-2]

Further, it is impossible to place the discussion of this entire issue (at DSEIR pages 5.9-34 to 5.9-36) in a meaningful context, because the DSEIR does not inform the reader if the discussion assumes construction or expansion of permanent wastewater treatment facilities by the SFPUC. 8 [HYD-5]

Also, the DSEIR says: "the [Hydroconsult] model estimated the annual average frequency, volume, and duration of CSDs that would occur once the Mariposa wet- and dry-weather pump stations reach the combined capacity of 11.2 mgd under existing and project conditions. The model estimates that under existing conditions, CSDs from the Mariposa sub-basin occur approximately 10 times per year with an average volume of 5.34 million gallons and duration of 17.2 hours." (DSEIR, p. 5.9-35.) This text implies that the "Hydroconsult" model includes wet-weather flows and wet-weather CSDs. But the only Hydrocunsult memo cited and included in Appendix HYD states:

9 [HYD-5]

> Three scenarios were analyzed: base case, project, and cumulative. The base case scenario includes existing conditions plus developments and improvements expected to be substantially complete previous to occupancy of the GSW arena. The project scenario adds the DWF from the arena only and the cumulative scenario adds the project DWF plus DWF from reasonably foreseeable projects in the basin. In all three scenarios, the wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay. All DWF from the proposed GSW arena is assumed to flow to the Mariposa pump station (MPS), therefore Mariposa is the only basin analyzed.

(DSEIR, Appendix HYD, p.1.) The statement "wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay" makes sense if it refers only to stormwater from the Mission Bay Redevelopment Area, because all of that stormwater will be separated from wastewater flows when the separate stormwater system for Mission Bay is completed in 2015. (See DSEIR, p. 5.7-4.)[4] But the DSEIR also states that storm water from areas outside Mission Bay will continue to combine with wastewater flows to the Mariposa Pump Station and will contribute to wet weather CSDs. (DSEIR, p. 5.7-7.)[5] If this is correct, then the Hydroconsult dry-weather analysis is beside the point. 9 [HYD-5] cont.

Also, the numbers for Mariposa Pump Station capacity and wastewater or stormwater flows are confusing. For example, DSEIR page 5.9-35 says the Mariposa wet- and dry-weather pump stations have a "combined capacity of 11.2 mgd." DSEIR page 5.7-7 also refers to "the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd)."[6] But DSEIR page 5.9-34 says: "The potential effect would be greatest in the reconfigured Mariposa sub-basin, which has a *wet weather capacity of 12 mgd* (italics added)." Which is correct? 10 UTIL-3]

---

[4]"The separate stormwater system for the Mission Bay South Plan area is currently being implemented by the master developer and includes four drainage zones within the geographic boundaries of the reconfigured Central sub-basin that have already been constructed and one drainage zone within the geographic boundaries of the reconfigured Mariposa sub-basin which is currently under construction. Stormwater in each of the drainage zones flows by gravity to one of five stormwater pump stations in the locations shown on **Figure 5.7-2**, including Pump Station SDPS-5 near the east end of 16th Street. When construction of the fifth drainage basin is completed (anticipated in 2015, prior to construction and operation of the proposed project), all stormwater runoff from Mission Bay South will be conveyed through the separate stormwater system and discharged to the Bay and China Basin Channel (Mission Creek)." (DSEIR, p. 5.7-4 (pdf151).)

[5]"The 240-acre reconfigured Mariposa sub-basin of the combined sewer system is divided into two tributary areas that direct flow to the Mariposa Pump Station. Tributary B includes Potrero Hill to the south of Mariposa Street and is outside of the Mission Bay Plan area; this tributary area directs both rainwater and wastewater to the pump station. Tributary A includes areas to the north of Mariposa Street that are located within the Plan area; in this area, stormwater flows are directed to the separate stormwater system constructed for the Mission Bay South development, and only wastewater flows are directed to the Mariposa Pump Station." (DSEIR, p. 5.7-7.)

[6]"In the event that wet weather flows in the Mariposa subbasin exceed the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd), the excess flows are discharged to the Bay as a combined sewer discharge after receiving flow-through treatment in the transport and storage structure."

III. The DSEIR Is Not Sufficient as an Informational Document with Respect to Project Impacts on Biological Resources, Including Wetlands and Wildlife.

A. The City's decision to exclude the Project's impacts on biological resources from the DSEIR is erroneous.

The City's decision to exclude the Project's impacts on biological resources from the DSEIR (see DSEIR, p. 5.1-1) is erroneous as a matter of law. Both the NOP/IS and the DSEIR announce that their analyses are "tiered" to the 1998 Mission Bay FSEIR pursuant to CEQA Guideline 15168(c). (IS, p. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR also announce that the standards used to exclude resource topics from the DSEIR are the standards used to determine if a subsequent EIR is required under CEQA section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.) 11 [ERP-7, BIO-1]

Based on these predicates, the City decided to prepare a focused EIR, and to conduct no environmental review with respect to the following resources: Biological Resources, Aesthetics, Land Use Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. As discussed in more detail in the July 27, 2015, letter from the Mission Bay Alliance's legal counsel regarding "tiering," the City's assumption that it may prepare an EIR for this Project that tiers to the 1998 Mission Bay FSEIR is legally incorrect. As discussed in several comment letters submitted on behalf of the Mission Bay Alliance, and below regarding the Project's impacts on biological resources, the evidence relating to these excluded resource topics meets both the "fair argument" standard, as well as the CEQA section 21166 standards. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all of the Project's environmental impacts.

B. There is substantial evidence supporting a fair argument the Project will have a significant adverse effect on biological resources.

While the NOP/IS give short shrift to on-site biological resources, there is substantial evidence, in the NOP/IS and the attached reports from Matt Hageman and Erik Ringelberg, supporting a fair argument the Project may have significant effects on (1) migratory birds; (2) off-site special status species downstream of the Project, including steelhead (Oncorhynchus mykiss); and (3) the on-site wetland and its ecology and associated wildlife. 12 [BIO-1]

With respect to migratory birds, the NOP/IS admits that the 1998 Mission Bay FSEIR did not assess the redevelopment Plan's effects on migratory birds. (NOP/IS, p. 81.) In addition, the NOP/IS concedes the Project may have significant impacts on migratory birds because it recommends the adoption of mitigation measures to substantially reduce these impacts, stating: "With implementation Mitigation Measures M-BI-4a, Preconstruction Surveys for Nesting Birds, and M-BI-4b, Bird Safe Building Practices, the project would not result in any new or substantially 13 [BIO-1, BIO-6] more severe significant impacts on resident or migratory bird species than those identified in the FSEIR." (NOP/IS, p. 81.)

This approach violates CEQA in a number of ways. First, as discussed above, the Project is a separate project from the 1998 Redevelopment Plan, or at a minimum, is not within the scope of the 1998 Mission Bay FSEIR. This fact precludes the City from "tiering" to the 1998 FSEIR for any resource, including impacts on biological resources such as migratory birds.[7] Second, trying to mitigate significant impacts before assessing their nature and extent puts the cart before the horse.[8] Third, as discussed above, the NOP/IS's concession that the Project may have significant impacts on migratory birds is substantial evidence supporting a fair argument the Project will have a significant adverse effect on migratory birds; therefore, the City is required to include an assessment of these impacts in the DSEIR.[9] Fourth, even if the City's assumption that CEQA section 21166 applies is correct, the addition of a 750,000 square foot sports arena and an additional 160 foot office tower to the Mission Bay Redevelopment Plan are substantial changes in the Redevelopment Plan that give rise to new potentially significant effects on birds that must be analyzed in the subsequent EIR. 13 [BIO-1, BIO-6] cont.

With respect to impacts on special status species, the NOP/IS states:

> At the time of preparation of the Mission Bay FSEIR, the project site contained several buildings and facilities and was noted as lacking any notable vegetative habitat, with no state listed threatened, endangered or rare plants, or rare, threatened or endangered animal species known to occur in the upland portion of the Mission Bay plan area, including the project site. Subsequent to that time, the project site has been subject to building removal, grading, excavation, and construction of paved surface parking lots, fencing and utilities on portions of the site. Other than the creation of the depression as a result of remediation actions, no other changes in the site since the preparation of the FSEIR have altered the characteristics of the site in relation to biological habitat. These changes in conditions on the project site have 14 [HYD-2, BIO-4]

[7] *Sierra Nevada Conservation, supra.*

[8] CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

[9] *Protect the Historic Amador Waterways, supra*.

> not altered the fact that the site provides no suitable habitat for any sensitive or special status species due to the sparse and ruderal nature of onsite vegetation, as well as the site's location in a densely urbanized environment, as confirmed through the reconnaissance survey and database review of special status species occurrences within the vicinity of the project site. In addition, there have been no substantial changes with respect to the circumstances under which the project would be undertaken, nor has any new information become available that demonstrates new or more severe impacts associated with the proposed project.

(NOP/IS, pp. 78-79.) 14 [HYD-2, BIO-4] cont.

But as Mr Ringelberg points out:

> the potential project impacts to the closest federally designated critical habitat is steelhead Oncorhynchus mykiss are ignored. This habitat runs directly adjacent to the project area. In addition, San Francisco manzanita (Arctostaphytos franciscana) critical habitat is present approximately 2.6 miles to the west and should also have been identified and analyzed. The federal critical habitat analysis is missing, and the provided analysis itself is defective. The potential project's impact(s) to these listed species and their critical habitat are therefore unexamined. The project's dust, stormwater, surface flooding, and groundwater place those species at risk from hazardous chemicals.

(Exhibit 2, p. 11.)

As both Mr. Hageman and Mr. Ringelberg point out, none of the Project's CEQA documents assess the effects of toxic chemical runoff on Bay biota, including steelhead. Where, as here, the lead agency fails to study an area of possible environmental impact, a fair argument may be based on the limited facts in the record because deficiencies in the record may enlarge the scope of fair argument by lending a logical plausibility to a wider range of inferences." (*Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311.) 15 [HYD-2, BIO-4]

Further, there is substantial evidence in the reports from Matt Hageman and Erik Ringelberg supporting a fair argument the Project may have significant effects on steelhead from toxic runoff. Again, even if CEQA section 21166 applies, CEQA requires including this issue in the subsequent EIR. The Phase 11 reports showing the site is contaminated with a suite of toxic compounds is significant new information showing the potential for new significant effects not previously

Re: Mission Bay Alliance comments on the Warriors Arena Project DSEIR: Hydrology, Water Quality and Biological Impacts
July 24, 2015
Page 14

identified.[10] 15 [HYD-2, BIO-4] cont.

With respect to potential impacts on the on-site wetland, the NOP/IS indicates the DSEIR will not assess impacts on the wetland even though the 1998 FSEIR did not, and could not have, analyzed the wetland since it was apparently created sometime after 2005. (See Exhibit 2, Figure 1 and accompanying text.)

Typically if there is a potential wetland resource, there would be a formal delineation prior to release of the DEIR so the resource can be analyzed, and appropriate mitigation developed. Here, the NOP/IS claims it may not be jurisdictional (p. 80), and at the same time attempts to suggest mitigation (p. 81) in case it is. But the mitigation suggested is not enforceable, in violation of CEQA. Further, as discussed above, trying to mitigate impacts before assessing their significance puts the cart before the horse. (*Lotus v. Department of Transportation*, *supra*.)[11]

In addition, the NOP/IS' evidentiary basis for dismissing the wetland from the DSEIR is flimsy, stating: 16 [BIO-5]

> Because the excavation depressions on the site are small, isolated features resulting from recently completed hazardous materials remediation activities and are surrounded by paved areas and urban development, these features do not provide the important biological habitat functions and values that are typically associated with federally protected wetlands.

(NOP/IS, pp. 78-79.) But as Mr. Ringelberg points out:

> Conversely, and in rebuttal to their prior assertion that there are readily substitutable habitats nearby, small wetland features can have exceptional ecological value, in particular if they are one of the few remaining features in an urban setting.

(Exhibit 2, p. 6.)

Further, there is substantial evidence in the report from Erik Ringelberg supporting a fair argument the Project may have a significant effect by destroying the on-site wetland. Again, even

[10]See Letter to Marty Glick re: Phase 2 Subsurface Investigation Approval, Golden State Warriors Arena, Blocks 29-32, San Francisco, CA 94158; Phase II Environmental Site Assessment, Golden State Warriors Arena, Blocks 29-32, Mission Bay, San Francisco, California.

[11]Also, the NOP/IS fails to even mention the state wetland policy (WRAPP) under Porter Cologne (fn. 49).

Page 15

if CEQA section 21166 applies, CEQA requires including this issue in the subsequent EIR because the presence of the wetland is a change in circumstances since certification of the 1998 FSEIR that gives rise to the potential for new significant effects not previously identified. 16 [BIO-5] cont.

IV. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Flooding Risk.

Chapter 5.9 of the DSEIR does not examine the potential for Project induced increases in storm water runoff to "contribute considerably" to cumulative risk of flooding. (See DSEIR p. 5.9-9 to 5.9-18.) Chapter 5.7 does not do so either. Instead, it analyzes whether the Project will require construction of new or additional storm drainage capacity. (See DSEIR, pp. 5.7-18, 19 [Impact C-UT-3].) But the question whether the Project will require construction of new facilities is different than the question whether it will cause the impact such new facilities are intended to avoid. (See e.g., Chapters 5.7 and 5.9 regarding CSD impacts, and the discussion of same in section 1 above.)

The DSEIR's analysis of cumulative stormwater (C-UT-3) states that the impact is less than significant because the capacity of the new, separated stormwater system is adequate. (DSEIR, p. 5.7-18.) This section of the DSEIR cites to "BKF, Mission Bay Blocks 29-32 - Stormwater Memorandum, January 6, 2015." (DSEIR, p. 5.7-18, note 20.) This Stormwater Memorandum, in turn, states: 17 [HYD-6]

> G. Major Storm Events
> The storm drain system and pump station are designed to handle runoff from a 5-year storm event. During larger events such as a 100-year storm event, runoff is conveyed through the streets to a controlled overflow to the Bay. The overland flow analysis was studied in the "Revised Summary Drainage Study for the South of Channel Watershed for Mission Bay Project", dated December 1, 2000. Based on December 2000 study, overland flow from drainage basin, where the Project is located (i.e., "Drainage Basin B"), currently enters the Bay via an existing overflow near Mission Bay Boulevard North (North Overflow). Overland flow in Project perimeter streets, except 16th Street, is conveyed to this North Overflow. Overland flow in 16th Street is conveyed to overflow located to the south of Project near park P24. Refer to attached Figure D for the location of the overland flow release.
> The Project will be sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment. Flood proofing will include using protective measures to prevent storm runoff from inundating and/or damaging equipment such as furnaces, boilers, air conditioning compressors, air ducts, electrical system components, electrical wiring, dry conduits, electrical and gas meters, utility rooms, septic tanks, control panels, HVAC systems and fuel systems."

(BKF, Mission Bay Blocks 29-32 - Stormwater Memorandum, January 6, 2015, p. 6.)

There are two missing pieces of this analysis. First, the memorandum tells us "The Project will be sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment." This may be good news for the Project itself, but it tells the reader nothing about the extent to which this Project will contribute to increased flood risk to surrounding properties. The DSEIR does not examine the potential for Project induced increases in storm water runoff to "contribute considerably" to cumulative risk of flooding around the Project. (See DSEIR p. 5.9-9 to 5.9-18.) Second, the DSEIR does not describe the "flood proofing" measures that it says will avoid inundating below grade structures of the Project.

17 [HYD-6] cont.

V. The DSEIR Is Not Sufficient as an Informational Document with Respect to Inundation Impacts of the Project.

The DSEIR concedes the Project will be vulnerable to inundation and flooding as a result of a combination of climate change induced sea level rise and storm surge. (DSEIR, pp. 5.9-10-16.) The DSEIR also describes several government initiatives to plan for and protect against such inundation. (DSEIR, p. 5.9-17-18.)

This discussion makes it clear the Mission Bay area, and the Project site in particular, will need to be protected from inundation in the foreseeable future. Therefore, the construction of protective measures is a reasonably foreseeable consequence of Project approval, and the construction of protective measures will change the nature and extent of the Project's environmental impacts. Therefore, the DSEIR must describe these measures and their environmental effects. (Laurel Heights I, supra.)

Subject: Comments on the Event Center and Mixed-Use Development Project at Mission Bay Blocks 29-32

Dear Mr. Lippe:

We have reviewed the June 5, 2015 Draft Subsequent Environmental Impact Report (DSEIR) for the Event Center and Mixed-Use Development Project ("Project") at Mission Bay Blocks 29-32. GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an approximately 11-acre site on Blocks 29-32 within the Mission Bay South Redevelopment Plan Area of San Francisco. The proposed event center would host the Golden State Warriors basketball team during the NBA season, and provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences, and conventions.

We have found significant shortcomings in the DSEIR in identifying impacts on Hydrology and Water Quality. A revised DSEIR should be prepared to address these inadequacies and to incorporate mitigation to reduce impacts which otherwise would degrade the water quality of San Francisco Bay.

Hydrology and Water Quality

The DSEIR acknowledges that the San Francisco Bay is impaired under Section 303(d) of the Clean Water Act for chlordane, DDT, dieldrin, dioxins, furan compounds, mercury, polychlorinated biphenyls (PCBs), invasive species, and trash (p. 5.9-22). Of these, PCBs are of the greatest concern for Project water quality impacts. A total maximum daily load (TMDL), limiting PCB discharges, has been issued by the San Francisco Bay Regional Water Quality Control Board (RWQCB) for PCBs in San Francisco Bay and it is proving very difficult and very costly for Bay Area cities, who are responsible for limiting PCB discharges,

19 [HYD-2]

to meet. According to the RWQCB, Bay Area municipalities will spend millions of dollars to achieve the ten-fold reduction in PCBs required by the TMDL.[1]

The DSEIR utterly fails to evaluate how Project construction may result in discharge of PCBs to San Francisco Bay, leading to further impairment. Failure to conduct this analysis flies in the face of the TMDL mandate which requires reduction of PCB discharge to the Bay and ignores guidance issued by the San Francisco Bay Regional Water Quality Control Board (RWQCB) on reducing PCB discharges at sites that require cleanup and where buildings that likely contain PCBs in construction materials will be torn down.

The Project poses significant threats to water quality of San Francisco Bay from the release of PCBs upon construction from two sources: (1) contamination in soil at sites that will undergo cleanup; and (2) PCBs used in former building materials at the Project site.

Contaminated Sites Pose Potential PCB Impacts

The DSEIR fails to acknowledge the PCB-contamination threat posed from numerous sites that will require cleanup prior to Project construction. The Initial Study (IS), in summarizing information in the Mission Bay SEIR, stated that land uses at Blocks 29-32 included crude oil storage, offices, railroad tracks, trucking-related activities, maintenance and repair facilities, junk yard, stock corral, a gravel plant, bus company facility, equipment rental, storage yard, auto body shop, and a warehouse (p. 108). No evaluation of these sites for PCB-containing equipment was included in the DSEIR and no analysis of any spills that would have originated from such equipment was conducted.

19 [HYD-2] cont.

The RWQCB has identified PCBs originating from sites undergoing cleanup on the margins of San Francisco Bay are a major threat to water achieving the TMDL, stating:

> Stormwater runoff from sites containing residual PCBs in soils after state and federal ordered cleanups contribute to PCB sediment concentrations in the Bay and such contributions must be essentially eliminated in order to achieve the TMDL target. For cleanup sites, the TMDL calls for implementing "on-land source control measures, to ensure that on-land sources of PCBs do not further contaminate in-Bay sediments."

The IS acknowledges the potential threats that contaminants pose during Project development, stating:

> The Mission Bay FSEIR discussed various types of construction activities, including excavation, grading, trenching, soil movement/transport, pile installation, building demolition and removal of underground storage tanks that would potentially expose workers and the public to contaminated soils, dust, soil gases and other hazards. The Mission Bay FSEIR also noted the potential for construction dust-related effects on the aquatic and terrestrial environment.

However, the Mission Bay FSEIR pre-dates the issuance of the RWQCB TMDL for PCBs in San Francisco Bay and mitigation in the Mission Bay FSEIR make no provisions for ensuring that PCBs are not mobilized and transported to the Bay during Project construction. As stated by the RWQCB:

[1] San Francisco Bay Regional Water Quality Control Board, September 2013, San Francisco Bay PCBs TMDL Implementation at Cleanup Sites: http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/TMDLs/sfbaypcbs/SF%20Bay%20PCBs%20TMDL%20-%20Considerations%20for%20Cleanup%20Sites%20September%205%202013.pdf, p. 1

> Of particular concern, and often overlooked, is the fact that PCBs in surface soil can be mobilized by stormwater runoff and flow to the Bay.

The RWQCB's concerns are justified by the failure of the DSEIR in identifying how Project construction might contribute to the PCB impairment of San Francisco Bay. The DSEIR, in ignoring this issue, provides no PCB-specific mitigation to prevent the flow of PCBs to the Bay upon construction. Mitigation identified in the Mission Bay FSEIR specified only minimum parameters to be included in a Risk Management Plan for the addressing contaminated soils and groundwater prior to and during construction of individual development projects.

PCBs, when spilled and released to soil, stick strongly to the soil particles that is entrained with stormwater when mobilized during rain events and which leads to PCB deposition in the Bay. The DSEIR offers no mitigation to address this likelihood, and only provides tepid assurance that stormwater will be managed consistent with "San Francisco Stormwater Design Guidelines" (p. 5.9-25). The cited San Francisco Stormwater Design Guidelines makes no special provisions for PCB contamination other than to say:

> Control of PCBs and mercury will be implemented through design measures that limit the mobilization of these pollutants in contaminated soils.[2]

19 [HYD-2] cont.

The San Francisco Stormwater Design Guidelines make no further statements about what the PCB design measures would entail and how specifically PCB discharge in stormwater will be limited. The San Francisco Stormwater Design Guidelines are mute on the urgency that faces San Francisco in preventing PCB discharges, in stark contrast to the language use by the RWQCB in issuing the following edict in eliminating all PCB discharges from cleanup sites:

> … it is important that cleanup sites do not contribute any PCBs to surface water runoff. Remedial actions should be conducted so as to eliminate all means of conveyance of PCBs from cleanup sites, including sediment runoff, vehicular drag out, and airborne dust.

Because the issue of PCBs is not specifically addressed, the DSEIR offers an inadequate basis for making the following statement on stormwater contamination:

> Implementation of BMPs and other stormwater control measures required by the updated Phase II General MS4 NPDES Permit; Article 4.2 of the San Francisco Public Works Code, Section 147; and the City's Stormwater Design Guidelines would ensure that the project does not contribute to an increase in discharge of stormwater pollutants to the Bay in discharges from the separate stormwater system. Therefore, impacts related to degradation of water quality and providing an additional source of stormwater pollutants are less than significant in relation to direct stormwater discharges.

Without mitigation and specific measures to address PCB contamination in the Project area, the impacts from Project construction on the already impaired San Francisco Bay may be significant. The DSEIR should acknowledge the PCB contamination potential and offer concrete mitigation to address the

[2] San Francisco Stormwater Design Guideline, September 2009 http://www.sfwater.org/Modules/ShowDocument.aspx?documentID=2779, p. 14

stormwater transport of PCB-contaminated soils to the Bay. Concrete steps to incorporate, as mitigation in a revised DSEIR and prior to Project construction, include:

- A thorough parcel-by-parcel review of the potential use of PCB-containing equipment;
- Site inspections of each parcel which used electrical equipment and sampling of soil where PCB-containing equipment is identified; and
- Cleanup of PCB-impacted soil at concentrations that exceed 25 ug/kg, consistent with RWQCB guidance.[3]

PCBs in Originating from former land uses at the Project Site have not been Adequately Evaluated

Polychlorinated biphenyls (PCB) contamination originating from materials used in building construction is receiving intense scrutiny from regulatory agencies. The U.S. EPA has acknowledged that demolition of 1950s- to 1970s-era buildings, or cleanup of those sites, may disturb PCB-containing materials used in caulking and as a plasticizer in paints and other coatings.[4] In fact, a recent report has found that PCBs are prevalent in the caulk in Bay Area buildings constructed from 1950 to 1980. PCBs were detected in 88% of the caulk samples tested; 40% of the samples contained greater than 50 ppm PCBs and 20% contained greater than 10,000 ppm PCBs.[5] PCBs were used in electrical transformers manufactured between 1929 and 1977 and are a well-recognized source of soil contamination when fluid is leaked.[6] 19 [HYD-2] cont.

According to the US EPA[7]:

> PCBs do not break down in our environment and can have severe health effects on humans. PCBs in the air eventually return to our land and water by settling or from runoff in snow and rain. In our water, PCBs build up in fish and can reach levels hundreds of thousands of times higher than the levels in water. Fish consumption advisories are in effect for PCBs in all five of the Great Lakes. PCBs are the leading chemical risk from fish consumption.

Because PCBs do not break down, PCBs may be present at the Project site from former land uses which include:[8]

- Bulk fuel storage and distribution (approximately 1902 to 1966).
- Railroad operations (approximately 1904 to 1939).
- A machine shop (approximately 1904 to 1927).
- A boiler house (approximately 1904 to 1927).
- Steel mill (approximately 1906 to 1928).
- Well casing manufacturer (1907 to 1975).

---

[4] US EPA, PCBs in Caulk in Older Buildings: http://www.epa.gov/pcbsincaulk/
[5] San Francisco Estuary Project, PCBs in Caulk Project: http://www.sfestuary.org/taking-action-for-clean-water-pcbs-in-caulk-project/
[6] US EPA, Polychlorinated Biphenyls (PCBs) http://www.epa.gov/reg3wcmd/ts_pcbs.htm
[7] Ibid.
[8] Letter from the San Francisco Department of Public Health to Golden State Warriors Arena, June 8, 2015, p. 2

- Warehousing, shipping, and receiving operations for a variety of products including agricultural chemicals, lumber, food, automobiles, metals, etc. (approximately 1910 to 2006).
- A fruit cannery (approximately 1935 to 1961).
- Junk yards, vehicle parking, and vehicle maintenance facilities (approximately 1950 to 2004).
- Ready-mix concrete facilities (approximately 1972 to 2010).

Of these uses, the 1950s-1980 land uses, which include well casing manufacturing, warehousing, a cannery, junk yards, and concrete manufacturing, could have been operated out of building that were constructed with PCB-containing materials and which were supplied with power by PCB-containing transformers. If PCB-containing building materials, such as caulking or paint, were weathered and disposed in soils adjacent to the former buildings, the could remain at concentrations that would serve as a source for contamination of San Francisco Bay, upon erosion by wind or stormwater.

In fact, a limited study conducted in January 2015 did detect PCBs in soil at the Project site. In this study, which took soil samples from only seven locations at the 10.9-acre site, PCBs were detected at 0.016 mg/kg or 16 ug/kg in one sample of the seven locations.[9] Although this is less than the 25 ug/kg RWQCB cleanup requirement, it is 16 times greater than the target PCB sediment concentration of 1 ug/kg in San Francisco Bay.[10] Given that the Project site is located less than 500 feet from the Bay, construction activities that disturb soil pose a significant potential for documented PCBs at the Project site to be transported to the Bay. 19 [HYD-2] cont.

I have found no analysis of PCBs used in the building materials of the previously existing structures at the site in the DSEIR or in the Mission Bay FSEIR or how PCBs, documented in soil at the Project site, may be mobilized by construction or by cleanup of contaminated sites, and transported to the Bay. The RWQCB has offered guidance on how to test for materials that may contain PCBs and how to evaluate sites undergoing cleanup on the Bay margin, guidance which was not mentioned in the DSEIR.

The failure to thoroughly analyze the presence of PCBs in the Project area and how Project construction activities would potentially mobilize the PCBs, leading to further impairment of San Francisco Bay, is a significant oversight which ignores a regulatory mandate for construction projects on the Bay margin to evaluate PCBs. A DSEIR should be prepared to include the results of a full evaluation of the potential of former Project site buildings to contain PCBs. A soil sampling study should be targeted to areas where PCBs may have been released or spilled. To ensure the adequacy of the PCB investigation, the study should be conducted under the oversight of the San Francisco Bay Regional Water Quality Control Board which should be engaged, specifically on the issue of potential PCB contamination to originate from Project construction.

The revised DSEIR should identify mitigation that would be necessary to protect PCB-containing materials from being mobilized though stormwater transport and aerial deposition to San Francisco Bay. The revised DSEIR should also include measures to protect construction workers and the health of adjacent residents who may be exposed to PCB-containing dust during demolition or renovation

---

19 [HYD-2] cont.

Of these compounds, mercury is identified in the DSEIR as an impairment in San Francisco Bay under Section 303(d) of the Clean Water Act (p. 5.9-22). Mercury, along with the other contaminants listed above, may sorb tightly to soil and be mobilized and transported to the Bay when eroded by stormwater, further degrading water quality.

No specific provisions to manage these contaminants to prevent discharge to the Bay are included in the DSEIR. The DSEIR provides only vague assurance that stormwater will be managed consistent with “San Francisco Stormwater Design Guidelines” which do mention mercury (along with PCBs, as noted above) but offer no specific mitigation to manage these contaminants (p. 5.9-25).

A revised DSEIR should be prepared to identify specific stormwater best management practices (BMPs) to prevent the discharge of contaminated sediment during rain events. The BMPs should be tailored to the each of the contaminants documented in soil at the Project site to prevent discharge and should include consideration of the use of sorbent or flocculent materials, retention basins, berms, silt fences, and bales.

Sincerely,

Matt Hagemann, P.G., C.Hg., QSD, QSP

Subject: DRAFT Biological Resources Review
Mission Bay Subsequent Environmental Impact Report
San Francisco, California

Dear Mr. Soluri:

Per your request, BSK Associates (BSK) reviewed publicly available documents associated with the Draft Subsequent Environmental Impact Report (SEIR) on the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32. BSK assessed these documents for potential project impacts on biological resources (following the California Environmental Quality Act [CEQA] Appendix G). The Draft SEIR (DSEIR), the associated 2014 Notice of Preparation-Initial Study (NOP-IS), and the prior Mission Bay Final Subsequent Environmental Impact Report (1998 FSEIR [FSEIR]) were compared to each other, as well as to State of California and federal Geographic Information System (GIS) databases, scientific and technical resources prepared by others, as well as current and historic aerial photographs.

SUMMARY

In our opinion, the SEIR, in several key areas related to biological resources, failed to adequately characterize the nature and the extent of the site's resources; failed to identify the full range of potential significant impacts from the proposed project on those resources; failed to examine those impacts at a sufficient level of detail to understand the project impacts; and, failed to provide adequate mitigation for those resources, both during construction and cumulatively. Specifically, key species and sensitive habitat(s) were left out of the discussion, and mitigation measures were missing, or inadequate, to reduce the impacts of the project on those species below the threshold of significance; and finally, significant changes have occurred at the site affecting both the applicable policies and the relevant resource use since the original analysis. 20 [BIO-1]

ECOLOGICAL CONDITIONS REVIEW

The project area has two boundaries, the larger "Mission Bay Redevelopment Plan Area Boundary," (Plan Area) which is described in the 1998 FSEIR and the current "site" boundary (site), which includes Blocks 29-32 within that larger planning boundary (Figure 1). Both boundaries will be used for the purposes of discussion as they relate to the corresponding environmental analysis documents and the project's potential impacts on biological resources. A current aerial photo is provided for detailed site context (Figure 2).

The Plan Area's near surface soils are the result of mixed fills and have been identified by the Natural Resource Conservation Service as: 134, Urban land-Orthents, reclaimed complex, 0 to 2 percent slopes (Figure 3). The soils are the result of historic filling of the Mission Bay with debris, earthquake waste spoils, and other material to reclaim the site from the San Francisco Bay (ESA 2014; Pg. 1). This soils information is consistent with other analyses, developed by others, discussed later.

The U.S. Fish & Wildlife Service, National Wetlands Inventory (NWI) identified several features adjacent to the Plan Area, but none within the site (Figure 4). The relative elevation of these features both within (and nearby) the project boundary appear to correlate with the local shallow water table (ESA 2014; LTR 2015; Pg. 13-14 and Figures A-2 and A-3). 21 [BIO-2]

The site itself appears to be a largely ruderal area that has been subject to various anthropogenic disturbances, within an urban setting, containing two large surface parking areas. The site currently contains an open water feature, actively used by wildlife, and a narrow swale to the east (Figure 5). The site's current conditions are detailed in the following site observations.

SITE OBSERVATIONS

The Blocks 29-32 footprint consists of two large paved areas (Southwest parking lot approximately 79,910 sq.ft./1.83 ac. and Northeast parking lot approximately 91,776 sq.ft./2.11 ac.)[1] currently being used as paid parking lots; an area of soil stockpiles (31,066 sq.ft./0.71 ac) on the eastern edge of the property (Terry A. Francois Boulevard); and an adjoining large open field, open water (22,115 sq.ft./0.51 ac) and wetland swale complex, (904 sq.ft./0.02 ac.) (closest to the Southwest parking lot) shown on Figure 2. A series of photographs were taken of the site and the adjoining areas (Attached Photo Plates).

At the time of observation, the open water area encompassed the majority of the water feature, with a patchy, but substantial fringe of palustrine emergent (predominately alkali bulrush [*Bolboschoenus maritimus*]) and riparian plants (willows [*Salix sp.*]). The emergent plants and shrubs were concentrated on the two narrower ends of the water feature. The narrower channel and the seasonal wetlands

[1]2015 Google Earth

BSK

apparent from the aerial photographs (Figures 2a-i) were not clearly visible from the site perimeter fence(es).

Numerous native birds were observed within, and in some cases flying to and from the water body. Several Canada geese (*Branta canadensis*) were seen, including what appear to be adult plumage juveniles; three killdeer (*Charadrius vociferous*), including two juveniles; a female mallard and a juvenile (*Anas platyrhynchos*); several crows (*Corvus brachyrhynchos*); two non-native Eurasian collared-doves (*Streptopelia decaocto*); and numerous non-native rock doves/pigeon (*Columba livia*). The site has significant use for nesting and foraging by these bird species.

2015 DSEIR

The DSEIR uses an incomplete description of the environmental setting in its impact assessment. 21 [BIO-2] cont.

The DSEIR incompletely characterizes the site's biological resources in the project site description and existing uses. The sole description of the site as it related to its biological resources in the DSEIR is as follows:

"Immediately east of, and adjacent to, Parking Lot B is a depressed area (measuring approximately 320 feet by 280 feet) created by an excavation and backfill associated with a prior environmental cleanup of that portion of the site. A surface swale extends west within this portion of the site to allow for drainage of surface water into the depression." (Pg. 3-10)

This description fails to mention any of the site biological resources, such as plants or animal or habitats, or the fact that there is a large permanent pond and wetland features in the middle of the site. There is no mention of wildlife use and the existing habitat(s) on the site in the DSEIR. The site's biological resources, including waters, wetlands, wildlife habitat and species are then not discussed at all in the DSEIR (except for the Appendix containing the NOP-IS).

The DSEIR failed to protect species and identify the appropriate list of sensitive natural communities, as well as Critical Habitat designations

1. The potential for Western pond turtles and California red-legged frog is stated as "low" since by their estimation, "No suitable habitat present." However, the perennial pond feature (and for the frog a constructed water feature in particular) is not ideal, but it is certainly suitable habitat. In particular, the analysis (and inferred conclusion) is faulty since low potential does not mean "no" potential, and therefor reasonable steps should be taken to establish or reject the presence of the species and as needed, mitigation. These simple mitigation measures are commonly applied to similar activities 22 [BIO-3]

BSK

throughout California, and include rare plant surveys, and targeted (focused) species surveys.[2, 3, 4] The rare plant surveys must be timed to the appropriate season, and the focused surveys for the right life stage of the target species. In our experience both in preparing EIRs, and supporting similar construction projects, that in virtually every case, where natural(ized) features exists that can potentially support species of concern, there is an additional mitigation measure that provides a preconstruction survey (or surveys); and if species of concern are likely to occupy the site, the preparation and implementation of a Worker Environmental Awareness Plan (WEAP). The DSEIR solely has a pre-construction breeding bird survey. 22 [BIO-3] cont.

2. The potential use (given the habitat values present and prior observations by others) of the site for at least foraging habitat is identified for Peregrine falcon[5], Red-tailed hawk, American kestrel[6], Great blue heron[7], American goldfinch[8] but its loss is not mitigated for (NOP-IS Appendix A. Table 2 A-8). Note: Two species that do not appear to meet the section 3503.5 Eggs, Nests, and Nestlings Protected under the California Department of Fish and Game Code provisions are identified as such in the text. 23 [BIO-6]

3. There is significant new information related to the federal designation of Critical Habitat for the listed anadromous fish, the steelhead (*Oncorhynchus [Salmo] mykiss*)[9]. The DSEIR failed to identify that the project has the potential to impact the defined Critical Habitat for the steelhead. This designation was completed in 2005 and was not described in the 1998 Mission Bay FSEIR. Neither the potential of the project activities to impact the steelhead (*See*: Other Biological Resource Issue Areas), or the designation of the status of this plan area was identified in the DSEIR. 24 [HYD-2, BIO-4]

The Project's impacts adequately are not fully disclosed in the DSEIR

1. The project fails to identify, assess, and mitigate for the proposed project impacts on the biological resources associated with the site water bodies. 25 [BIO-5, BIO-6]

2. The DSEIR analysis restates that there are no new or significant changes to biological resources and appears to rely entirely on the NOP-IS (Pg. 1-9; Pg. 5.1-1; Pg. 1-58/59). Despite these statements, there is in fact a significant new impact identified in the DSEIR from the project to birds identified in the text on Pg. 3-28, "The project sponsor proposes to incorporate bird-safe design measures that would reduce

BSK

the potential effects of the proposed buildings, signage and lighting on birds." And, that impact requires and was provided a new mitigation measure: The project sponsor shall design and implement the project consistent with the San Francisco *Standards for Bird-Safe Buildings* and Planning Code Section 139, as approved by OCII. OCII shall consult with the Planning Department and the Zoning Administrator concerning project consistency with Planning Code Section 139." (Pg. 1-59)

Nowhere in the DSEIR is there an analysis of which bird species would be subject to these strike impacts, what time of year, or which types of impacts they were subject to. There was no discussion of the determination of thresholds for the bird injury and/or death associated with the project, and no explanation about how or why the mitigation proposed would be sufficient to reduce those injury and/or deaths below a specified threshold. 25 [BIO-5, BIO-6] cont.

The Project's impacts are not appropriately mitigated in the DSEIR

The DSEIR analysis, at a minimum, should have been fully developed to reflect the 2015 federal Wetland Policy modifications, the observations of its own wetland experts, and the numerous state and federal wetland policies and regulations that apply to this site. It is our opinion that the DSEIR fails to mitigate for impacts to waters and wetlands at the site; as well as the potential impacts to biological resources within and around the site through contact with hazardous waste. Effective mitigation measures are available to reduce the impacts below significance. These comments are more fully explained under the NOP-IS analysis below. 26 [BIO-5]

2014 NOP-IS

The 2014 NOP-IS Applies the Prior Impact Analysis to the Modified Current Setting

1. The NOP-IS (Pg. 76) re-characterizes the 1998 FSEIR in order to minimize the type, extent and value of current ecological features of the site. The analysis conflates the prior CEQA analysis with the current ecological conditions, without fully assessing the significant changes that currently exist under and the impacts of the project on the biological resources. The analysis further parses the "upland" species and habitat from the aquatic species and habitat, without identifying and relating the project impacts associated with each of those contexts. For example, the proposed project has both direct (loss of habitat) and indirect environmental impacts (potential contamination) to both terrestrial and aquatic resources, within and adjacent to the site (dust, groundwater and stormwater), but these impacts are not fully identified (impacts identified only to nesting and flying birds). The project must be evaluated with an associated impact analysis that defines the specific project impacts on the site's (and Plan Area) biological resources. 27 [BIO-1]

2. There are <u>substantially new ecological conditions</u> at the site that differ from the description provided in the FSEIR, the project analysis under the NOP-IS newly identifies water bodies as wetland features, but fails to provide analysis of the project impacts on those features, define their regulatory status, and 28 [BIO-5]

identify suitable mitigation according to its regulatory status (NOP-IS, Pg.78; ESA 2014; WRA 2014). For example, if the features are only determined to be regulated by the State there is typically one set of mitigation measures similar to those identified in the IS-NOP, if they are both state and federal, additional measures may be required, however those measures are dependent on a series of tests, and since the project may be subject to CWA 404(b)(1) provisions, significant additional analysis and mitigation may be required.

Instead, the analysis claims that the habitat is: "…limited due to the sparse and ruderal nature of onsite vegetation, as well as the site's location in a densely urbanized environment. While several bird species were observed foraging and hunting onsite, these species are common to San Francisco and would continue to be supported by vegetation communities and water features found in the project vicinity." By its own admission the analysis states that these features would be permanently lost, but that impact doesn't matter because there is some other place for the species to go. It fails to fully define what the biological impacts are, and then identify where (to which nearby features) these species would go.

Further the analysis states: "Because the excavation depressions on the site are small, isolated features resulting from recently completed hazardous materials remediation activities and are surrounded by paved areas and urban development, these features do not provide the important biological habitat functions and values that are typically associated with federally protected wetlands." Conversely, and in rebuttal to their prior assertion that there are readily substitutable habitats nearby, small wetland features can have exceptional ecological value, in particular if they are one of the few remaining features in an urban setting. 28 [BIO-5] cont.

This biological resource information in the NOP-IS was only analyzed in a cursory manner, simply recapitulating the site observations, without fully identifying and evaluating the CEQA-required biological resource impacts from the project. Without a full technical understanding of which resources are impacted, mitigation cannot, and indeed was not, adequately developed- as these measures depend on the nature and extent of the resources impacted. The standards of significance are not identified, and fail to show the application of thresholds to the project impacts for wetlands and other special ecological habitats.

For example, on Pg. 78 of the analysis, the NOP-IS identifies use of the site's open water and wetland by a variety of native plants and animals:

"Site reconnaissance revealed the deepest part of the excavation within this area contains standing water with a mixture of ruderal vegetation described above, and wetland plants, including alkali bulrush (*Bolboschoenus maritimus*), brass buttons (*Cotula coronopifolia*), fat-hen (*Atriplex prostrata*), and saltgrass (*Distichlis spicata*), present around its perimeter. The standing water supports common wildlife as evidenced by a snowy egret (*Egretta thula*) hunting at the water's edge and a black phoebe (*Sayornis nigricans*) sallying insects from a vegetative perch."

Despite these observations, the analysis fails to accurately characterize the site habitats, and reconcile the appropriate list of species regulatory concern (Table 1, Attachment 1). The habitats observed by BSK (2014) and ESA (2014) at the site appear to include: open water, shallow water with emergent vegetation (alkali wetland), mud flats, riparian fringe (locally called scrub), ruderal grassland, seasonal wetlands, and open/disturbed shrubland. California identifies one of these habitat types as sensitive: *Bulboschoenus maritimus* (Salt marsh bulrush marshes) Alliance, status S3[10] (S3 = Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the state.)

For illustration of the biological resources analysis defects, as they related to waters and wetlands, the following section provides a site waters and wetland feature history and summary analysis of how the provided data and analysis are insufficient or incorrect.

WATERS AND WETLAND FEATURE HISTORY

The term "wetlands" from a Clean Water Act (CWA) 404 perspective generally means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands typically include swamps, marshes, bogs, and similar areas. These are typically identified using a three-part test, examining the presence of water, wetland (hydric) soil, and wetland dependent (hydrophytic) vegetation, following specific guidance(s). The federal CWA section 404(b)(1) Guidelines list both wetlands and mud flats as types of "special aquatic sites."

28
[BIO-5]
cont.

A wetland under California's regulations contains the following features, an area that is covered by shallow water or where the surface soil is saturated, either year-round or during periods of the year; where that water coverage has caused a lack of oxygen in the surface soil; and, has either no vegetation or plants of a type that have adapted to shallow water or saturated soil. Some examples are fresh water marshes, bogs, riparian areas, vernal pools, coastal mud flats and salt marshes. In this case, there are both a permanent water body and a seasonal feature (possibly a small complex) with wetland characteristics by the admission of the experts who prepared the environmental documentation for the project. These characteristics meet the definitions contained in the various regulations, including 14 CCR 13577(b), Cal. Pub. Res. Code § 30121. The open water feature and its wetland (hydrophytic) vegetation were verified in the field, and through the use of aerial photos, showing their presence over time, both by season and by year.

The site is within the footprint of the historic Mission Bay, which has been filled in over time (ESA 2014; Pg. 1). The original Bay muds are still found below the site, as evidenced by the site soil borings (LTR 2015; Pg. 13 and Figures A-2 and A-3). The excavation intercepted local shallow groundwater and is

[10] https://www.dfg.ca.gov/biogeodata/vegcamp/pdfs/natcomlist.pdf

evidently maintained by that natural source (LTR 2015; Pg. 14). The site also has seasonal wetland features which appear to be dominated by stormwater. It is not clear that these seasonal features would not be maintained for far longer in the spring, but they have been captured through an excavated trench apparently intended to drain them to the open water body (ESA 2014; Pg. 2). The site "remedial" activities thus captured the local water table and allowed for the expression of open water and wetland features (ESA 2014; Pg. 2). The ESA analysis goes on to specifically identify that the: "…deeper excavation and surrounding shallow depressions within the proposed project site are features that exhibit hydrology and vegetation characteristics of wetlands. Hydric soil is presumed present due to the year-round inundation and presence of obligate wetland plants." (ESA 2014; Pg. 3)

28
[BIO-5]
cont.

Federal Jurisdiction-Wetlands created by human actions fall under discrete classes under Federal jurisdiction. Most typically these are agricultural features that are caused by the movement of water from one location to another, such as a dam providing water to a canal constructed in uplands. In this case however, the site was originally a tidal mudflat or estuary wetland which has since reverted back to a wetland (ESA 2014). In addition, even if it was not originally a water or wetland, it currently meets those adjacency, and direct hydrologic connectivity requirements under the Final Clean Water Rule (2015; 33 CFR Part 328 and 40 CFR Parts 110, 112, 116, 117, 122, 230, 232, 300, 302, and 401); and, even manmade wetlands and water bodies have restrictions on discharges under 33 CFR 323.4(b).

There are Federal exemptions for specific construction associated activities. These exemptions (33 CFR 323.4 - Discharges not requiring permits) are invalidated, however: "If any discharge of dredged or fill material resulting from the activities listed in paragraphs (a) (1) through (6) of this section contains any toxic pollutant listed under section 307 of the CWA such discharge shall be subject to any applicable toxic effluent standard or prohibition, and shall require a section 404 permit." (33 CFR 323.4(b)).

The site's water and soils include several chemicals identified under CWA section 307 as toxic pollutants (BBL 2006; LTR 2015).[11] Those chemicals include the following 12 Priority Pollutants found in the Phase II (LTR 2015; Table 4 and Table 5):

29
[BIO-5]

1. Benzene
2. Naphthalene
3. Cyanide
4. Antimony
5. Arsenic
6. Chromium
7. Copper
8. Lead
9. Mercury
10. Nickel

[11] http://water.epa.gov/scitech/methods/cwa/pollutants-background.cfm

11. Selenium
12. Zinc

Therefore, the site is *not exempted* under 33 CFR 323.4 because it contains 12 of the chemicals identified as priority pollutants under section 307.

The proponents' consultant, WRA, in a separate analysis, claims exemption from the CWA under yet a different test (without identifying that any exemption is *invalidated* by the section 307 test described above (WRA 2014; Pg. 2)). WRA states that: "1986 (51 Fed. Reg. 41206) (e) Water-filled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and until the construction or excavation operation is abandoned and the resulting body of water meets the definition of waters of the United States."

The site owner's continuing failure to backfill the excavation and its abandonment for the past decade, despite being under Order No. R2-2005-0028 and its RRMP, constitutes abandonment and its clear reversion to the definition of waters, wetlands and/or other special aquatic site. WRA's explanation, contrary to demonstrating how the site may be exempted as an incidental construction feature, documents how that feature has been abandoned. Therefore the exemption also does not apply on that basis. 29 [BIO-5] cont.

Indeed, there is no merit to the further argument made by WRA (Pg. 4) that: "As described in the RWQCB Order No. R2-2005-0028, the Project Area was to be excavated and backfilled in preparation for future development as part of the overall Mission Bay redevelopment plan." The site was not backfilled. It should be noted by WRA's argument there could never be a case for reversion under the CWA, because any naturalized feature would simply 'be ready' for some postulated future backfilling. The provided analysis fails to show: 1. How the feature has not reverted and 2. How the exemption override under 33 CFR 323.4 does not apply due to the presence of section 307 toxic chemicals. Regardless, WRA is silent on the open water and wetland features in context of the State water and wetland policy and applicable regulations.

California Jurisdiction-California does not have the same exemptions in its waters and wetland framework as exist under the CWA. California derives its authority from different sources (Porter-Cologne Water Quality Control Act and various other Acts) for its policies, and includes all man-made features under its jurisdiction. Therefore the site's water features, regardless of origin, appear to be regulated and protected waters and wetlands of the State.

The NOP-IS acknowledges that the project would result in the fill of a wetland (and without identifying it Pg. 76, its associated fringe riparian zone), however, the proponent has not yet (and does not propose to) characterized the wetlands to determine their jurisdictional status (Pg. 78). The failure to prepare the jurisdictional determination prior to public comment eliminates full public disclosure and the ability to assess the potential reasonableness and efficacy of mitigation measures. Moreover, the specified 30 [BIO-5]

failure to establish specific (offsite) mitigation may violate CEQA's mandate to impose all feasible mitigation measures, and may fail to meet both Porter Cologne and the Clean Water Act permitting requirements for filling wetlands and waters. 30 [BIO-5] cont.

SITE ABANDONMENT AND NEW EXPOSURES

The Site's Failure to Fill the Excavation Has Led to Wetland Formation and New and Unanalyzed Exposures

The site petroleum-related remedial activities exposed the local water table and allowed for the expression of wetland characteristics and the site which have become naturalized over time (ESA 2014; Pg. 2). These activities have resulted in the creation of stockpiles of material adjacent or near to these wetland features that in some cases: "…contains contaminants that exceed hazardous waste threshold concentrations and will require special handling and disposal," (LTR 2015; Pg. 1). These activities took place over several years culminating in a Phase II remedial action that left the excavated area open and abandoned in 2005 (LTR 2015; Pg. 6). The Revised Risk Management Plan (RRMP, BBS; Pg. 2-3 and 2-3) infers that the excavation was backfilled, however, it was not. 31 [HAZ-4, BIO-5]

The RRMP further identifies that: "1. Because North Terminal, Parcel X4, OAS and 16th Street East OUs are currently under development, interim risk management measures (IRMMs) designed for undeveloped parcels are not relevant to the protection of human health on those OUs. If development ceases or areas are created with uncovered native soils, IRMMs may again be necessary." (BBS 2006; Table 1) The development of the site still has not occurred, and there is no evidence that the IRMMs have been applied.

The site's open water and wetland features are thus a direct result of the abandonment of a site cleanup allowed to revert back to a 'natural state' for approximately a decade. Not only did natural features evolve in response to this abandonment, but the very abandonment created conditions that may have exposed wildlife to a variety of hazardous chemicals through their use of that habitat (LTR 2015).

The Project Impact Evaluation Modifies the Appendix G Question in a Manner that Eliminates Critical Analysis

The project Impact Evaluation BI-1 fails to follow the language of Appendix G by removing the second half of the question, and reduces the subject matter and detail of its impact analysis accordingly (Pg. 77). The current (2015) Appendix G states: 32 [BIO-4]

IV. BIOLOGICAL RESOURCES -- Would the project:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Instead the NOP-IS states:

"Impact BI‐2: The proposed project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations. (No Impact)"

The result of this text deletion is that the potential for the project to impact U.S. Fish and Wildlife Service designated critical habitat is not analyzed. Therefore, the potential project impacts to the closest federally designated critical habitat is steelhead *Oncorhynchus mykiss* are ignored. This habitat runs directly adjacent to the project area. In addition, San Francisco manzanita (*Arctostaphytos franciscana*) critical habitat is present approximately 2.6 miles to the west and should also have been identified and analyzed. The federal critical habitat analysis is missing, and the provided analysis itself is defective. The potential project's impact(s) to these listed species and their critical habitat are therefore unexamined. The project's dust, stormwater, surface flooding, and groundwater place those species at risk from hazardous chemicals. This issue is discussed in detail in Other Biological Resource Issue Areas.

32 [BIO-4] cont.

OTHER BIOLOGICAL RESOURCE ISSUES

The DSEIR is silent on the potential project impacts on offsite fish and wildlife issues associated with stormwater and other discharges from the site to the surrounding area, Mission Creek Channel, and the San Francisco Bay. The DSEIR Appendix MIT Mission Bay FSEIR Mitigation Measures: Applicability to Proposed Project K. Hydrology and Water Quality section (MIT-27 through -29) states that the project would fall under different mitigation measures under different programs (such as the General Stormwater Permit) and that the detailed mitigation requirements from the 1998 FSEIR would not be used. The site's hazardous material history show that the proposed project construction activities pose risks to the environment and its biological resources through the release of hazardous chemical to surface waters, through wind redeposition, stormwater drainage, or unabated stormwater sheet flow above a 5-year design rain event (BBL 2006, LTR 2005). The RMP has not protected these resources because it was not intended to covers these features, followed superseded analytical methods, and even if it was applicable and current, has had implementation failures. Some of these issues are identified in greater detail in a separate document, SWPPP Memorandum BSK Associates, 2015.

There is a direct route from the site to the surrounding area, including the Bay, from dust and stormwater. Stormwater can take several routes off the site, and may enter a sediment trapping system, or not, and flows over a 5-year event run unabated into neighboring properties and the Bay. Currently, there are what appear to be multiple failures to implement and maintain effective Best Management Practices (BMPs) for dust and stormwater. The DSEIR fails to identify these risks and conditions, and fails to identify the potential environmental impacts from the substantially changed new

33 [HYD-2, BIO-4]

environmental conditions as a result of the site remedial activities. The DSEIR further identifies that there were detailed mitigation measures for these potential impacts as they related to stormwater (but not biological resources) in the FSEIR, but that they deleted the hazardous material protective elements and simplified the sediment management. The site stormwater operations have management issues that need reconciliation, but the evidence shows a likelihood of these contaminants reaching surface waters, despite the prior BMPs and this must be fully analyzed and the mitigation measures modified correspondingly to reflect those significant new conditions in order to protect biological resources, designated critical habitat and listed fish and wildlife.

33 [HYD-2, BIO-4] cont.

CUMULATIVE IMPACTS

In our opinion, the project's impacts on listed species, waters and wetlands, and their loss, were not analyzed in sufficient detail or context to be able to understand what the likely cumulative impacts would be on those and other biological resources. It seems probable that there would be cumulatively considerable impacts from the project given the limited availability of those habitats, and that there are mitigation measures available for those impacts. However, the IS-NOP analysis discusses some broadly applicable mitigation measures for wetlands, then fails to identify or apply any of those mitigation measures in Table 1-2 (NOP/IS Pg. 1-58) Appendix MIT (Pg. MIT-30). There are only two mitigation measures described as applicable to biological resources at the site in the DSEIR, breeding bird use protection and bird strike impacts.

The DSEIR's cumulative impact analysis lacks the degree of detail that the 1988 DEIR completed and fails to apply that analysis to the current waters and wetlands, and contradicts the current DSEIR's findings:

"Wetland habitats in the San Francisco Bay Region continue to be eliminated and altered. Wetlands provide a continuity of habitat between the open waters of the Bay and upland areas. Wetlands increase the wildlife diversity by providing additional habitats, and by providing many of the animals' life history requirements (e.g., feeding, mating, and nesting) in one area." (1988 FEIR Pg. VI.M.12)

According to the project analysis: "The proposed project could potentially result in adverse effects on various bird species through disruption of nests, collisions with buildings, or disorientation from night lighting. These impacts, in combination with other projects along the San Francisco waterfront, could potentially result in cumulative impacts to birds." (NOP/IS Pg. 84) There is no assessment of how many birds or which species would be impacted and how the mitigation would achieve that reduction below the unstated threshold. The document then fails to identify how the mitigation measures would result in a less than significant finding over the cumulative impact analysis area. There is also no supporting analysis for these bird impacts in the 1988 FEIR or 1998 FSEIR.

34 [BIO-5, BIO-6]

1998 FSEIR

HABITAT ANALYSIS

No Prior Interior Wetland Presence and Analysis

The 1998 FSEIR states: "This section focuses on the aquatic and wetland habitats of China Basin Channel. Terrestrial habitats in the remainder of the Project Area do not support any significant biological resources, as discussed in the Initial Study (see Appendix A)." At the time of that analysis, there were no documented interior water and wetland features at the site, and therefore the project impacts on waters and wetlands were not analyzed (Pg. II.30). It also is important to note that the mitigation used for the China Basin Channel may, and in some cases may not, be applicable to the project impacts on the current interior wetlands, and thus require significantly new and more detailed analysis for both the impact to these features, and the impacts on their associated species. 35 [BIO-5]

HAZARDOUS CHEMICALS

Hazardous Chemical effects on Biota

The FSEIR identified that for the purposes of analyzing wastewater impacts from the project, that "Near-Shore Effects-Treated combined sewer overflows currently occur at Bayside discharge facilities, including facilities at China Basin Channel, at the end of Mariposa Street, and in Islais Creek. The proposed project would marginally increase treated combined sewer overflows and direct stormwater discharges to near-shore waters of the Bay, including China Basin Channel and Islais Creek. Near-shore discharges are not subject to the same rapid mixing and dilution as the deep-water discharges from the Southeast Plant." (Pg. II.27) This effect is generally correct and holds for both wastewater, and typically to an even greater degree, most particulate or soluble chemicals that would come off the site through the groundwater, aerial re-deposition or stormwater/surface transport. 36 [HYD-5]

However, in the immediately following section, Effects of Stormwater Discharges, it states that "Under the project, the volume of stormwater directly discharged to near-shore waters of the Bay from the Project Area would increase about 2%. The concentrations of pollutants in the stormwater discharge would change, because the project would intensify land use in the Project Area. Neither the increase in stormwater flow, nor the change in pollutant concentrations would constitute a significant effect on aquatic biota." (Pg. II.28) The recent findings of Class 1 and Class 2 hazardous waste is not taken into account for these analyses and comprise significant new information that requires analysis in the 2015 SEIR because of the different and <u>significantly greater biological impacts</u> of these hazardous materials (LTR 2015).

The FSEIR identifies an analysis of potential adverse ecological effect associated with the current conditions at the site in 1998 (Pg. I.54). It states: "As noted by ENVIRON, no criteria have been 37 [HAZ-1]

developed for the assessment of risk to ecological receptors in the aquatic environment based on comparisons to groundwater chemical concentrations. However, ambient water quality criteria for the protection of marine (saltwater) organisms are used as a conservative means of evaluating the potential risk to surface water organisms." (Pg. I.57) However, since 1998, the San Francisco Regional Water quality Control Board has developed these very criteria as described below.

The 1998 analysis relied on Preliminary Remediation Goals (PRGs) for its analysis, however the San Francisco Regional Water Quality Board (SFRWQB) states in its current guidance document that: "The U.S. EPA Regional Screening Levels or RSLs (formerly PRGs; U.S. EPA, 2013d) address human health concerns associated with direct exposure to chemicals in soil, but do not address ecological concerns. Exposure routes and receptors not addressed by the RSLs, but included in the ESLs [Environmental Screening Levels] are listed below: …groundwater screening levels for the protection of aquatic…habitats/surface water quality…soil screening levels for urban area ecological concerns; (SFRWQB 2013; Pg. 1-3). These exposure routes which apply and are specific to the site are identified in the current Environmental Screening Levels (ESLs). This is <u>new and substantial information</u> that affects the potential environmental impacts to biological resources which was not used in the DSEIR.

Further, the ESLs (the PRGs for that matter) are not legal limits, but they are intended to inform decision-making. However, they may not be protective enough in particular for "…sediment or sensitive ecological habitats (such as wetlands or endangered-species habitats). The need for a detailed human health or ecological risk assessment should be evaluated on a site-by-site basis for areas where significant concerns may exist (SFRWQB 2013; Pg. ES-1 and 2). 37 [HAZ-1] cont.

The prior FEIR analysis identifies that in their opinion there were no significant species or habitats at the site, and therefore the analysis was specifically intended not to be protective of terrestrial habitat or interior wetlands, and therefore does not apply to the current conditions: "As previously described, chemicals present in the soils could potentially impact the health of the ecological environment if terrestrial or nesting avian species come into direct contact with soils which contain elevated levels of chemicals, or if the chemicals in exposed soil were to be released into China Basin Channel or San Francisco Bay through surface water runoff. Additionally, chemicals present in the soil and groundwater could potentially impact the aquatic environment if the chemicals leach from the soil into the groundwater and subsequently migrate to China Basin Channel or San Francisco Bay. As discussed in the Mission Bay Final Environmental Impact Report (FEIR), the current and future conditions within the Project Area do not provide a habitat capable of supporting a significant terrestrial or nesting avian wildlife community. Accordingly, potential exposures that terrestrial species could have with soils would not represent a significant effect on the terrestrial wildlife community." FEIR 1998; Pg. I.54) The current conditions are <u>significantly different</u> and specifically excluded from the prior 1998 analysis and the current ESL methods do apply to these conditions.

The 1998 "risk analysis" applies the PRG criteria for impacts on biological resources in the Bay as a result of offsite groundwater movement only. It also uses average values and only for selected contaminants.

This is an artificial narrowing of chemicals that can have biological impacts, and likely a major reduction of the risk by not using the maximum observed concentration and the biologically relevant risk drivers. For example, species are exposed to actual concentrations, not site averages. By using the observed peak concentrations, it establishes the appropriate worst case scenario and sets the upper limits for the purposes of developing mitigation.

However, groundwater is but one of several potential routes by which contaminants can leave the site. Wind can blow contaminated dust and stormwater (containing both fine sediment and dissolved contaminants) can also run off the site. The RMP and RRMP also do not apply and cannot be relied upon because they specifically rely on the previous risk analysis, which does not look at terrestrial or interior wetlands.

Additional Mechanisms of Impacts to Biological Resources

Some of the mechanisms for biological impacts from the project's contribution to contaminants are through bio-accumulation, as well as the unanalyzed bio-concentration: "These contaminants could be directly lethal to smaller organisms, and could accumulate in the food chain and become successively more concentrated in a process known as bio-accumulation. Through bio-accumulation, the toxic concentrations could reach levels in which they are lethal to larger organisms, such as birds or marine mammals. Turbidity and toxicity from re-suspended sediments could also interfere with beneficial uses of the channel, such as spawning of Pacific herring." (1998 FSEIR Pg. II.31) The FSEIR analysis describes just one of the potential mechanisms for biological impacts from the project-associated hazardous chemicals, then identifies that it is significant and mitigatable, but then simply ignores that potential mechanism for other species that would potentially come in contact with the same material. The analysis should instead examine the various chemical of concern, their individual and joint biological impacts (chemicals can have additive (or counteracting) or multiplicative effects) and their routes of exposure (wind, groundwater or stormwater) and asses the risk drivers for each species (or trophic surrogate). 37 [HAZ-1] cont.

There are newly identified Class 1 and 2 hazardous waste materials at the site, the newly identified use of the site by diverse biota, the designated Critical Habitat, and similar release pathways off of the site. These changed conditions require analysis of both onsite impacts and offsite impacts. The lines of reasoning, based on high contaminant concentrations at/close to the site, poor mixing in the shallows, and bio-concentration/bio-accumulation should also be applied to the current physical conditions and the elevated contaminant concentrations.

Mitigation for Hazardous Materials

The analysis provided above in the 1998 FSEIR relied on the dilution effect of the Bay, despite its own earlier analysis that there would be significant impacts which required mitigation, but cumulatively there would be no impact (1998 FSEIR Pg. II.27). General stormwater impacts are not the same as

impacts from solid phase and dissolved phase hazardous materials. Specific analysis must be developed to identify which capture or treatment systems are required for which hazardous constituent in which phase. For example, large particles traveling in the stormwater system could be trapped through a conventional filtration system, however, overflow of that system (and/or poor maintenance) by design flow above a 5-year rain event could cause that material to be flushed directly into the Bay. Very fine size and dissolved phase chemicals typically require specific treatment technologies to stop their direct movement to the Bay during mobilizing rain events. The mitigation does not appear to be sufficient to protect biota from hazardous materials identified at the site in the LTR 2015 report.

Cumulative Hazardous Issues

The same failure to identify, and therefore analyze cumulative impacts, as a result of newly identified hazardous materials also applies to cumulative impacts from these chemicals: "To put this in context, City discharges are a very small portion of the region-wide discharges to the Bay. Considering the contribution of the project and of the cumulative Bayside projects in the context of all the other pollutant inputs to the Bay, the cumulative pollutant loading from the Bayside projects would be extremely small." (1998 FSEIR Pg. II.29) The cumulative impacts of hazardous materials (not just generalized pollutants) would be specific to certain species in the Bayside proximate to the site, not generically in the context of the entirety of the Bay. It is inappropriate to consider the entirety of the Bay in the cumulative impacts specifically because of the mechanics of chemical redistribution identified in another section in the FSEIR (1998 FSEIR Pg. II.27, and see above). The analysis provided in the FSEIR does not cover the hazardous materials and fails to look at the appropriate biological context, including resident and locally foraging migrants, and must be reanalyzed in light of the new cumulative impact information. In our opinion, because of the new analysis methods and standards, and the lack of mitigation for soluble or stormwater transportable hazardous materials, the project's impacts on aquatic biological resources is cumulatively significant after mitigation. Mitigation measures are readily available for these potential impacts, but they require a careful analysis of the specific hazardous constituents and what levels of contamination are acceptable to develop. 37 [HAZ-1] cont.

LIMITATIONS

Our review was limited to the Ecological-related aspects as they are identified in the project environmental documents provided or otherwise made available for review. Additional information related to the project may be available through other sources, but were not reviewed for the purposes of this analysis.

The observations, assessment and recommendations submitted in this report are based upon the data obtained from listed reports prepared by others, limited field investigation, and site observations. The report does not reflect variations which may occur beyond the assessed area. BSK's services were be performed in a manner consistent with the level of care and skill ordinarily exercised by other professionals practicing in the same locale and under similar circumstances at the time the work is performed. No warranty, either expressed or implied, is included. The findings of the field observation may have a potential for negative impact(s) on the value or suitability of the site for some purposes. BSK cannot assume liability for any such negative impact(s). Permitting requirements or permit interpretations may change over time. The findings of this report are valid as of the present. However, changes in the conditions of the site can occur with the passage of time, whether caused by natural processes or the human-induced changes on this property or adjacent properties. In addition, changes in applicable or appropriate standards or practices may occur, whether they result from legislation, governmental policy, or the broadening of knowledge.

We appreciate the opportunity to be of service to Soluri Meserve and trust that this correspondence provides you with the information necessary at this time. Please contact us with any questions regarding the review comments presented this letter.

RE: Supplemental Comments on Environmental Review for Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 – Clean Water Act 404 and CZMA Consistency

Dear Ms. Bohee:

This firm represents the Mission Bay Alliance ("MBA") with respect to the Warriors Event Center Project ("Project"). These comments supplement MBA's prior comments on the Draft Subsequent Environmental Impact Report for the Event Center and Mixed Use Development at Mission Bay Blocks 29-32 ("DSEIR").

As described in the July 24, 2015, comment letter submitted by the Law Offices of Thomas Lippe regarding Hydrology, Water Quality and Biological Impacts ("Hydro Comments"), the Project site contains a wetland feature that is likely jurisdictional and will require permits from the U.S. Army Corps of Engineers ("Corps") and/or the State Water Resources Control Board in order to lawfully fill. (See Hydro Comments, pp. 11-15, and Exhibit 2, pp. 2-3.) Specifically, the Project site contains a wetland area consisting of a large, permanent pond created by a narrow channel that seasonally contains surface waters and creates further, seasonal wetland features. (Exhibit 2, p. 2.) The area is replete with shrubs and riparian plants, and it serves as habitat for various species, including nesting and foraging sites for native birds. (*Id.* at pp. 2-3.) 1 [BIO-5]

Despite the existence of likely jurisdictional wetlands on the site, the DSEIR does not include the Clean Water Act ("CWA") 404 fill permit that will be needed to fill the wetland in the list of project approvals. (DSEIR, pp. 3-51 to 52.) The need for a 404 fill permit also requires the Corps to prepare a Coastal Zone Management Act ("CZMA") consistency finding, as required by the Bay Conservation Development Commission

("BCDC") Management Program (see 16 U.S.C., § 1456, subd. (c)(3)), which should also be on the list of project approvals. (See CEQA Guidelines, § 15124, subd. (d).)

Under the CZMA, any applicant for a federal permit to conduct an activity, regardless of its location, will be required to certify its consistency if that activity will affect a land use, water use, or natural resource of the coastal zone. (See, e.g., *Amber Res. Co. v. United States* (Fed.Cir. 2008) 538 F.3d. 1358, 1363-1364; *Southern Pacific Transp. Co. v. California Coastal Com.* (N.D.Cal. 1981) 520 F.Supp. 800, 802-803.) Effects on coastal uses and resources need not be direct, but may include "any reasonably foreseeable effect," including "indirect (cumulative and secondary) effects which result from the activity and are later in time or further removed in distance, but are still reasonably foreseeable." (15 C.F.R., § 930.11, subd. (g).) It is likely that this Project will have effects on coastal resources, as the area to be filled is adjacent to the coastal zone. Coastal resources include biological and physical resources, such as vegetation and animals that are found in the state's coastal zone on a regular or cyclical basis. (15 C.F.R., § 930.11, subd. (b).) This Project site provides nesting and foraging habitat for several such species of birds. (See Hydro Comments, Exhibit 2, p. 3.) Thus, a consistency determination is necessary. 1 [BIO-5] cont.

In summary, the DSEIR omits necessary project approvals and overlooks impacts associated with the Project's inconsistency with the BCDC Management Program. These omissions from the Project description and lack of analysis must be corrected prior to certification of the EIR. Thank you for considering these supplemental comments. Please feel free to contact my office with any questions.

Very truly yours,

RE: "Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32" OCII File No. ER 2014-919-97; San Francisco Planning Department No. 2014.1441E

PUBLIC COMMENT ON DRAFT SUPPLEMENTAL EIR

This is Public Comment on the Draft Supplemental Environmental Impact Report ("DSEIR") for the "Golden State Warriors Event Center and Mixed Use Development at Mission Bay Blocks 29-32" ("the Project"). The Project proposes placing a championship basketball team drawing capacity crowds of more than 18,000 for every game in a new sports arena and "event space" with drastically inadequate parking and access for vehicles, inadequate public transportation, less than one mile from the AT&T baseball stadium with overlapping events and already-existing severe traffic congestion. The proposed Project location is directly adjacent to the largest medical facility in San Francisco, creating blocked access for both existing staff, visitors, and emergency vehicles. 1 [ERP-9]

The Project proposes a sports arena for the Golden State Warriors in San Francisco, relocating that arena and "event center" from its present location in Oakland California to the Mission Bay complex adjacent to new medical centers and residential developments, where the Warriors would then host capacity crowds of 18,000 from all over the Bay Area. (DSEIR, pp.1-8; 5.2-235.) The "events" would be held 225 times per year. (DSEIR p. 1-8.) Even the severely flawed SDEIR admits the Project will generate significant traffic and transit impacts affecting travel throughout the City and the entire region "at multiple intersections and freeway ramps" with "regional transit providers exceeding capacity," "noise and crowd noise affecting sensitive receptors," air quality impacts, wind impacts, and impacts on public utilities, including wastewater facilities with existing already-"inadequate capacity to serve the project's wastewater demand." (SDEIR, p. 1-9.) The SDEIR proposes no 2 [ERP-9]

O-MM

effective or publicly enforceable mitigation for those significant impacts. 2 [ERP-9] cont.

Instead of improving severely congested traffic and already substandard air quality conditions, the Project proposes to make them worse throughout the Project area, which includes the entire downtown area cumulatively, freeway ingress and egress, and AT&T Ballpark. The Project therefore directly and facially conflicts with the mandates of the California Environmental Quality Act ("CEQA," Pub. Res. Code [PRC] § 21000 *et seq*.) to "enhance the environmental quality of the state," to mitigate the Project's impacts, and to "consider alternatives to proposed actions affecting the environment." (PRC § 21001.) The DSEIR fails propose feasible mitigation measures or alternatives for the admitted impacts of the Project, and therefore violates not only those mandates but the legal requirements of CEQA to inform the public of the Project's impacts and mitigate them. The DSEIR fails propose feasible mitigation measures or alternatives for the admitted impacts of the Project, and therefore violates not only those mandates but the legal requirements of CEQA to inform the public of the Project's impacts and mitigate them. 3 [TR-2j]

The SDEIR fails to accurately identify the magnitude of the obvious congestion, transportation and parking impacts of the proposed Project, has no coherent or accurate cumulative impacts analysis, and no accurate direct or cumulative analysis of the Project's impacts on air quality, and fails to meet other requirements of the California Environmental Quality Act ("CEQA"), Public Resources Code ("PRC") §§21000 *et seq.*

The DSEIR does not comply with CEQA's requirements to accurately state existing (baseline) conditions of traffic, thus negating the impacts analysis, the mitigations analysis, and the alternatives analysis on these crucial impacts affecting traffic, transit, air quality, safety, and human health throughout the affected area. The DSEIR contains *no* traffic counts or other traffic indicators and inadequate analysis of operational air quality impacts from the congestion inevitably caused by removing traffic lanes and parking. 4 [TR-2c] The DSEIR's disingenuous conclusion that the Project will have no impact on emergency services is false and dangerous. With the gridlock created by bottlenecked traffic, those emergency vehicles will not be able to climb over the backed up cars and buses. 5 [TR-9] The DSEIR also fails comply with CEQA's mandate to mitigate the Project's impacts by proposing in a separate section of the EIR feasible, effective, and enforceable mitigation measures for each impact identified, and to present a full range of alternatives, including off-site alternatives, to the Project to eliminate or reduce the Project's impacts. 6 [IO-2, ALT-1]

These defects make the DSEIR legally inadequate, since it fails to inform the public and decisionmakers of the Project's true impacts and fails to mitigate them. Further, the DSEIR's conclusory statements are in many instances unsupported. The large number of references to other EIR's and documents on other projects make the document user-unfriendly and its conclusions unsupported. The minimal public comment period on the DSEIR from June 5 to July 27, 2015, is inadequate for a Project of this size, regional importance, magnitude, and severity of impact, and a DSEIR of this complexity. The location of the Project area in downtown San Francisco and the large number of affected travelers and residents in the area make this Project of regional and statewide importance. Therefore, this public comment is necessarily incomplete, and other comment may be submitted later on issues not addressed here. The following are some inadequacies of the DSEIR. 7 [ERP-6]

1. Traffic Impacts Are Neither Adequately Analyzed Nor Mitigated.

Even though it drastically underestimates the vehicle traffic generated by the Project, 8 [TR-4] the DSEIR concludes that the Project will have significant "project-specific" impacts at seven study intersections, including King/Fourth; Fifth/Harrison; I-80 westbound off-ramp; Fifth/Bryant/I-80 eastbound on-ramp; Third/Channel; Seventh/Mission Bay Drive; and seventh/Mississippi/16th. (DSEIR 5.2-128.) The DSEIR then claims that it will not provide proposed mitigation measures for the Project's gridlock-creating mess throughout downtown San Francisco and on major freeways in violation of CEQA's fundamental mandate, claiming that any mitigation of the Project's impacts would have to increase lane capacity, which the DSEIR claims would "generally be infeasible," providing no substantial evidence to support the conclusion of infeasibility. (DSEIR 5.2-128.)

The Project description in the DSEIR fails to include an accurate description of The Project area, since the Project's impacts extend far beyond the Project site and will affect citywide and regional streets, freeways, and transit lines.

There appears to be no accurate traffic count data supporting the baseline (existing) conditions from which the impacts analysis proceeds. Further, even if only seven of the analyzed intersections streets were impacted by the Project, the backup from those intersections would affect many entire streets and other intersections that the DSEIR claims would not be degraded. An EIR that fails to inform the public and decisionmakers of the Project's impacts is legally defective.

8 [TR-4] cont.

The DSEIR proposes admittedly ineffective "mitigation," such as on-site "PCO's that shall be deployed," without saying where and when they would be "deployed," who would pay for them (the public), and how they would affect the intersections where impacts are identified. (DSEIR 5.2-128.) Instead of proposing effective mitigation measures for the identified impacts, the DSEIR then claims that "strategies to reduce traffic congestion" "could" include more ineffective "outreach" to urge people not to drive, urging the project sponsor to buy up more parking spaces, and other vague "strategies." (DSEIR 5.2-129.) The DSEIR then proposes a "Strategy to Enhance Non-auto Modes," which also would not mitigate the Project's impacts on traffic, including traffic that is not attending a basketball game or a "special event," which is not even considered in the DSEIR. (DSEIR 5.2-129.) The "Non-auto Mode" strategy includes, *e.g.*, a "promotional incentive…for public transit use and/or bicycle valet use at the event center." (*Id.*) The "Non-auto Mode" strategy, however, again fails to address the traffic impacts of the Project, and does nothing to mitigate them.

Regardless of whether the City provides additional Muni "Special Event Transit Service," a central assumption of the DSEIR, the document admits that traffic impacts will affect the entire Project area, freeway ingress/egress, and Bay Bridge travel. (DSEIR 5.2-118 - 129, 5.2-191-207.)

The DSEIR's analysis and the proposed "mitigation" fall far short of the requirements of CEQA to identify significant impacts and mitigate them.

2. The Cumulative Traffic Analysis Is Factually and Legally Defective.

Even though its cumulative analysis is severely flawed, the DSEIR admits that the Project will cause cumulative traffic impacts at 16 "study intersections" including I-80 and I-280 freeway ramps. (DSEIR 5.2-219-221.) The DSEIR then fails to propose any effective mitigation measures for those impacts.

9 [TR-2h]

The DSEIR's cumulative traffic impacts analysis legally inadequate and unsupported. The document claims that it assessed cumulative impacts "by calculating the project-generated traffic conditions at intersections that are projected to operate at LOS E or LOS F under 2040 cumulative conditions for the No Event scenario for the weekday p.m. and Saturday evening peak hours." (DSEIR 5.2-212-213.) However, that "methodology" is irrelevant to, and does not meet the legal requirements of, CEQA for assessing cumulative impacts. Rather, the DSEIR was required to identify the Project's impacts in combination

with other past, present, and reasonably foreseeable future projects that would also result in traffic impacts. The baseline for assessing cumulative traffic impacts is not conditions existing in 2040 but is conditions existing now. The DSEIR's pointless computer exercise thus does not comply with CEQA. (DSEIR 5.2-212-215.) Further, the DSEIR fails to include in the cumulative analysis many other reasonably foreseeable future projects that will also result in traffic impacts, such as the "Second Street Bicycle Plan project," a major project that will eliminate two traffic lanes, turning facilities, and all parking on Second Street from Market Street to King Street to create raised separated bicycle lanes, and similar bicycle plan "road diet" features proposed by the City in the "Central Soma Plan" on Third, Fourth, and Fifth Streets and the closure of Market Street to vehicles in August, 2015, and large private development projects in the project area, all of which should have been included in the cumulative analysis. In short, the Project's impacts today and in the future will contribute significantly to the creation of severe congestion and gridlock throughout the downtown area, the freeway system, and the Project area. The failure to identify and mitigate these foreseeable cumulative impacts violates CEQA.

9 [TR-2h] cont.

3. The Project Will Overwhelm Transit Capacity With No Effective Mitigation.

There is no accurate analysis of transit impacts in the SDEIR. The SDEIR says that "the project sponsor is working with the City to secure funding for the Muni Special Event Transit Service Plan as part of the project improvements." (SDEIR 5-2.191.) That vague promise is not a legally adequate project description or baseline assumption. The SDEIR then engages in an argument to secure that funding, which requires public subsidy in an unstated amount, with a series of claims showing how much *worse* vehicle traffic will be if that funding isn't provided. However, that strong-arm tactic is irrelevant to CEQA's required analysis and mitigation of the Project's transit impacts. (DSEIR 5-2-192 - 194)

10 [TR-5a]

The DSEIR fails to properly identify and propose mitigation for the Project's specific impacts on Muni, concluding that "the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to transit impacts." (DSEIR 5.2-224.) That conclusion improperly relies on an EIR that is both outdated and irrelevant to the Project, which was not included in that EIR.

Transit will also be delayed by queuing and gridlock caused by the project, since buses and vehicles will have to share the congested streets resulting from the Project.

The DSEIR admits that the Project will cause significant impacts due to exceeding capacity on other transit services, including BART, proposing no mitigation. (DSEIR 5.2-226.)

11 [TR-12b]

The SDEIR also admits that the Project would result in significant cumulative transit impacts on BART, Caltrain, Golden Gate Transit, and WETA, particularly with overlapping events, again proposing no mitigation. (DSEIR 5.2-226.)

4. Direct, Indirect, Secondary, and Cumulative Parking Impacts Are Not Analyzed or Mitigated

The DSEIR claims that it need not analyze or mitigate the Project's direct, indirect, secondary, and cumulative impacts from creating a shortfall of thousands of parking spaces throughout the area, falsely claiming that the Project is either a "residential, mixed-use residential, or employment center project on an infill site within a transit priority area." (DSEIR 5.2-233, citing PRC §21099(d).) The Project fits none of those categories, and the DSEIR must therefore analyze and propose effective mitigation for the Project's significant parking impacts.

12 [TR-13]

The parking analysis understates the drastic parking shortfall created by the Project and misleadingly overstates the number of available parking spaces outside the Project area on which it irresponsibly relies.

Warriors games will always draw peak attendance of 18,000 (DSEIR, pp.1-5 [stadium capacity of 18,064 seats]; 1-8.) with most attendees driving and parking at the arena. The Project admits that it will supply only 1,082 parking spaces, including 950 in the "on-site parking garage" and 132 "within the 450 South Street Parking Garage for which the project sponsor has acquired parking rights to serve the project." (DSEIR 5.2-235.)

Admitting that the Project's proposed on-site parking is grossly inadequate and that there are few metered parking spaces in the Project area, the DSEIR claims to include parking lots within a mile of the Project, and still comes up drastically short of the parking capacity needed for the "events" in the stadium.

The parking availability baseline is outdated and inaccurate, particularly since it incorrectly lists in its offsite parking inventory the "SF Giants Facilities," which are slated for removal and development under the "Mission Rock Project." Therefore, where the DSEIR claims there are "2,530" available parking spaces at "SF Giants facilities," no such spaces will be available under the planned development, and those spaces are not available when Project "events" overlap with "events" at the AT&T stadium. (DSEIR 5.2-236-238.) The baseline (existing conditions) thus grossly overestimates the existing parking supply, disregarding the reality of ongoing development throughout the downtown and Project area.

The baseline also grossly underestimates existing parking demand for its proposed "events," claiming without support that, with 18,000 event attendees, the parking space "demand" would be only 5,937 spaces for midday events, and 9,614 spaces for evening events. (DSEIR 5.2-242.) The DSEIR does not state how those baseline "demand" figures were derived. The failure to set forth either an accurate baseline supported by evidence and an accurate description of the Project demand not surprisingly results in the DSEIR's implausible and irresponsible conclusions that it need not realistically assess and effectively mitigate the Project's significant parking and traffic impacts due to a lack of parking.

Instead, we are told that by creating a parking shortfall, attendees "may instead use transit to arrive at the site because the perceived convenience of driving is lessened by a shortage of parking" (DSEIR 5.2-241) is completely unsupported, and evades the Project's impacts on other travelers who are not attending a Project "event" who must also contend with the secondary impacts of snarled traffic, congestion, delays, and lack of parking throughout the area. That conclusion is even more dubious in view of the DSEIR's admission that existing transit cannot accommodate Project demand. (DSEIR 5.2-140-147.)

The DSEIR concludes that, "By promoting carpooling, providing parking attendant services, providing clear direction to alternative parking locations in advance of events, and adjusting event parking rates (raising them), the parking supply would likely be more efficiently utilized during the event days and the potential parking deficit would be eliminated." (DSEIR 5.2-241.) That absurd conclusion is again completely unsupported.

The same error that flaws all of the cumulative impacts analyses in the DSEIR also applies to the cumulative parking impacts analysis, which again mistakenly begins with a baseline of "existing" conditions in 2040, instead of present existing conditions. (DSEIR 5.2-248.)

12 [TR-13] cont.

5. There Is No Accurate or Legally Adequate Analysis and Mitigation of the Project's Air Quality Impacts or GHG Impacts.

The DSEIR fails to quantify or coherently analyze air quality impacts, complaining, for example, that "it is difficult to predict the magnitude of health effects from the project's exceedance of significance criteria for regional ROG and NOx emissions. (DSEIR 5.4-40.) The DSEIR also admits that its proposed "mitigation" of reducing vehicle trips by not providing adequate parking or transportation capacity "would be difficult to quantify." The

13 [AQ-4c]

O-MM

DSEIR may not hide behind its failure to gather the necessary data to analyze these and other air quality impacts, because that failure also violates CEQA's requirement to inform the public and decisionmakers of the Project's impacts and to mitigate them.

13 [AQ-4c] cont.

6. The DSEIR Fails To Propose Effective And Feasible Mitigation Measures For The Project's Impacts.

Under CEQA, "An EIR is an informational document which will inform public agency decisionmakers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project." (14 Cal. Code Regs. ["Guidelines"] §15121(a); PRC §21002.1(a), (b).) CEQA requires specific content in the EIR, including either a separate chapter on mitigation measures proposed to minimize the significant effects or a table showing where that subject is discussed. (Guidelines §15126.) The DSEIR contains *no* chapter on mitigation and no table showing where mitigation, including feasibility analyses, are discussed. (*Id.*)

Proposed mitigation measures include "[a]voiding the impact altogether by not taking a certain action or parts of an action." (Guidelines, §15370(a).) The EIR should propose effective, enforceable mitigation measures for each impact it identifies. The effectiveness of proposed mitigation measures should be supported by substantial evidence.

Claiming a significant impact is "unavoidable" does not excuse the failure to propose effective mitigation, but that is what this DSEIR assumes it may do, including significant transportation and circulation impacts, noise impacts, air quality impacts, wind impacts, and utilities impacts. (DSEIR 6-1 - 6-4.) That does not comply with CEQA.

14 [IO-2]

7. The DSEIR Fails To Adequately Evaluate Alternatives To The Project, Including Offsite Alternatives.

The DSEIR fails to evaluate a "range of reasonable alternatives to the project, or the location of the project, which…would avoid or substantially lessen any of the significant effects." (Guidelines, §15126.6(a).) The DSEIR proposes instead analyzes only three alleged "alternatives": "Alternative A: No Project Alternative," "Alternative B: Reduced Intensity Alternative," and "Alternative C: Off-Site Alternative at Piers 30-32 and Seawall Lot 330."

The "No-Project Alternative" may not be counted as an "alternative," because it will be rejected as not satisfying the "Project-Sponsor's Objectives." The other two alternatives do not substantially lessen any of the significant impacts, and could even make them worse. (SDEIR 7-48, 7-73 - 109. Indeed, "Alternative C" met with such intense public outcry that it resulted in the land deal that moved the proposed Project to the present location. The only proposed alternative that should be considered is the No Project alternative, which is also the environmentally superior alternative.

15 [ALT-1]

8. There Is No Accurate Analysis or Mitigation of Impacts on Emergency and Public Services on the Directly Adjacent Major Medical Complex.

The DSEIR's conclusions that the Project will not cause significant impacts for emergency vehicles is false, dangerous, and irresponsible. The false implication that the entire area would not be gridlocked is silly, since the backup from gridlocked intersections would prevent any vehicles from moving anywhere during "events."

16 [TR-9]

9. There Is No Proposed Mitigation Of The Project's Impacts On Wastewater. 17 [HYD-4]

10. The SDEIR Fails to Address The Project's Direct and Cumulative Land Use 18 [LU-1]

O-MM

Impacts.

The DSEIR incorrectly claims that an "Initial Study" can substitute for the analysis and mitigation of the Project's land use impacts, claiming the Project "would not physically divide an established community; conflict with land use plans, policies, or regulation adopted for the purpose of avoiding or mitigating an environmental effect; or have impacts on the existing character of the vicinity." (DSEIR 6-4.) In fact, the Project it plainly incompatible with existing uses in the immediate vicinity, including a major medical center, research and hospital facility, and residential uses. The Project's significant impacts clash with and affect all of those other land uses. Indeed a "subsequent" environmental impact report is inappropriate for this Project, since it drastically departs from existing land uses. 19 [LU-1]

11. The SDEIR Lacks Objectivity.

The DSEIR fails to fulfill CEQA's requirement of objectivity, instead advocating for the Project sponsor. The lack of objective analysis flaws the DSEIR as an informational document and violates CEQA. (See *e.g., Citizens for Ceres v. Superior Court* (2013) 217 Cal.App.4th 889, 918-919.) 20 ERP-6

For the foregoing and other reasons, the DSEIR is legally inadequate in violation of CEQA. 21 [ERP-6]

POTRERO BOOSTERS
NEIGHBORHOOD ASSOCIATION
SERVING THE HILL SINCE 1926

July 27, 2015

Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: Potrero Boosters Comments to Warriors SEIR

Via Email

Dear Mr. Bollinger:

When the Golden State Warriors announced the acquisition of the rights to Mission Bay blocks 29-32, the Potrero Boosters Neighborhood Association was carefully optimistic that the City, with its stated desire to lure the Warriors to San Francisco, would provide additional transportation and transit infrastructure to our neighborhoods.[1] Indeed, we saw the Warriors as a tremendous opportunity, as the City has lagged in developing the infrastructure to accommodate the growth, both residential and commercial, experience by our neighborhoods over the last decade. 1 [TR-3a]

However, upon reading the Supplemental Environmental Impact Report (the "SEIR") for the Golden State Warriors Event Center and Mixed Use Development (the "Arena"), we have some significant concerns. We are distressed by the volume of identified impacts on traffic transit and parking identified as "significant and unavoidable." A failure to avoid significant impacts will directly reduce the day-to-day quality of life for the residents living and moving into the Potrero neighborhoods. 2 [TR-4]

As a result, we are compelled to comment on the SEIR. We do so not with an eye to preventing the Arena from being built. We do so based on our belief that the City is capable, with the right measures in place, of making this development an asset to not just the City as a whole, but to its direct neighbors as well. 3 [GEN-5]

This letter will consider two sets of impacts, those associated with (i) parking, transit, traffic and emergency vehicles, and (ii) air quality.

[1] The "Boosters" represent the Potrero neighborhoods of Potrero Hill, Showplace Square and Dogpatch, i.e., those neighborhoods directly adjacent to the Mission Bay site in question.

1459 EIGHTEENTH ST. #133 • SAN FRANCISCO, CA • 94107

Parking, Transit, Traffic and Emergency Vehicles

General Comments

For the Arena to coexist within its rapidly developing surrounding neighborhoods, the City must maintain dedicated funding of full time transit and transportation solutions and review the parking management programs throughout the adjacent areas. Proper attention must be paid to the travel needs of the populations that live and work (and who will soon live and work) in the area full time, and not be reserved for those few times a year when the confluence of San Francisco Giants and Arena events bring about the largest transportation challenges. New transit should be based on current data and SFMTA should be prepared to move away from more outdated transit planning. 4 [GEN-1a]

Impact TR-2b: Parking

Parts of northeast Potrero Hill and Dogpatch are currently part of Residential Parking Permit ("RPP") Zone X. RPP enforcement is from Monday to Friday, from 8:00 am to 6:00 pm reflecting the out-of-City commuter concerns RPP was designed to remedy. These hours do not correspond with the weekend and evening operations of the Arena. Due to proximity to the Arena and existing transit options, Zone X is well within the parking shed for the Arena.

Extension of RPP enforcement hours should be considered. Yet mere extension of enforcement may not be enough. RPP areas marked with four-, rather than two-, hour limits, which may serve local businesses well, would not generally provide protection from Arena parking. Areas in our neighborhoods not currently under RPP, but which are otherwise residential in character, cannot be allowed to suffer the pressures of Arena parking. And, of course, enforcement must have the resources behind it to provide appropriate ticketing and towing for violators. 5 [TR-13]

A plan needs to be developed to prevent our neighborhoods from becoming a free parking zone for Arena event attendees. Metering by itself will not provide an adequate solution given the day-to-day mixed uses of the areas in question. A meeting with community stakeholders would ensure the adequacy of a plan and help garner the support necessary to make it a reality.

We also believe that parking for the Arena should be bundled with the tickets sold. No person driving to an event at the Arena should have to guess about where they will be parking. Remote, satellite parking served by shuttles and taking advantage of mobile application technology should be required under the SEIR.

Impact TR-4: Transit

We would celebrate the introduction of ferry service to the Arena site, and would hope that an electrified Caltrain would provide additional service to and from the Peninsula. We consider both improvements to be part of the critical path to the Arena opening—that is, they must be operational prior to the Arena's first tip-off. That parochial interests on the Peninsula have tied-up Caltrain electrification is of great concern. Ridership is already at capacity levels throughout much 6 [TR-5d]

of the weekday schedule. Without additional trains on the schedule, we question the extent that Caltrain can be depended on in the Arena rideshare models. 6 [TR-5d] cont.

Transit improvements should be funded from dedicated sources, regardless of whether those funds come from the incremental property, sales or ticket taxes arising from the Arena. With a current estimate of $14 million being collected by the City annually, at least half that mount should be funding improvements to our transportation system intended to move people out of cars. Our neighborhood intersections are overburdened as they are, with many graded a "D" or an "F" under level of service standards. We do not have any excess capacity to accommodate more drivers.

Transit funding can go to infrastructure and operations that, when not deployed for the largest of events, can mitigate the day-to-day concerns of the neighborhood. We have identified the following necessary enhancements:

- Connecting the 11 North Point-Mission Bay line through to the commercial districts on 17th, 18th, and 20th streets in Potrero Hill, to the 22nd Street Caltrain Station, and terminating adjacent to the Pier 70 and NRG Power Plant development projects. This line can serve as an outlet for residents and business to move around, rather than through, the greatest Arena impacts. 7 [TR-12b]
- Increased running of the 10 Townsend to three times an hour during events.
- Making the E Embarcadero a seven-days-a-week line, turning south from its current 4th and King terminus to serve the Arena, with a terminus at the 25th Street Muni Yard.
- Moving the proposed Muni Turnaround from the congestion inducing 18th and 19th Streets to the 25th Street Muni Yard, where staging could be done more efficiently and more residents to the south of the Arena could be served on a daily basis.
- Keeping the 55 16th Street line as a dedicated connector from 16th Street BART to Mission Bay, and perhaps extending the line to incorporate transfers from the J Church.

This list of improvements is not intended to be exhaustive. But they represent the need for a global transit plan for the area—one with a growing population and growing businesses—and one that has additional transit *decreases* planned, exacerbating cuts made in 2008-2009.

Impact TR-5: Traffic

Traffic is perhaps the Boosters greatest concern; increased traffic drives every other discussion in this letter. The intersection of 7th and 16th Streets is already at an "F" grade for level of service, creating danger to bicycles and pedestrians at all hours of the day. New drivers, not familiar with the area, will only compound the difficulties of an intersection where four modes (Caltrain's tracks run adjacent to 7th Street) of traffic come together. Prior to the Arena's opening, this intersection should be reworked under the City's Vision Zero plan. 8 [TR-4]

Additional bicycle infrastructure may also be appropriate. Both 16th Streets and Mariposa Streets experience significant automobile traffic, and with dedicated bus lanes coming to 16th Street, neither are ideal for bicycles. A pedestrian and bicycle connector at 17th Street, including an 9 [TR-7] overpass over the Caltrain tracks, would extend the bicycle routes already on 17th Street through the Mission and the western part of Potrero Hill. Such improvements should be evaluated so that bicycling can be a safer, more prevalent means of reaching the Arena. 9 [TR-7] cont.

Impact TR-10: Emergency Vehicle Access

The SEIR should provide greater clarity as to how emergency vehicles, patients and hospital staff will access the UCSF medical facilities adjacent to the Arena. Mariposa Street between 101 and 280 has an increasingly residential character and a three-ton vehicle weight limit, and runs adjacent to a school and Jackson Park. It should not be depended upon as a route from the 101 Freeway to UCSF. Emergency traffic along this stretch would be dangerous and inconvenient to residents and patients alike. 10 [TR-9]

Early discussions on UCSF transportation showed Minnesota Street through the Dogpatch Historic District serving the hospital. The SEIR should make clear that this routing has been abandoned, and show an alternative route that allows ease of access to the hospital under the heaviest of traffic conditions.

Air Quality Impacts

Impact AQ-2 and Mitigation M-AQ-2b

The air quality mitigation disbursement plan described in AQ-2 and M-AQ-2b is not adequate to meet the needs of the Potrero neighborhoods and our neighbors to the south. Given our proximity to freeways, industrial activities (including a UPS distribution center and a Recology recycling facility), heavy trucking, and the historical uses of our neighborhoods (including a recently decommissioned power plant), we feel that this represents a significant environmental justice issue.

While the Bay Area Air Quality Management District ("BAAQMD") may be able to use mitigation funding anywhere in the counties of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara and portions of Solano, and the Arena is likely to draw automobile traffic from all of these areas, the bulk of the pollution by vehicles will be within two miles of the Arena. Mitigating pollution sources in Solano County will not go to reduce the impacts in our neighborhoods, which will experience additional car traffic at least 225 times per year. 11 [GEN-3]

As pointed out by the San Francisco Department of Environment, "The City's neighborhoods in the Southeast areas are heavily burdened by air pollution-not only from major industrial facilities, but also from the thousands of automobiles and heavy-duty diesel trucks that travel daily on nearby freeways and City streets."

The SEIR forecasts that 53% of Arena attendees on a weekday, and 59% on a weekend, will drive to the Arena. While those mobile sources of pollution will travel through other Bay Area counties, they will all arrive in our neighborhood, the analysis of the BAAQMD seems to equate moving efficiently at freeway speeds to idling on our neighborhood off-ramps and our poor level-of-service intersections.

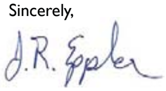
As Arena traffic is the source of the impact, money should mitigate pollution sources near the Arena. 11 [GEN-3] cont. If a stationary source of mitigation cannot be identified near the Arena, then mitigation could take the form of additional hybrid and electric buses for the SFMTA. 12 [AQ-7]

As a result, 80% of the funds called for in Mitigation M-AQ-2b should go to reducing the impacts in the area of the Arena itself. 13 [AQ-7]

Summary

The Potrero Boosters Neighborhood Association believes that, without mitigation, the Arena would significantly impact our neighborhoods for the worse. The SEIR, with its failure to identify reasonable mitigations to predicted impacts, causes us significant concern. That said, we are still optimistic that, with dedicated funding and enforceable agreements between the City and the Warriors, and with appropriate air quality management, there are opportunities to not only accommodate the Arena, but to address concerns with the context in which it is proposed to be built. 14 [ERP-9]

Sincerely,



J.R. Eppler
President

Dear Mr. Bollinger,

I am a San Francisco resident and I am dismayed that the city would devote substantial resources, obstruct views, and congest an already highly over-used area for the sake of a sports franchise. I happen to be a major sports fan, but this type of municipal support (financial and political) is profoundly inconsistent with the needs of the vast majority of San Franciscans. 1 [GEN-5]

Thank you for your time and consideration.

RE: Comments on the Draft Subsequent Environmental Impact Report for Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Dear Ms. Bohee,

Please accept the San Francisco Bicycle Coalition's comments on the Draft Subsequent Environmental Impact Report for Event Center and Mixed-Use Development at Mission Bay Blocks 29-32.

Background

Over the course of nearly a year, GSW Arena LLC, an affiliate of Golden State Warriors, LLC ("Warriors") and the San Francisco Bicycle Coalition ("SFBC") have had on-going discussions, outside of the formal EIR process, to address bicycle access and infrastructure at the proposed arena site. Discussions thus far between SFBC and the Warriors have led to strong plans and support of existing and future bicycle travel to and from the Project, as well as plans to address enhanced bicycle infrastructure in and around the Project site, including publicly accessible bicycle parking, bicycle valet and additional secure bicycle parking for special events, secure commercial bike parking for employees. These discussions have also led to the Warriors and SFBC's commitment to work with appropriate agencies to add public bike share to the project vicinity, intersection management during special events to maximize bicycle and pedestrian safety, ongoing bicycle encouragement for special events, and a commitment to expanding bicycle capacity if/when need increases over the life of the Project. 1 [GEN-5]

We would like to commend the Warriors for being receptive and responsive partners that have demonstrated a strong commitment to promoting bicycle trips to the Project site in this Draft Subsequent Environmental Impact Review document (DSEIR) and in their goals beyond this document. Both the Warriors and SFBC acknowledge that bicycle infrastructure and promotion on and near the Event Center site are critical and cost-effective investments for the immediate and long-term success of the project and help to reduce neighborhood congestion, improve local environmental quality, support positive health outcomes, and drive local economic development.

SFBC, working in close partnership with the Warriors, supports the following activities to create better biking at the Project Site. These recommendations, if not already included in the DSEIR, 2 [TR-7] should be addressed under Mitigation Measure M-TR-2b, Impact TR-7, or wherever appropriate in the DSEIR document:

New and Enhanced On-Street Bicycle Facilities
SFBC supports the Warriors' and this DSEIR's inclusion of new and/or enhanced on-street bicycle facilities, to be designed in coordination with SFBC, the San Francisco Municipal Transportation Agency (SFMTA), Port of San Francisco, Office of Community Investment and Infrastructure (OCII), and Mission Bay Development Group (MBDG). These priority streets for bicycle infrastructure include:

- **Terry Francois Boulevard,** two-way protected bikeway on the East side of the roadway from Lefty O'Doul Bridge to Mariposa Street;
- **16th Street between 3rd and Terry Francois Boulevard**: one-way buffered and/or parking-protected bike lanes on North and South side;
- **Enhanced intersection designs around the arena**, with special attention paid to bicycle and pedestrian safety at 16th and Illinois Streets and 16th Street and Terry Francois Boulevard and;
- **Managed intersections around the site during special events**, with special attention paid to 16th and Illinois Streets. 2 [TR-7] cont.

The Warriors should encourage Mission Bay Development Group and public agencies to construct or implement these improvements prior to the opening of the event center.

Bicycle Parking
Adequate bicycle parking is critical to support the mode share goals of the project. SFBC encourages the Warriors to provide ample bicycle parking at the Project for special events, as well as for everyday commercial and neighborhood use. SFBC appreciates the Warriors commitment in on-going discussions to expand bicycle capacity as needed over the life of the development to meet additional capacity requirements that may arise.

Valet Bicycle Parking
The Warriors and this DSEIR indicate a need for enclosed bicycle valet space with a minimum capacity of 300 bikes. SFBC supports and encourages the current allocation of roughly 2,000 square feet for the operation and management of on-site bicycle valet, which would allow proper space for expansion, as noted above. The valet space should be designed to maximize the amount of bike storage available and to be consistent with current and projected neighborhood transportation plans. The bicycle valet should be sited as close to a main entrance to the Event Center as reasonably possible and located along one of the new or enhanced on-street bicycle facilities described above. The bicycle valet space should be completed and fully operational in conjunction with the opening of the Project.

We are pleased that valet bicycle parking will be provided at special events at the Event Center, including concerts and performances throughout the year, and at other events with an expected attendance past a threshold size to be reasonably determined in consultation with the SFBC, and

O_SFBC

revisited annually, as needed. Bicycle valet services could also be scaled up or down based on expected attendance levels on a per-event basis.

SFBC could plan to promote the availability of bicycle valet parking in communications and in programs to drive use. This could include promotion on the SFBC website, newsletters and social media with a reach of over 30,000 San Franciscans, and through programs and events as outlined below.

Commercial Bicycle Parking
As indicated in the DSEIR, the Warriors should provide secure (Class 1) bicycle parking for commercial office tenants and short-term bike parking (Class 2) for retail tenants, customers and guests at or above the requirements of applicable law including the City of San Francisco Planning Code Section 155.2, which sets standards for the provision of bike parking in new commercial development.

Other Bicycle Parking and As-Needed Expansion
SFBC supports the Warriors' and this DSEIR's proposal for an approximately 100-bike "pop-up" corral in a publicly accessible and highly visible location at the Event Center for special events on an as-needed basis. The pop-up corral should be monitored by event security staff and should be set up no less than one hour before such events.

SFBC also supports the Warriors' intention to identify on-site locations for additional pop-up corrals and/or additional bike parking facilities if/when the need for expanded bicycle parking capacity should arise. This additional bike parking capacity should be provided as additional pop-up corrals, expanded valet, and/or other forms of secure, monitored bicycle parking. 2 [TR-7] cont.

SFBC is encouraged by the Warriors' plan to identify additional future bike parking capacity to achieve a total of up to 900 potential spaces available to the general public during full-capacity special events (the sum of on-site bicycle valet spaces, on-site Class 2 spaces, pop-up corral spaces, and other publicly accessible secure bike parking spaces in the project vicinity). The Warriors should assess the need for expanded event bicycle parking facilities up to this number on a yearly basis and in consultation with SFBC to meet projected growth in bicycle trips. These spaces would be in addition to the permanent bike rooms in each on-site office building, which together with expanded event bicycle parking as described above, may in the future exceed 1,000 total available bike spaces for varied users at the project site.

SFBC is committed to continue working with the Warriors to find secure, public, and appropriate locations and systems to accommodate future bicycle capacity at the Project site.

Bay Area Bike Share Stations
SFBC supports the Warriors and this DSEIR's inclusion of Bay Area Bike Share stations at and/or around the Project site.

Marketing and Bicycle Promotion
We are pleased that the Warriors and this DSEIR acknowledge that increasing the number of bicycle trips to and from the Project will support the Citywide goal of a 8% bicycle mode share by 2023. As such, trends in bicycle trip generation and mode split should be studied and

evaluated on at least a yearly basis, with bicycle parking expansion, marketing, and promotion adjusted, to support this goal.

The Warriors and this DSEIR discuss integrating bicycle transportation into marketing and promotional activities for the Event Center to support the above stated goals. SFBC is supportive and committed to work with the Warriors on an on-going basis to further develop, implement, and promote the programs outlined below.

The Warriors and this DSEIR note that marketing and promotion are possible mitigations under *Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts* for enhancing non-auto modes. As consistent with on-going discussions with the Warriors, SFBC encourages the Warriors to also consider marketing the Event Center as a bicycle-friendly destination in other press and marketing materials that may include but are not limited to:

- Warriors players and employees on bicycles at Warriors events and at SFBC events
- Feature bicycle facilities and programs in sustainability or environmental promotional materials or media
- Encourage bicycle travel information in non-Warriors special event promotions and marketing, such as concerts and performances

2 [TR-7] cont.

Promotions to enhance the bicycle experience should also include a recurring, season-long program that encourages more people to arrive to basketball games by bicycle. Similar promotions could also be used to promote bicycle trips at other events at the Event Center throughout the year.

The Warriors should design a plan prior to the opening of the Project for promoting bicycling to the Event Center that may include but is not limited to:

- Regular "Bike to Game" nights that include group rides from various starting locations in San Francisco and the region, rides with GSW staff prior to the game, and/or special offers for people who bike to the game;
- Bike-related raffles or prizes for people who bike to games. Giveaways could include branded lights, stickers, discount tickets, etc.;
- Special services and programs for people who bike to games. These could include monthly free or discounted tune-ups and minor repairs, and other incentives for people who frequently ride their bikes to games, such as a Bike Fan of the Month/Year program, and;
- Special events leading up to and during NBA "Green Week", in coordination with the Green Sports Alliance.

SFBC could help organize, implement and promote bicycle-related events and promotions, ensuring strong attendance and participation. SFBC could promote the plan and the Warriors'

commitment through existing email and social media channels, through partners, and on our website.

The Warriors and SFBC, through both the EIR process and on-going discussions, are committed to continued refinement of the plans and roles described in this letter and in the DSEIR.

2 [TR-7] cont.

Thank you for considering these comments as part of a truly collaborative effort to make the proposed Mission Bay Arena and Event Center the most bicycle-friendly sports venue in the country and an addition to the neighborhood that supports current city and neighborhood transportation goals.

Sincerely,

Paolo Cosulich-Schwartz
Business and Community Program Manager

RE: Warriors Arena Draft Environmental Impact Report (DEIR)

Dear Ms. Bohee:

The San Francisco Bay Trail is a 500-mile shoreline walking and bicycling path that will one day encircle the Bay. With over 340 miles complete, it follows the shoreline in nine counties, passes through 47 cities and crosses four-and-a half toll bridges. The Trail provides scenic recreation for hikers, joggers, bicyclists, skaters and wheelchair riders. It offers a setting for wildlife viewing and environmental education, and serves as an important commute alternative for bicyclists.

Several inaccuracies regarding the Bay Trail alignment and bicycle infrastructure were found in the DEIR, and it is our hope they can be corrected in the final.

Page 5.2-3, under "Local Access" states "As part of the Mission Bay Plan, Terry A. Francois Boulevard will be realigned to the west to be adjacent to the east side of Blocks 30 and 32, and a buffered two-way cycle track (Class II)3 will be provided as part of the San Francisco Bay Trail on the east side of the street." The term "Class II" is a Caltrans standard that refers to a striped bicycle lane as opposed to the buffered two-way cycletrack referenced here. Cycletracks do not currently have a Caltrans classification, though it is our understanding that one may be forthcoming. The footnote at the bottom of this page also erroneously defines both a bike lane and a cycletrack as a Class II bikeway. 1 [TR-1]

Page 5.4-4 states that Fourth Street between King and Mission is part of the Bay Trail alignment. It is not. The Bay Trail alignment in this area is on Terry Francois, Lefty O'Doul Bridge, waterside of AT&T Park, and north along the Embarcadero. See attached map. 2 [TR-1]

Page 5.2-28 states "At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, bike lanes, sidewalks or city streets signed as bicycle routes." The vision and goal of the Bay Trail is a Class I, multi-use pathway for cyclists and pedestrians, separated from traffic, as close to the shoreline as possible. While in certain locations, on a case-by-case-basis, the Bay Trail can consist of Class II bike lanes and sidewalks where there is *no possibility* for a multi-use path, city streets signed as bike routes are never proposed or accepted as complete segments of Bay Trail. 3 [TR-1]

On page 5.2-43, the DEIR states that the Bay Trail is a 400-mile pathway, and that 338 miles are complete. Please note the Bay Trail's total length is 500 miles, and we are happy to report that 341 miles are complete. 4 [TR-1]

Signage and Wayfinding

The San Francisco Bay Trail should be included in wayfinding signage on and around the project site. We would be happy to provide either the physical signs or our logo in electronic format for incorporation into the Warriors Arena signage and wayfinding plans. 5 [TR-3a]

While the Bay Trail Project was a commenter on the Notice of Preparation for this project, we were not notified regarding the availability of the Draft EIR. Please add us to your list of interested parties so that we will be notified when the Final EIR is available for review. 6 [ERP-2]

If you have any questions regarding these comments or about the Bay Trail, please contact me at (510) 464-7909 or by e-mail at maureeng@abag.ca.gov.

Sincerely,

Maureen Gaffney
Bay Trail Planner

Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco CA 94103-2414

Dear Mr. Bollinger:

Please accept the following comments on the Draft Supplemental EIR for the Event Center and Mixed-Use development at Mission Bay, Blocks 29-32.

The Sierra Club does not agree that this project fits the definition of an AB 900 Leadership project. The state legislature passed, and the governor signed, AB 900 as an economic boost during the Great Recession. It was designed to fast track infill projects through any CEQA litigation proceedings if those projects created good permanent jobs while at the same time minimizing environmental impacts, including GHG emissions, as determined by the CARB. We are well past the Great Recession, and California's economy is booming. In this midst of this boom, the project sponsors have proposed constructing a venue to nearly match the current Oracle Arena in capacity. 1 [AB-1]

However, the project sponsors are proposing a project in Mission Bay without proposing adequate transportation infrastructure to match the capacity of BART in Oakland, especially when events are happening simultaneously at AT&T Park and in Mission. (*Volume 1, TR-2 through TR-6*). 2 [TR-5b]

The Sierra Club also believes there are other inadequacies in the SEIR. For example, the Warriors currently have about 150 full-time employees (Volume 3, Page 16). Have the project sponsors done an analysis of where these employees live, and to what extent GHG emissions will increase or decrease as a result of their commutes to the new location? 3 [GHG-2] Have the sponsors estimated how many FTEs will take advantage of the proposed transportation subsidies described in FSEIR Mitigation Measure E47.c: *Employee Transit Subsidies - Provide a system of* 4 [TR-12c]

4 [TR-12c] (cont.)

employee transportation subsidies for major employers? And will part-time employees who are not actually employees of the Warriors or other event sponsors (but who may work for food and souvenir concessions that have contracts with event sponsors) be eligible for these subsidies? 5 [TR-12c]

The SEIR notes that the roughly 1,000 day-of-game/event staff at the Mission Bay site will be assumed to be new hires (*Volume 3, Page 42*). The SEIR is inadequate because of this assumption. Project sponsors have not actually determined the number of events that will still be held at the Oracle Arena or surveyed current part-time employees to determine where they live and how many might transfer to the Mission Bay site in lieu of losing hours, if not their jobs, at the Oracle Arena. If roughly 1,000 part-time day-of-game employees will commute to events at the Mission Bay site from the East Bay, or anywhere else in the Bay Area, what are the GHG impacts? 6 [GHG-2]

The Sierra Club notes that project sponsors intend to rely on the availability of livery and TNC vehicles after events to transport people (*Volume 1 – TR-2)*. No analysis, to the knowledge of the Sierra Club, has ever yet been done on the environmental impact of TNCs in San Francisco. No one knows how many additional vehicle miles are being traveled in the City due to the availability of TNCs. No study, to the knowledge of the Sierra Club, has been done on the impact of TNCs on congestion or air quality, including GHG emissions. And yet the project sponsors propose to rely on TNCs for an unspecified portion of transportation needs of people going to and getting from events. Project sponsors should include an analysis of the GHG and other air pollution impacts of the TNCs they intend to rely on for transporting people to and from events. 7 [TR-2e]

The SEIR notes that there are many GHG regulations – both state and local – with which the project must comply. It credits these laws with reducing emissions of greenhouse gases in San Francisco. However, the Sierra Club notes that a large part of the reason the City's GHG emissions levels have dropped is because of the closure of the PG&E power plant in the Bayview a few years ago. (*Volume 2, 5-5-11*) 8 [GHG-1]

The Sierra Club does not agree that the purchase of carbon credits is an adequate method for reducing greenhouse gases, in this case, or that the purchase of carbon credits, in this case, render the project "GHG neutral." (*Volume 2, 5-5-11: As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits.*) The Sierra Club believes mitigations should be implemented at the point of impact. 9 [AB-1]

The Sierra Club is also concerned that there is no requirement to purchase carbon credits until the site is 90 percent leased and occupied, and, for the arena, until 90 percent of the available booking dates are utilized. (*Volume 2, 5-5-12*). If more than 10 percent of the facility remains vacant and/or more than 10 percent of the available booking dates are never filled, the project sponsors will never have to purchase carbon credits – let alone mitigate for the impacts of all the additional car traffic and transit use on the ground. The Sierra Club believes that the project sponsors should mitigate for all GHG emissions. 10 [AB-1, GHG-2]

Additionally, the Sierra Club thinks that the requirement to mitigate for greenhouse gas emissions should not end after 30 years, as the project sponsors propose, but should continue as long as the facility is in use. 11 [AB-1, GHG-2]

The SC also notes many inadequacies in the 1999 and 2006 testing for hazard substances in the soil at the site, including the fact that the methodology used in 1999 and 2006 is outdated. 12 [HAZ-1]

The Sierra Club believes that the project sponsors should design a project that remains at the current site in Oakland but proposes conversion of the parking lot for the Oracle Arena into workforce housing – and then compare GHG emissions to current operations. 13 [ALT-4]

Sincerely,
Susan Elizabeth Vaughan
Chair
San Francisco Group, Sierra Club

UCSF
University of California
San Francisco

September 22, 2015

The Honorable Edwin M. Lee
City Hall, Room 200
1 Dr. Carlton B. Goodlett Place
San Francisco, CA 94102

Re: Golden State Warriors Arena and Events Center in Mission Bay

Dear Mayor Lee,

We write as faculty members at UCSF who are also members of the US National Academy of Sciences. Many of us either are, or have previously been, leaders on this Campus. We have seen this University rise to true excellence over the course of the past 40 years, and we look forward to an even greater future for UCSF and the exciting private biotech and medical organizations that it has attracted to Mission Bay. But we are seriously concerned that this future is threatened by the plan to construct a very large sports, entertainment, and event arena in our midst.

As you know, the plan for Mission Bay approved by the Board of Supervisors (October 1998) states, as one of the major objectives of this visionary project:

> Facilitating emerging commercial and industrial sectors including those expected to emerge or expand due to the proximity to the new UCSF site, such as research and development, bio-technical research, telecommunications, business service, multi-media services, and related light industrial…

And indeed, Mission Bay has rapidly become one of the most prominent academic-industry biotechnology/medical complexes in the world. But we cannot stop here: we face increasing competition from other rapidly growing complexes of this type, both in the US and abroad. It will be critical to keep moving aggressively forward, if we are to continue to attract the very best talent – both academic and private sector – to San Francisco. 1 [LU-1]

It is absolutely clear to us that the planned new Golden State Warriors Arena and Events Center in Mission Bay would severely degrade the environment for the many thousands of researchers and private sector biomedical scientists who come to work at Mission Bay each day. It would also curtail the beehive-like, daily exchanges of personnel – from the South Bay and elsewhere – on which the success of the Mission Bay biomedical complex depends. Our major fear is that the Mission Bay site will lose its appeal – not only for the new biomedical enterprises that the city would like to attract here, but also for most of its current occupants. The result could critically harm not only UCSF, but also the enormously promising, larger set of biomedical enterprises that currently promises to make San Francisco the envy of the world.

Much attention has been properly focused on how traffic gridlock caused by the new stadium would affect access to the three new UCSF hospitals that are immediately adjacent to the site, one of which houses one of only two Children's Emergency 2 [TR-4]

rooms in San Francisco. It is unavoidable that terrible, and possibly even life-threatening, traffic congestion will be associated with the planned complex, given that it is intended to be the site of some 220 events per year, held both in the evening and during the day (*New York Times*, September 6, 2015; business section, pages 1, 4 and 5). Many of us have experienced the hours-long gridlock that paralyzes all Mission Bay streets before and after San Francisco Giants home games. The absolute paralysis that it creates is already a non-trivial problem, which the planned stadium promises to both greatly expand and intensify.

The presence of the 41,000-seat AT&T Park less than a mile (a 15-minute walk) from UCSF Mission Bay has not been sufficiently factored into the plans to build the Warriors' huge new sports/entertainment complex. The ballpark already significantly impacts life and work at Mission Bay, with nearly 50 San Francisco Giants home weekday games per season. Due to these events, it can take cars and UCSF shuttle buses over an hour to exit from the UCSF parking lot onto the streets, and a 20-minute trip may require two hours.

The widespread traffic impact of AT&T Park games is noted on the website for the San Francisco Municipal Transportation Agency (SFMTA):

> "Motorists are advised to avoid the increased congestion in downtown San Francisco related to these special events and advises commuters to use transit, taxis, bicycles or walk and to avoid using the Bay Bridge in the two hours before or after these games. ... As a reminder to fans, in order to reduce congestion on city streets after all events at AT&T Park, the SFMTA will close eastbound King Street between 3rd and 2nd streets from the seventh inning until after the post-game traffic has died down. Additionally, the northbound portion of the 4th Street (Peter R. Maloney) Bridge will be closed to all traffic except streetcars, buses, taxis and bicycles during the post-game period. (https://www.sfmta.com/news/press-releases/sfmta-weekend-transit-and-traffic-advisory) 2 [TR-4] (cont.)

Adding an 18,500-seat Warriors complex on top of what is already a transportation mess is asking for disaster. We are highly skeptical of any plan that proposes to segment traffic by restricting 4th street and other routes for "UCSF business only," since those of us at Mission Bay have experienced the unruly behavior of frustrated drivers stuck for long times in traffic jams. In fact, there is no believable transportation solution for two very large complexes placed in such close proximity at Mission Bay.

Imagine dropping a 41,000-seat stadium anywhere within a 1-mile radius of San Francisco City Hall, and then tripling the capacity of Bill Graham Civic Auditorium. It would make no sense, for the same reason that it makes no sense to squeeze the planned Warriors facility into the Mission Bay neighborhood. The resulting perfect storm of traffic would make it miserable for both the existing neighborhood and for sports fans – in addition to threatening the entire future of UCSF as the center of a world-class academic/ biotech/medical complex.

In summary, we urge you and the city to reconsider the wisdom of proceeding with 3 [GEN-5]

I-Alberts

current construction plans. 3 [GEN-5] (cont.)

Date: Monday, July 13, 2015 12:21:28 PM

Dear Brett,
I am very concerned about the new warrior stadium in San Francisco...The health and well being of patients and people are at risk here...
Please help with the new stadium NOT coming to San Francisco!!! 1 [GEN-5]

Thank you,
Sula Anagnostou

From:	rrraphy@aol.com
To:	Warriors, PLN (CPC)
Subject:	Comments and objections to the Warrior"s plans and EIR
Date:	Monday, July 27, 2015 3:53:48 PM

Dated July 27, 2015

From: Ralph A. Anavy
420 Mission Bay Blvd N #1503
San Francisco CA 94158
Phone 415 647-8093, cell 415 813-7457

Subject: Comments and objections to the Warriors' plans and EIR.

Mission Bay is a planned community with specific businesses allowed in the Master plan.
Mission Bay is subject to strict usage and zoning rules, in particular for type of business, building heights, density, open space. It is a planned community and all buildings must fit within the guidelines of the Master plan.
While the Mission Bay master plan should be respected in its entirety, one can visualize needs for minor modifications. Any requested for variances to the Master plan should be fully justified, and provide offsets. 1 [PD-1]

The EIR clearly shows that the proposed arena and the adjoining developments on blocks 29, 30, 31, 32 ignore this master plan, and will have major negative impacts that are inadequately or not addressed in the EIR.

Many have commented on parking, traffic congestion and the impact on nearby hospitals, UCSF and businesses. I fully concur and will not add to the discussion here, except in voicing my support for the filed objections. 2 [ERP-9]

This addresses specific design flaws that are totally ignored in the EIR and are in complete disagreement with the Mission Bay Master plan.
First the height issue: Lots 30 and 32 are zone 90 ft. Lots 29 and 31 are zoned 160 ft and height density is spelled out. Not all the lot surface can be built to 160 ft.
The Warriors could have put the arena that has a peak height of 130 ft on the lots zoned 160 ft max height. Instead they chose to located mostly of it to the east, on the lots zoned maximum 90 feet. 3 [PP-1]
This is counter to the Master plan for Mission Bay. Yet they chose to put it on the 90 ft max height lots asking for variances and offering no offsets by lowering the height of buildings on lot 29 and 32.
In order to get conditional approval to the plan, and stay within the Master plan intent for Mission Bay, they should either move the arena to lots 29 & 31(the lots zoned to the proper height for the arena) or offset their request for the height variance (necessitated by placing the arena on lots 30 & 32), by lowering significantly the remaining buildings.
Second the Usage issue: The Mission Bay plan is quite explicit about the type of businesses it allows. An arena and entertainment center are not considered as valid developments in the Master Plan. If an exception is granted, it should be for cause. And the impact on the rest of Mission Bay should be minimized.

But more that just an arena, aspects of the design, not properly addressed in the EIR are of great concern. In particular, the so called "viewing deck" or "sky bar" which it really is. 4 [PD-1]

Usage and reason for the "viewing deck" or "sky bar".
In addition to asking that the height limitations of the Master Plan be raised to 130 ft for the arena on lots zoned 90 ft, (understandable if an arena is to be built, as an arena does require a certain height), the Warriors plan adds a "viewing deck" at 110 ft elevation (on lots zone maximum 90 ft) for the sole purpose of gaining views of the downtown and bridge for their sky bar patrons. This would put the "sky bar", well above the adjacent buildings which are all built within code! Gaining views is an outrageous

I-Anavy

request for a height variance, one of at least 20 ft, and more like 30 ft! These views are not even guaranteed as the Giants may yet build higher than allowing them to the North! But the impact will not change!
No one gets to climb higher than allowed by code just to get views, especially if it impacts the nearby buildings! And for what? a "sky bar"! Are they also contemplating a restaurant, as it was once described during preliminary meetings? The plans are devoid of any specifics for it, and should be disallowed just for this cause alone. Its impact is not measured. It is being swept under the rug!
The views on the Bay are just as spectacular on the East side. If the Warriors want to add a "viewing deck" or "sky bar", justifying its use which is not allowed in the Mission Bay plan, it should not tower above adjacent buildings, encroaching even more than the arena on the 90 ft maximum height limit of lots 30 & 32.
Furthermore the open deck now looks straight into office and residential buildings windows next to it. These, built specifically within the Mission Bay Master Plan will now have this new invasive intrusion, a few hundred feets away. Above all it is not allowed in the plan. 4 [PD-1] cont.
And its stated usage occupancy of thousands of guests, its hours of occupation (conceivably until 11pm, 365 days per year), its ill-defined and open ended purpose, the bright light pollution impact and the potential noise pollution impact (it is an open deck) on nearby residences is just unjustifiable.
And it is totally ignored in the EIR study. No impact discussed, no offsets, no specifics... a quick underhanded way of trying to slip in this totally unjustifiable aspect of the project!
There are no "sky decks", "sky bars", "sky restaurants" or "sky lounges" allowed in the Mission Bay plan. That aspect of the Arena project should be cut out. Not modified. Just cut out! There are no functional justifications for it, except the Warriors wanting it, at the height they chose!

If the Warriors insist on a "viewing deck" or "sky bar", it should be strictly within the guidelines of the Mission Bay plan, its purpose stated, its limited usage defined and strict use restrictions should be agreed upon. And not subject to future appeal. It should be lower, topping at a maximum height of 90 feet (thus sheltering nearby buildings from its impact). It should face East. Its hours of operation should be pre-agreed upon.
And the EIR should address its specific impact.

Subject: Mission Bay resident concerns
Date: Monday, July 13, 2015 12:40:34 PM

Hi,
I own a unit in the Madrone and have lived here since December, 2012. I'm rather concerned about the traffic implications of the new Warriors stadium. Frankly, it feels like SF doesn't understand traffic flow and density in Mission Bay in general, and I'm concerned that the Warrior's impact is totally unknown/inaccurately-planned. For example:

* I frequently seeing fire trucks driving the wrong way on 3rd St so that they can get to China Basin St.
* Around game times, the traffic on 3rd st backs up so much it's faster to walk downtown and catch a cab than try to drive somewhere.
* The light timing, especially around Berry St and 3rd/4th, makes it very hard to get out of Mission Bay during games. I've had it take me 50 minutes to go from the Madrone to 4th & King because of the light timing.

Right now, during a Giants game, the only way to get out of Mission Bay is to head towards 3rd & 16th, and if the Warriors are there, with 200 events/year at least, we'll basically be trapped. Yes, I know if Salesforce had been there we would've had additional traffic, but I suspect the number of employees would be significant less than the people at a game, and tech busses + people biking to work take even more cars off the road. 1 [TR-4]

I can't imagine the fire department, police departments, and UCSF are terribly happy about having to get through even more traffic to get to an emergency, and in some emergencies, seconds can make the difference between life and death. It seems like a lack of foresight to have built this new station if they can't function at 100% efficiency. 2 [TR-9]

I've also heard the mayor wants to add additional public transit into the area, reducing road space, but I'm sure many people will still drive, and this will just make the roads more congested. 3 [TR-4]

Last, I have additional concerns about parking. We're fortunate enough to have 1 space per unit, but we don't have guest parking and some units have multiple cars. It's quite difficult to find parking during a game, and it's expensive for me to have a driving guest over given how expensive the meters are during games. That hassle will only increase with the Warriors. (Plus guests hate having to drive over here because of the game traffic!) 4 [TR-13]

Thanks,
Josh

Subject: Warriors Arena in Mission Bay--NO!
Date: Friday, July 24, 2015 10:58:15 AM

I think putting a sporting arena that close to a hospital with very sick people is not only bad planning, it is greedy and selfish. The hospital and the UCSF buildings were there first. 1 [GEN-5] The traffic, noise, pollution, and general crowding and confusion that this plan would bring should be obvious to everyone concerned. I vote no on the arena in Mission Bay. 2 [ERP-9]

Subject: Warriors Arena
Date: Monday, July 27, 2015 1:54:48 PM

Hello,

I live in the surrounding area, Potrero Hill, of the future Warriors Arena and I am writing this email in support of the new arena. I believe the stadium is the perfect choice for this neighborhood. The Mission Bay has been poorly planned up to this point as outlined in this video clip comparing SF and Vancouver https://vimeo.com/86566866. The Mission Bay has become a sterile business park without any character or life. It needs something that can give it some kind of character and a major NBA sporting arena can help do just that. The arena alone will not give it a character, but the businesses that will sprout up once it is developed to support the people coming and going should reflect more character than another office building that closes down at 5 pm. I am excited for the bars, restaurants, and other small businesses that will come to this area to support the weekend and after 5 pm events (note: I am a parent of two, not a single kid just looking for parties) 1 [GEN-5]

The arguments against the stadium do not hold water

-The traffic will be horrible
The traffic is already horrible because of the Giants game. The addition of additional cars are not going to make traffic worse it will just be traffic more frequently something that will happen no matter what is built there. The detractors make it seem like the traffic will be analogous to a flood where cars are going to pile on top of each other and block every nook and cranny preventing any kind of human movement 2 [TR-4, TR-9]

-The space is for bio science
I'd say there is an ample amount of research space provided for research between the hospital and UCSF campus. 3 [GEN-6]

-The original plan did not call for a stadium
While the very original plan did not include a stadium, the Giants have been kicking around the idea of putting a stadium across the ball park since 2001 4 [PD-1]

-Pregnant ladies and sick children will not be able to get to the hospital 5

I-Barton

If this were true why did they build it so close to the Giants stadium. The Giants traffic definitely reaches the Hospital. Furthermore, if this were true than I am curious if pregnant women are advised not to live in high congestion areas. Do they not like in the towers near the Baybridge on ramps where traffic is often gridlocked 5 cont.

-It will be difficult for employees to drive to work
SFMTA has been employing a policy of making driving worse for years and years.

-The infrastructure is not adequate to support this arena.
I am not aware of SFMTA being proactive in creating infrastructure for a neighborhood. You need to build it first and then use the funds to create the infrastructure 6 [TR-5a]

This is private land and it will be developed along with the traffic. Please approve this project so we do not get another borring business park and a neighborhood without character and turns into a ghost town on weekends and evenings. 7 [GEN-5]

Best Regards
Jason Barton

Hello,

As someone who has lived on Potrero Hill for over 25 years, I must comment on the proposed Warriors project. Traffic getting in and out of our neighborhood has already increased and slowed to a crawl during rush hour, and is even worse before and after Giant's games. Third to Cesar Chavez is impossible, and the other directions to 80 on 3rd and 5th are a half hour crawl to get on the freeway. All despite the promise of better public transportation that were made before the Giants moved into town. 1 [TR-4]

Can you imagine what it will be like with Warriors games and the events that will certainly be held their off season year round? I think this is absolutely the wrong place for a new stadium and yet another development to be built. 2 [GEN-5]
But I am sure that our current city father's will explain these problems away, and we'll no longer be living in what was once the best neighborhood in the city.

Has their been any consideration of putting them in the Candlestick site? 3 [ALT-4]

Brett Bollinger:

I'm writing to oppose the construction of the Warriors new stadium at the currently proposed site in Mission Bay. I'm a neighbor in the area, already affected by the great increase in traffic on game days from the Giants Stadium. We often have complete gridlock NOW on home game days. An additional arena for a very popular team (!) would make the area impassable on Warriors game days. I have read the traffic solution currently being considered by the City and the Warriors, and find it laughable. 1 [TR-4] The neighborhood simply doesn't have enough parking to support TWO major stadiums within blocks of each other. 2 [TR-13]

I'm also a nurse, and completely agree with the California Nurses Association's opposition to the new Warriors stadium. The traffic congestion will make it difficult or impossible for patients, families and emergency responders to reach the new UCSF Hospital on game days. Emergency access to the Hospital is critical to the survival of patients. The gridlock produced by the proposed Warriors stadium would result in patient deaths. 3 [TR-9]

Subject: 2014.1441E DSEIR traffic/parking comments

Hello Brett Bollinger

Re: Comments on Warriors Traffic/transportation Management proposal DSEIR
2014.1441E Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Based on the transportation Management Plan presented to Dogpatch Neighborhood Association by the Warriors (Theo Ellington, and MTA Peter Albert) on July 14, 2015, the plan lacks sufficient plans/funding for congestion management.

There is a need for:

1 [TR-12a]

1. No added parking at 19th St./Illinois St because it will:
a. add to Dogpatch traffic congestion while not serving the neighborhood in any way.
2. It will draw game and function day Peninsula parkers through Dogpatch via 280 N. 23rd St off/on ramp, and THIRD St., crowd out the official Traffic route for trucks and bikes on Illinois St. and interfere with the planned but also opposed MTA turn-around loop at 19th and Illinois St as well as the proposed and opposed 19th St. extension and egress for 10 wheeler trucks from BAE ship repair business on SFPort land.
3. It will interfere with/cause safety issues for pedestrians, park users of the upcoming Crane Cove Park at 19th St./Illinois and Blue Greenway along Illinois St and Pier 70.

2 [TR-3b]

2. Need for more PCO's pre and post game/event located throughout Dogpatch and south to Cezar Chavez to avoid traffic going through neighborhood to/from 23rd St. on/off ramp at 280 N. Traffic should be kept off Tennessee, Minnesota, Indiana, 22nd St and 20th streets as these are mainly residential in nature.

3 [GEN-1b]

3. Dogpatch Neighborhood mitigation projects/ funds need to be identified and funded by the Warriors:
These could include:

a. 250 parking space garage located on Port land or south of 24th St. Dogpatch (with shuttle buses to the stadium). This lot would also serve workers and shoppers in Dogpatch while not sending traffic through the neighborhood. It could be designed such that it could be a park-like setting or off-leash dog park on non-game days.
b. Ongoing funds for Esprit Park maintenance and capital improvements
c. Ongoing maintenance and upgrading of neighborhood basketball court at the Historic Scott School (1060 Tennessee St) playground area on Minnesota St.
d. Ongoing cleaning/greening funds for public sidewalks and now neighborhood volunteer maintained spaces in and around Dogpatch.
e. Increased funding for more N/S T-Third cars and E/W MTA routes and ongoing funding/maintenance of these expansions

I-Carpinelli

3 [GEN-1b] cont.

f. Ongoing funding for Blue Greenway
g. Ongoing educational scholarship funds for underprivileged Dogpatch/Potrero neighborhood children to attend Dogpatch and Mission Bay pre-schools, after school programs, and charter schools

Thank you,
Janet Carpinelli

Dear OCII and the Golden State Warriors:

I am writing to provide my feedback during the allowed period for the Draft SEIR. I live in Mission Bay with a direct view of the planned venue. Already a neighbor to the SF Giants let me briefly convey my concerns about the planned arena based on my lived experience living down the street from the SF Giants.

Quality of life:

- Noise- Intoxicated people being loud outside after games- after 10 pm and weeknights. 1 [NOI-6]
- Public urination and discarded trash/alcohol bottles- fans urinating on our building and landscaping. 2 [GEN-2]
- All public parking around the building taken up by sports fans. Try having friends over. 3 [TR-13]
- People driving the wrong way down *one-way* Mission Bay Blvd. North and South. 4 [TR-4]
- Full Muni cars as I am trying to get home from work. I now ride a Vespa because of this. 5 [TR-5a]
- Mission Bay shuttles stuck in traffic, mainly due to the next: 6 [TR-4]
- No traffic officers at Mission Bay Blvd N. and S.; cars blocking the intersection in bumper to bumper traffic. Cross traffic not getting through.
- Local traffic diverted off China Basin St. down Mission Bay Blvd. North to accommodate SFPD Southern Station during games.
- People double parked/idling in the "mews" on Bridgeview (our garage entrance).
- Cars idling across our driveway entrance- blocking access to our homes.

And now there will be "traffic lanes" with the new stadium? *Please make sure we can get across 3rd Street to get to our homes*. I strongly recommend/request stickers for our vehicles to make passing through traffic lanes an easier process. 7 [TR-12a] Also- anything you can do to route foot traffic away from our homes would be appreciated. 8 [TR-6]

Re: Comments on Draft EIR for Warriors Mission Bay Project

I have significant concerns that the Draft EIR does not adequately address traffic impacts beyond the defined project area.

Specifically:

1) The additional auto trips generated by this project will have far-reaching impacts across the entire SOMA district, including on the Embarcadero, and the on-ramps to the eastbound lanes of the Bay Bridge from Bryant, Harrison and First Streets.These are already heavily congested freeway access points.

2) Indeed, it will have a regional impacts on highways, including the Bay Bridge/580/880 maze and 101/92 interchanges, much as Giant's games currently do. On dates with overlapping events at AT&T and the proposed project, traffic will likely be negatively impacted for 8+ hours, including the main auto egress points out of the Financial District. 1 [TR-4]

I believe a wider traffic study area needs to be defined for mitigation analysis. 2 [TR-2b]

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

I am San Francisco homeowner and a local (4th and Townsend) worker concerned about the impact of the proposed Golden State Warriors stadium on the future of the close-knit, surrounding neighborhood communities and the medical campus at Mission Bay. 1 [GEN-5, LU-1]

I believe that the proposed stadium will unequivocally add unbearable congestion and stress to the current neighborhood environment, besides creating an impossible situation for the local services including Fire Stations, and healthcare providers such as USCF and Kaiser Permanente.

My co-workers, many of whom are also homeowners in the Soma/Mission Bay have already been impacted by the traffic caused just by the SF GIANTS' home games! Many of us have had to adjust our work hours to avoid the traffic gridlock. This congestion has also impacted the health and welfare of our outside environment and has impeded our enjoyment of daily walks and outside 2 [TR-4] lunching— which we deem necessary to keep up our health and sanity. During home games, it is virtually impossible to navigate the sidewalks and cars around 4th and Townsend not to mention the continuous bombardment of pedestrians who have parked in Mission Bay for the game. This creates sidewalk congestion even when walking on the San Francisco Bay Trail (one of our favorite walking trails) that runs along the Bay near Terry A Francois Blvd, RIGHT at the site of 3 [TR-6] the proposed Warriors Stadium and other mixed-use buildings. This stadium project absolutely promises additional traffic logjams and parking nightmares. 4 [TR-4, TR-13]

This is area no longer a Healthy SF but a STRESS SF. This community is already impacted with very dense structures. This area should be PRESERVED and developed as a GREENSPACE PUBLIC PARK. As far as I have seen from walking this neighborhood for over 3 years, there is definitely not enough OPEN SPACE allotted for the population. Preserving this area should be a priority for 5 [REC-2] the City of San Francisco! I DO NOT HAVE ANY FAITH, that the City Officials will be able to provide any traffic control that will alleviate the hellish congestion created by this proposed project. 6 [TR-4]

I appeal to the Planning Department to step up, turn this proposition around and instead consider funding an OPEN SPACE 'Heritage' Project – one that this world-class city needs and deserves and an oasis to be enjoyed for many years by the surrounding neighborhoods, the guests and children of UCSF, local workers and visitors. I implore you to consider preserving what little is left of our beautiful waterfront by creating a gem to be enjoyed like Golden Gate Park on the western edge of our city. 7 [REC-2]

I-Cunningham

This project is not a welcome addition and will only burden the city in the years to come; creating an impossibly hellish situation in an environment that is already unlivable and unsustainable! Again, I appeal to you to you please DO NOT place your support behind this project. 8 [GEN-5]

Sincerely,
Micki Cunningham

Subject: My concern with Warriors/Mission Bay Project
Date: Monday, July 27, 2015 2:09:57 PM

Dear Brett Bollinger,
I wish to comment on the Warriors/Mission Bay project. I was recently informed that Kaiser Permanente medical offices will be moving in the Mission Bay Area early 2016. My doctor and my elderly mother's doctor will be located there. My concern is the traffic especially during game days/special events. Yes, I can plan in advance my appointments but in case of an emergency or urgent care appointment I do not want to be stuck in traffic. I am not a basketball fan and I would not know when game days /special events are. I prefer to drive my mother to her appointments and I would not consider taking an 80 year old woman in a wheelchair on MUNI.
I was born and raised in San Francisco and I respect the development of The City. So I hope the necessary steps will be considered to make automobile traffic flow better in the areas of the UC hospital and Kaiser Permanente Medical offices in the Mission Bay Area most of the time and especially during game days and special events. 1 [TR-4]

Thank you for letting me comment on this and thank you for your attention to this important matter.

Sincerely,
Marian Dalere

I-deCastro1

From: John deCastro
To: Warriors, PLN (CPC)
Subject: Comments on Draft EIR for Warriors Arena
Date: Monday, July 27, 2015 10:03:15 AM

As a long time resident of Potrero Hill that will be impacted by the unmitigated effects of the Warriors stadium and event arena's proposed 205 days a year of activities.

I am disappointed that the City is calling traffic, transit and parking issues "significant and unavoidable". 1 [TR-2j]

First many of our blocks already have Residential Permits. What is the City going to do to keep people hunting for parking in our residential neighborhoods? We already suffer daily commuter parking problems cause by UCSF, Mission Bay and Caltrain that have not been addressed for years. 2 [TR-13]

Second, transit is promised to be improved as a result of the Warriors Event Center. However plans are very fluid and not well described to the neighborhood. The only minor improvement is the 55 line which is an interim measure until the only reliable bus line (22) is removed from 18th St. The 22 is proposed to
be replaced by the unreliable 33. 3 [TR-5a]

The concept of a "lock box" for ticket tax revenue is a good idea. However I am waiting for legislative action to make it a reality. Given that the Eastern Neighborhoods Plan called for improved transit 5 years ago. We have seen little progress on that front. 4 [IO-3]

Finally, traffic caused by on going development of thousands of units has not been addressed. How can I believe that the Warriors & City will follow through with their promises? 5 [TR-2h]

Potrero Hill is an island with only two east - west streets on the north slope of the Hill that cross the 101. Most of our intersections are gridlocked twice a day during morning and evening commute. Add a Giants game to the mix and we get a third rush hour gridlock.
I am not optimistic that the City is going to be able to implement an effective traffic management plan. The promised traffic officers will disappear during the next economic downturn, never to return unless the ticket tax money is in a "lock box" in the City budget.

If the City and the Warriors are going to build the Arena, traffic, transit and residential parking impacts can not be "significant and unavoidable". They must be mitigated and addressed before the Arena is built. 6 [TR-12a]

Subject: Comments on Warriors DSEIR
Date: Monday, June 22, 2015 9:49:47 AM

Dear group reviewing the EIR for the Mission Bay Warriors stadium:

I am writing to express my concern about the proposed new stadium for the Golden State Warriors in the Mission Bay area. I feel that this new complex will have a huge negative impact upon the UCSF Mission Bay medical center and upon the patients which it serves. The traffic congestion created by this new sports complex will make it very difficult for patients and their families to reach the medical center, which could delay urgent or emergency medical care. [1 TR-4] It is far more important to be able to provide care for the children and families of San Francisco and the larger Bay Area, than to meet the needs of the Golden State Warriors. The Warriors already have an excellent facility for its games in Oakland. Why compromise the care of children for the sake of a basketball team? The City of San Francisco needs to get its priorities straight. The City needs to be more concerned about children and families, and not the financial goals of the rich owners of the Warriors. Subject: Comments on Warriors DSEIR
Date: Wednesday, June 24, 2015 4:37:52 PM

To whom it may concern,
I am concerned about the dangerous impact of having the warriors stadium/concert hall across the street from the ucsf childrens hospital. I feel like this part of the city already has issues during the baseball games at ATT park, sometimes hidering staff from getting where they are vitally needed in a timely manner. I also think its a burden stressed parents should not have to deal with. These streets cant handle much more congestion. I hope these concerns are looked at before anything is built because I think it will have a very negative impact on our facility. [1 [TR-4]]

Subject: UCSF Employee against Warriors Stadium at Mission Bay
Date: Monday, July 27, 2015 11:29:50 AM

Dear Tiffany Bohee,

I am an employee at UCSF and mother to a small child. I am writing today to share my very serious concerns for the Warriors stadium planned for the Mission Bay area of San Francisco. I commute every day to work along both the Bart and Muni lines (either T or 55). I have literally lost sleep about the commute home on days where the Giants are playing as it makes the commute home absolutely terrible and I am often late to pick my child up from daycare. Commuter trains are packed, late, or they get stuck after on a few stops due to the huge foot and car traffic that results on game days. Busses that were added that can sometimes avoid the Giant's stadium (55, Mission Bay Shuttle, UCSF Shuttles) are no better as cars in the area are desperate to find ways around the traffic and they clog up every side street and major through way for blocks around. 1 [TR-4]

Beyond the commute, imagine being in labor and getting stuck in the traffic or having a child critically ill and needing to get to ER immediately. I have heard of ambulances getting stuck in traffic and have noticed that families are very late to their appointments on days where there are day games. As a mother and patient, I cannot even fathom the anxiety this would produce and would never plan any of my care at UCSF Mission Bay if any additional traffic hazards (like the stadium) were added to an already clogged area. 2 [TR-9]

I feel like the planned stadium would be a huge liability to the City of San Francisco, the Warriors franchise, UCSF, and Kaiser (who is also building in the area) - imagine if the traffic held up an ambulance and a child died? Please consider the patients, employees, and families of San Francisco when considering this proposed development and the true cost it would have to our community.

Best,

Subject: I SUPPORT the stadium :)
Date: Monday, July 13, 2015 1:18:43 PM

.......NOT!

don't do it. Please understand what the effects on our community would be. Specifically the destruction of the environment, and encouraging people to spend money they don't have.

What does the Warriors team, or the basketball league as a whole do for their community? How do they give back? I only see children who have been pummeled by their parents and coaches, happened to be the best of the best, to be paid exorbantly to "entertain" the crowds, only to piddle it away on childish things, go into debt, and be expected to be perfect spouses and parents as well as players. What kind of upside down world do we live in ?

Please see that we really don't need another stadium around. It is unfortunate football and soccer got their stadium around here but please respect where our lives are and our environment.
Please do not turn your cheek to the extremely fragile state the earth is in.
Please understand and choose to be the honorary example of a man who chooses to put the earth he lives on, the great great grandchildren he doesn't know yet, a fighting chance at survival.

1 [GEN-5]

Thank you for your consideration

JANESSA

Greetings,

Keep the Warriors in Oakland. This is an incredibly ill conceived plan and will result in traffic beyond belief! You propose a few traffic cops to help with the congestion and a few hundred parking spaces?

Surely you must be insane! Have you been in that neighborhood now with the gridlock? No point in directing traffic in complete gridlock.

Subject: concerns over proposed Warriors Stadium
Date: Monday, July 27, 2015 1:55:41 PM

Dear Brett Bollinger,

I am writing to express my personal concerns over the planned stadium at Mission Bay. I am a professor and faculty member at the University of California, San Francisco, and my research lab and office are located on the Mission Bay Campus. The traffic in this region of the city is terrible on many days, especially those that have an event at the baseball stadium. A few months ago it took me 2 hours and 40 minutes to drive a car from Mission Bay across the Bay Bridge. This is completely unacceptable, and it highlights that the growth in this region of the city is outpacing the infrastructure for transport into and out of the region. As you know, this traffic problem is only going to get worse if this new proposed stadium is built in Mission Bay. Therefore, I oppose this new stadium, and I believe that the city should oppose this new construction also. 1 [TR-4]

I want to state again that these are my own opinions.

Sincerely,
Michael Grabe

From: Max Grant
To: Warriors, PLN (CPC)
Subject: RE: My Opposition to Move the Warriors to San Francisco
Date: Monday, July 13, 2015 2:39:07 PM

Dear Brett Bollinger,

I am greatly oppose to having the Warriors move to San Francisco. I am opposed to this move for several reasons, but more importantly the Warriors are where they are supposed to be. They are in a city that love them--win or loose, support them, and are very loyal to them, not a city that only want them when they are at there best for financial gains.

In addition, San Francisco is becoming overly crowded with parking being a major problem and the city is becoming a city only for the wealthy. And despite of the wealth in the city, no one wanted to spend the money to repair Candlestick park and keep San Francisco 49ers in San Francisco. So , it's an enigma to me as to why it is okay to spend the money to build a new arena to steal the Warriors from Oakland? 1 [GEN-5]

Vehicle manslaughter is on the rise in San Francisco, parking is a nightmare, and traffic is a nightmare so a Warriors Arena is not a welcoming addition.

~Max K. Grant

I-Hansen

From: Cassidy Hansen
To: Warriors, PLN (CPC)
Subject: No room for arena
Date: Monday, July 27, 2015 6:43:54 PM

3rd street is a parking lot when Giants' games get out. When the two seasons overlap, it will be catastrophic to the locals and those trying to reach the Bay Bridge. 1 [TR-4]

There is hardly room in this tiny city for one sports team. The 49ers move although sentimentally disappointing made sense which is proving to be beneficial for San Francisco, I believe. 2 [GEN-5]

Unless a way could be devised to inhibit/divert the majority of extra cars coming into the city with some sort of shuttle service (we know Muni cannot handle it), Mission Bay is going to suffer. Let's also remember there is a hospital with emergency capabilities there. It would be devastating to generate a bunch of gridlock right around a major hospital. 3 [TR-4]

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR.

Unmanageable Traffic and Incompatible Land Uses

The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities. 1 [ERP-9] A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR. 2 [LU-1]

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle up to 18,500 fans at 225 events per year, especially when both stadiums have games. Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, 3 [TR-4] the practical effect will be yet more gridlock and unhealthy air emissions. 4 [AQ-4b]

The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities. 5 [TR-9]

Health Concerns

The project's traffic new massive gridlock and parking problems will also cause significant and unavoidable impacts on air quality. Increased car and truck emissions in the area will be unhealthy for residents, workers and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents and patients and families who rely on UCSF and other lifesaving services in Mission Bay. The Draft EIR fails to address and mitigate these health impacts, relying on vague plans and purchases of emissions offsets rather than effective mitigation measures as required by CEQA. 6 [AQ-4b]

The current health care and research center is a hub of care and innovation, the future of this world-class medical center should not be jeopardized by billionaires seeking to double the value of the Warriors as a sports franchise on the backs of San Francisco residents. 7

* * *

Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements. 8 [ERP-7] Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship. 9 [PD-4]

Thus, we ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors. 10 [GEN-5] The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project and conduct a new and complete environmental review process before any decisions are made. 11 [ALT-4] Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project. 12 [ERP-2]

Sincerely,
Alison Heath

Subject: Public Comment: concern about street parking for residents
Date: Monday, June 22, 2015 5:17:50 PM

Hello -

While I'm very excited for the Warriors on their 2015 Championship - I am concerned with the impact that having their new stadium at their proposed SF location.
I live in the neighborhood nearby - Dogpatch - and street parking is already limited by the new hospital, university, private business and Giants fans (why use the paid parking when street is free?).

I would like to see the neighborhood parking restrictions extended later in the day for those without a permit to discourage game goers from using all the street parking before residents get home from work. We see this impact already with the AT&T stadium events and the continuing growth of the neighborhood - it will no doubt occur more with another event center nearby.

1 [TR-13]

Thank you for considering your impact on the residents of the neighborhood

Subject: STADIUM
Date: Monday, July 27, 2015 5:37:56 PM
Importance: High

Please note that I am opposed to the building of a monster stadium in San Francisco's South of Market area. I moved to Potrero Hill in 1987 and, since then, every inch of land has been taken over by the developers and big money interests. 1 [GEN-5]

Meantime, our quality of living has suffered and it is now impossible to even go to the grocery store without encountering traffic jams. When there is a game at AT&T, traffic is a nightmare and getting worse every day. We were told that measures would be taken to alleviate traffic problems when that stadium was proposed – that has not happened. At the beginning, there were traffic cops to assist with the traffic flow but they disappeared pretty quickly. **My street has become a thoroughfare before and after the games and I take my life in my hands trying to back out with cars racing up and down the hill.** On Sunday, the cars used my street to bypass the runners during the San Francisco Marathon—one after the other coming up the hill from 3rd Street to get onto the 280 south freeway. They are not polite and slide through the stop signs! 2 [TR-4]

We are tired of broken promises!

I have no faith that this is going to be a good move. There is nowhere for the traffic to go. We have run out of land, folks, and also air space and all I see in the area now is one high rise after the other. Those movies now showing San Francisco destroyed are depicting what is going to happen when the next earthquake hits and it is not a pleasurable thing.

Ed Lee and the Board of Supervisors need to get back to taking care of the people who pay the taxes and love San Francisco for its unique qualities. Stop selling our streets to the highest bidder – remember the America's Cup... 3 [GEN-5]

I am a dedicated voter and I will not forget who voted for this disaster in the making!

Date: Monday, July 27, 2015 1:06:23 PM

San Francisco Planning Department
Atten: Miss. Sarah B. Jones, Environmental Review Officer
1650 Mission Street, Suite 400
San Francisco, CA. 94103

July 20, 2015

Subject: Comments on the Draft Subsequent Environmental Impact Report
(Draft SEIR) Case Number: 2014.1441E – Event Center and Mixed Use
Development Mission Bay Blocks 29-32

Good morning Miss. Sarah Jones,

My name is Dennis Hong, I have been a resident and a private citizen residing in San Francisco all my life – Sixty five plus years and currently retired. Thank you the opportunity to review and comment on this exciting Project. I appreciate all the professional work/efforts made by both the OCII and the Planning Department made on this document. I realize that the original scope of work done on this project had changed several times including; a different site, including a number of positive community meetings with the Planning Department, the City, the sponsor (GSW), UCSF and many other stakeholders. In addition, a number of changes have been made (tweaked out) since the publication of the current Draft SEIR – June 5, 2015. To me this shows that progress is being made. As always; communication, collaboration works.

Below you will find my response and comments to this Draft SEIR - as requested by the Planning Department for consideration by the San Francisco Planning Commission, these comments are my personal views. These comments are based on the above Draft SEIR June 5, 2015 – Comment Period – June 5, 2015 to July 20, 2015 (July 27, 2015 @5pm-recently revised).

1. TRAFFIC- I am writing to express my sincere and significant concern with the impact of the additional traffic to this area; both pedestrians and vehicles; both during and after construction. Especially when the project is completed. I have been tracking this project as best as I could. Both the sponsor (GSW) and UCSF have been doing the best possible and with other involved stake holders to resolve some of these issues. This Draft SEIR captures some of that. However, it did not include some of the recent comments and or concessions that came up since it's publication. The recent concerns are mainly with traffic; during and after the games. The possibilities of these issues seem endless. But it looks like all stakeholders are on the same page and are closer than ever to resolving these issues. Most of these issues have been vented, but a compromised plan still needs to be made, the best part is, we are getting there. 1 [TR-12a]

2. My main concern is making sure that the traffic issues with pedestrian, vehicle, public transit (Muni, Cal Trains), are worked out with UCSF's master Plan. If the removal of the 280 freeway happens as proposed, it needs to be part of the EIR/plan. Removing this major link and rerouting it under ground as proposed may have a major impact to the project and this area. As I understand it a tunnel would be under Third street which happens to be land fill. 2 [TR-2h]

3. Under Cumulative Projects 5.1.5.2, were the following projects considered? HOPE, possible removal of the 280 freeway, Giants Project-Pier 70, 590 Minnesota-UCSF proposed Student Housing and 600 Minnesota-UCSF proposed Student Housing? Several of these Projects may be identified as another name – specifically the HOPE Project. For clarity purposes, could all of these cumulative projects be shown on a map, similar to fig 5-2-12? 3 [IO-3]

I-Hong

4. I realize that the control of Fugitive Dust and construction work is hard to handle. All to often the "best practices" does not work. But with all this work going on how will it affect/impact the ongoing adjacent projects, UCSF's adjacent facilities and their daily operations? The current project at Union Square, Central Subway Station is doing a better than usual job in controlling the dust from entering these high-end retail shops. This includes the California Pacific Medical Center along the Van Ness Corridor. (Use of semi- closed barriers with mesh screens). This may be an better option than some of the best practices. 4 [AQ-2]

5. The Draft SEIR does a good job trying to identify the Traffic issues. However, as I mentioned above, since it's publication additional thoughts from the community, MTA, UCSF and others came up are good, these comments should be part of the RTC / Final EIR. All stakeholders have done a relatively good job here. Most importantly the new Arena Facility needs to work with UCSF's Master Plan. 5 [TR-11]

6. More on traffic:

a. During the Events at the arena, add a MUNI shuttle/service to and from the two BART stations 16th and 24th Mission Street to the arena. 6 [TR-5a]
b. Provide additional traffic control officers before and after the events. 7 [TR-3b]
c. Possibly use other near by garages for additional parking. 8 [TR-13]
d. Restrict traffic along some of the main streets during the events for a smother flow of traffic.
e. During game/event time, work with Caltrans and the city to use a electronic freeway/street type of sign to help direct the traffic before they get in to the Mission Bay area, these events. They are doing this now when freeway sections and the bridge/s close and it works fine. 9 [TR-4]
f. Consider closing off some of the streets for emergency only access to the hospitals. 10 [TR-9]

7. Aesthetics of the project, both the sponsor and the architects have done an wonderful job. However, I do disagree with some of the comments made on the describing the Area. The use of color Photo-simulations has done an excellent job in showing what this arena may look like. As the design, color and material could have an impact on the visual skyline. I also realize CEQA does not require this step. 11 [ERP-8]

8. The new Arena will be an economic boom to both the city and local business, including UCSF, the Dogpatch area and others in the South Eastern part of town.

9.The proposed location is in an ideal part of town. The Sponsor has already done a diligent job in selecting this new site from the original Pier 30-32 which was voted down. 12 [GEN-5]

10. Include any other comments made to the (RTC) Response to Comments made during any of the public Planning Commission meetings, i.e., Planning Commission hearing held on June 30, 2015. 13 [ERP-3]

11. Construction Phase, request that the Final EIR provide time lines of this Project. 14 [PD-3]

a. A construction time line showing all ongoing/current, cumulatively or upcoming projects in the vicinity of this project must be considered. 15 [IO-3]
b. Provide the following for controls, signs and etc., for pedestrians and traffic during the construction; traffic control officers, signs, control barriers, etc.
c.Communicate with the local merchants, residences in the area of the dates, construction schedules. Especially if certain streets will be closed. A contact i.e., Project Manager to call if needed.
d. Provide provisions for dust controls, safety barriers and control signs.
e.Can the use of dust barriers be used to control the dust from getting in to the restaurants, business and residences and the hospital?
f.Can any of the recent/current legislation under consideration (regarding construction dust) be used here? I believe there was something the Board of Supervisors were looking at on this matter. 16 [PD-3]

12. Will this plan include some of Muni's "Traffic Calming" measures such as some of the intersections along Market Street? This might be a great project to include some of these concept along Market and the Van Ness Corridor. 17 [TR-3a]

I-Hong

13. It would be a true shame if the sponsor should abandon this Project. Lets not loose this opportunity of a life time. 18 [GEN-5]

In Conclusion: Based on my comments and evaluation of this Draft SEIR, case 2014.1441E of June 5, 2015; I have concluded there is sufficient information and I fully support this Project and this Draft SEIR. With all that said; a little more work needs to be done with communicating and working on the traffic issues, especially how this will or will not impact the Hospitals operations. 19 [TR-4]

If any additional information could be provided in the final Report (RTC), it would be appreciated by the many stakeholders who are personally interested in this project.

Thanks to you, the Office of Community Investment and Infrastructure (OCII), the Planning Department, the Board of Supervisors, the Planning Commission and the Mayors Office for working so hard on this project. I would like to see the process expedited so that construction can start.

Incidentally, I have also been working, I believe with UCSF's most recent Final-UCSF's Long range plan of – November 2014-State Clearing House Number 2013092047, chapter 5.

Thank you for your consideration of my comments as part of the DEIRIS and the process.
Should you have any questions regarding this email/letter, please do not hesitate to contact me at dennisj.gov88@yahoo.com.

Please: If there are any compelling reasons why you think this project should not continue or be delayed, I would be interested to understand why.

Respectfully Submitted,

Dennis Hong

A WIN-WIN FOR WARRIORS-UCSF

There's a win-win way around a potential Warriors /UCSF-land-bankers quarrel whose aim is to thwart the basketball team's Third Street arena plans until a distant time when UCSF may need additional space for research -- and then junk the arena altogether.

1 [GEN-5]

In this win-win scenario, the **Warriors** would get an arena a year ahead of when they would have if the mysterious non-UCSF-affiliated group sued "until the cows come home," as they've threatened. Plus, the Warriors would have an assured income stream from office leasing, leading to the best financing rate available in the commercial real estate market; **UCSF and biotech firms** would get access to a half-million square feet of research space accommodating 2000 workers, at a timing of the university's or biotech companies' choosing; the **anti-arena crowd** would get to claim a victory plus save at least $228 million in cash in the first year and earn untold millions later in a few years; and **non-basketball-fan San Franciscans** wouldn't have to travel 100 miles to San Jose and back to see a concert.

Here's how the idea would work:

The property upon which the arena and two 250,000 square foot office/research buildings would be built was purchased by Salesforce in 2010 for $278 million, according to Bloomberg Business News. So UCSF's benefactors would presumably have to pay that sum or more to acquire and land-bank the property. But suppose they land-banked it by leasing all 500,000 square feet now and then sub-leased completed, ready-to-occupy space as researchers needed it over the next several years. At the going rate of $60 per square foot for Class A San Francisco office space, the benefactors would have an expense of $30 million a year. That's as opposed to a minimum $278 million cost of buying-and-banking it…a savings of at least a cool $248 million. The cream upon this cake is that the benefactors would almost certainly be able to sublease the space for more than they leased it, thereby making a neat profit on their good deeds.

1 [GEN-5] cont.

I-Horn1

In such a scenario, the only losers would be the delay-delay lawyers whose salivating over the prospect of years of fees would suddenly dry up.

1 [GEN-5] cont.

Below is a comment about the June 5 Warriors SEIR. I hope you can incorporate it into the public comments section of the next version. Thank you. Stan Horn

Because San Francisco couldn't get its act together and build an arena 40 years ago -- the proposed arena site at 4th and Howard was turned into low-cost housing -- the Warriors defaulted to the nearest suitable place, the Oakland Coliseum. Oakland has had a good run. But now the party's over.

1 [GEN-5]

There are many good reasons why the Warriors belong in San Francisco.

- San Francisco has twice the population of Oakland. So it should have twice the fan base.

- San Francisco is much wealthier per capita, so it should

I-Horn2

provide the Warriors with a bigger potential.

- San Francisco's cachet alone will make the team more valuable as it basks in the reflections of one of the world's most popular cities.

- According to FBI statistics, fans visiting the Coliseum must forge through some of the nation's highest-crime zip codes. In San Francisco, the site is bounded by the bay, a world-renowned university, and some of the highest-priced real estate in America…none of which are known as high-crime breeders.

- Before and after games, there are nothing but acres of asphalt parking and concrete freeways and raw gray elevated train stations to greet fans in Oakland. Across the bay the arena would be surrounded by scores of cafes, night-spots, restaurants, bars, bayside parks, and pleasant walks in attractive, lively neighborhoods.

1 [GEN-5] cont.

But perhaps the main reason the Warriors belong in the City is that it will finally bring San Francisco a modern events center. San Francisco is the only big city in America that doesn't have one. San Franciscans who want to see a concert, for example, must make a 100-mile round trip to San Jose or a 40-mile round trip to Oakland. No other residents of America's principal cities have to go through that.

I-Horn2

Dozens of cultural, entertainment, artistic, educational, and sports experiences that are not now available to San Franciscans would be if there were an arena. In that sense, the events center would be as much a cultural addition to the region as our great museums. And not only San Franciscans would benefit: because of the new Muni-to-BART subway, Caltrain, future high-speed rail, ferry service, and thousands of parking spaces, the arena would be much more accessible to all Northern Californians than the freeway-and-parking-girded Coliseum is.

And don't cry for Oakland. The forever-wannabe has gone after -- and won -- virtually all of San Francisco's port jobs, more than a thousand former San Francisco BART headquarters jobs, more than a thousand former San Francisco Caltrans District IV headquarters jobs, more than a thousand former San Francisco federal government jobs, and more. Some would say that giving a little back is not unreasonable.

1 [GEN-5] cont.

Below is a comment about the June 5 Warriors SEIR. I hope you can incorporate it into the public comments section of the next version. Thank you. Stan Horn

A Chronicle letter-writer pointed out that more than a dozen cities have arenas near hospitals and co-exist well.

Perhaps the best such example is right here in San Francisco.

For three generations, the 60,000-seat Kezar Stadium was closer to the main entrance of the UCSF Hospital on Parnassus than the proposed 18,000-seat Warriors arena will be to the main entrance of UCSF Mission Bay. Yet never in those generations -- and thousands of 49er, USF, and high school games and traffic -- were there reported complaints about ambulance access. With 200 events per year scheduled and perhaps an hour or two of heavy traffic at each, that means that **96% of each year will be free of arena traffic that might affect ambulances.**

1 [GEN-5]

I-Horn3

As for parking, there was none at Kezar. The Warriors will build almost 1000 spaces and the Giants are about to build several thousand spaces virtually adjacent to the new arena. Several thousand spaces already exist in UCSF garages, largely empty at nights and weekends when events will be scheduled. 1 [GEN-5] cont.

Draft SEIR - Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Submitted by: **Christopher Hrones, AICP**

Date: **June 30, 2015**

Good afternoon and thank you for the opportunity to comment on this draft SEIR. I am a new resident to San Francisco who has followed this project with interest. Prior to this year I lived and worked in Brooklyn, New York, where I had the opportunity to participate professionally in the planning and public discussion of the Barclays Center arena and associated Atlantic Yards development, which saw the relocation of the Nets basketball team from New Jersey to Brooklyn. Although there are obviously differences between that development and this proposal, there are also some interesting parallels, namely, the creation of a new 18,000 seat multiuse arena at an urban infill site accessible by transit, with major concerns initially expressed by some about traffic and parking impacts. 1 [ERP-9]

I would like to offer some observations on my experience in Brooklyn that can be instructive as we think about how to plan for the Warriors arena development.

First, the traffic congestion impact feared by many at the Barclays Center site for the most part did not materialize. As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fear of congestion generated by the arena so greatly exceeded the actual impact that when the facility opened traffic congestion was more or less a non-story. This was due to a number of factors, but the two most important were that transit utilization did meet the project goals, and that vehicle arrivals to the arena were more spread out than projected, as many people who drove came early to the area to go to nearby restaurants, bars, etc. Given this, I am happy to see that this EIR does focus on transit investments. Also, developing retail at the site as proposed will encourage some people to arrive early and eat or drink before an event. This should among, other potential benefits, disperse traffic impacts 2 [TR-2d, TR-4]

A second observation from Brooklyn is that off-street parking supply provided by the project, combined with existing nearby off-street parking, far exceeded demand, and parking availability was therefore not an issue. The 541 parking spaces provided on site were never at full capacity and the lot was typically less than half full for major events such as basketball games. This was due, in addition to high transit mode share, to the availability of many nearby parking lots and garages that had capacity after the workday was over, as well as free and low cost on street parking. Many of the same conditions are present at the 3 [TR-13]

Warriors site and therefore I do not believe parking availability will be an issue here either. I will mention one negative impact associated with parking in Brooklyn -- there has been some concern from residents about parking becoming more difficult in surrounding neighborhoods as a result of arena patrons parking on street. The investigation into Residential Permit Parking zone expansion referenced in the EIR will be important if this type of impact is to be minimized in Mission Bay. 3 [TR-13] cont.

Third, inappropriate staging and idling by for-hire vehicles was a major community quality of life concern that the Barclays Arena plan did not in my opinion adequately address. Subsequent to the arena opening, a curbside area was designated for staging in response to this concern and efforts were made to reach out to the for hire vehicle industry. However, limousines and other vehicles idling in bus stops, no standing zones, etc. continues to remain an issue well after the arena opening. With this in mind, I was pleased to see that the SDEIR calls for a specific plan to stage these types of vehicles. Early and thorough communication with the for-hire vehicle industry will be important to ensure that utilization of the designated staging areas actually occurs. 4 [TR-3a]

Fourth, emergency vehicle access, which has been raised as a potential concern by some with this project, was effectively accommodated in Brooklyn, where police and fire stations are located immediately adjacent to Barclay's Center. There were no significant issues that I am aware of with fire or police vehicle response. However, close coordination between these agencies and the project owner was necessary to ensure things went smoothly. 5 [TR-9]

Fifth, management of pedestrian flows, especially immediately after events, can be challenging. Barclay's Center has an excellent pedestrian safety record; however, there was a need to make adjustments after the opening, which in addition to pedestrian management by operational personnel, included creating more effective sidewalk space, adding crosswalks, and installing barriers to prevent midblock crossing. The SDEIR is correct to propose solutions to prevent mid-block crossings to the southbound light rail platform at 3rd Street, and to acknowledge that the intersection of 3rd Street and South Street requires active operational management. I would suggest in addition to this that permanent physical infrastructure to adequately accommodate pedestrian flows, especially at 3rd Street and South Street, be included in the project. It is much easier to implement measures such as pedestrian bulbouts and additional crosswalks as part of the project than trying to create retrofits after the arena has opened. 6 [TR-6]

Finally, the phased nature of the buildout of the Atlantic Yards/Barclays Arena project led to prolonged and repeated construction impacts that overlapped with arena events. This including suboptimal temporary conditions for pedestrians, cyclists, and motorists. I was therefore pleased to see that the plan here is to 7 [TR-10] complete all construction on the site including the office towers prior to the opening of the arena, and I would urge that course of action be maintained. 7 [TR-10] cont.

Having recently lived through the planning, construction, and operation of an urban arena, I hope these observations and lessons learned are instructive. Thanks again for the opportunity to provide comments and best of luck with the project.

Aren't things bad enough already? How can you consciously decide to add yet one more traffic creating, system clogging stadium to an area already mired by traffic jams. It should not take us 1.5 hours to get to the east bay during game time, or an hour and a half to get to the embarcadero from the Bayview if there is a game at any point that day, but it does and we endure. Now you're going to add to the infrastructural nightmare? And for what? We already know that the residents of the Bayview neighborhood factor the least in all city planning decisions, but to essentially ensure gridlock along the only pathway from it to the main segment of the city, and along the least efficient public transit line to boot (the T?) When do the concerns of the constituents finally stack up against the dollar signs? Where is the city planner who has chosen to do this to our city? Have they been to the neighborhood during game time? Have they commuted to and from the Bayview during a 6:00 Giants let-out? Only 2 months ago it took me two and a half hours to make it from the Bayview to the Exploratorium for a presentation, attempted arrival time 5pm. The game had let out at 3! If this city does not have the wherewithal to make it stop and improve our already laughable traffic conditions, can we not at least stop actively making it worse? Please, don't shut down transit for all. Find another location! 1 [TR-4]

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR.

I have lived on Potrero Hill for a long time, and while it is perhaps a better place to live now than it was 50 years ago, recent development has drastically increased traffic and threatens to make parking impossible for residents. Building the Warriors Arena in this neighborhood will only exacerbate these problems. We already have serious gridlock at certain times of the day at the bottom of Mississippi Street where 7th and 16th Street come together. Soon we will become prisoners in our own neighborhood. 1 [TR-4]

Overall, I am disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements. 2 [ERP-7] Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship. 3 [PD-4]

Thus, I ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors. 4 [GEN-5] The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project and conduct a new and complete environmental review process before any decisions are made. 5 [ALT-4] Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project. 6 [ERP-2]

Dear Mr. Bollinger-

I am a long time resident of San Francisco and I have worked in the Mission Bay/ Dogpatch area over the course of 7 years.

To be brief and to the point, I am totally opposed to the Warriors Stadium being located in San Francisco for these reasons:

OAKLAND
Oakland needs the Warriors and the jobs.
BART goes to Oakland, it is efficient and has long term sustainability
The City of Oakland and the Warriors can easily enhance the stadium with activities, shops, museums, and other businesses.

1 [GEN-5]

SAN FRANCISCO
SF does not need more congestion and traffic problems
Parking lots and a new bus line will not solve the problem 2 [TR-4]
Do not build on landfill 3 [PD-4, GEO-7]
The traffic has changed dramatically for the worse at Mission Bay 4 [TR-4]
Regular events at the stadium will have a negative impact for the neighborhood, businesses and UCSF hospitals in the area.
We do not need more sports and events in that area of the city. 5 [LU-1]

3 [PD-4, GEO-7]

If for some reason you are not able to keep the Warriors in Oakland, I encourage to build the stadium at the former Candlestick Park site. That neighborhood is growing and changing, they need jobs, activities, more businesses and the T - Line trains can be increased. The Warriors would receive recognition for improving the schools, sports activities in the area, and they could add museums and local light manufacturing businesses near the site. 6 [ALT-4]

Thank you,

Kathryn Hyde

Subject: RE: REMINDER! Monday July 27 is the Deadline to Voice Your Concerns About the Proposed Warriors' Stadium

"An arena can not comply with the public trust doctrine governing waterfront development in the state, which requires public benefits and maritime use, and San Francisco has far better inland locations, opponents say."

Has an EIS been reviewed?

environmental impact report

n. a study of all the factors which a land development or construction project would have on the environment in the area, including population, traffic, schools, fire protection, endangered species, archeological artifacts, and community beauty. Many states require such reports be submitted to local governments before the development or project can be approved, unless the governmental body finds there is no possible impact, which finding is called a "negative declaration." (See: EIR, negative declaration)

http://www.sfgate.com/warriors/article/A-look-at-alternative-locations-for-Warriors-arena-5099137.php

Another persistent issue with the arena proposal is how to deal with **traffic on the Embarcadero**. Although the site is in close proximity to BART and Muni, a planned 500-space parking lot on-site would be for VIPs only. The arena could bring an additional 18,000 people to the waterfront on game days.

Dear Brett Bollinger - Here's the copy of my letter tp you.

Dear Planning Department - My comments in regard to the proposed Warriors stadium, and the UCSF Hospital.

This is an incompatible combination and should be allowed to proceed. The UCSF Medical Center is there already. Adding a sports stadium next to it would be detrimental to UCSF. It would be wiser to seek another location for the Stadium, not nextdoor to UCSF Medical center hospital. Sports games tend to attract a loud and rowdy crowd, which can be aggressive and sometimes violent. Also it monopolizes the waterfront. I object to this choice of location. It would best be put somewhere else. Let's stop it now before the trouble begins.

Please record me as being against the Warriors Stadium at the Mission Bay location. Thank You.

Re: Comments on Warriors Entertainment Center draft Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the traffic flow projections for the proposed Warriors Arena, which appear to not have been adequately analyzed in the draft Environmental Impact Report (dEIR).

Unmanageable Traffic Flow

Based on the dEIR, I have significant concerns about how the traffic will be monitored, handled, and directed around the proposed stadium. The idea that busses will transport people from more distant parking structures ignores the immediate problem of the complete gridlock in the area that blocks all movement in and around Mission Bay for 2-3 hours after Giants games. In looking at another recent stadium example that was also executed poorly, the busses that transport people to the train station from the 49ers Levi's stadium are overcrowded, infrequent and delayed by gridlock, making the trip between Santa Clara and San Francisco a four-hour journey after events. I fear that the proposed Warriors stadium will devolve into a similar unmanageable outcome.

I believe that two dedicated traffic lanes will be insufficient to handle the surge of traffic to this small, landlocked site. I recall all too well that the traffic lanes at Candlestick Park that were specifically directed and reconfigured to handle pre- and post-game traffic did not solve the problem of gridlock and congestion. And Candlestick had direct access to the freeway with no traffic contributing other than game traffic. In contrast, traffic along 3rd Street is already a problem. There is a major traffic flow every afternoon through the area along 3rd Street toward the Giants stadium that contributes significantly to the gridlock that follows every afternoon Giants games. Traffic congestion in the Mission Bay area is certain to continue to worsen as other already approved construction projects are completed and is likely to be devastating to our environment if the Warriors project is approved. I am aware of businesses that have already moved from the area to escape the existing traffic problems, and it is certainly not wise public policy to contribute further to them. 1 [TR-4]

The dEIR appears to assume that scheduling events in the evening will avoid traffic issues, but this seems unlikely if projections of traffic flow have not considered the contributions of all the approved projects that bring new residents and new businesses to the area, or the many occasions when there are coincident events at both the Giants and Warriors stadiums. Does the planning anticipate that attendees will arrive earlier and earlier as traffic and parking problems increase, so that the traffic to night games will inevitably encounter afternoon rush hour traffic? Does the planning address whether TV networks will be able to require earlier

I-Kornberg

than normal Warriors game times? Will there be a stipulation that no event can be scheduled earlier than a certain night hour?

Other major cities with stadiums and sports arenas in urban centers have infrastructure to handle traffic. Madison Square Garden in New York City is serviced almost entirely by public transport. Cincinnati, which has adjacent football and baseball stadiums in its downtown, has adjacent ample parking lots with direct freeway access. By contrast, Mission Bay has no infrastructure to support the increased traffic. The claim recently made on the Michael Krasny forum that the number of attendees to Warriors games is 20% of Giants games does not compute—18,500 is closer to 50% of 42,000. The notion that Warriors' games would only overlap with Giants games on rare occasions ignores the larger number of other events the facility will host – and the combination of other events happening in the City in large spaces such as the Moscone Center that draw traffic through this area. It is not just the Giants games that impact the area and must be considered.

It must be understood as a given that traffic and parking issues will reduce access for emergency and urgent care for patients seeking health care services and will add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The dEIR ignores the health and safety impacts of interfering with access to essential medical facilities. 1 [TR-4] cont.

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle a surge of up to 18,500 fans, especially when both stadiums have games. Parking will be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions.

I am disappointed by the City's failure to realistically consider the inevitable traffic problems and the compatibility of the project with the homes, businesses and hospitals already located in the area. There is already a major problem with traffic that the City has not addressed and the modest improvements to public transport and efficiency of existing traffic lanes that have been proposed solution seem to be woefully insufficient. Certainly, the claim that there is already ample infrastructure and public transport to handle traffic is false, and the problem will only be exacerbated by the growth that is already approved.

No new major projects should be approved unless and until a solution to the existing problem is solved. 2 [GEN-5]

I ask that the City of San Francisco recognize the health and welfare of patients, families, employees and neighbors of the Mission Bay area and avoid the disastrous impacts of the proposed entertainment center. The prudent course would be for the City to consider alternative sites other than Mission Bay for this quality of life damaging project, and conduct a new and complete review process before any decisions are made. 3 [ALT-4] Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project. 4 [ERP-2]

Sincerely,

T Kornberg

Subject: Keep mission bay clean

To Brett Bollinger of the San Francisco planning department,

The Golden State Warriors have given new inspiration to sports fans this year.

This inspiration will be even more appreciated when the team decides to build their arena elsewhere, rather than at Mission Bay.
That is an unwelcome addition and will supersede the needed protection of the bay.
Please ask the warriors to choose another site and leave Mission Bay alone.
Thank you,
Michelle

Subject: Warriors should not come to SF without proper traffic and parking mitigation
Date: Monday, July 27, 2015 2:55:21 PM

Hi there,

I fully agree with John deCastro's position on the Warriors project (I've pasted a copy of his letter below). I am already concerned with the level of traffic and congestion in our neighborhood and on the highway exits that bring us home. The city has not presented solutions to our current problems, and so I have no confidence in any action in the future. Also, these traffic and parking troubles won't only affect the residents here, they will affect the potential ticketholders and event-goers. If the arena develops a reputation of being difficult to get to and relentlessly hard and expensive to park at the attendance numbers will be affected. I currently oppose the new arena because of the lack of planning for transit.

1 [TR-4]

Thank you for taking my concerns into account.

Amy

John deCastro's Letter:

As a long-time resident of Potrero Hill that will be impacted by the unmitigated effects of

Subject: Comments on Warriors DSEIR
Date: Monday, June 29, 2015 9:56:39 AM

To Whom it May Concern,

I am writing you today to express my concerns regarding the proposed Warriors stadium on 3rd Street in San Francisco.

I am a Registered Nurse at UCSF Benioff Children's Hospital, and I love the Warriors. I do, however, value the safety and well-being of my patients, and their families more than a new sports arena directly across from the hospital.

The infrastructure is not in place to accomodate the immense increase in traffic to the area, if a new stadium is built in the proposed location. I am concerned that staff, patients and families will have an undue amount of stress and increased travel time to and from the hospital on game days (already experienced on Giant's home game days). It took more than an hour to go 2 miles on the last Giant's home game day, and I would expect this issue to occur routinely if the proposed stadium is built. 1 [TR-4]

Having a sick child is stressful enough, I would hope that adding this extra burden to families and staff caring for them, is something you would consider as a serious negative impact that the stadium would have in its current proposed location.

I hope that the children and their families would hold a higher priority than a "nice to have" new stadium. 2 [GEN-5]

Thank you for your time, and thoughtful consideration of the impact of this proposal.

Sincerely,
Rachel Leavitt, RN
UCSF Benioff Children's Hospital
San Francisco

P.S. Go Warriors!!

Subject: Another stadium will make Mission Bay unliveable

I lived in Mission Bay for two years at the Radiance Building on Mission Bay Blvd and recently moved out of the neighborhood. I left Mission Bay primarily because AT&T Park and its crowds wrecked havoc on the burgeoning neighborhood. Anytime there was a Giants game, it became impossible to get home using the inbound T line. Fans would transfer to the T line starting at Civic Center and fill it beyond capacity. Working in SoMa, it became impossible to board a train home. 1 [GEN-6]

Driving was also impaired. Just trying to leave my home or return to it during a game sometimes meant planning an additional half hour to get through the few blocks of traffic. 2 [GEN-6]

After games, the neighborhood sidewalks were covered in trash, vomit, and urine of drunken fans. 3 [GEN-6]

Adding a basketball stadium to Mission Bay would make this nightmare a year round nuisance. Stadiums don't belong in urban centers. Don't let the Warriors ruin the neighborhood with the most potential in San Francisco. 4 [LU-1]

Sincerely,
Jeremiah Lee

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

California Nurses Association has serious concerns regarding the environmental impacts on patient access, safety and health of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR, and show a fundamental incompatibility between the project and Benioff Women and Children's Medical Center located across the street.

Unmanageable Traffic and Incompatible Land Uses

The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities. 1 [ERP-9] A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR. 2 [LU-1]

Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions. For the nurses who work at the Medical Center, parking access looms as a major concern, unsatisfied by the parking provisions of the project and the implementation of the Muni transit plan or the timing of the event start times. 3 [TR-13] 4 [AQ-4b]

The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities. 5 [TR-9]

Health Concerns

The project's traffic new massive gridlock and parking problems will also cause significant and unavoidable impacts on air quality. Increased car and truck emissions in the area will be unhealthy for residents, workers and hospital patients. This will have a severe impact on the health and welfare of Mission Bay residents and patients and families who rely on UCSF and other lifesaving services in Mission Bay. The Draft EIR fails to address and mitigate these health impacts, relying on vague plans and purchases of emissions offsets rather than effective mitigation measures as required by CEQA. 6 [AQ-4b] This concern includes the construction phase, which though temporary, occurs next to a health care facility that has large numbers of sensitive receptors. 7 [AQ-4b]

I-Lighty

Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. 8 [ERP-6]

For example, the assertion that there will be no significant impact on access to Emergency Services during events at the project lacks plausibility given the traffic volume and restricted road network. Traffic patrol officers will not be sufficient to identify non-ambulance patients coming to the Medical Center with an emergency, including women in labor. The ambulances themselves may be delayed, which is of course a matter of life and death. 9 [TR-9]

Given these impacts, which the SEIR fails to identify and/or mitigate, and which may not be possible to mitigate, point to the incompatibility of locating the project across the street from a hospital serving some of the most sensitive patients in the region. 10 [LU-1]

Sincerely,
Michael Lighty
Director of Public Policy
California Nurses Association

From: Tina Ly
To: Warriors, PLN (CPC)
Subject: Comments on Warriors DSEIR
Date: Thursday, July 02, 2015 9:06:01 PM

To Whom This May Concern,

Wow, What a season for the Warriors! and for Oakland, the Bay Area, and Warriors fans everywhere. I was born and raised in San Francisco, recently moved to Oakland, and working at UCSF Benioff Children's Hospital where the proposed Warriors stadium sits across. Part time, i work as a real estate agent at Climb SF in Potrero Hill.

While i am happy that San Francisco has grown and flourished so much since i was a kid, i am also troubled at the rate and way in which it is all happening. I am seeing my co-workers, great nurses and doctors, leave the Bay Area because they just can't afford to live here anymore. Most recently, a nurse on our unit who has been vital to our Neuro Neonatal ICU program and her husband who works as a special ed teacher. Portland now gets to benefit from their hard work and dedication in their fields of work.

Having the Stadium built across from the medical center will surely impact the quality of life for all the employees in how they get to and from work. I commute across the Bay Bridge, which isn't bad now (30min average commute), but am very afraid that the numerous game days will extend this. Public transportation is not efficient enough to get me to work in the same amount of time or less. I work 12-hour night shifts from 7pm to 7:30am the next morning and when i get off work, i just want to be home and in bed. 1 [TR-4]

While the Medical Center has a heli-pad, we are limited in the hours we are allowed to use it because of the noise it would create for our resident neighbors. Therefore, we need to rely on efficient ambulance transfers of sick patients in order to get them care. When you are THAT sick, EVERY MINUTE COUNTS. 2 [TR-9]

And what about Oakland? Sure, we can think about all the benefits this has for Oakland, but taking 20 steps back and looking at the bigger picture, we are taking away a positive force from Oakland. A city that needs more positivity in the community. San Francisco has the Giants, we have the techies, we have the city that everyone wants to be in, why not allow Oakland to keep the Warriors and provide them with a new stadium? Because after all, they are our neighbors and as San Francisco continues to grow and spill over, our communities will be shared. Let's allow the Bay Area to grow and flourish together so people have more incentive to stay close and not feel like SF is the ONLY option. Because THAT is what makes people move to other states. 3 [GEN-5]

Thank you for giving me this opportunity to speak my mind. I trust that the decision made will be one that sees not only monetary value, but the value of all humans living in this area.

I appreciate your time and consideration.

<3 tina.

San Francisco Planning Department Case No. 2014.144IE

Draft SEIR Public Comment Period: June 5, 2015 – July 27, 2015

Dear Ms. Bohee and Mr. Bollinger,

I am writing to share my thoughts and comments in response to this Draft Subsequent Environmental Impact Report regarding the Warriors Arena & Event Center proposed to be built in San Francisco's Mission Bay neighborhood in relation to the following issues.

Please study and respond to my following comments addressing the potential impacts that the construction of a Warriors Arena & Event Center can have for San Francisco and Mission Bay.

****

Chapter 7 – Alternatives
Page 7-20

7.3.1 – Alternative A: No Project

As required by CEQA Guidelines Section 15126.6(e), the No Project Alternative is evaluated to allow decision-makers to compare the environmental effects of approving the proposed project with the effects of not approving the project. The No Project Alternative represents what would reasonably be expected to occur in the foreseeable future if the project is not approved.

7.3.1.1 - Description of the No Project Alternative

Under the No Project Alternative, the Golden State Warriors organization would not relocate to San Francisco, and Blocks 29-32 in the Mission Bay South Plan area would not be developed with the proposed event center and mixed-use development described in Chapter 3 of the SEIR. Instead, it is assumed that in the short term, the Warriors organization would exercise its option to stay in Oakland, and accordingly, the team would continue to play its home games at Oracle Arena and lease their management offices and practice facility at the Oakland Convention Center in Oakland. Oracle Arena, built in 1966 and remodeled in 1996, is the oldest facility still in use by the NBA. Therefore, under this alternative, it is likely that the Warriors organization would either build a new arena at its current location or relocate and build a new facility in the long term in the Bay Area or elsewhere.

<u>7.3.1.3 - Impacts of the No Project Alternative</u>
Page 7-23

The No Project Alternative would result in similar impacts to those disclosed in the Mission Bay FSEIR and would be subject to all mitigation measures identified in the Mission Bay FSEIR applicable to Blocks 29-32. Impacts of the No Project Alternative would also be similar to those of the proposed project. This is because many of the impacts would result from the conversion of a vacant parcel at this same location to a fully developed City block, regardless of the size of the development, and the same or similar mitigation or improvement measures identified for the proposed project would apply to the No Project Alternative. The impacts of the No Project Alternative as compared to those of the proposed project are summarized below by resource topic. The reader is referred to Initial Study (Appendix NOP-IS) and Chapter 5 of this SEIR for the full analysis of impacts similar to those of the proposed project.

The environmental impact analysis of the No Project Alternative considers only the hypothetical development scenario on Blocks 29-32 described above and does not consider any effects associated with building a new arena for the Warriors basketball team at another location. However, it should be noted that in March 2015, the City of Oakland certified a Final EIR on the Coliseum Area Specific Plan 3 which discloses the environmental impacts of a new sports venue at the current location of Oracle Arena and the surrounding area.

****
My comments and perspectives in relation to these above Chapter 7 items:

One of many potential impacts that a "No Project Alternative" would have if the construction of the proposed Warrior's San Francisco Arena & Event Center is not built at this Mission Bay location, is a fact that has become crystal clear; that is, the Warriors would not be able to return to San Francisco in order to build a new state-of-the-art Arena & Event Center. This option would also prevent the opportunity to offer an indoor multi-purpose facility that would provide not only Warriors professional NBA basketball games, concerts and a variety of sports tournaments and games for numerous college, high schools and other youth programs, but it would also prevent the potential creation of an innovative Model indoor Education & Career Development Classroom within this facility capable of offering a wide range of social-economic benefits including education, career development programs and new businesses for an untold 1 [PS-3]

I-MacKenzie1

amount of public and private sector organizations, students and youth, young adults, families and our entire San Francisco-Oakland Bay Area Community as a whole.

This is a unique opportunity to build an Event Center and Mixed-Use Development at Mission Bay on Blocks 29-32, that can offer unique and invaluable incentives, inspiration and real-world career guidance and skills development and leadership training opportunities for our youth that would disappear if this Warriors Arena project does not get built. This project can also inspire and create new jobs and careers, as well as build education and career development programs that will not be possible in any other central location in San Francisco, Oakland or other Bay Area cities. I believe it would be an unfortunate failure of our collective responsibilities if we do not cooperate as a city and community and demonstrate the successful leadership necessary to construct an NBA Arena in San Francisco at the Mission Bay location. This is a once in a life time opportunity for San Francisco leaders to collaborate effectively in order to build a professional sports facility integrated with a model visionary, innovative and strategically located indoor Classroom facility capable of enhancing and expanding our capacity to establish effective wide-ranging and healthy socio-economic growth and opportunities for our entire diverse, cross-cultural San Francisco community. At the same time, I believe our public and private sector agencies, corporate leaders and Non-Profit Foundations and officials can work together in collaboration with the Warriors in order to benefit, support and share their professional knowledge and experience inside this Arena & Event Center environment for all our San Francisco, Oakland and our Bay Area schools, youth, teachers, families and communities all year-round. 1 [PS-3] cont.

****
Chapter 6
<u>Other CEQA Issues</u>

<u>6.1 - Growth Inducing Impacts</u>

<u>6.3 - Effects Found Not to Be Significant</u>
Page 6.3 – 6.4

Public Services -The project would not create impacts associated with the need for new or altered schools, parks, or other services.

<u>7.3.1.3 Impacts of the No Project Alternative</u>
Public Services / Page 7-41

Schools, Public Health, Childcare, Library, and Street Maintenance Services. Like the proposed project, the No Project Alternative would not result in increased demand for schools because it would not include residential uses. Other public services, such as demand for public health, childcare, library, street maintenance, and emergency medical would be within the assumptions provided for in the overall Mission Bay Redevelopment Plan and analyzed in the Mission Bay FSEIR. These impacts would be less than significant and no mitigation would be required.

****
My comments and perspectives in relation to these above Chapter 6 and Chapter 7 items regarding Schools:

Once again, the failure to build this Arena & Event Center - including the loss of socio-economic growth, enhanced and newly created business opportunities and a wide range of educational and career development programs, jobs, internships, practical real-world experience, leadership training and comprehensive support for our San Francisco, Oakland and Bay Area high school and college age students, non-profit youth and community organizations that can all be served year-round through visiting an indoor Warriors Arena Classroom - would be a huge loss for all sectors of our San Francisco, Oakland and the Bay Area Community; as well as the loss of creating an educational Model for our nations professional sports organizations and teams that would be worthy of emulation for future construction of Arenas and Stadiums throughout our country – and beyond.

The potential loss of building this San Francisco Warriors professional NBA Basketball Arena & Event Center, would also include the lost opportunity to create a model facility with the visionary capacity to initiate and develop an Education and Career Development Classroom in collaboration with San Francisco government, public and private sector officials and business leaders, the San Francisco Unified School District, non-profit youth and community organizations; while at the same time, create effective partnerships with public-private Non-Profit Foundations and philanthropists for financial support and matching funds as well. 2 [PS-3]

The loss of this unique opportunity would also prevent enhancing and expanding much needed opportunities for our San Francisco-Oakland and Bay Area high schools and college students. This Mission Bay location also has the opportunity to inspire new businesses, and offer our public-private sectors and government leaders and agencies to work together in order to enhance and expand long-term, comprehensive socio-economic initiatives and cross-cultural, international sports and education exchange programs as well; if not, this will be instead - a huge and irreplaceable missed opportunity for our interdependent communities of San Francisco, Oakland and the entire Bay Area.

****
7.3.1.3 Impacts of the No Project Alternative
Public Services / Page 7-23

Public Services / Page 7-41
Schools, Public Health, Childcare, Library, and Street Maintenance Services. Like the proposed project, the No Project Alternative would not result in increased demand for schools because it would not include residential uses. Other public services, such as demand for public health, childcare, library, street maintenance, and emergency medical would be within the assumptions provided for in the overall Mission Bay Redevelopment Plan and analyzed in the Mission Bay FSEIR. These impacts would be less than significant and no mitigation would be required.

I-MacKenzie1

****
My comments and perspectives below address these above items contained within the SEIR, and the 'less than significant' impact, which will not require any additional schools to be built for our San Francisco Unified School District and family needs. With this in mind, I ask that our collective efforts envision this opportunity to build a Warriors Arena & Event Center in Mission Bay to be considered an invaluable opportunity for the Warriors, City and County of San Francisco's public and private sector officials, the SF Chamber of Commerce, Non-Profit Foundations and organizations – as well as business and community leaders to support the inclusion of an indoor Classroom to be built within this Warriors facility that can be accessible to all of our San Francisco Unified School District's high schools, students and teachers in order to initiate, create and establish an Educational Methodology Model 'Magnet Education & Career Development Classroom' within this Warriors Arena & Event Center in Mission Bay:

I believe the proposal I have shared with the Warriors and all San Francisco public and private sector officials, agencies and leaders can create a "Model Magnet Sports Management & Facilities Operations Pathway" studies, including the numerous multi-media, journalism, business and other curriculums I've shared with you, the Warriors, all San Francisco Unified School District leaders and San Francisco officials that can contribute to our current challenge to attract parents and families to raise their children in San Francisco, and attend our San Francisco public schools. The numerous jobs and careers associated with any professional Basketball Arena and NBA team, ownership and organization, could initiate tremendously inspiring incentives for high school age students to listen to and learn from all the professionals presenting their knowledge, experience and guidance within this proposed state-of-the-art Warriors Arena and Event Center High School-College Career Pathway & Field Study Classroom. I trust there would be tremendous interest throughout our San Francisco and Bay Area communities and schools to participate and become involved in an education system that included real-world experience and training within this Warriors Arena in San Francisco's Mission Bay. 3 [PS-3]

This indoor Warriors Arena Classroom would have the capacity to create first-of-its-kind Model programs; including the ability to serve as a model for building future NBA Arenas throughout the country, and the Americas - as well as a unique opportunity to serve our community, city, state and country by establishing and building a National Model for other professional sports organizations and teams across the country for generations to come.

In addition to my comments above addressing these issues contained within the SEIR, I respectfully ask that you and your OCII and Planning Department staff and city officials take into consideration the details of the comprehensive programs and positive influential impacts of this Arena that I have shared with you through my previous communications and materials in writing and in public comments at both the OCII and Planning Commission hearings regarding this Arena & Event Center, my proposal to include a high school classroom within this Arena, and this Environmental Impact Report.

I-MacKenzie1

I respectfully ask that my proposal requesting the Warriors and SF city officials and leaders collaborate in order to include the far-reaching positive impact the construction of a High School-College Career Pathway & Field Study Classroom© within this SF-Warriors Multi-Use Arena & Event Center can have for San Francisco and this proposed project to be built on Blocks 29-32 in Mission Bay. I also ask that this Environmental Impact Report consider - and comment on - the immense potential loss that not building this Arena & Event Center would have; including the lost socio-economic benefits and educational programs and options lost through the failure to build this project would have without initiating a national Model Education and Career Development Classroom for the benefit of supporting our students, youth, young adults, families, communities and newly created business opportunities in the present - and for generations to come. 3 [PS-3] cont.

Thank you for your time, and the immense effort you and your staffs have dedicated in order to study and assess these numerous environmental and community issues and impacts that the construction of this proposed Warriors Arena & Event Center in Mission Bay will have for our entire San Francisco community – for generations to come.

Sincerely,

Dennis MacKenzie

Hello,

I am a nurse at UCSF BCH. I have major concerns regarding the warriors stadium location proposal in San Francisco. 1 [GEN-5]

I have heard the debates both for and against the proposal. However, having two stadiums so close to the hospital would be detrimental to our patients, families, and employees.

I am less concerned with my personal commuting problems. More so, I am concnerned with the fact that critically ill patients will not receive the care and attention they deserve and are now able to receive. I have spoken with several AMR employees as well who have major concern regarding the transportation of patients to the hospital when there are events. I am also a transport nurse that works closely with AMR and I have seen first hand how badly traffic can impact our patient care.

Often patients are in a Code III situation, where lights and sirens are permitted. Most often, however, our patients are getting transported because they are very very ill and are near code status. It is imperative that we not sit in heavy traffic and get in and out of the hospital very quickly. Our resources are limited on the ambulance and we simply need to get back in a safe manner of time. 2 [TR-9]

I am afraid that our paitent's safety will be compromised and also that patient and family satisfaction will dramatically decrease and therefore the hospital will eventually lose the funding we need to continue to be one of the top hospitals.

Please consider my deep concerns.

Thank you

Subject: Public Comment on Warriors Arena
Date: Monday, July 27, 2015 7:45:15 AM

Re: Case No.: OCII: ER 2014-919-97
Planning Dept.: 2014.1441E

Thank you for the opportunity to comment on the proposed Warriors Arena project and related office buildings in Mission Bay. As a local resident (I live by the Ballpark at 2nd and King) I strongly support the proposed development as a sport and entertainment destination for our neighborhood. Please see my thoughts below: 1 [GEN-5]

1. Traffic. The original proposal to locate the Warriors Arena at Pier 32/34 was far preferable from a traffic perspective as it would have permitted visitors to the Arena to use the multiple public transit lines that pass within a few blocks of that location. However, in view of the significant politics and expense associated with that proposal, I feel the current proposal is the "next best thing" while still providing our neighborhood the benefits of the vibrancy and activity that will be generated by the Arena. I call on Muni and Caltrans, in particular, to take whatever steps they can to enhance service in and around the proposed arena and understand that the Arena would use extra traffic-control officers during events in the same way that Giants games do. 2 [TR-3a]

2. Aesthetics. The Arena, with its round, gleaming design, will be a striking presence on the waterfront and in the neighborhood. The Mission Bay neighborhood has been built, for better or worse, with a very standardized, stucco-box and concrete aesthetic, and the proposed arena will shake that up quite a bit. When the building is empty, which will be most of the time, it will be an enhancement to have a modern building in our midst. Also, the landscaping of the waterfront park will help extend the beautiful jogging/bike trail that's been started further north. 3 [ERP-8]

3. Neighborhood benefits. Just as with the Giants ballpark, the presence of the Arena in Mission Bay will attract and encourage the development of restaurants, bars, and other entertainment facilities, more than would be drawn to the simple residential and office neighborhood that's been built around UCSF. As in the South Beach neighborhood, those bars and restaurants will attract more residents to the area and will generate taxes and activities even when the Arena is dark. 4 [GEN-5]

Thank you,

Bruce McDougal

Subject: Strongly Opposed to New Arena in Mission Bay
Date: Monday, July 27, 2015 12:18:58 PM

Dear Arena Planners,

We who work in Mission Bay already face many days a year in which a normally 35 minute commute home takes 60 minutes or more due to traffic congestion from Giants' games. Even if we like baseball, it makes us glad whenever the Giants are away or baseball season is over. For those away or off season days we actually get a sensible commute time. 1 [TR-4]

The original city plan for the area included more EVENING entertainment space, not a massive new stadium with hundreds of events at all times of day, all year long. 2 [PD-1] If the traffic were more congested after dark, that would probably be fine. During the day time, however, the Giants' stadium congestion is already enough of a challenge. 3 [TR-4]

I signed UCSF's WinWin petition because it is better than total surrender, but I would really vastly prefer that you put the new stadium somewhere else entirely.

It really isn"t fair to take a neighborhood already seriously damaged by the congested traffic around AT&T ballpark events to endure a doubling of the traffic with the Warriors' stadium. 4 TR-4

We could use a lot more retail establishments around here, and smaller restaurants would do well. The thousands of us working out here don't have a lot of choices to walk to at lunch time. That would be a welcome addition. And that is the type of thing that was on the original plan I believe. 5 [LU-1]

Ah well,
I hope the project goes somewhere else,

Kim

Subject: don"t gut the Warrior"s base!!
Date: Monday, July 13, 2015 2:16:36 PM

Dear Mr. Bollinger,

I'm writing to offer my perspective on the proposed Golden State Warriors Arena and Events Center at Mission Bay.

The Warriors have been Oakland's team for decades, and they belong here. This is where the heart is. You will lose a significant portion of your regular ticketholders with the move, and derail the (current and ongoing) accessibility of East Bay youth and community to continue to afford and gain access to the team we love.

Moving to SF may seem strategically great from a financial/investment perspective, but that's not everything. It's not that I dislike change, it's that if you saw the turnout that came to the parade, or the energy in the playoffs and the finals, you know that Oakland doesn't just support, Oakland needs and loves this team. And Oakland needs a team to love.

I was born in SF, and my family has been here for 5 generations. I love the city. It's not about that. San Francisco has plenty of reason to party and celebrate, with all the attractions and civic and community pride. I'm thinking Pride Parade, BatKid, St. Paddy's day parade, not to mention the Giants and the 49ers (Okay, so they've left or may leave. You'll still have their parades in SF, and ATT park will continue to be a hip destination and tourist destination.) SF doesn't need more congestion to already overstressed transit, street parking, and street and ramp traffic. It also doesn't need the kind of regentrification that displaces hundreds or thousands of hardworking San Franciscans who keep the lights on and do much of the heavy lifting in the local economy. It needs to fine-tune the garden it's growing, by helping the homeless, supporting underserved neighborhoods, cleaning up the urine-soaked streets and entryways, and providing more grassroots community events to engage the public and energize neighborhood continuity. 1 [GEN-5]

Oakland deserves to keep the Warriors. The spirit of connection and civic pride that's evolved from this championship is beyond compare. People here are talking to each other in supermarkets, gas stations, banks, cafes. It's such a happy vibe, and it's pulling Oakland together. Don't hijack one of the most significant bright spots this east bay community has seen in years.

Sincerely,
Mary Pezzuto
Bay Area Native, Oakland & Visitacion Valley

Dear City Planners:

I am writing to plea that you do not approve construction of the planned sports arena at Mission Bay. Such a facility would have a devastating impact on the Mission Bay Environment and the workers who must travel there to go to work and home again, as well as to the accessibility of U.C. Medical Center. 1 [GEN-5]

Thank you for your consideration.

Subject: Comments on Warriors DSEIR
Date: Wednesday, June 24, 2015 9:29:00 AM

To whom it may concern,

I am a nurse practitioner at UCSF Benioff Children's Hospital, and I am strongly opposed to building a new Warriors stadium at Mission Bay. 1 [GEN-5]

It is already very difficult to commute in and out of the area, so much so that some co-workers have resigned their positions since we left the Parnassus campus. I will also likely resign if this stadium is built. I work in an Intensive Care Unit, and cannot withstand the additional stress of negotiating gridlock at the end of my workday.

The report that traffic can be managed in the area when the new stadium is built is not realistic, and leads me to suspect financial motives/bias in the 'experts' generating this report. 2 [TR-4]

I also cannot imagine adding to the stress of parents with sick children, who already find it difficult to travel to the new Benioff campus.

Ill children matter more than money.

Sincerely,
Kay Ramsdell, RN, NNP, MSN

Subject: Concerns about Warriors Arena & 5M Development
Date: Monday, July 27, 2015 4:13:08 PM

Dear Ms. Kim,

I've never taken the time to contact anyone at City Hall but two huge developments currently under consideration demand responses.

I work at UCSF Mission Bay and am convinced that the proposed arena development is a huge mistake. I am fortunate to be able to walk to work, but for my colleagues game days at AT&T Park already involve forward planning, changes to schedules, or work from home. Traffic is awful and the already glacial Muni cars are further slowed. [1 [TR-4]] The arena development is completely ill-suited to a university campus and medical center location--not to mention a prime waterfront site. [2 [LU-1]] The scale is ill judged and and it just does not fit with a world class research institution. The site is poorly served by public transport, just two routes--it only functions now because of extensive private shuttle links. [3 [TR-5a]]

Secondly I recently learned of the so-called 5M development two blocks from my home (Russ St). I am horrified by the inappropriate scale of the plans. Retail and service businesses are already being squeezed out of Soma, extending the FiDi westward will not help. The plan strikes me as intentionally vague, with promises of retail and art space, that just don't add up financially. Retail even in the Westfield is struggling to survive, and arts organizations don't stand a chance. Witness the Mint building which has sat closed--when that project for a museum (or a gallery, something?) should have been a city priority.

While I'm taking the time to write I'm curious to know what is being done about the vacant lot that used to be a car park on 7th St at Minna. It's been ripped up and become a eyesore, at night it's positively apocalyptic. I can only imagine what the tourists in the 3 nearby hotels make of it. Surely the owner has a responsibility to maintain even a vacant lot?

I could continue, but I won't.

Yours Gavin Rynne

Subject: Vibration sensitive equipment at Mission Bay
Date: Monday, July 27, 2015 2:44:03 PM
Attachments: Vibrationexamples.pptx
ATT00001.htm

Dear Ms Bohee:

The following statement is provided in addition and as complementary information to the comments provided to you by Tom Lippe (Law Offices of Thomas N. Lippe APC, 201 Mission St., 12th Floor, San Francisco, CA 94105) on behalf of the Mission Bay Alliance regarding the Warriors Arena Project.

Surveying the vibration-sensitive equipments that are mostly used at the UCSF Mission Bay (MB) by members of the Neuroscience research community, there appear to be two groups of equipment that fall under different criteria when considering vibration design/tolerance features for buildings (according to the ASHRAE Handbook).

The main category (VC-B) relevant for MB includes: Microsurgery, eye surgery, neurosurgery; bench microscopes greater than 400x magnification; optical equipment on isolation tables such as two-photon microscopes. Tolerance vibration velocities (in microns/sec) are indicated as the yellow line in the two attached figures from a study in another building (not at MB but relevant as general reference for vibration-sensitive equipment used here). Acceptable values for vibration velocities above 8Hz vibration frequencies are 25 microns/sec (max) and up to 50 microns/sec for lower frequencies, especially those in the range of walking-induced vibrations (~2Hz). Actual values of measurements should fall below those lines (as in the example measurement in the second slide; again not made at MB) for equipment to work error free.

1
[NOI-5]

The next category (VC-C) deals with ultrahigh vibration requirements (< 6 microns/sec Max.) for electron microscopes (TEMs, SEMs). However, I did not hear from any of the Neuroscience faculty whether those currently are in use.

The EIR considers vibration-sensitive equipment not to be 'sensitive receptors' but we would disagree with that since those pieces of equipment are indispensable for performing our research, largely supported by the National Institute of Healths. The EIR indicates that, during construction, research buildings may experience vibration velocities that exceed 0.008 in/s (or 203.2 microns/s), 5 to10-fold the values considered acceptable for operating the equipment (although the affected vibration frequency range is not indicated). Additionally, the EIR does not indicate by how much those velocities may be exceeded. Without a more thorough assessment of the potential vibration levels and spectra to be expected during construction and usage of the facility the impact on vibration-sensitive equipment is not possible. Even from the few points mentioned in the EIR it appears that vibration levels would be significantly above the VC-B criteria and, thus, may constitute intolerable interference with ongoing research or medical practice.

Sincerely,

I-Schreiner

Christoph Schreiner, PhD, MD

Examples of vibration measurements and standards in a research building

I-Schreiner

Floor Vibration Criteria

The 2007 ASHRE Hand Book (Section 47.39, table 46) provides a set of floor vibration criteria (VC) as a function of vibration frequency that are often used when the actual tool sensitivity has not been quantified. The frequency axis is broken in to bands each of which is 1/3 of an octave wide called a 1/3 octave band plot. The curves are plotted in floor vibration velocity units of microns/sec.

The yellow line across the 1/3 octave band plot of the vertical floor vibration corresponds to the ASHRE VC-B criterion.

VC-B – Microsurgery, eye surgery, neurosurgery; bench microscopes greater than 400x magnification; optical equipment on isolation tables; microelectronic manufacturing equipment such as inspection and lithography equipment (including steppers) to 3 um line widths.

From section 47.39 table 46 of the 2007 ASHRAE Handbook.

Subject: The water front is a national treasure. Put the stadium some place else!!!
Date: Tuesday, July 14, 2015 11:25:23 AM

The San Francisco water front is a national treasure. We don't need an ugly visually polluting stadium or the cluster of bars and fan excesses that go along with the highly commercialized and hyped up nature of professional sports today.

Stadiums can go anywhere. There is only one San Francisco Bay. It should be a place where anyone can walk, enjoy sweeping views and feel the power and healing nature of the ocean and tides. Do not ruin this national treasure by giving into crass commercial interests who what to take this treasure from all of us, to put up a massive building that cannot but be ugly, polluting, noisy and the equivalent of trading paradise for a parking lot. 1 [GEN-5]

Save the water front for all. Put the stadium someplace else.

Subject: Traffic Mitigation in Dogpatch
Date: Tuesday, July 14, 2015 10:08:03 PM

I am VP and founder of the Dogpatch Neighborhood Assc. We have been living at 917 Minnesota St.since 1986. We are supportive of the Warriors development if proper steps are taken to guarantee parking and traffic will be mitigated in the Dogpatch neighborhood. 1 [GEN-5]

We are concerned about the negative impact the new stadium will have on our already over taxed neighborhood parking.
Hospital workers and patients at the newly opened UCSF Hospital are currently parking on Minnesota and Tennessee streets further taxing street parking already at capacity. This is happening in spite of UCSF promising to provide traffic mitigation for 5 years prior to the hospital opening. In addition to the hospital, Giants fans are also parking in the neighborhood during games both day and night.
The addition of the Warriors stadium and other events planned at the site will only worsen an already untenable situation.
The Warriors and the City must take the necessary steps to limit further street parking in Dogpatch. Muni and Caltrain and the City must commit in writing upgrading existing public transport to accommodate increased traffic and pressure on Dogpatch parking. 2 [TR-13]

Sincerely,
David Siegel
917 Minnesota St.

Subject: Feedback on EIR

Hi,

I am a (concerned) resident of the Radiance (corner of Terry A Francois and Mission Bay Blvd North). I have raised this with several stakeholders, without any response yet.

Here is my concern. I would appreciate your feedback asap.

- The post-game traffic planning involves shutting down 3rd Street to northbound traffic. This is justified to allow pedestrian traffic to get onto Muni.
- Therefore, all northbound traffic will go on TAF northbound.
- The Giants development plan calls for closing TAF north of Mission Rock Street. TAF is currently often closed at the north intersection with 3rd.
- The Police and Fire station limits cross traffic on Mission Rock and China Basin Streets. They limit traffic when there are ball games; it is reasonable to expect that they will do likewise during arena events.
- Thus, **all northbound TAF traffic will need to funnel through Mission Bay Blvd North.**
- Mission Bay Blvd North is a single lane road adjacent to residences and a park. It is the only reasonable ingress/egress point for residents of the Radiance and the Madrone.

My question: Has this untenable situation been discussed, and accepted as the correct approach? Or, has this not yet been fully considered? If the later, I hope to raise awareness and effect a change to this plan. 1 [TR-4]

How can I raise the priority of this issue?

Regards,
Todd Simpson

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

SPEAKER'S CARD

(Please Print)

NAME TODD SIMPSON

AFFILIATION RADIANCE (MISSION BAY RESIDENT)

AGENDA ITEM (OR SUBJECT YOU WISH TO SPEAK TO) Post event traffic plan (see back)

SPEAKING FOR THE ITEM ☐

SPEAKING AGAINST THE ITEM ☑

(See Agency Secretary for Speaker Regulations)

SPEAKER'S TIME LIMIT

Please be advised a member of the public has up to three minutes to make pertinent public comments on each agenda item unless the Commission adopts a shorter period on any item. It is strongly recommended that members of the public who wish to address the Commission should fill out a "Speaker Card" provided by the Commission Secretary, and submit the completed card to the Commission Secretary.

All northbound traffic after arena events will end up on a one way one lane residential street (Mission Bay Blvd North) as all other connectors to 3rd street from Terry A. Francois are blocked or closed (due to Giants and/or PSB). This is unacceptible.

1 [TR-4]

I-Smith

From: Smith, Christine G.
To: Warriors, PLN (CPC)
Subject: Comments on Warriors DSEIR
Date: Friday, June 19, 2015 11:08:38 AM

To whom it may concern,
I am a Neonatal Nurse Practitioner, specializing in emergency newborn care that includes transport of these complicated, high acuity, critically ill infants. My job involves helicopter, airplane and ambulance transport of medically fragile infants. My greatest concern regarding the proposed development of an arena in such close proximity to the hospital is that is would prevent the ambulances/personal cars transporting patients from reaching the hospital in a timely matter, potentially creating life threatening situations for a mother or child that is in urgent need of medical care. The importance of this cannot be understated.

1 [TR-9]

I have personally witnessed the traffic jams from an afternoon game getting out from SF Giants Stadium, which is actually further away than the proposed stadium would be. I was outside the UCSF Benioff CHildrens Hospital after a day of work at approximately 430 pm, waiting for muni. There was complete gridlock, no T train was able to easily move and people in their independent cars were stuck, people were acting aggressively, honking, yelling, and actually driving up on the designated muni sectioned off train path to break out of the gridlock. UCSF Shuttle buses downloaded their passengers to get on the T train towards downtown since they were unable to move for at least 30 minutes. Although I was frustrated to not to be able to get home from work, I was feeling relieved that I wasn't in the back of an ambulance providing life sustaining care to a child that needed further care that I cannot provide in the back of an ambulance. To say that we have a helipad, transports will fly in, is an inaccurate statement. Contact our transport team and you will see that the majority of our tranports are ambulance based, some from even here within our own city. Children often need life sustaining treatments that only UCSF can provide, such as ECMO. In fact, there are limitations on the number of helicopter landings we can do per month per the community board. I remember also thinking, I hope there is not a laboring mother in any of these cars, because I certainly wouldn't want to be in her shoes. Now what if there was an event at this new proposed arena and an event at Giants stadium? It is already so bad as it is! Not to mention there was not one security or police presence in the entire area near UCSF. It is literally an accident and lawsuit waiting to happen!

2 [TR-9]

I am from NY City, I realize change happens, areas get rejuvenated! There needs to be thorough and realistic approach to any considerations of any further developments. Quite frankly, lives are at stake. The area already has enough congestion and lack of insightfulness around how to alleviate the already cramped roadways in the Mision Bay area. The impact of such a large stadium in this hospital area would be multifold. I am writing this letter in hopes for more to gain insight into actually what we are doing here everyday at UCSF, this isn't about money, getting stuck in traffic on the way to /from work, this is about providing efficient, reliable, state of the art healthcare. The city of SF needs to reevaluate what its primary goals are and be thoughtful about how major decisions such as an arena could single handedly increase the mortality and morbidity of its citizens. Is this really worth it?

3 [TR-4]

Subject: comments on Warriors arena draft SEIR

Dear Ms. Bohee,

I would like to submit the following comments regarding the DSEIR for the Warriors arena in Mission Bay. For disclosure, I am a Mission Bay resident, I am on the Board of the South Beach / Rincon / Mission Bay Neighborhood Association, and I am a UCSF professor. My comments do not necessarily reflect the views of the Neighborhood Association nor UCSF; they are my own.

1) Use of third-party parking structures: In Figure 5-2 in the Transportation Management Plan, it appears that several UCSF or residential parking structures are being provided as examples of where fans might park. A note in accompanying text states that the figure does not reflect actual third-party agreements, but residential parking garages should not be used for fan parking, and while perhaps the UCSF parking garage closest to the arena could potentially be incorporated into a deal of some sort with the university, the parking structure on the other side of campus in the Rutter Center should not be used as a preferred fan parking structure because that would result in a horde of fans, sometimes drunken fans, pouring through the campus. This is not acceptable at any time of day, as the research mission of the university is not confined to business hours. 1 [TR-13]

2) Page 5.2-68 states that preferred performance standards include that "event traffic does not block access to the UCSF emergency room entrance for emergency vehicles or patients on Mariposa Street between I-280 and Third Street" and says "In the event that ongoing monitoring shows at any time that the performance standards outlines above are not being met,…" It is crucial that lack of blocking of patient access to the UCSF hospital will never be a performance standard that isn't being met. That is, monitoring of the blocking of access to the hospital to identify a problem is not sufficient; rather, monitoring should be in place to prevent that from ever occurring and to actively control event traffic to allow patient access at all times. 2 [TR-3a]

3) The funding must be guaranteed for the mitigations outlined in the SEIR. Whether it comes from the City or the Warriors, the mitigations must not be reliant on there being sufficient funds; those funds should be identified and secured before the project is approved, or else the EIR is irrelevant. 3 [GEN-1b, IO-2]

4) Egress from Mission Bay South to the west occurs via the traffic circle and via 16th/Mariposa corridors. The arena attendees will be encouraged to use the 16th and Mariposa corridors or to exit to the north, but I suggest that they be actively diverted away from Mission Bay Blvd. MB Blvd doesn't show up as a preferred route but it is hard to interpret from the maps whether the traffic will be kept away from it. The residents of Mission Bay South, and those of Mission Bay North via the west end of Berry St, will rely on the traffic circle to be able to get in and out of their homes during pre- and post-event times. If arena traffic is pouring westward through the 4 [TR-4]

traffic circle, the residents will be trapped in Mission Bay or prevented from reaching it, especially as the Caltrains come through. The traffic circle should be reserved for non-event traffic. Please note that from my experience on Berry St before the west end was completed through Mission Bay Drive to 7th St, we were trapped on Berry whenever there was pre- or post-AT&T Park traffic, and we had to plan to not leave home or come home during those times via car or transit. If the traffic circle becomes held hostage to event traffic as well, then everyone in Mission Bay will experience unacceptable access limitations to their homes. 4 [TR-4] cont.

Re: Comments on Warriors Entertainment Center Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

As a professor at UCSF-Mission Bay, I believe that the proposed Warriors Arena will have a devastating impact on the faculty and students of UCSF and on the health care professionals and patients in our hospital. The impact of this project on traffic and transportation is not appropriately analyzed in the portions of the Draft EIR that I have read. 1 [ERP-9]

We who work at UCSF Mission Bay and use public transportation (the T line and the Golden Gate ferry) know that the transportation system frequently fails during Giants games, extending commute times unreliably often by hours as a result of missed connections in the intermodal travel. The overall impact of the Giants home games on public transportation (and on alternatives like Uber and taxis) are such that I personally, along with many others, choose to drive a car back and forth to Marin when there are events at AT&T Park during the times I would travel. The failure of public transportation can not be remedied when the Muni shares right of way with cars and the intersections are blocked. The proposed Warriors Arena would exacerbate this situation beyond measure. 2 [TR-5a]

The idea that there would be more than 225 traffic-generating events per year at the proposed Warriors Arena, which is much closer to our campus and hospital than AT&T Park, is a nightmare that can not be alleviated by having policemen direct traffic. The fact that events at AT&T Park and the proposed Warriors Arena would coincide more than than 30 time a year is truly horrible. No one will be able to go to or from work on those days, or get to our hospital, without delays that are completely unreasonable.

Access to the Bay Bridge and to the south, as well as to the hospitals, will also be tremendously compromised by the gridlock that will ensue when fans come to the stadium. Bay Bridge commuters have to go north, and 3rd and 4th streets will be impassible or perhaps closed to cars in order to allow the Muni to run. The Mariposa freeway entrance and exit can take only very low traffic flows, nothing like the freeway entrances and exits at the present Warriors arena in Oakland. 3 [TR-4]

The proposed parking restriction, with 200 spaces for 18,000 fans at the proposed Warriors Arena, is also ludicrous, and will result in further gridlock and air pollution [5] as fans cruise the neighborhoods in search of a place to park. 4 [TR-13]

I-Stryker

Finally, the traffic situation will surely impair ambulance access to our hospitals. I have seen this happen during occasional Giants game gridlock, as ambulances get stuck on 3rd Street for more than 5 minutes through 3 lights. This problem will be unimaginably worse with the addition of the proposed arena. The Draft EIR ignores the health and safety impacts of interfering with access to essential medical facilities. 6 [TR-9]

None of the assessments of traffic take account of the huge increase in the residential population of the Mission Bay community that will take place when the many apartment blocks under construction are occupied. The transit-first philosophy of the City assumes, I suppose, that the public transit system that is already overburdened and frequently dysfunctional can accommodate the thousands of additional patrons without further deterioration. Given features like the transit constriction at the 4th street bridge, such a view is unreasonable. The transit system and traffic will surely become worse even before the proposed Warriors Arena is in place. No reasonable assessment of the traffic impact of the proposed Arena can be made without measuring that of the new residential developments, something that will be possible only in a year or two. 7 [TR-2h, AQ-4b]

I ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, neighbors, and university students and employees including faculty members like me. 8 [GEN-5] The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project 9 [ALT-4] and conduct a new and complete environmental review process before any decisions are made. Finally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City concerning this project. 10 [ERP-2]

Sincerely,

Michael P. Stryker

I-Sullivan

From: Jim Sullivan
To: Warriors, PLN (CPC)
Subject: Comments on Draft SEIR
Date: Thursday, July 09, 2015 9:24:05 PM

I have three comments:

1) The planned event center will hold less than half of AT&T Park's capacity and by far the majority of events at the new arena will be held on days/times when the Giants will not be playing.

2) As at AT&T Park, the arrival times of attendees will be occur over a longer period than at other venues in the country because of the various attractions and amenities (food and otherwise) that will exist around the arena site. Traffic of all types (autos, public, walking) will not all occur right before the start of the events easing the various traffic flows. 1 [TR-2d]

3) I believe that this event center will be a very positive addition to San Francisco. 2 [GEN-5]

Thank you for your consideration of these items.

Re: Comments on Warriors Entertainment Center
Draft Subsequent Environmental Impact Report

Dear Mr. Bollinger,

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR. I do not believe that the most recent announcement from UCSF (WinWinSF) would adequately address the following points:

Unmanageable Traffic and Incompatible Land Uses

The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities. 1 [ERP-9]

A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR. 2 [LU-1]

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle up to 18,500 fans at 225 events per year, especially when both stadiums have games. Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect 3 [TR-13]
will be yet more gridlock and unhealthy air emissions. 4 [AQ-4b]

The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities. 5 [TR-9]

Health Concerns

The project's traffic new massive gridlock and parking problems will also cause significant and unavoidable impacts on air quality. Increased car and truck emissions in the area will be unhealthy for residents, workers and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents and patients and families who rely on UCSF and other lifesaving services in Mission Bay. The Draft EIR fails to address and mitigate these health impacts, relying on vague plans and purchases of emissions offsets rather than effective mitigation measures as required by CEQA. 6 [AQ-4b]

The current health care and research center is a hub of care and innovation, the future of this world-class medical center should not be jeopardized by billionaires seeking to double the value of the Warriors as a sports franchise on the backs of San Francisco residents. 7 [GEN-5]

* * *

Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements. 8 [ERP-7]
Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship. 9 [PD-4]

Thus, we ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors. 10 [GEN-5]
The City should consider alternative sites, other than Mission Bay, for this environmentally damaging project 11 [ALT-4]
and conduct a new and complete environmental review process before any decisions are made. Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project. 12 [ERP-2]

Subject: concerns for new warriors stadium
Date: Thursday, July 23, 2015 2:58:36 PM

Hello,

I am a physician at UCSF Mission Bay (research buildings, not the recently opened hospital) and am concerned about the impact to traffic a new Warriors stadium will bring to the area. I commute daily to Mission Bay by car and have already noted a significant increase in traffic since the hospital opened. On days with Giant's games or other events, traffic is pretty much a stand still.

There are currently only really 4 options into and out of Mission Bay for the vast majority of people coming from the city, or bay bridge. When one consults a map, you can see that you need to take either 16th street west, Mariposa West, or you can take 3rd or 4th street north. The entire Portrero Hill area cannot exit west unless at 16th, 17th street or all the west south to Cesar Chavez. This creates huge bottle necks at 16th and Mariposa, which are at times only single lanes due to construction or people making left turns. 1 [TR-4]

7th street or Owens street to 7th street will NOT be a viable option. The intersection of Owens to 7th Street is very complicated, spanning 2 lights and a busy Cal Train crossing. People who want to turn onto 7th from Owen often cannot because during rush hours, 7th street is a parking lot and the Cal train is frequently passing by.

Let's not even try using 3rd and 4th street to exit/enter Mission Bay during a Giant's game, let alone a Giant's game and/or other events at the proposed Warriors stadium.

The ability for patients and healthcare givers to access Mission Bay in a timely manner is of paramount importance, and another giant, busy public venue such as the Warrior's stadium will certainly impede that.

Thank you,
Richard Tsai

Subject: proposed Golden State Warriors' Arena and Events Center at Mission Bay.
Date: Tuesday, July 14, 2015 10:49:38 AM

Hello,

Mission bay is a beautiful area where I go on a regular basis to take loved ones to medical appointments and visits. The arena being built here is going to be a huge inconvenience to many residents, commuters, and especially hospital visitors and staff in general. More than that, I feel it poses a safety issue to the community's children. 1 [GEN-2]

I demand that the powers that be understand and truly consider the implications of building an arena in this area. The new children's hospital and its EMERGENCY ROOM are located there. The traffic that this arena will bring to the area will devastate any chances of parents, in a true emergency, being able to get to the hospital in time. By building this arena here, you are putting the lives of children unnecessarily at risk all so you can have one more sports team in the city. 2 [TR-9]

Entertaining this idea is reckless and irresponsible. As the local SF government you have a responsibility to the health and public safety of the community and that MUST come first! 3 [GEN-5]

Blessings,

R. Tuialu'ulu'u

Considering the new UCSF hospital and current traffic jams in the Mission Bay Area locating the Warrior Stadium in the area if absurd and should not be allowed by city. Certainly, the owners of the 12 acre parcel have a profit motive with utter disregard for the crowded development around the area. Hope that the civic minded authorities in the city hall will prevent this from happening. 1 [TR-4]

Subject: Public Comment: concern about street parking for residents

I live 2 blocks away from the proposed site (18th and Tennessee). Street parking is already limited by the new hospital (why use the paid parking when street is free?).

I would like to see the restrictions extended later in the day for those without a permit to discourage game goers from using all the street parking before residents get home from work. (Some already happens with ATT, even though not as close.). Or maybe restricted sections on each street for only permit holders. Or some other solution. 1 [TR-13]

People are not going to pay for parking in those "many" available spots if they can park on street. And that will cause untold problems for residents.

Please do not allow a stadium to be built next to the hospital. This is a crazy plan. The MTA says it will have solutions for traffic. Does anyone who lives in this city believe the MTA about anything? Just look at the job they are doing now with traffic 'solutions'. I am a native San Franciscan and enough is enough!!! 1 [TR-4]

Re: GSW Event Center DSEIR OCII Case No. ER2014-919-97
Planning Department Case No. 2014.1441E

Dear Tiffany,

I have questions about the adequacy and accuracy of the DSEIR for the Golden State Warriors Arena project in Mission Bay South Blocks 29-32.

Transportation and Circulation, SEIR Section 5.2

Impact TR-1. While the SEIR states that the project would not result in construction-related ground transportation impacts because of their temporary and limited duration, the use of Terry Francois Boulevard for construction staging will have a significant impact on traffic flow to and from AT&T ballpark parking lots. Improvement Measure 1-TR-1 needs to be stronger. Where suggested mitigations "could" be required, the word should be changed to "shall", and enforcement must be incorporated in the plans. When there are events at AT&T Park, Terry Francois Boulevard needs to be vacated by construction staging and equipment to allow clear traffic flow, as is done by Mission Bay infrastructure developers to clear roads on event days to allow free traffic flow. 1 [TR-10]

Impact TR-2 and TR-3. While parking in and of itself is not considered a significant environmental impact (based on SB743), the traffic caused by searching for (acknowledged inadequate) parking, or drop-off/pick-ups around the Arena, will create a significant and unavoidable impact, even with mitigation. If this neighborhood is to survive the impact of the arena in addition to the already unacceptable conditions that result from ballpark events, there needs to be effective mitigation of the unavoidable impacts. The SEIR suggests mitigation strategies that "could" be implemented "if feasible", but there are no teeth in the recommendations. Mitigation measures must be specific and enforceable through permits, conditions, agreements or other measures. Mitigations contingent upon further (required) discretionary approvals may not be enforceable, and cannot be deferred. The SEIR mitigation strategies need to be tightened up so that "could" becomes "shall", and the necessary mitigations are stated as conditions of project approval. 2 [TR-4]

Creation of a Transportation Management Plan and coordination and implementation of the TMP demand oversight and authority to enforce and if necessary, amend the plans to respond to "lessons learned", conflicts and changing conditions. While the Ballpark/Mission Bay Transportation Coordinating Committee (see Mitigation Measure M-TR-11b) has been helpful in both interagency coordination of traffic and transportation impacts of the ballpark and expression of neighborhood issues, the BMBTCC has no official authority or standing to enforce or amend plans, or ensure adequate funding for required mitigations. The OCII is in no position to become an enforcing agency, and leaving 3 [TR-3a]

I-Woods

implementation to "the City" is too vague – there's no authority or accountability. The SEIR should clearly designate a responsible authority to enforce, amend and access funding for mitigations. 3 [TR-3a] cont.

It has been our experience that adequate funding and oversight of mitigations, and flexibility to amend the plan, is the key to success. While the project sponsors are supposed to be drafting a Special Reserve Account to set aside the operational costs of the impacts of the arena, there needs to be a specific and enforceable reference in the SEIR that funding of mitigations will be dedicated for the life of the plan and not subject to the vagaries of City General Fund budget cycles. 4 [GEN-16]

Impact TR-6, TR-21, TR-22 While the SEIR addresses active management of pedestrian flows, it needs to be tied to priority for transit. Pedestrians need to be controlled so that transit vehicles have priority over vehicles exiting garages and pedestrian movement. 5 TR-6

The most important mitigation for traffic congestion is to reduce the number of private passenger vehicles attempting to access the arena through Mission Bay's limited and congested street network. It is important that the SEIR require off-site parking, shuttle access to off-site parking, link ticket sales to off-site parking or transportation alternatives, create smart phone or other electronic links to available parking (including reactivation of SFPark), and actively discourage private passenger vehicle access to the Mission Bay neighborhood by providing better transit service. 6 [TR-12a] The assumption that UCSF or Alexandria (ARE) parking garages or private parking lots in Mission Bay will be available for Arena patrons is faulty. This incorrect assumption, which inaccurately overstates available parking in the neighborhood, makes it even more critical to discourage "at will" attempts by arena patrons to drive and hope to find parking or the congestion caused by ride-hailing services (TNC's). 7 [TR-13]

As an active participant in the development of Mission Bay, Chair of the Mission Bay Citizens Advisory Committee, 30 year resident of the neighborhood, and MBCAC representative to the B/MBTCC, I am very concerned that resources for mitigations are overestimated, enforcement and funding are underestimated, and authority and responsibility for implementation of mitigations is vague and 8 [IO-2] unenforceable as expressed in the SEIR. Some of the proposed mitigations in the Mission Bay SEIR still haven't been implemented, and without specific designated authority and responsibility for implementation, there is no assurance that important mitigations for the impacts of the GSW Arena will actually occur or be maintained. 9 [PD-1]

Sincerely yours,

Corinne W. Woods

July 25, 2015

Ms. Tiffany Bohee
c/o Brett Bollinger
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Ms. Bohee:

I am writing and submitting this letter to voice my concerns and objections to the proposed building of the Golden State Warriors Arena in Mission Bay.

I am a longtime San Francisco resident and have lived in several different neighborhoods over a period that exceeds 25 years. I have lived in the Mission Bay area for the past three and one-half years. I moved to the area in December 2011 and lived in the Strata Apartments located at Fourth Street and China Basin. At that time, there was very little completed development in the area and little in the way of on-going construction projects. In August 2012, I moved into a newly constructed condominium building located on Mission Bay Boulevard North. I still reside there.

I am retired and have keenly followed the growth and development in the area. I walk between four to six miles about five times a week. These walks take me all around Dogpatch, Mission Bay, Lower Potrero Hill, Showplace Square, SOMA and the Embarcadero. I walk at various times in both the morning and afternoon hours. I walk before, during and after events at AT&T Park.

During these walks I am constantly evaluating vehicular traffic flow, pedestrian and bicycle traffic patterns, signal light timing, traffic signage effectiveness, the impacts of on-going construction projects and observing, when possible, traffic control and mitigation efforts by police officers, parking control officers and employees of construction companies. 2 [TR-1]

Why do I take such a detailed and keen interest in these matters? Simply put, I'm a retired law enforcement officer with well over 30 years of municipal law enforcement experience and this stuff just fascinates me. I have extensive experience in all aspects of municipal policing. With respect to the development of the Mission Bay area my extensive experience with uniformed patrol duties, traffic enforcement strategies, traffic control measures, noise issues, parking enforcement, community policing and crime prevention, addressing quality of life issues and special event management is relevant. In fact, I would be considered a subject matter expert (SME) in these areas.

In addition to walking extensively, I also regularly take the Muni T-line and the new 55 bus. This allows me to adequately evaluate those services as well.

Over the past years things have changed significantly in Mission Bay and throughout a large portion of San Francisco. Specifically, in Mission Bay many large residential buildings have been completed and occupied. Others are in various states of construction. The new UCSF Children's Hospital project has been built and opened in early 2015. The new Public Safety Building has been completed and occupied. The San Francisco Giants' plan for significant development on Lot A is working its way through a process and has yet to be finalized. It does call for significant proposed changes on that parcel. Proposed changes to Pier 48 are in the works. High-profile businesses plan to build and locate their corporate offices in the area. A significant amount of newly planned residential developments are in the proverbial "pipeline" in Mission Bay, Dogpatch, Potrero Hill and Showplace Square. 3 [IO-3]

Virtually all of these projects impact local residents by causing traffic congestion, noise pollution, taxing public transit and affecting important quality of life issues in the area. As the projects are completed, the influx of new residents living in the area has increased significantly and at a rapid rate. The influx of new workers (in significant numbers) also impacts traffic and public transportation ridership. This will only be accelerated over the next couple of years as thousands of new residential units and many large-scale new retail and commercial buildings will be built and occupied. The scope and pace of development in Mission Bay and its surrounding areas is astonishing.

New local residents use many services that draw additional traffic to our neighborhood. Many of these services use or even require the use of vehicles such as: taxis and ride share companies, delivery services (UPS, FedEx), moving services, pet walkers, house cleaners, nannies, home repair and remodel services and meal delivery companies. In my building alone there are 50-70 of these occurrences on most days. Many of the local businesses also receive deliveries and they face the same problem. 4 [TR-8]

Few of the streets have any commercial loading zones or parking spaces for these vehicles and as a result vehicles frequently circle the area looking for parking, double-park, park in front of fire hydrants, block driveways, and illegally park in turn lanes and the like. This is a regular and predictable practice that is only going to get worse. Although most of these indiscretions last for short periods of time, there is a cumulative effect on the neighborhood and its residents.

Parking in the area is very restrictive. Some of the area is controlled by the Port Authority and metered on a sliding pricing model. Other streets have abusive (in my view) parking restrictions which include two-hour parking zones from 7 a.m. – 10 p.m. daily. On many weekdays (non SF Giant game days) after 6 p.m. and most weekend days, the immediate area around my building is a virtual ghost town. It is not uncommon to have dozens upon dozens of vacant parking spaces on nearby streets 5 [TR-13] throughout the day. Terry Francois Street often has 50 – 75, if not more, open spaces alone. Yet restrictive parking restrictions are in place. The Port Authority does not make it a practice to offer residential parking permits in our area. Residents understand the need for parking restrictions, but in our area the two-hour parking hours should be relaxed to a more realistic timeframe of perhaps between 8 a.m. – 7 p.m. on non-event days. 5 [TR-13] cont.

The new Public Safety Building recently opened and already residents are experiencing problems as police vehicles park illegally, drive too fast and have been observed committing a variety of California Vehicle Code violations. I recently attended a community meeting with police officials where these issues (among others) were brought up and discussed. The meeting went well and the police department will be looking for ways to mitigate these issues.

City officials and the public have long recognized that the City's public transportation system is not as efficient, effective and robust as it needs to be. Complaints about the system have been occurring for decades. Former Mayor Willie Brown vowed to fix Muni within his first 100 days in office and we all know how that turned out. 6 [TR-5a]

Ironically, in a July 22, 2015, article published in the San Francisco Chronicle titled, "Housing boom fee could boost Muni," written by J.K. Dineen and Michael Cabanatuan, Mayor Lee is quoted as saying, "As our city grows, we must ensure that our transportation network grows along with it." The article further states San Francisco has added over 100,000 jobs since 2010 and is growing by 10,000 residents a year. It references the hot-bed issue about the proliferation of high-end residential towers in areas that have not been accompanied by adequate improvements in open space, transit and affordable housing.

The article did not mention the proliferation of commercial and retail developments and their significant impacts on San Francisco over the last five years. It is the cumulative impacts of all of these changes that affect our daily lives, our health and our outlook on the City. 7 [IO-3]

I choose not to belabor the historical problems and proposed fixes to our public transportation system. I choose to not focus on the increased advocacy for bicycle riders and pedestrians. I choose to not focus on homelessness and the mentally ill. I choose to not take up the issue of affordable housing and open space. I choose not to evaluate future proposed changes that may never be funded or built. I truly understand these issues and the interests of various advocacy groups.

I choose to look at the project(s) and simply evaluate it based on my extensive professional experiences. Can a project be developed and ultimately function in an efficient, effective, cost-effective and safe manner without causing significant disruptions and degrading the quality of life for nearby residents, workers and visitors? Can it be developed and be successful in the present? Can it work now?

As a longtime San Francisco resident, I understand the interests of many of the City's residents. Having worked in law enforcement has given me a unique perspective and insight into many issues that truly matter to residents, workers and visitors alike.

Residents want to live in a clean, safe and well-maintained environment that offers exceptional public services and infrastructure; a city in which both our elected officials and city staff are responsive and willing to focus on quality of life issues; a city that plans for, and manages, change in a thoughtful, orderly and well-conceived manner; a city that is open and transparent. Simply put, we want to work in a city "that works well at a high level." The expectations are high, but very straightforward.

With regard to quality of life issues, they are of great importance and can be described as:

Those issues which affect the residents, businesses and visitors to the area by creating fear or adversely impacting their health, safety, and welfare.

Some typical quality of life issues in Mission Bay and our surrounding areas include, but are not limited to:

- Aggressive panhandling
- Ticket scalpers hassling people and/or stepping into traffic
- Chronic public intoxication 8 [GEN-2]
- Drinking in Public and open containers
- Litter, graffiti and public nuisances such as urinating and defecating in public
- Incidents that involve the mentally ill
- Illegal encampments
- Illegal dumping
- Chronic noise complaints
- Illegally parked vehicles
- Dust and grime associated with on-going construction projects
- Significant numbers of California Vehicle Code violations being committed by motor vehicles, bicycles and pedestrians.
- Constant and often poorly designed and implemented road and/or lane closures and traffic modifications disrupt all modes of both public and private transportation with regularity.

In order to make an assessment of the project I did extensive research, conducted site visits, spoke with local residents, local employees, delivery drivers, a variety of City workers who work special events and several construction workers.

I also spent significant time directly observing traffic flow (all modes) both during Giants games (pre and post-game) and on non-Giants game days at many intersections. I walked and observed over a period of several months.

I have reviewed many sections of the proposed Environmental Impact Report, Planning Department Case No. 2014.1441E for an Events Center and Mixed Use Development at Mission Bay Blocks 29-32.

Based on my direct observations, review of the EIR and my prior experience, I have many concerns and do not believe the City should allow this development to proceed as designed. 9 [GEN-5]

The construction of the Warriors arena is only one piece of the local puzzle. Multiple major projects are in various states of planning and/or development. These include:

- Expanding UCSF – Several projects
- Developing Pier 50 – Anchor Steam
- Building a hotel in Mission Bay
- Developing Seawall Lot 337 – Lot A – A massive project
- Pier 70 – A large mixed use development
- The Eastern Neighborhood Program
- The Uber Headquarters Project
- Realignment of Terry A. Francois Boulevard and Mission Bay Park
- The construction of many new residential complexes that will contain several thousand new units in Mission Bay, Dogpatch, Potrero and Showplace Square

In congested urban areas like San Francisco, no new development can be evaluated in isolation. For that reason you need to consider the total cumulative impacts these projects will have. The Warriors Arena was never originally intended to be built in Mission Bay. It was never included in any previous plan for Mission Bay. It would, however, be arguably the biggest and most impactful project ever built in the area. It was thrust and forced on San Francisco when the owners of the Warriors went into contract to buy parcels of land in Mission Bay. This was after the failed attempt to build the arena along the Embarcadero. 10 [IO-3]

The report fails to adequately address many of the actual event usage plans. The Warriors intend to have up to an additional 200+ events at the site. In total, the arena may easily host more than 250+ events a year. This is only an estimate. This number of events is excessive. The area cannot handle these events without significant negative impacts affecting local residents and other people that work in the area. 11 [PD-2]

The plan focuses on the Warriors games and potential overlap with some San Francisco Giants home games. It refers vaguely to other events, but offers no specificity on the types of events, the days or hours of the events and/or any realistic estimate of

the number of people expected to attend. Possible events seem to have a classified threshold of whether they expect to attract over 12,500 attendees or not. This is pure guesswork. 11 [PD-2] cont.

The Warriors, to my knowledge, have never publicly released any demographic information about their season ticket holder base. It would be easy for them to acknowledge, for instance, how many of their season ticket holders reside or work in various postal codes in the Bay Area. This measure, would at least offer a starting point to evaluate the efficiency and effectiveness of current public transportation options for their large base to use as many presumably would need to travel to San Francisco from other communities. The following issues could, at least, preliminarily be looked into: 12 [TR-2e]

- Are viable public transportation options currently available?
- How would the scheduling work for transferring between agencies?
- Would it be convenient for those individuals to take public transit?
- How many transfers would the average rider to need make?
- What would the average cost for a round-trip fare likely be?
- How long would a sampling of journeys take each way on average?
- Would the transit options run late enough for attendees staying in the area after a game to still use public transportation to get home?

Vagueness is not my friend.

The Warriors have a huge financial incentive to use the site extensively in order to generate revenue and help pay for the project and ultimately make more profits.

The City should be a staunch steward of City resources and funds, taking appropriate measures to ensure we do not over-commit limited resources or over-spend for service delivery. 13 [GEN-1b]

Section 5.8 – Public Services

This section evaluates if the project would require new or physically altered governmental facilities to maintain adequate public safety. This is a misleading measure. We should really be assessing the issues associated with providing the broad range of public services to the geographic area impacted by the project.

For example Table 5.8-2 addresses San Francisco Fire Department (SFFD) responses in the project area over a 12-month period. Staff at four fire stations responded to 10,702 medical responses and 4,968 fire calls. In total, SFFD responded to 15,670 incidents. For urban municipal fire departments, medical aid calls typically outnumber all other types of calls for service. Indeed, nearly 70% of the calls at the four stations were medical in nature. Should all the projects in the pipeline be constructed and occupied, the number of total calls will increase dramatically in the target area. With the 14 [PS-1, PS-2] increase of traffic congestion and associated factors of event management, SFFD response times under current staffing levels are likely to increase.

There is no way to evaluate if there are more or fewer calls on special event days compared to non-event days. There is no way to determine which days of the week and hours of the day are peak response times. Simple raw data does not give us the information we need to determine if the proposed arena project, along with all the other projects, will cause service delays or disruptions.

The San Francisco Police Department (SFPD) is currently understaffed by as many as 300 officers. Although they plan to aggressively hire recruits and increase staffing, this process is arduous and slow. SFPD intends to offer up to three (3) new academy classes with as many as 50 recruits per class over the next several years. Unfortunately, during the next three years they will lose other staff members to retirement, lateral transfer, disability leave and others who choose to transition into other career fields.

The process of recruiting, hiring and training an individual to become a fully functioning and solo officer can easily take up to 18 months. This means that even if you have staff "on paper" there are likely many officers in various stages of the employment and training process. Individuals, who are not yet fully trained and have not completed the FTO program and are not qualified to perform solo officer duties. A police department's current staffing level is merely a number. The more important number is how many physically able and qualified officers can actually be deployed to staff events and/or handle calls for service. These numbers are usually quite different.

14 [PS-1, PS-2] cont.

Furthermore, if SFPD is successful in sponsoring an academy class with 50 recruits, it is unlikely that all new hires will pass the police academy. Others will fail to complete the rigorous Field Training Program and some will fail to complete their probationary period. This is the nature of police hiring and training programs. It is a predictable outcome that occurs in all local law enforcement agencies.

It is therefore highly unlikely that SFPD can achieve full staffing levels by mid-2018. Any new officers would be inexperienced. It can easily take several years or more for new hires to become truly skilled and competent in handling the broad range of police calls that occur in municipal jurisdictions after achieving solo officer status.

Because SFPD will not, in my view, ever reach its authorized staffing level it may be stretched to safely, professionally and adequately staff another 250+ special events each year. They may be required, at times, to have staff pull double shifts (working patrol and then stay over to work an event), require some form of mandatory overtime and utilize creative scheduling practices.

With respect to staffing levels at special events, the document indicates:

- Staffing levels are determined by SFPD's Event Commander in coordination with the event sponsor in advance of the event as well as by levels established in event security/operations plans. The Department of Parking and Traffic typically provides traffic control services for special events.

Without more specificity, I am not able to determine if adequate resources and being utilized for on-site security by sworn members of SFPD and parking control officers (PCOs).

14 [PS-1, PS-2] cont.

I can tell you from my own personal experience that sponsors have a financial incentive for fewer personnel usage because they often pay for these services. Sponsors often try to supplant the use of sworn officers and trained PCOs with far less expensive "private security" personnel. Unfortunately, when things go bad – and they will at some point, the ultimate burden to respond and resolve an incident will rest with the sworn police officers and PCOs.

Private security guards can be a deterrent and provide valuable services, particularly inside venues, but for the most part they will not be arresting, citing or physically ejecting people from an event site. They will not be writing a detailed crime report, but rather are usually treated as "witnesses." They will observe, report on conditions and request assistance from uniformed sworn officers or PCOs in enforcement-related incidents or in any circumstance in which the personal safety of a patron or themselves is involved.

In Table 5.8-3 the Summary of Annual Crimes in Mission Bay Area does not specify how many of the crimes occurred on special event dates versus non-special event dates. It is not possible to make an accurate evaluation and/or comparison from the raw numbers supplied.

The numbers reported appear to be crimes that require reporting under the FBI's Uniform Crime Reporting Program. These are crimes that all police departments report annually. They serve as a basis to compare crime rates between jurisdictions in an "apples to apples" approach or crimes that occur year over year for comparison purposes.

15 [PS-1]

While interesting you'll notice that there is no mention of any of the following:

- Actual police calls for service (CFS) in the area
- CFS types and frequencies on event days versus non-event days
- Number of self-initiated detentions, stops, citations issued and arrests made by SFPD
- Number of parking citations issued and vehicles tows by PCOs
- Statistics relating to the many **quality of life issues – previously listed**

- Vehicle collisions
- Disturbance calls
- Disorderly conduct calls
- Alcohol or drug-related calls and crimes
- Total number of crime reports taken
- Response times to crimes in the event area.
- Alarm calls
- Incidents occurring at public transportation facilities
- Incidents occurring on public transportation vehicles of all types
- Number of private person arrests made

Having accurate statistics relating to these types of incidents (in addition to the FBI UCR) gives you significantly more information to evaluate and determine accurate levels of overall police activity in any given area. 15 [PS-1] cont.

Critical information is not provided for analysis in the report. Simply put, utilizing the FBI Uniformed Crime Reporting for SFPD alone is a very ineffective way to gauge the actual level of police, parking and traffic related incidents in a given geographical area or associated with special events.

Given the location of the proposed project it would be prudent to obtain the more comprehensive crime statistics and information from the following agencies:

- University of California Police Department
- The California Highway Patrol
- Port of San Francisco Police Office
- Bay Area Rapid Transit Police Department (BART)

Once the appropriate information is gathered from all relevant sources a detailed analysis of the actual impacts to public safety could be evaluated.

With respect to emergency vehicle access (5.2.3.6) and parking conditions (5.2.3.7) the report is woefully lacking.

The report indicates the primary access for emergency vehicles would be 3rd Street because it has two lanes of traffic in each direction. Although 3rd Street has two lanes in each direction, they are separated by raised curbs and Municipal rail tracks. The lanes on 3rd Street are standard width and there are no shoulders, delineated bike lanes, loading zones, parking spots or any place to pull out of traffic between intersections. 16 [TR-9]

Subsequently, should any disruption occur mid-block that impedes any lane of traffic, all vehicles behind it will be negatively affected and congestion will begin occurring almost immediately. In essence a “bottleneck” will occur. There are many scenarios in which

this could happen; a traffic collision, a stalled vehicle, or any type of police, fire or medical response to a fixed location along the corridor – to name only a few of the likely possibilities.

If a traffic collision occurred where an individual needed immediate medical assistance and transport to a hospital and/or have their disabled vehicle towed, it could easily take an hour or longer to clear the scene. The traffic back-up associated with this type of incident and closure would be stifling. Emergency responders, in vehicles, would have a difficult time getting to the incident. Police on motorcycles and bicycles would be able to get there, but they don’t have the ability to transport injured parties or move and tow disabled vehicles. 16 [TR-9] cont.

The existing parking was looked at in the parking study area. That area was defined to include off-street parking facilities located within a reasonable walking distance from the project site – one-half (.5) mile with easy access to major street corridors that provide access to Mission Bay. 17 [TR-13]

Geographical constraints make access to the area problematic already. To the east is the Bay. To the north there are only two access routes, namely 3rd and 4th Streets.

To the west, the Mission Bay Boulevard extension to 7th Street has not been completed. Sixteenth Street also runs east/west. It crosses the railroad tracks at 7th Street and dead ends at Illinois. Much of the local traffic uses 16th Street to access retail establishments in Potrero, the Mission and beyond. Access to the new UCSF Medical facilities is accomplished by taking 16th Street. Seventh Street extends south, crossing 16th Street and becomes Mississippi Street. This is taken to access southbound Highway 280 from Mariposa Street.

Mariposa Street also runs east/west. It is a primary entrance and exit point for traffic using Highway 280. The ramp northbound frequently gets backed up for up to one-half mile during normal commute times. The ramp to southbound 280 is heavily used and traffic on Mariposa during normal days can be brutal during the afternoon commute. From the south, 3rd Street and Illinois Street allow access to César Chavez and Pennsylvania to access Highway 280 south. 18 [TR-4]

In reality, there are limited points of ingress and egress to the project area. The streets are either one or two lanes in each direction. Many are controlled by signalized intersections and the freeway entrance and exit ramps are poorly designed to handle significant traffic. These ramps were built decades ago and have not been modernized to reflect current demands.

To make modifications would be costly and is in conflict with the City’s transit first policy. The old adage, “you can’t have it both ways” comes to mind. The City would resist making improvements and modifications that might actually increase vehicle traffic efficiency and effectiveness because it contradicts established policy.

The City would also have to coordinate with other local and state agencies to accomplish any improvements to freeway on and off ramps. It is unknown what funding sources would exist to do this type of work. Local community groups would surely oppose such measures. In short, this appears to be a non-starter, which bodes poorly for the proposed arena attendees, local residents in the area and other merchants or businesses that are reliant on the use of these public roadways. 18 [TR-4] cont.

In my opinion, the proposed number of parking control officers (PCOs) slated for deployment is not nearly sufficient.

The report identifies PCO controlled intersections during the various scenarios. Table 5.2-10 gives an example in which only six of 22 locations are staffed. There is no mention of how many PCOs are assigned to each location and no indication of what traffic control measures they will utilize to expedite the safe flow of all modes of traffic. My observations tell me that much PCO intervention focuses on monitoring traffic from a distance and/or controlling the signals via the override function. I do not see a lot of engagement and interaction. Pedestrians and bicyclists regularly do what they want on many of the local streets. The intersections of King Street and 3rd Street, King Street and 4th Street and King Street and 2nd Street are staffed with more personnel. The staff working those intersections appears to be much more engaged and interactive in their efforts to safely control the various modes of traffic. If you do not facilitate the flow of traffic all the way to freeway on-ramps and other major exit routes, traffic will always "bottleneck upstream" and clog its way back toward the event site. 19 [TR-3b]

Over the past three years, I've often observed one and sometimes two PCOs at intersections who were simply controlling the traffic signals (manual override) to facilitate vehicular traffic. They were not adequately engaging with pedestrians to prevent jaywalking, pedestrians crossing against red lights and people crowding into the roadway. They also weren't able to control bicyclists that were weaving through traffic. The focus was on cycling the lights rather than a comprehensive effort to facilitate all modes of traffic. PCOs must engage with people to control the intersection and make it clear how the manual traffic flow cycle will be handled and monitored. Each mode of transportation must be addressed independently, but within the context of a master plan, during times of heavy congestion to promote safe traffic movement for all modes.

Traffic control duties can be quite difficult and require significant resources and constant engagement. Simply standing at a signal light control box and manually controlling the light cycle at signalized intersections is not sufficient to ensure the safe movement of vehicles, bicyclists and pedestrians. Active engagement and proper use of traffic control devices (cones, barricades, signs, flares, reflective sleeves and message boards) is also required. Many of the intersections listed in the report indicate "a PCO" will be used. In my opinion, most of these intersections would require between two-three PCOs to safely facilitate the movement of vehicles, bicyclists and pedestrians.

Remember, many attendees may not be familiar with the area. Many events will conclude at night when it is dark. Some people leaving the venue will have consumed alcohol. Existing lighting at some of the critical intersections is not robust. There may be inclement weather. It is likely that with the ongoing construction of other projects that roadway modifications may need to be navigated, which only makes facilitating traffic more difficult. I view the plan as significantly understaffing the traffic control aspect.

According to the plan during overlapping events, due to restricted access on the 3rd Street and 4th Street bridges, it is assumed that no vehicles will travel north on either street during overlapping events. This will be a self-induced "double bottleneck" that will force traffic south and west. The plan calls for "a PCO to be stationed at the intersection of 4th and 16th Streets to "discourage the use of this street except for local access." Good luck with that! 19 [TR-3b] cont.

The intersection would require minimally two and maybe three PCOs to safely facilitate all modes of traffic and respond to inquiries made by individuals on congested days. People will stop and ask PCOs questions. When they do stop or at least slow down, traffic disruption occurs. This is predictable and inevitable to some degree.

The parking lot assessment in section 5.2.3.7 is flawed in my opinion. It claims the 15 off-street parking facilities are located in areas "with easy access from the major street corridors that provide access to the Mission Bay Area." Unfortunately, given the geographical constraints in the area, and the limited points of ingress and egress, everybody that needs to access Mission Bay for any reason will be on the same few roads. There is no such thing as "easy access" in this area today. To claim "easy access to the major street corridors" is a blatant misrepresentation. Existing conditions do not warrant that description. In theory, by looking at a map, one would expect simple access. In practice this is simply not true. 20 [TR-13]

Twice this last week, for example, between 2:00 – 2:30 p.m. I observed northbound 3rd Street backed up (bumper to bumper) from South Street all the way to King Street and beyond. In both instances it took vehicles over 35 minutes to traverse this short distance. Yes, I stayed, watched and timed a truck. Terry Francois Boulevard was no better, being backed up around the bend all the way to Pier 50. It was an absolute mess and the drivers were frustrated. 21 [TR-4]

Oftentimes when the traffic lights at the signalized intersections turned green no more than a dozen or so cars could get through. This is because the signal light cycles are not long enough and may not be synchronized. The "bottleneck upstream" that was causing the congestion clearly wasn't being handled properly. The "bottleneck upstream" in this instance was the temporary closure of King Street between 3rd and 4th Streets. One closure (or other incident that blocks a road) had the cumulative ripple effect of bringing an entire section of town to a virtual grind for a period of hours. I have gone out to this location on five occasions and spent an hour or two watching traffic, watching the efforts of traffic control personnel and have been unimpressed. It's not uncommon for the traffic control staff to simply stand on the sidewalk and watch the gridlock. They only seem to intervene when somebody tries to do something unsafe.

At the intersection of 3rd Street and Townsend I found two PCOs manually overriding the signal in an effort to facilitate traffic flow. Unfortunately, neither was engaging and controlling the pedestrians and bicyclists in the area. At that location, 3rd Street has four lanes of traffic (one way) heading north. There were so many pedestrians in the area crossing the street that vehicles wanting to make left or right hand turns onto Townsend, Brannan or Bryant could not turn and had to wait. This means two of the four lanes did not flow. No efforts were being made to stop all pedestrians, at some point, and allow vehicles to proceed and turn. The City's effort to mitigate this street closure (planned for about a month during weekday hours) is pretty dismal. 21 TR-4 cont.

All it takes is one incident to bottleneck and clog any of these arteries for hours. It is blatantly irresponsible and defies logic to believe that hundreds if not thousands of cars will descend on the Mission Bay, Dogpatch and Potrero areas over 260+ times a year without a level of congestion and disruption

To reiterate, traffic control duties can be quite difficult and require significant resources and constant engagement. Simply standing at a signal light control box and manually controlling the light cycle at signalized intersections is not sufficient to ensure the safe movement of vehicles, bicyclists and pedestrians. Active engagement and proper use of traffic control devices (cones, barricades, signs, flares, reflective sleeves and message boards) is also required.

With respect to the timeframes used to evaluate parking and occupancy rates, the evening hours used in the study were from 7:00 – 8:30 p.m. This timeframe is flawed. I have seen, with the San Francisco Giants games, fans are often arriving very early to the area. In fact, people come several hours early regardless of transportation mode; hang out, walk the waterfront, and frequent local eating establishments. 22 [TR-13]

If this trend holds, the people looking to park in these 15 facilities will be arriving hours before the 7:00 p.m. threshold. Spots will not be available because day workers will not have vacated them yet. These people will circle the area looking for other options or decide to park further away in residential areas.

I do volunteer work several days a week between 3:00 – 4:30 p.m. at Market Street and 2nd Street. I regularly walk to and from this location. I walk along the Embarcadero to Market Street or walk up 2nd, 3rd, or 4th Streets. I return using one of the same four routes. I do this walk between 2:00 – 3:00 p.m. and 4:30 – 5:30 p.m. These frequent walks give me the great opportunity to observe all modes of traffic in the area.

I am amazed at the congestion and traffic gridlock trying to access the Bay Bridge. I also see Giants fans parking in lots and on the streets along the way. Once again, on a normal non-game day, the traffic gridlock on these streets is often remarkable. On 23 [TR-4]

game days it can be worse. I see people in their Giants garb driving, parking and wandering the area hours before the opening pitch. There is no reason to believe Warriors fans and other event attendees will not come to the area hours before an event. When "newbies" to the area discover how bad navigating the City can be they will likely: adjust schedules to arrive even earlier, decide not to come as often or look at public transportation options. 23 [TR-4] cont.

At any rate, limiting the survey hours in the evening from 7:00 – 8:30 p.m. is flawed. The survey should look at parking supply and occupancy rates in the 15 lots beginning as early as 4:30 p.m. and starting no later than 5:30 p.m. to accurately assess parking availability. 24 [TR-13]

The report indicates in section 5.2.3.7 that bicycle conditions were observed to be operating acceptably, with no conflicts, between bicyclists, pedestrians and vehicles. I dispute this. 25 [TR-1]

It is actually fairly common for bicyclists to ride their bikes on the sidewalk northbound on 3rd Street from South Street up to AT&T Park. They choose to do this because the pavement is wide and 3rd Street has no delineated bike lane in the roadway. Apparently, shifting over to Terry Francois Boulevard or 4th Street, which both have established bike lanes is cumbersome.

As I continue to read through the report page by page, I'm amazed at how frequently problem areas are identified.

For example, the report openly acknowledged that many intersections would have significant traffic impacts that would remain "**significant and unavoidable with mitigation,**" under specified scenarios. Accordingly, the report says the City and the project sponsor should work together to seek feasible mitigation measures to reduce transportation impacts.

One strategy being considered is to use additional off-site parking lots south of the project (not within walking distance) and providing a free shuttle service to patrons.

The report says location sites (yet to be identified) that could provide up to 250 parking spaces for events drawing less than 12,500 patrons and up to 1,000 total spaces on days with overlapping events would be used to accomplish this. Working details regarding to this traffic mitigation option have yet to be specified and defined. Unfortunately, no sites have been identified as possibilities to date. There is no guarantee the sponsor and City could negotiate acceptable terms that would be feasible in the long term. 26 [TR-12a]

The report says the sponsor would need to provide, as needed, up to six (6) shuttle trips per hour both before and after the events. There is no mention of the types of shuttles being considered or their capacity. These shuttles would be required to navigate to and from drop-off and pick-up points and be subject to traffic disruptions like other vehicles. If, in the extreme, the maximum 1,000 cars were to use this service it is likely a minimum of 2,000 people (two people per vehicle average) would be shuttled to and from.

Most shuttles (airport rental car and hotel type) probably hold a maximum of 25 people. Doing that math, it could take up to 80 shuttle trips to accommodate the patrons. At six shuttle trips per hour there would be a significant capacity shortfall to move patrons in a timely fashion. Using a lower number of only 500 cars and 1,000 patrons would require up to 40 shuttle trips (given full capacity for each trip) and would also result in capacity shortages, delays and disruptions.

Given the lack of specifics and details about this option, I believe patrons using this mode of transportation will incur significant delays both before and after games.

As the report continues other notable references to traffic problems are aptly addressed. Some of these include:

Page 5.2-178 of the report addresses other factors that affect traffic mitigation efforts. These include physical limitations of the City's street grid and the City's Transit First policies and goals that seek to limit private vehicle usage.

26 [TR-12a] cont.

Page 5.2-182 of the report specifically and clearly states, "for conditions without an overlapping SF Giants evening game, no feasible mitigations are available for the freeway ramp impacts because there is insufficient physical space for additional capacity without redesign of the I-80 and I-280 ramps and mainline structures, and which may require acquisition of additional right-of-way, and other potential measures would not adequately address the short term peak travel patterns associated with special events." Later it states, "Thus, for these reasons, the proposed project's impacts related to freeway ramp operations would be significant and unavoidable with mitigation."

27 [TR-12a]

It would require significantly more time and effort to for me to continue to cite other report sections that highlight problems with the plan and/or point out other deficiencies. I think my efforts thus far have been sufficient to highlight the many problems I see with the plan.

I sincerely hope that you and other members of San Francisco City Government will read the report in its entirety and in detail. If you do, you'll read about many other aspects that the report indicates would be problematic.

Interestingly, I have gone to great lengths to speak with many people who live, work and visit the area. I engaged them in conversation about the current state of life in Mission Bay, the rapid and substantial increase in development, the on-going disruptions

associated with construction, the reliability of public transportation and, of course, their thoughts about the proposed Warriors Arena complex.

These individuals included a broad spectrum of: local delivery drivers, US Postal employees, local technology sector workers, construction workers, employees of Impark, Mission Bay Shuttle employees, UCSF employees, dog walkers, cleaning service workers, San Francisco police officers, San Francisco parking control officers, Muni employees, food delivery services and random visitors to the area as they recreate and enjoy local food establishments.

The overwhelming majority of responses cite great concern about too much growth in Mission Bay. They raised concerns about inadequate public transportation and infrastructure, the immense scope and scale of the arena and all the other developments that are underway or planned. Specific objections usually involved: traffic congestion, noise and nuisance problems and some mention of one of the quality of life issues I referenced earlier.

28 [PD-1]

The City's current infrastructure can't efficiently and effectively handle the large influx of people to an estimated 250+ yearly events in our neighborhood. The police and fire departments did not adequately address relevant issues in their sections of the report. The City's Public Works Department admittedly struggles now to deal with keeping our streets, sidewalks and neighborhoods clean.

29 [PS-1, PS-2]

30 [GEN-6]

Traffic mitigation options that include concepts like private shuttles, identifying and using new parking lots and increasing public transportation services lack details, specificity, funding sources and could take many years to build.

31 [TR-12a]

People living, working or visiting the area would be exposed to a tremendous increase in the number of quality of life incidents and upsurge in crimes. These increases would degrade our personal quality of life. Local residents and local workers often bear the unpleasant burden of over-development, poor infrastructure and the increases in crime, nuisances and disruptions that it brings.

32 [PS-1]

The City may have admirable intentions by implementing a transit first policy. The City cannot, however, impose this policy on the region. There are about 26 different public transportation entities in the Bay Area. Oftentimes, their systems do not operate on schedule and delays occur. Any glitch on one system will negatively affect an individual's ability to make transfers. Until the entire public transportation system in the region is improved and integrated more cohesively, traveling throughout the region by linking multiple systems can be problematic.

33 [TR-5d]

Trying to force a transit first policy on people throughout the region is problematic. To try and impose your will, and policy, on people throughout the region will not be successful. In my view, the City is mistaken if it believes the transit first policy and existing public transportation system will be able to alleviate traffic congestion and disruptions in Mission Bay.

Many patrons attending events at the proposed arena will come from cities throughout the greater Bay Area. Most will want to see events with friends and family. People want to go together so they can socialize, hang out and perhaps dine before or after events. Many people have friends and coworkers that live in different cities, have different work hours and may not have robust public transportation options immediately available to them. In the end, much of what we choose to do or not do really involves details, logistics and convenience. 33 [TR-5d] cont.

So what inevitably happens? Often groups of attendees make a decision to carpool and drive to the event together. This allows them to share costs. They can decide if they want to leave early or stay late without the constraints of an unpredictable transit schedule. They keep their options open. This is modern day life. This is what happens. This is predictable.

Although not related to the arena project, take a look at recent incidents at Dolores Park. Recently, newspaper articles have reported the park has been besieged by people on weekends, vandalized multiple times and is a filthy mess. Garbage has been strewn about and an inadequate number of trash receptacles were installed. Apparently, the City thought if they didn't put a significant number of trash receptacles in the park that park goers would responsibly haul their trash out and pick up their own mess. How did that work out?

The City is also grappling with measures to curb people urinating and defecating on City streets. So far that effort has not been successful. These issues are the types of quality of life issues that are so important to residents.

We need to focus on, and remedy, the current pressing problems that we face before embarking on additional major projects that will only exacerbate the situation.

In summary, I urge you to prohibit the Warriors Arena project in Mission Bay. The area simply cannot handle a project of this magnitude, especially given all the other major developments currently underway or on the drawing board. The over-all negative impact to the local residents, and ultimately the City, is very concerning. There are far too many unknowns, uncertainties and ambiguities in the report. 34 [GEN-5]

Sincerely,

James F. Zboralske

JFZ/et

APPENDIX PH

Public Hearing Transcripts

This appendix contains the complete transcripts of the public hearing on the Draft SEIR held before the OCII Commission on June 30, 2015.

The public hearing transcripts include commenter codes, which designate "PH" followed by the person's last name. The public transcript presents all oral comments chronologically, in the order in which they were presented at the public hearing. **Table PH-1** lists all of the commenters who presented oral comments at the public hearing alphabetically, indicates the corresponding comment code prefix for each commenter, and provides the page numbers of the transcript where their comments are located.

To facilitate the commenter in locating the responses to his or her comments, the SEIR assigns a unique commenter code plus one or more topic code to each individual comment, as explained below. Both the commenter and topic codes are shown in the margin of the transcript, with the unique commenter code shown first and the topic code(s) in square brackets beneath the commenter code. This information shown in the margins of each written comment serves as the cross-reference guide for the commenter and topic codes.

Commenter Codes

This document assigns a code to each person that provided oral comment at the public hearing transcript based on the name of the agency, organization, or individual submitting the comment. Comments submitted by mail, email, facsimile, comment card, or orally at the public hearing (as transcribed in the official public hearing transcript) are all coded and numbered the same way. Each commenter code begins with the individual's last name. The second part of the code is the sequential numbering of individual comments within a letter or email that represents a distinct topic. In the public hearing transcript, the comment codes are shown in the margin alongside the individual bracketed comment. Only substantive comments received on the Draft SEIR are bracketed; for example, oral testimony that describe an agency's or organization's mission or a persons biographical history are not bracketed as comments for the purposes of this document.

As an example of the commenter coding system, the public hearing transcript for Bruce Agid is coded PH-Agid, and the first comment in the letter is coded PH-Agid-1, the second comment from Bruce Agid on a different topic is coded PH-Agid-2, etc.

Topic Codes

The prefixes for the topic codes used in the organization of Chapter 13, Responses to Comments, are shown below:

- General Comments (GEN)
- Environmental Review Process (ERP)
- AB 900 Process (AB)
- Project Description (PD)
- Plans and Policies (PP)
- Impact Overview (IO)
- Land Use (LU)
- Cultural Resources (CULT)
- Transportation and Circulation (TR)
- Noise and Vibration (NOI)
- Air Quality (AQ)
- Greenhouse Gases Emissions (GHG)
- Wind and Shadow (WS)
- Recreation (RE)
- Utilities and Service Systems (UTIL)
- Public Services (PS)
- Biological Resources (BIO)
- Geology (GEO)
- Hydrology and Water Quality (HYDRO)
- Hazards and Hazardous Materials (HAZ)
- Energy Resources (EN)
- Alternatives (ALT)

Within each topic area, similar comments are grouped together, and Chapter 13 provides a comprehensive response to those related comments under one topic code. Topic codes are numbered sequentially using the topic code prefix and sequential numbering for each subtopic. For example, General Comments [GEN] are listed as [GEN-1], [GEN-2], [GEN-3], and so on. Under each topic code in each section of Chapter 13, all of the commenter codes that are addressed under each topic code as a cross-reference. As described above, topic codes are shown in this appendix in the margin of the transcript in square brackets underneath the commenter code.

TUESDAY, JUNE 30, 2015 1:22 P.M.

AGENDA ITEM No. 5(b)

EXECUTIVE ASST. GUERRA: The next order of business is Regular Agenda 5(b), Public Hearing on the Draft Subsequent Environmental Impact Report for the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay South Blocks 29 through 32, Discussion.

Agenda Item 5(b) is a Public Hearing on the Draft Subsequent Environmental Impact Report for the Golden State Warriors Event Center and Mixed-Use Development Project at Mission Bay.

The purpose of this hearing is to receive comments on the adequacy and accuracy of the Draft SEIR in identifying the potential impacts of the project -- proposed project on the environment.

Members of the public wishing to make comments are asked to please limit your oral comments to two minutes and try not to repeat points already made by other speakers. More detailed comments may be submitted

in writing until July 20th, 2015.

Please be advised for safety reasons standing is not allowed due to room capacity. We have open overflow rooms in Room 400, 408, and in the event that fills up, Room 421 will also be available.

Once you have made your public comment, please make your way to the overflow rooms to allow other individuals to make their public comment. Thank you.

Madam Director.

EXECUTIVE DIRECTOR BOHEE: Thank you, Madam Secretary.

Good afternoon, Commissioners and good afternoon to the members of the public. Thank you so very much for joining us.

Commissioners, this is a public hearing. There is no proposed action on the proposed Golden State Warriors mixed-use project. Today, again, the sole purpose is to receive comments on the EIR.

So, with that brief introduction, I'd like Sally Oerth, OCII Deputy Director, to provide context and outline a process and procedures. Then the Commission will receive public comment.

DEPUTY DIRECTOR OERTH: Thank you, Director Bohee.

Good afternoon, Commissioners. Again,

Sally Oerth, Deputy Director.

So, this item before you is to -- is a hearing to receive comments on the Draft Subsequent Environmental Impact Report, or SEIR, for the Golden State Warriors Event Center and Mixed-Use Development at Mission Bay South Blocks 29 to 32.

The Draft SEIR was published on June 10th, and the comment period runs through July 20th, 2015. Written comments may also be sent via E-mail to warriors@sfgov.org or to the Planning Department, which is assisting OCII with the Draft SEIR, and the specific mailing address for submitting written comments to the Planning Department is listed on page 2-9 of the SEIR.

Comments provided will be transcribed and responded to in a Responses to Comment document, which will respond to all verbal and written comments received and make revisions to the Draft SEIR as appropriate.

This is not a hearing to consider approval or disapproval of the project, therefore staff is not here to respond to comments today. That hearing will accompany the final certification of the SEIR later this fall.

Comments today should be directed to the adequacy and accuracy of information contained in the Draft SEIR. Commenters are asked to state their name

and to speak slowly and clearly so that the Court Reporter can produce an accurate transcript.

After hearing comments from the general public, we will also take comments on the Draft SEIR by members of the Commission.

And with that, that concludes my presentation. I'm available for any questions. Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Members of the public, please come to the podium in the following order and state your name for the record: Anna Fernandez, Neal Ushman, Ray Nyden, Esther Stearns, and Matt Prieshoff.

CHAIRPERSON ROSALES: Can you repeat those names?

EXECUTIVE ASST. GUERRA: Esther Sterns, Ray Nyden, Neal Ushman, Anna Fernandez, and Matt Prieshoff.

RAY NYDEN: Hello, Commissioners. My name is Ray Nyden. I have lived in Potrero Hill and South Beach for the past 15 years. I also have two businesses nearby, and I'm a board member for the South Beach Mission Bay Merchants Association.

The Warriors have shown an impressive commitment to collaboration and community input in

PH

planning the arena, in my opinion. They regularly brief community stakeholders, present updates to the Mission Bay Advisory Committee meetings, and gather feedback from small businesses such as myself in the neighborhood.

One of the many reasons I support the project is because it's -- it is so pedestrian friendly. I will be able to actually walk to the arena events from my home, as well as be able to take dogs the new green area that's going to be developed because of this arena.

I also like the fact that they're gonna have year-round retail as well as restaurants for local residents. So, it's going to be a new meeting place and a place for us to enjoy.

Nyden-1 [GEN-5]

With that short set, I would like to just thank you for your time today, and the City, for taking the time to do the Environmental Impact Report. Thank you.

CHAIRPERSON ROSALES: Thank you.

NEAL USHMAN: Good afternoon, Commissioners. My name is Neal Ushman, and I'm a resident of Mission Bay.

I was originally going to address how impressed I have been with the way the Warriors have been working with the community in addressing our

PH

concerns regarding the new arena. At the many community meetings I have attended, concerns by residents were voiced, and potential solutions to these concerns were explained in great detail. However, after reading this morning's Chronicle, I would like to address another topic.

Thus far, the major opposition has come from the Mission Bay Alliance, and while most of the membership is anonymous, none of those publicly-named members even live close to Mission Bay, and as most thinking-people realize, this group is made up of U.C.S.F. donors and biotech executives who are upset that the land is not going to be used for biotech. After all, they know what's best for San Francisco.

Now, the California Nurses Association comes out against the arena with concerns about access to U.C.S.F. Mission Bay. Have any of these representatives attended any of the CAC meetings where these items were discussed? No.

And according to the Chronicle, when asked about the Warriors' plans, all of the speakers admitted they were unfamiliar with the EIR. And while they claim to have no affiliation with the Mission Bay Alliance, their news conference, conveniently timed for coverage on the same day as this meeting, was organized by the same public relations company that represents the Alliance.

I'm an educator, and as I remind my students about the duck test, if it looks like a duck and quacks like a duck, it probably is a duck. I would give much more credence to the nurses' concerns if they were brought up earlier, and even if one the speakers yesterday had taken the time to actually read the relevant sections of the EIR.

As a grandparent, my granddaughter was a patient in the U.C.S.F. neonatal unit at Parnassus. Access and parking at that location was a challenge. I find it difficult to believe that the Nurses Association believes that the City, U.C.S.F., and the Warriors have turned a blind eye to the legitimate traffic concerns surrounding the new arena and have not taken steps to deal with this issue. After all, we are talking about approximately 200 events per year.

Salesforce would have brought in at least that number of people into the area five days a week, 52 weeks a year.

Let's not use traffic concerns that have been or are being addressed as a foil for other people's agendas.

Thank you.

Ushman-1 [GEN-5]

ESTHER STEARNS: Good afternoon. My name is Esther Sterns. I am a resident of Mission Bay, where I've been a homeowner since 2010.

I'm very excited about the arena's bike and pedestrian access, which I hope will really encourage people to get out of their cars and walk more in our neighborhood, which is something I would like to see.

My wife and I are raising three teenage children in Mission Bay. Until recently, I think they were the only teenagers in Mission Bay. But -- so, when we moved to Mission Bay, when we crossed the creek and moved South, we knew there would be more development, more traffic, more density. And so, we're not surprised that there's new development on this lot. We don't expect there to be empty lots anyplace in a valuable part of San Francisco.

We think the arena is an unexpected bonus for our neighborhood, with the bike paths, with the new parks, with the holiday ice arena as a possibility. All of these things are things that we think enhance our neighborhood for families in a way that few alternatives really could achieve.

So, in that sense, we are excited about the arena. Of course, we support the Warriors, but we're also excited about what the arena can mean for our

Stearns-1 [GEN-6]

neighborhood, and particularly, children in our neighborhood. And there are now 250 new children in our neighborhood. We're very excited for them to have access to all of this.

So, that's the basis for our support. I thank you for your attention today, and I hope you'll take into consideration these neighborhood needs as you make your decision.

Thank you.

Stearns-1 [GEN-5] cont.

CHAIRPERSON ROSALES: Thank you.

MATT PRIESHOFF: Good afternoon. My name is Matt Prieshoff. I'm the chief operating officer for Live Nation in the State of California.

As many of you know, Live Nation is one of the world's largest entertainment companies, putting concerts on all across the world.

We're strong supporters of the proposed arena in the Mission Bay area, in large part because there's no major arena in San Francisco, and this great city deserves a great arena, and we know the Warriors have planned for one.

As San Francisco's first ever multipurpose arena, the Warriors will attract people from around the Bay Area, from around the state, and around the world for major events.

Prieshoff-1 [GEN-5]

As a city, we should be pushing transit first, and we believe that the Warriors EIR plan does that. We believe that this is a transit-rich area and -- that they've done a phenomenal job studying all the potential parking areas around the arena as well.

Prieshoff-2 [TR-3a]

We want to go on record to you to voice our enthusiastic support of this arena plan, and we hope you will consider our recommendation throughout this process.

Prieshoff-3 [GEN-5]

Thank you very much.

EXECUTIVE ASST. GUERRA: Anna Fernandez, Alyssa Kies, Alejandro Madi, Alex -- and I'll spell the last name -- it's D-O-N-I-A-C-H -- Damion Scott, Andrew Battàt, please come to the podium.

ALYSSA KIES: My name is as Alyssa Kies, and I'm here representing SPUR.

We've been involved with planning in Mission Bay for many decades, and while we understand that the idea of putting an arena in Mission Bay is a change, we think it's going to be very positive overall for the neighborhood. It's how cities work.

Over the years, different people bring you ideas, and places evolve through the layering process of each generation contributing something different. It's going to make Mission Bay a more interesting place than

Kies-1 [GEN-5]

have it all being one thing.

And on the issue involving transportation impacts, we believe the Warriors are doing pretty much everything we could hope for. Between the transit investments, the existing transit infrastructure, and the fact that some people will be able to walk from Caltrans or from their neighborhood, the impacts are going to be manageable. The City is making the proper investments in transportation infrastructure to support the project.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

ANNA FERNANDEZ: Good afternoon. My name is Anna Fernandez, and I work at the Pediatric Emergency Department in Mission Bay.

I care for very sick children who need continual monitoring and devoted, hands-on care. I am here today to convey my concerns and the concerns of my colleagues, the 3,000 registered nurses represented by the California Nurses Association at U.C.S.F., including the 900 registered nurses who work at U.C.S.F. Mission Bay.

We are not here today to protest the Golden State Warriors. We are here today for one reason: To advocate for our patients and their family members.

Kies-1 [GEN-5] cont.

Kies-2 [TR-3a]

As you know, the area around the hospital and clinic facilities at Mission Bay is almost like a small island unto itself, with a very narrow corridor between the Bay and the highways. It is an increasingly dense community with little public transportation that can become easily congested.

A major additional project such as this will undoubtedly increase congestion during the events it is intended to house. We know that the games or other special events -- in those narrow corridors, the traffic can result in gridlock and can limit access for everyone, and that is our major concern.

What will the City do to ensure the patients who need the highly specialized care that we provide, and other patients coming to Mission Bay -- will they have access in a timely manner when they need it -- 24 hours a day, every day of the year, including during games, concerts, or other special events?

What will the City do to ensure the parents of the children I care for and members of other patients -- will they be able to get to the hospital to be by the side of the -- of their loved ones?

What will the City do to ensure that nurses like myself and doctors and other healthcare professionals and personnel will be able to get to the

Fernandez-1 [TR-4]

PH

hospital and clinics at Mission Bay to care for our patients?

In a small, densely-packed city such as ours, congestion that affects public health and safety must always be addressed, and the needs of the whole community, not just the wealthy developers, must always be addressed.

Fernandez-1 [TR-4] cont.

Many of us raised similar concerns during the review process for the California Pacific Medical Center facility --

CHAIRPERSON ROSALES: I'm sorry, but your two minutes is up.

ANNA FERNANDEZ: Thank you for your time.

CHAIRPERSON ROSALES: Thank you.

ALEJANDRO MADI: Hello. My name is Alejandro Madi, and I'm a research analyst for Unite Here Local 2. We are the union that represents more than 14,000 hotel and food workers in San Francisco.

I'm here today to express our union's strong support for the Warriors project. From the prospective of creating good, quality, working-class jobs, the proposed arena is probably the most important development we have seen in San Francisco in the last 15 years.

At a time when working-class families are

Madi-1 [GEN-5]

19

PH

being squeezed out of our City through a combination of stagnant incomes and rising rents, we should be doing everything we can to promote projects like this one.

As you may know, our union represents 800 concession workers at the AT&T park. While we struggle hard to raise wages and benefits at the ballpark, those remain very part-time jobs because of the nature of the baseball season.

The prospect of a basketball and event center close by holds out the possibility that food service workers could string jobs at these facilities together to something that gives them a real pathway to middle-class jobs. That would be a game changer for food service workers in San Francisco.

The Warriors reached out to our union early on to ensure that workers who currently staff their concessions are guaranteed a place at the new arena, and that the addition of positions created here will be the kind of jobs that raise the bar in San Francisco. That's exactly the kind of development that our City should be investing in.

Madi-1 [GEN-5] cont.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the next person please come up?

20

ALEX DONIACH: Good afternoon. Thank you. My name is Alex Doniach, and I am speaking on behalf of the Mission Bay Alliance, the coalition of U.C.S.F. staff, stakeholders, and residents concerned about the proposed stadium in Mission Bay.

Doniach-1 [ERP-9]

Since we've launched our efforts, we've been out talking to employees and residents in the Mission Bay neighborhood. We've heard from hundreds, if not thousands, of people who are concerned about this project and its significant impacts on traffic, parking, access, and quality of life in Mission Bay.

Doniach-2 [GEN-5]

We've also launched a petition, calling for the City to reject this project. In the past few weeks alone, we've collected more than 4,600 signatures from residents, U.C.S.F. healthcare workers, employees, and neighbors who are concerned about the impact of this 18,500-seat arena.

Doniach-3 [ERP-9]

I am submitting that petition today. We have received letters, too, which we're also submitting, from neighbors who are concerned about the impacts of this project on parking, access to hospitals, traffic, and air quality --

Doniach-4 [ALT-4]

letters that ask the City of San Francisco to consider alternative sites other than Mission Bay for this environmentally-damaging project.

Doniach-5 [ERP-9]

Just yesterday, the California Nurses

Doniach-5 [ERP-9] cont.

Association expressed their concerns about this project. In the weeks and months to come, more people will be joining the growing numbers who are coming to understand just how bad this will be for the neighborhood, U.C.S.F. access to emergency care, and traffic throughout the entire east side of the City.

We hope you'll take these residents and their strong opinions into consideration when reviewing this project.

Thank you.

EXECUTIVE ASST. GUERRA: Please come to the podium.

DAMION SCOTT: Good afternoon. Thank you very much for this opportunity. I am speaking on behalf of Allison Heath, who could not make it here today.

She writes:

Scott-1 [ERP-9]

"I have serious concerns regarding the environmental impacts of the proposed Warriors arena which are not fully disclosed or fully analyzed in the Draft EIR.

"The Draft EIR shows that the project would cause severe traffic gridlock, noise, and air pollution in Mission Bay, right next to the U.C.S.F. and other medical

Scott-2 [LU-2]

facilities, yet the Draft EIR does not even discuss the land-use impacts of the project. They were not analyzed in the mission of the planned EIR.

"Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements proposed by the City, Mission Bay cannot handle up to 18,500 fans and 225 events per year, especially when both stadiums have games.

"While restricting the number of parking spaces may be considered a means of traffic management under the City's regulation, the practical effects will be yet more gridlocked and unhealthy air emissions, and traffic and parking impacts will reduce access for emergency and urgent care for patients and add to the existing commute challenges for the nurses, doctors, and medical staffs who work at the Mission Bay medical campus.

"The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities.

"Increased car and truck emissions in

Scott-2 [LU-2] cont.

Scott-3 [TR-4]

Scott-4 [AQ-4b]

Scott-5 [TR-9]

Scott-6 [AQ-4b]

the area will be unhealthy for residents, workers, and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents.

"Overall, we are disappointed with the City's approach to the environmental review of the project, which fails to fully access the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR.

"Thus, we ask the City of San Francisco, avoid the disastrous impacts of the proposed entertainment center at the Mission Bay community, including the health and welfare of patients, families, employees and neighbors."

Thank you very much.

EXECUTIVE ASST. GUERRA: Sir, would you please state your name?

DAMION SCOTT: Oh, I'm sorry. My name is Damion Scott.

EXECUTIVE ASST. GUERRA: Would the following people please come to the podium: Blaise Gisslow, Annabel Ortiz, Vanessa Aquino, Curt Yagi, Alex -- and I'll spell the last name -- it's G-A-N-O-W-S-I-H-I.

Scott-6 [AQ-4b] cont.

Scott-7 [IO-2]

I-Scott-8 [GEN-5]

PH

ANDREW BATTÀT: Hello. My name is Andrew Battàt, and I'll be reading a letter on behalf of J. Huerta (phonetic), who was not able to attend this meeting.

"I am very concerned about the negative impact of traffic and parking in the neighborhood by the proposed stadium at 3rd and 16th Streets.

"Currently, when there is an event at the Giants Stadium, my commute to the Financial District is doubled, be it by car, T-train, or bicycle, due to the influx of people to the neighborhood. Furthermore, parking in the neighborhood is filled with fans, and makes it difficult for residents returning from work.

"While I appreciate these fans supporting our local Giants, I do not appreciate the out-of-town, In-N-Out Burger trash, nor the empty containers left in the streets. This speaks to the way that crowds rush into the games and are often not supporting the local" -- excuse me -- "and how the crowds are not supporting the local community since the games are already so

Battat-1 [TR-4]

Battat-2 [GEN-2]

25

PH

expensive.

"Adding basketball season to the event calendar for this neighborhood will definitely have a negative impact on the traffic and parking in the surrounding neighborhoods, and residents will be hurt, along with business development and growth.

"I am in favor of neighborhood growth, but unfortunately, I think this stadium will only profit the developer, and I would rather have long-term business growth that this neighborhood is already invested in."

Thank you again. That was J. Huerta, a San Francisco resident.

CHAIRPERSON ROSALES: Thank you.

BLAISE GISSLOW: Thank you to the board for putting on this meeting. I'm very happy to have an opportunity to voice my opinion.

My name is Blaise Gisslow. I'm a concerned citizen of San Francisco, and I'm pretty familiar with the EIR. And I know we've all heard a lot of statistics about parking and stuff, so I'm going to start with a quote I read from an SF Gate article. The quote was from a City official. It said:

"Will there be traffic?"

Battat-2 [GEN-2] cont.

Battat-3 [GEN-5]

Gisslow-1 [TR-5a]

26

PH

"Yes."

"Will we be able to handle it?"

"Yes."

Well, I look around the City, and I don't think it's been handled at all. I don't see the credibility in an official who says they know how to handle traffic in a city that's been overrun with traffic for years now.

Gisslow-1 [TR-5a] cont.

A problem, I think, with the EIR and the public's opinion is, people are very uninformed about what's actually going on with the costs going into this arena.

Yes, the arena is publicly -- I mean, privately financed, but one thing they haven't talked about is the resulting public transportation improvements that will come along with this project.

So, Caltrans had a proposed and approved line going through King Station, but the Mayor wants to change that line going to the new arena he's proposing, and that would cost $2.5 billion.

That is not privately funded. That would be taxpayer money. And I think that's a huge problem that's not addressed in the EIR. That's a huge amount of money not accounted for, let alone the $40 million of proposed improvements to the public transportation, as

Gisslow-2 [GEN-1b]

27

PH

well as $6.6 million in annual upkeep fees to the public transportation.

These are all costs that are not addressed at all in the EIR. These are all under the radar that no one talks about or knows about, and I think that's a huge problem with this project.

Gisslow-2 [GEN-1b] cont.

Thank you.

CHAIRPERSON ROSALES: Thank you.

VANESSA AQUINO: Good afternoon, Commissioners. My name is Vanessa Aquino. I'm a native San Franciscan and have lived in Dogpatch for almost 12 years. I'm also on the board of the neighborhood Dogpatch Association, and I have witnessed firsthand how our community has grown and changed a lot.

I proudly support the Warriors mixed-used development, because it will serve as a community hub for performing arts, retail space, restaurants, and a wide range of community events, and the Warriors have outreached to us and communicate within our community.

Aquino-1 [GEN-5]

Even better, the Warriors are privately financing it with no money coming from the City or the public, and no new taxes would be involved.

This is a huge win for our community and for all of San Francisco. Having the Warriors in our neighborhood and community will create and bring new

28

PH

needed businesses within Mission Bay, Dogpatch, and beyond, which would be Bayview, for me speaking.

Thank you for your time, and I hope you will take my support in consideration. Have a good afternoon.

CHAIRPERSON ROSALES: Thank you.

ANNABEL ORTIZ: Hi. Good afternoon. My name is Annabel Ortiz, and I am here to talk about the opposition, because we do not want the stadium to be built at the Mission Bay.

So, over the past two weeks, I have been canvassing the Mission Bay area, and I've been speaking with residents and employees, and I've been speaking to the relatives who are visiting patients at the hospital, and I've been asking them, What are your views on building the stadium in such a closed unit?

And overwhelmingly, the response that I received frequently was, Do not build it. I do not want the stadium here. We do not need the traffic. We do not have enough parking.

Ortiz-1 [GEN-5]

Again, you know, the BART station doesn't go in that direction, so more people are going to be driving in. So, number one, the concern is to definitely avoid the traffic congestion.

One employee said that when he's driving out

Ortiz-2 [TR-4]

PH

of the parking area to go home, and if there's a Giant's game, it takes him about 30 minutes just to drive one block, and it takes about two hours or two-and-a-half hours just to get out of the area and to catch the freeway. So, in thinking about that, the infrastructure is not suited for a stadium. It's not suited to bring 18,000 fans into this area.

Ortiz-2 [TR-4] cont.

A nurse also mentioned her concerns, which are, How are the emergency vehicles going to access? How can they come in and out of the area?

Well, there's really no plan, and if there is, it hasn't been communicated, and that's a problem.

Ortiz-3 [TR-9]

And, lastly, I want to just leave you with a question about, What would responsible development look like in San Francisco?

You know, it's not just a problem with the stadium, but in San Francisco in general. What does that really look like for the council members? And, you know, we can't deny that traffic is a problem in the quality of life for all of San Francisco.

Ortiz-4 [GEN-2]

Thank you.

CHAIRPERSON ROSALES: Thank you.

CURT YAGI: Hello, Commissioners. My name is Curt Yagi. I'm the executive director of ROCK, Real Options For City Kids. We're a non-profit in

San Francisco's Visitacion Valley for over 28 years, serving children and youth there. I'm also a long-term Potrero Hill resident.

I'm a big supporter of the Warriors and their move to Mission Bay. I know the team and the City have worked really hard to take feedback from the community, address their needs, and put this into a plan. I think this is great for that community.

Yagi-1 [GEN-5]

In addition, through my work at ROCK -- we have been working with them in partnership for well over about 10 years, probably even longer -- they're the one rare sports team in the Bay Area that really takes to heart what they want to do, gives back to the community, like organizations like us, does a host of things without the need for -- and expectations for PR. They're doing it for the right reasons.

I have no doubt they're going to look out for the community organizations such as ours, as well as the general community.

Thank you.

CHAIRPERSON ROSALES: Thank you.

ALEXANDER GRANOWSKI: Good afternoon. My name is Alexander Granowski. I'll be speaking on behalf of Harold M. Hoogasian, who could not make it today.

"Although I support the quest for an

Granowski-1 [TR-13]

event arena that might serve as the Warriors' home in San Francisco, the site proposed to cross the U.C.S.F. Mission Bay is not appropriate.

"The lack of parking, coupled with the proximity to both the Medical Center and AT&T park is a recipe for congestion and a potential disturbance for the quiet care of patients at the Medical Center.

Granowski-1 [TR-13] cont.

"I understand there's an alternative site available for consideration which has comparable transportation infrastructure support and is removed by some distance from the Medical Center and the ballpark."

Thank you for your time.

Granowski-2 [ALT-4]

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come up: Sebastian Conn, Kevin Carroll, Scott Van Horn, Pat Valentino, and Esther Stearns.

SEBASTIAN CONN: Good afternoon, Commissioners and Madame Chairman. My name is Sebastian Conn, and I'm here to speak in support of the project.

I'm a student here in San Francisco, and like so many San Franciscans, I rely on riding my bicycle everywhere.

Conn-1 [GEN-5]

I'm excited for the Warriors to move to Mission Bay, because I think this venue will have tremendous bicycle access, with the abundant bike parking as outlined in the EIR.

It has over 300 valet spots, over 100 secure bike parking spots in the office buildings, and dozens more around the site. Plus, this project will bring new bike lines on Terry Francois and 16th Street, making it simple and safe to get to.

Thank you for your time.

Conn-1 [GEN-5] cont.

CHAIRPERSON ROSALES: Thank you.

SCOTT VAN HORN: Hi. I'm Scott Van Horn. Thank you for the opportunity to have me speak today on the Draft EIR.

I live in Dogpatch, just a couple of blocks from the site. I'm actually one of the very few that is going to get my view of the Bay Bridge blocked from my apartment by the project, however I'm not a NIMBY.

As others have talked about this document, this document is incredibly thorough, and I applaud the City for looking at all the issues so carefully and demonstrating attention to the impacts to my neighborhood.

I'm especially pleased about the new businesses and parks that will go in within walking

VanHorn-1 [GEN-5]

distance.

As you know, the Warriors and the City have been working very closely with neighbors like myself, listening to our feedback and incorporating the community suggestions into their plan. As a result, they've come up with a project that perfectly fits into the Mission Bay, Dogpatch, and other surrounding communities.

Most of the neighbors that I've talked about [sic] are extremely excited about it. I'd like to go on record that I am personally in support of the new arena.

VanHorn-1 [GEN-5] cont.

Thank you.

EXECUTIVE ASST. GUERRA: Cathy Searby, Ace Washington, D.J. Brookter, and Nick Belloini, please come to the podium.

PATRICK VALENTINO: Good afternoon. My name is Patrick Valentino. I'm the vice president of the South Beach Mission Bay Merchants Association. I also live in the neighborhood, close to where the new event center will be.

I've taken some time to look at the Traffic Management Plan and the Draft EIR, and a couple of things, I think, are very important to point out.

Number one, if you start to compare traffic management plans of arenas that have been constructed in

Valentino-1 [TR-3a]

the recent decade, you'd see that this is probably one of the most in-depth and forward-looking plans, moving to a transit-first plan, as opposed to prioritizing the automobile, which I think is extremely important. This one talks about having the most bike parking spaces that we'll ever see for an arena.

Also, in discussions, as I understand it from attending a lot of the public meetings, is that there's talk about having direct right-of-way for hospital workers and emergency vehicles. And I think that's extremely important to consider.

It is not the case that the hospital and the emergency issues have been taken off the table. That is very much part of the discussions, and we should pay deference to that.

Valentino-1 [TR-3a] cont.

As far as quality of life goes, you know, we're evolving and finding out that cities are some of the greenest places that we can be, and this is where we have a chance to put housing next to work, next to play.

And the event center is a sense of place that can happen in Mission Bay. It can create a very new and exciting place for us that is environmentally very aware and sensitive to our surroundings.

It's going to be a LEED gold-certified construction -- that's significantly important -- with

Valentino-2 [PD-4]

offers to mitigate 100 percent of any greenhouse gas emissions.

Valentino-2 [PD-4] cont.

Again, we shouldn't look through the lense of the automobile and what might have been construction in the 1950's, but look forward to what we're doing today.

I very much support this project, and so does our association.

Valentino-3 [GEN-5]

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

CATHY SEARBY: Thank you, Commissioners. My name is Cathy Searby, and I live in Mission Bay with my husband and daughter, and I live next door to the proposed arena site.

We're very excited as a family, not only to watch the championship Warriors basketball team in the arena, but we feel strongly that San Francisco needs this entertainment destination, with the family shows such as "Disney on Ice," the Globetrotters, and concerts we can attend together.

I'm also excited about the waterfront park as there's nothing like this currently in the south neighborhoods, and it provides a place for kids and families to enjoy the beautiful views, have fun in a safe environment.

The Warriors and the City have gone through

Searby-1 [GEN-5]

thorough analysis of the project, including extensive meetings -- the Mission Bay CAC, U.C.S.F., and our neighborhood -- to address our concerns. They have made good progress with all of us, especially U.C.S.F., in coordinating their respective operations so both can function productively in our neighborhood.

As a result, the Warriors team have come up with a project that fits well in the community and that we, as neighbors, are very excited about, if you would put us down for three.

Searby-1 [GEN-5] cont.

Thank you.

CHAIRPERSON ROSALES: Thank you.

D.J. BROOKTER: Good afternoon, Commissioners, Madam Chair, Director Bohee. My name is D.J. Brookter, and I'm the president of Bayview-Hunters Point, and I'm also the deputy director of Young Community Developers, which is in Bayview-Hunters Point, and I'm here to express my strong support for the Warriors and the arena at Mission Bay.

Pat actually stated -- I was extremely impressed on how green the project itself is based off the EIR. The arena emission rate will be LEED gold certified and will truly set a standard for sustainable building design, I think, here in the City.

And the Warriors are more than just a

Brookter-1 [GEN-5]

PH

basketball team, as we've seen, especially with the championship that we just had. And what the team will actually do is be a partner in the community.

I know just that Young Community Developers alone, within the past two seasons, we've been able to employ well over 200 individuals from Bayview-Hunters Point that we actually transported from Bayview-Hunters Point to Oakland to work in the arena. So, just imagine how many more folks, from an economic standpoint, that will be able to work once those guys are here in Mission Bay.

Brookter-1 [GEN-5] cont.

I just want to thank you all for the opportunity to speak on behalf of the EIR and for your time today in my support for the Warriors stadium.

Thank you.

ACE WASHINGTON: Good afternoon.

I apologize to the younger generation in the back here, but, you know, this is what happens down here at City Hall. I mean, this is something light.

But let me just go on. Ace on the Case. Who is gonna replace Ace is the Case, Community Assistance Service Enterprise?

See, what we do is analyze things -- think about the theme, the scheme, and the team. We analyze the team, find out what the scheme is, and we come back and analyze it.

Think about it, ladies and gentlemen. I'm not new to this; I'm true to this. Okay.

Let me just also go on and say, I don't need the permission, because I'm on a mission. You know, I've been doing this for 25 years, youngsters back there, so you all need to take note. My name is Ace, and I'll give you my numbers later.

But right now, let's talk about the players we've got here. The players. This is all about dollar bills. You know, you talk about the EIR. This is about dollar bills.

Right here. Let's talk about the players, the bases. Let's talk about who is representing who. One side is an ex-member of the Mayor's, and then you got a next side that's a -- what -- he's a community or -- he works for consultants for the big Lennar out there. So, you've got big two big consultants. We're talking about money now. We don't mention that in the EIR, but I'm here to tell you, that A-C-E has been studying it.

So, we're going got put all these things together and we're gonna up with a solution, Mr. Warrior. It's called "community reform," to get -- you know, flip-flop and drop all this other stuff.

We, as community people, must be involved with

Washington-1 [GEN-6]

the growth of this city for the next 10 years for the generation in the back. So, therefore, I've got a method to all this pollution.

You need to have some kind of conversations about how we're going to put things together. And the only way to do that is you've got to collectively deal with our legislators out here, with our supervisors -- London Breed and Cohen.

Washington-1 [GEN-6] cont.

That's the only way, youngsters in the back, we're gonna change, so you, in 10 years, will be able to have some part of it.

My name is Ace, and I'm on the case.

Also, about the Warriors down at Mission Bay, my request is a simple one: For the blacks to note that we were part of the Mission Bay through Jim Jefferson.

My name is Ace, and I'm on the case.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: John Caine, Jon Ballesteros, Dianne Hartnett, and Kim Kobasil [sic], please come to the podium.

KIM KOBASIC: Good afternoon, Commissioners. My name is Kim Kobasic. I am a Potrero Hill resident and small business owner in the South Beach.

I'm also the copresident of the South Beach Mission Bay Business Association, and I am here to

Kobasic-1 [GEN-5]

PH

express my support for the Warrior's arena in Mission Bay.

After taking some time to review the EIR, I am excited about the open pedestrian accessibility in the arena. The walk is going to be flat. It's going to be easy and beautiful along the waterfront.

The venue's proximity to public transportation means that anyone who lives near BART, Muni, or a Caltrain line can walk to a stop or station and arrive at the arena's doorstep within minutes.

The new arena also triggers the construction of the new bayfront park, which will make Mission Bay more hospitable for runners, families, and allow people to enjoy the waterfront. Right now, that is not currently possible.

Kobasic-1 [GEN-5] cont.

Thank you for your time today, and I hope you will take my feedback into consideration.

TIM PAULSON: Commissioners, good afternoon. my name is Tim Paulson.

I'm the executive director of the San Francisco Labor Council. We represent over 100 unions here in town, many of members who do live in the District 10 and 6 in the areas that have been revitalized over the last 30 years.

I can remember when there was an old shipyard

PH

out there -- I should say an old train station -- out in that area, and there were many different plans that were put together to build a hospital, build new businesses and parks. There's so many different, exciting things that are going there. And I've been on record as saying that the Labor Council supports this arena to come to San Francisco.

The first thing that the Warriors did -- one of the first things they did when they first announced their intentions to come to San Francisco is to call the Labor Council, and there have been many, many meetings and discussions with the unions here in town, and that's where we moved.

And I'll tell you, even last night when I was coming back on the plane from New York City and I noticed that the California Nurses Association, which is a very wonderful union that's part of our Labor Council -- even before I saw that they had a press conference yesterday, there still were concerns that people had about traffic mitigation next to a hospital.

And we take that very seriously, and we take the nurses very seriously. But I've been assured by the Warriors and the City as we go through this ongoing process that those mitigations will take place.

Paulson-1 [GEN-5]

Again, this is an evolving neighborhood, and it's a wonderful neighborhood, and it's exciting that the Warriors are coming here, and I think that we will get to the right place at the right time to make sure that this happens.

Paulson-1 [GEN-5] cont.

Thank you very much.

JOHN CAINE: Hello, Commissioners. My name is John Caine, and I'm a small business owner in Mission Bay and in South Beach.

I support the Warriors arena project in San Francisco, knowing that it will have a positive impact on our Mission Bay Community. I've reviewed the arena plan, and what really stands out to me is the steps that the architects have taken to minimize the impact that this project has on our environment.

Caine-1 [GEN-5]

Thank you for the opportunity to weigh in today.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Please come to the podium: Paul -- and I'll spell the last name -- it's O-B-I-D-S-M-O-N; Stefano -- and I'll spell the last name -- C-A-S-S-O-L-A-T-O; Ben Bleiman. Please come to the podium, Adam Gould and Curt Yagi.

JON BALLESTEROS: Good afternoon, Commissioners. Jon Ballesteros, San Francisco Travel Association, and I'm here today to express our strong

Ballasteros-1 [GEN-5]

43

support for the Warriors arena in Mission Bay.

Throughout the EIR process, the City has done a thorough analysis of the project and every conceivable impact it could have on the city. The team has been above board and maintained complete transparency in their plans since they've been talking about this project many, many years ago.

We have confidence in the City's assessment that traffic be manageable, and we believe that the benefits of having a multipurpose arena that will serve all of San Francisco will far outweigh any potential impacts.

Ballasteros-1 [GEN-5] cont.

So, with that, I want to thank you for opportunity to weigh in today.

DIANNE HARTNETT: Thank you for your time. I'm Dianne Hartnett, and I'm here because I'm a real estate professional that's been working in the South Beach Mission Bay area since 1989.

I have been specializing in South Beach Mission Bay since 2005. I have worked with hundreds of people renting, purchasing, developing in the area, and I am here to support the progress.

I know change is difficult, and I believe, witnessing, attending meetings, talking to people that I have worked with, for the most part they're supportive

Hartnett-1 [GEN-5]

44

of a responsible vote.

There is no place in the City that does not have a traffic headache at this moment in time, that I, too, have witnessed. I, too, live in a neighborhood with retail. That comes with some pros and cons, but the majority of the people with this vision for this neighborhood moved here knowing this change was inevitable. And I think that the outcome, if people will collaborate, could be very, very positive for the entire City, not just Mission Bay.

Hartnett-1 [GEN-5] cont.

We thank you for taking so much time to really thoughtfully think and listen to everybody and all their opinions.

Thank you.

CHAIRPERSON ROSALES: Thank you.

STEFANO CASSOLATO: Good afternoon, Commission. My name is Stefano Cassolato. I'm a registered lobbyist in the City, but I'm here on a pro-bono basis.

I'm coming as a long-term resident. I'm 50 years old, and I was 10 years old when the Warriors won the championship. That really made me happy as a young child and really got me interested in the Warriors. And I'm 50 now, and I'm still very excited about what they brought to the Bay Area.

I would like to say this: When the Giants came, you know, to talk about putting a stadium on the water, there was opposition. There was many of the same opposing dis- -- opposing arguments that we're hearing today. However, this is a very thorough group, project sponsor, from the top down -- Mr. Wells, Lacob, Gruber. They pay attention to detail. They dot their I's. They cross their T's. They hire very, very skilled people, and they're very well prepared.

This City is going to have something that they've needed desperately for years. We have a big venue, we have many small venues, but we don't have a an arena. If we want to call ourselves a world-class city, we're going to need a venue that they're proposing today. More than just basketball. Concerts. Events.

I remember, in 2001, I worked with Bob Arum of Top Rank to bring Mayweather-Chavez before Mayweather was money. And we had that event at the Civic. And I remember how important that was. We can attract more venues like this.

This EIR is very thorough, well thought out, and this arena will be nestled in Mission Bay, which many people will embrace.

Cassolato-1 [GEN-5]

I think what's going to happen here is, we're going to make sure that all the steps are taken so that

PH

all these concerns are addressed.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come to the podium: Kevin Carroll, Cathy Searby, Andrew Goldstein [sic], and Nick Belloini.

BENJAMIN BLEIMAN: Hello, Commissioners. Thank you from having me. My name is Benjamin Bleiman.

I am the founder and owner of Tonic Nightlife Group, which has seven bars in San Francisco, as well as an event company. We employ over 75 people.

I'm also the founder and manager of the San Francisco Bar Owner Alliance. We have 220 elite bar owners in that group.

I'm also the chairman of the board of the California Music and Culture Association, which is the trade group called CMAC for short, that represents bars, nightclubs, music festivals, and music venues in San Francisco.

I want to talk today about the impact that this stadium, this arena, will have on San Francisco's nightlife.

It is -- all those groups that I spoke of, it's our job to support vibrant, world-class nightlife in San Francisco, and we feel that this arena will

Bleiman-1
[GEN-5]

47

PH

contribute in a very meaningful way to bringing San Francisco up to a world-class city in terms of nightlife, not just from the events that will be there, from sporting events to A-list concerts and music events such as the Red Hot Chili Peppers or Beyoncé, which now have a chance of actually playing in our city, but also in all the people that it'll draw from the outside areas, who will then stay in the city, some of them, and go in the City and spend their time and their money and their joyous smiles at our nightlife venues. So, we're very excited about that.

They've outlined the existing parking near the venue and the extensive of public transportation that will serve the site, and the traffic management plan that I've looked at is very thoughtful and thoroughly done, and it gives us no reason for concern.

So, we want to go on record to support the arena in the strongest possible terms.

Bleiman-1
[GEN-5]
cont.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

NICK BELLOINI: Good afternoon, Commissioners. My name is Nick Belloini. I'm going to weigh in on this proposal.

I think that's it's a wonderful idea to have an arena here in the San Francisco. The area has gone

Belloini-1
[GEN-5]

48

through an extensive EIR early on, when it became the Mission Bay.

I remember hearing my dad's stories -- who used to be a part of customs, going through the warehouses that used to be there. And, trust me, there's some things you never want to hear that happened down that way.

But the issue is, it had that EIR that made it the great possible [sic] that it is now. And now we're doing a second EIR that is turning into making it so that the Warriors can have the arena here, which is a true gem for San Francisco.

It will complement the hospital, it will complement everything there, and it will be a great thing for San Francisco. So, I fully want to say I support this project and I support the arena with all of my existence.

Belloini-1 [GEN-5] cont.

Thanks, guys.

EXECUTIVE ASST. GUERRA: Please come to the podium: Sheryl Davis; Henry -- and I'll spell the last name -- it's K-A-R-H-O-L-O-W-I-T-Z [sic]; Jim Lazarus; Abe Evans, and Elizabeth Kirk.

ADAM GREENSTEIN: Good afternoon, Commissioners. My name is Adam Greenstein, and I'm a resident of San Francisco and business owner, and I'm

Greenstein-1 [GEN-5]

here to support the Warriors arena in Mission Bay.

Greenstein-1 [GEN-5] cont.

I reviewed the plans, and what really stands out to me is the steps that the architects have taken to minimize the impact this project has on our environment.

They made a promise to offset 100 percent of the arena's greenhouse gas emissions by paying to the state's Carl Moyer program, which funds the upgrade of vehicles such as dirty school buses, in terms of getting clean, fuel-burning buses. This focus on climate-change mitigation is the future of responsible building, and I'm proud that the Golden State Warriors are leading the way.

Greenstein-2 [AB-1, GHG-2]

I'd also like to point out there were similar concerns when the San Francisco Giants built their stadium, but I've witnessed how that stadium has revitalized the SOMA area. And as a future homeowner in Mission Bay, because I plan to buy a place this year, I'd like to see that same transformation happen in Mission Bay.

Greenstein-3 [GEN-5]

Thank you very much for your time.

CHAIRPERSON ROSALES: Thank you.

KEVIN CARROLL: Good afternoon, Commissioners. My name is Kevin Carroll. I'm the executive director of the Hotel Council of San Francisco.

I have the pleasure of working for an industry that employs 24,000 people, the majority of whom live and work it San Francisco. And I'm here to fully support the Warriors arena in Mission Bay.

We do believe that by having the arena there, we will continue to attract more events and other activities to the City that will help not only those who are participating in the events, but those who are working in industries like the hotel industry that will get extra hours and be able to work to be able to support the events as well.

Carroll-1
[GEN-5]

The public space that's part of it, I know, is equivalent to the size of Union Square, and it's something that's adding public space to the project. And working with the project as well as it's done is something that would be important to both us and to our hotel guests as well.

Guests who stay at our hotels spend more money outside our hotels as they do inside. So, if we can attract more people to come in for the events that are part of the arena, they'll spend more money, which will benefit all those who not only work in the hotels, but those who have businesses around them and many small businesses that rely on the visitors as well.

So, again, I'm here to fully support the arena, and I really thank you for your time today.

CHAIRPERSON ROSALES: Thank you.

JIM LAZARUS: Good afternoon. Jim Lazarus, San Francisco Chamber of Commerce.

The Chamber of Commerce represents over 1,500 businesses of all sizes throughout the City, employing over 200,000 people, including the City's hospitals, including the Warriors, including many businesses in Mission Bay.

If the issue is traffic congestion, it can be managed. Hospitals throughout San Francisco are in locations that deal with access issues every day.

Lazarus-1
[TR-4]

How many of us have driven by Saint Mary's Hospital on Fulton and Stanyan on an afternoon or when JFK Drive is closed? Or C.P.M.C. building a new hospital at Van Ness and Post? Or U.C.S.F. Parnassus, which for decades was a neighbor of Kezar Stadium, with 70,000 people going to 49er games, college and high school sports in that facility for decades before it was reduced in size about 30 years ago?

I took a look at the March 1996 voter handbook in San Francisco when the voters were asked to approve the ballpark. Some unnamed group called San Franciscans for Planning Priorities '96 had the ballot argument against the ballpark.

They opposed Prop B because, Millions of additional cars and no parking will drive jobs and businesses out of China Basin, will create gridlock over 200 days a year. Well, we all know within weeks of that ballpark opening in 2000 it was a gem on the waterfront that is supported by San Franciscans throughout the City.

The Draft EIR outlines a mitigation plan for traffic and congestion management that will work for U.C.S.F., it will work for the residents, and it will work for the businesses in Mission Bay, and we urge this Commission to support that EIR and to move this project forward as quickly as possible.

Lazarus-2 [TR-3a]

Lazarus-3 [GEN-5]

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

HENRY KARNILOWICZ: Good afternoon, Commissioners. Henry Karnilowicz, and I am the president of the Council of District Merchants, which represents some -- over 2,000 businesses in the City.

I am in full support of the Warriors arena project in San Francisco, knowing it will have a positive impact not only on Mission Bay, but also on our gem of a city. I want to thank the City for taking the time and energy to create a world-class project that is deserving of a world-class city.

Karnilowicz-1 [GEN-5]

Thank you for the opportunity to weigh in

today. I hope you will take my support to consideration.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Please come to the podium: Matt Prieshoff, Drake [sic] Donaldson, Bruce Agid, and Celestino Ellington.

ABE EVANS: Hi, Commissioners. My name is Abe Evans. I'm a student here, and I live in Potrero Hill, and I'm really excited about this stadium and arena, because it's really bike-friendly, and I bike everywhere in the City.

Evans-1 [GEN-5]

I love that it is in line with the City's Bike Plan and the Transit-First policies.

I'm excited because it's going to add to the Blue Greenway, and it will be great to have a lot more of that bike path, especially somewhere where I can drop off and grab a bite to eat at some of the retail that's going to be open on the bike path.

Thank you so much for your time.

CHAIRPERSON ROSALES: Thank you.

ELIZABETH KIRK: Hello, and thank you, Commissioners. My name is Elizabeth Kirk. I'm also a student here and a Warriors fan.

I've come today to fully support the Warriors'

Kirk-1 [GEN-5]

plan to move to Mission Bay.

I'd like to express my support, mostly because of some of the environmental plans that have been made for this project. In reviewing those plans and by looking at many of the renditions, I'm impressed with the emphasis on landscaping and green space, as well as the incorporation of the natural environment with the site.

From trees and grass lawns and all of the green rooftops that have been designed, I think that this project will have a big impact on making our City more green.

Thank you.

Kirk-1 [GEN-5] cont.

CHAIRPERSON ROSALES: Thank you.

SHERYL DAVIS: Hello, Commissioners. My name is Sheryl Davis. I run a non-profit here in San Francisco.

And, first and foremost, I just wanted to thank you for the time and deliberation that you have already taken into looking at the EIR, and then also to express just gratitude for the way that the Warriors and the City have worked together to address some of the issues identified.

I know that we're talking about the Environmental Impact Report, and I just wanted to say

Davis-1 [GEN-5]

55

that for us, for me, specifically, in working with young people, really looking at the social impact and the possibility and potential of what the Warriors have already demonstrated as a great partnership, we actually brought young people out here today to be able to see the process.

Davis-1 [GEN-5] cont.

They've been talking about the role of science and technology and engineering and mathematics, and all the different fields, and this has really afforded them to be able to look deeper.

But also looking at sports as more than just sports and the workforce development opportunities that the Warriors have provided -- the community development, the collaboration, the partnerships -- I think that those are all things to be highlighted and supported.

They have been amazing community partners for us, and I can only imagine how much more so that can happen with them here in the City -- the opportunity to actually visit the building and to see that it's more than just a sports arena, but to also see the people that are behind the scenes, even in things like this today, to understand that the Warriors is an organization and that there's a commitment for community giving and support and giving back and being able to learn that process.

56

So, I think, for me, it's much bigger than just the idea of the team, but it's really about the organization itself, and what they represent, and what they're doing for community, and allowing young people to be able to see that firsthand and see that happening in the City for a team that, right now, is being celebrated for the championship, but I think should be celebrated for work that they've already done with the community.

Thank you.

CHAIRPERSON ROSALES: Thank you.

BRUCE AGID: Good afternoon, Commissioners. My name is Bruce Agid. I'm the transportation rep and a board member of the South Beach/Rincon Hill/Mission Bay Neighborhood Association. However, today, I'm speaking on behalf of myself as a resident of Mission Bay.

I'm a supporter of the arena project and look forward to the Warriors coming home to San Francisco. Agid-1 [GEN-5]

My comments today are focused on the transportation aspect of the EIR and the associated mitigation plans. Agid-2 [TR-3a]

A review of the Draft EIR clearly indicates a detailed account regarding the traffic and transit impacts on Mission Bay. There is no sugarcoating of the assumptions, and all the impacts of the traffic and

traffic congestion appear to have been identified.

Those of us who live in the area understand the congestion that exists today, can anticipate the impacts of events at the arena, and the assumptions outlined in the EIR seem to align with my intuitive perspective on the subject.

With that said, I've attended public meetings and have reviewed the mitigation measures outlined in the Event Management Plan. Some of those included transit improvements, supplemental service, a robust Traffic Management Plan, and the bike and ped improvements, again, just to name a few -- and have confidence that with the appropriate event coordination, resource availability, and effective implementation of these mitigation measures, the traffic and transit congestion can be managed effectively. Agid-2 [TR-3a] cont.

Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come to the podium: Michael Sesich, David Siegel, Dennis MacKenzie, Jac Taliaferro, and Christopher Hrones.

DRAKARI DONALDSON: Good afternoon, Commissioners. My name is Drakari Donaldson.

I'm a student, I'm a bicycle advocate, and I'm very impressed by how bike friendly this venue will be. Donaldson-1 [GEN-5]

Furthermore, the project promises to bring new bike lanes to Terry Francois Boulevard and 16th Street, making it simple and easy to get in and out of the area. By making the venue so accessible to bicyclists, they are reducing carbon emissions in cars and traffic congestion in the area as well.

Donaldson-1 [GEN-5] cont.

Thank you for your time and consideration.

CHAIRPERSON ROSALES: Thank you.

CELESTINO ELLINGTON: Good afternoon, Commission. My name is Celestino Ellington.

Not only am I a San Francisco resident, but I'm also the sports and recreation director for the YMCA of San Francisco Bayview-Hunters Point branch. And we've been community partners with the Warriors. I started the program in 2006, and I can remember being a part of the Warriors ever since then. And they've been more than just a sports team to me and the families of our YMCA.

Through the years, we've been able to experience the whole Warriors organization, from inside out, outside of just the game of basketball. And, believe me, those are opportunities that people dream to be a part of, and they were in Oakland this whole time.

They've been amazing community partners who have proven that they will work to address the needs and

challenges, and implement strategies that are best for everybody. You know, the Warriors and the City have worked hard to address the concerns and listening to feedback and incorporating the community's suggestions into their plans, and as a result, they've come up with a project that fits very well in the Mission Bay community, and the community and the whole City is excited.

I'd just like to acknowledge my support on record that I do support this project, and if we'd been able to do this with a relationship across the Bay, imagine how many more organizations that the Warriors can affect right here in the City.

And I really do believe that the Warriors' mission, outside of basketball, is community. We've been a direct result and have been privileged to experience those things, and we're looking forward to those in the future as well.

Ellington-1 [GEN-5]

Thank you.

CHAIRPERSON ROSALES: Thank you.

MICHAEL SESICH: Good afternoon. My name is Michael Sesich. I'm a native San Franciscan. I've lived in Mission Bay for the last three years.

I find the Warriors a good attraction to San Francisco. I'm not opposed to the team moving back

Sesich-1 [GEN-5]

to San Francisco or even a new arena in Oakland, but I do have concerns about the placement of the new arena in the Mission Bay neighborhood.

The proximity to the hospital, which the nurses' association is pointing out, makes it difficult to get to that location. And I know from living two blocks away from the proposed site how bad the traffic is now with just the AT&T traffic in that area.

One time, I was coming home with my wife in the car, and the traffic was so bad on Third Street, I got out and walked and got home before she did in the car. And I think that a woman, pregnant and going to a woman's hospital in Mission Bay, being stuck in traffic -- the problems that can create.

So, I'm deeply concerned. I've voiced these at local community meetings before.

And I must praise the organization of the Warriors too. I think they've done a good job of reaching out. But when I read the Environmental Report, I came across terms like "provide adequate," "various management strategies," "encourage," "should not," "commercially reasonable efforts." All that could be sidestepped and not get what you want.

When the AT&T park went in, we were told that people would take the train and people would take public

Sesich-1 [GEN-5] cont.

Sesich-2 [TR-4]

Sesich-3 [ERP-6]

Sesich-4 [TR-13]

transportation, yet the parking lots of that park are overflowing, and they're looking for new space now that there's a building going in.

So, I'm very concerned about the project's impact on the neighborhood parking and traffic, but not opposed to the Warriors.

Thank you.

CHAIRPERSON ROSALES: Thank you.

DAVID SIEGEL: Good afternoon. David Siegel. 25-year resident of the Dogpatch and vice president of the Dogpatch Neighborhood Association.

The D.N.A. is not opposed to the stadium. However, the development will have direct and lasting impact on our neighborhood, and of course, is of grave concern to the Dogpatch Neighborhood Association and residents of the community.

Our small, beleaguered neighborhood is being severely impacted by the relentless encroachment of U.C.S.F., housing developers, and now, Warriors.

Today, specifically, I want to direct my remarks to the proposed parking lot at Crane Cove. There are a number of issues that we're concerned about regarding this parking lot location.

First of all, Illinois Street is the official route for trucks and bikes as part of the Transportation

Sesich-4 [TR-13] cont.

Siegel2-1 [LU-1]

Siegel2-2 [TR-12a]

Plan of the City. This street would be the nearest street to the proposed parking lot. The Port is also planning on having a 19th Street extension serve as a BAE heavy large-truck route, and Muni is also planing a turnaround loop, as well, directly in that area. Further, Crane Cove is a small patch of green space on the waterfront that serves the community and needs to be protected.

Siegel2-2
[TR-12a]
cont.

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Joe Boss, Jennifer Davis, Rudy Corpus, John Cornwell, and Silvia Johnson, please make your way to the podium.

DENNIS MACKENZIE: Thank you, Commissioners. I'm Dennis MacKenzie. I'm work in consulting and education, and I teach in the San Francisco public high schools, including at the Juvenile Hall.

I have made a proposal and shared with everyone, requesting the Warriors and all the City departments and leaders, including high school classroom, put a golf program inside the arena.

At the last meeting on May 19th, I shared with the Committee and the other leaders in the City and the Warriors that one the things that I've been asking -- and first of all, I am wholeheartedly in

MacKenzie2-1
[GEN-5]

MacKenzie2-1
[GEN-5]
cont.

support of this arena and believe all City family leaders can get together and find solutions to this traffic part.

I introduced the idea of the Warriors collaborating with Juvenile Hall on what's referred to as Log Haven Ranch, which has the opportunity -- they have a small gymnasium. I just introduced that to the Warriors and the City, that that is an opportunity for this small gym to provide what I mentioned about golf-course training programs in Philadelphia, Pennsylvania -- I'd like to share this with you (Indicating). But the history of using the sports facilities can be a tremendous influence for kids at risk and all students.

So, in the minutes, I just wanted that to be corrected. I meant to say this earlier -- that there's a statement that I -- I admit I was a Giant -- I mean, the Warriors -- I had proposed to them -- have already done tremendous work in this entire Bay Area promoting education, and then the basketball and the community foundation.

So, in the minutes, it states that I was asking the Warriors to do something with the golf course. That was the not my intent. It was to use this golf-course training program as a model, which my

PH

proposal in the classroom is a model to use for future NBA professional or indoor arenas, which I believe is very tremendously valuable for our country.

Thank you very much.

CHRISTOPHER HRONES: Good afternoon, Commissioners, and thank you for the opportunity to comment on this Draft SEIR.

I'm a new resident of San Francisco, who has followed this project with interest. Prior to this year, I lived in Brooklyn, New York, where I had the opportunity to participate professionally in the planning and public discussion of the Barclays Center Arena and associated Atlantic Yards development. This saw the relocation of the Nets basketball team from New Jersey to Brooklyn.

Although there are obviously some differences between that development and this proposal, there are also some interesting parallels, namely the creation of an 18,000-seat multi-use arena in an urban infill site accessible by transit, but also, there are major concerns in both cases initially expressed by some about traffic and parking impacts. So, I have a number of observations I think are relevant.

In the interest of time, I'm going to focus on three things which seem to come up the most today, which

Hrones2-1 [TR-4]

65

PH

are traffic congestion, parking, and emergency vehicle access.

As far as traffic congestion goes, the impact feared by many of the Barclays Center site, for the most part, did not materialize.

As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fears of congestion greatly -- were greatly -- were exceeded by -- greatly exceeded the actual impact, so that when the facility opened, traffic congestion was more or less a nonstory.

This was due to a number of factors, but the two most important were that transit utilization did not meet the project goals, and that vehicle arrivals to the arena were more spread out than projected.

Hrones2-1 [TR-4] cont.

In terms of parking, the main observation is that off-street parking supply provided by the project, combined with existing nearby off-street parking, far exceeded demands. And so, parking availability was not an issue there either.

Hrones2-2 [TR-13]

And finally, for emergency vehicle access, which has been raised as a potential concern here, this was effectively accommodated in Brooklyn, where police and fire stations are located immediately adjacent to Barclays Center, and there are no significant issues

Hrones2-3 [TR-9]

66

Hrones2-3 [TR-9] cont.

that I'm aware of.

CHAIRPERSON ROSALES: Your time is up.

CHRISTOPHER HRONES: Thank you.

EXECUTIVE ASST. GUERRA: Sir, can you please provide your name for the record?

CHRISTOPHER HRONES: Yes. My name is Christopher Hrones.

JAC TALIAFERRO: Good afternoon, ladies and gentlemen. My name is Jac Taliaferro, and I own La Hitz Digital Media. I'm a San Francisco native, and I own a business here.

The tradition of building stadiums here in San Francisco is -- dates back to the first century -- or, two centuries ago, turn of the century. Robert Taylor, who you may not know, in the Polo Fields, was a gold medalist and also the world champion, and he was an attraction for the Polo Fields when it was built at the turn of the last century.

We know that tourism is the number one industry, and that's fueled by entertainment. So, right now we have one the best entertainers in the world, Bobby Ware, back there. He's helping the fight to get the Yoshi's back into our control.

But my main concern here is the business that the Warriors are or are not doing with black-owned

businesses, which is different than non-profits.

I haven't seen one black business come up here, except for myself, and I was born here. So, of course, when the Warriors won, I was here. And it was a great delight.

This time it was bittersweet, because before the Warriors season started, I was told by a Warriors staff person that he was going to keep my business, which is connected to other black businesses, from doing business with the Warriors. I honestly didn't like that.

So, I wrote this article about that and got a call from that person later, but the opportunity was gone for us to start at the beginning of the season and see them all the way through to the championship.

And I know this well because I'm in entertainment. I've been with groups that's went from obscurity to number one, winning Grammies, et cetera, et cetera, and dealing with people who were there before us to when, now, it is different.

So, my company has lost out on maybe from $700,000 to 1.5, an analyst said. This is a question of "Black Lives Matter." "Black Lives Matter" is not about crisis situation. It's about us flourishing, and we need to flourish with the Warriors.

PH

They're welcome to come here, but you know, if there's an issue about planning, put them out at Candlestick.

Taliaferro-1 [ALT-4]

EXECUTIVE ASST. GUERRA: Sir, your time is up.

JAC TALIAFERRO: Thank you.

This is -- this is the article that I wrote, and I would love the Commission to see that (Indicating).

CHAIRPERSON ROSALES: Thank you.

JAC TALIAFERRO: You're welcome.

Thank you.

JOHN CORNWELL: Hello, Commissioners. My name is John Cornwell, C-O-R-N-W-E-L-L.

I'm actually a third-generation San Franciscan. I have two young kids who will hopefully be long-term, fourth-generation residents. I've been a resident in the area for 20 years.

And, you know, I worked -- was around when the Giants negotiated with community impacts. The traffic density was a lot different back then.

I respect the Warriors. They're a good organization, but they're not this non-profit organization that should be exempt from smart urban planning; right?

Cornwell2-1 [LU-1]

If we had a bank headquarters that was going

69

PH

to go in that spot with that traffic density as it now exists, and you're going to have 20,000-some-odd visitors, you would write that off immediately. That's awful urban planning.

They're not a non-profit. They're a multibillion-dollar asset and a very profitable organization. And it does not make sense for a company that is going to put that kind of burden on the community and the region; right?

Cornwell2-1 [LU-1] cont.

I only ask that you guys go out to that area during commutes and see how bad the traffic is now. The Third Street corridor already is saturated.

And, you know, this isn't about the surface streets in the that area. That's bad enough. But you're talking about the Bay Bridge. We all know that the Bay Bridge rush hour starts at 2:30 and goes to 8:30. So, now are we ready to basically have there be no non-rush hour, for the morning rush hour to run into the afternoon rush hour?

Even if you have 80 percent traffic utilization, already traffic is at a breaking point in San Francisco. I think we all know that from everyday experience. It's not smart urban planning.

These EIR statements about, There will be adequate -- yeah, there may be transparency, but that

Cornwell2-2 [TR-4]

70

PH

still doesn't change the fact that it is a huge impact, and it's not a proper use. And you can do all the mitigation you want, but there's not the ability to add bandwidth and traffic capabilities around there. That's common sense.

Cornwell2-2 [TR-4] cont.

So, you can offset carbon utilization and all the rest, but the bottom line is this is a really bad regional project.

Cornwell2-3 [GHG-2]

CHAIRPERSON ROSALES: Thank you.

SILVIA JOHNSON: My name is Silvia Johnson and (Unintelligible) a lot of people would be jealous of me playing the guitar and be rich and famous right now.

I'm just (Unintelligible) you know, my priorities were -- over there in the mountains they don't have no (Unintelligible). You know, I think that's where we should be putting places where you can park. (Unintelligible) put the BART system to where it can go to the stadium, and that way, we would have a lot impact with our plans than when we go to see the Warriors.

And I think there's more solutions to those problems -- is that we need to agree with the Warriors, which would eliminate a lot of these impacts. Maybe put that in thought, that -- to build a BART over there behind the mountains there. You see on this picture

Johnson-1 [GEN-6]

PH

right there.

Johnson-1 [GEN-6] cont.

And I think that this is one of our main problems -- is that -- of course, jealousy is really bad out there. And this is one of the reasons why I haven't been able to build up my career with my guitar playing. And I had already 18 guitars already stolen from me. I went to Washington, D.C., played down there. They stole that too.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: Will the following people please come to the podium: John deCastro, John Caine, Mr. Al Norman, Mr. Oscar James, Osha Meserve, and Paul Osmundson.

JOE BOSS: Good afternoon, Commissioners. And good to see you, Tiffany.

The -- I am not for or against the Warriors. They're doing a fairly adequate job with their EIR, but the thing is, what will happen with -- I live in Dogpatch. I've been here for 32 years, worked here since I was 16, so I hate to tell you how old I am. But at the end of the day, if the City wants to get something done, it just moves mountains.

They were trying to get a legacy here for someone -- I can't remember who -- keeping the Warriors in San Francisco, not on the pier, but it is in

PH

San Francisco.

The Warriors actually are a very wonderful team and I love to follow them, and I would love to have them in the City.

We also have, right down the road, the Giants and the Giants attempting to build a rather large development. And being in Dogpatch and -- we've always been up with what's going on, and helped the Port and helped redevelopment in Mission Bay and so forth.

So, I just want to express the opinion that if we really, as a community at San Francisco, wanted to get something done, you would probably crack a whip and have the Warriors have to work with the Giants all on Lot A and B.

And, you know, maybe I'm whistling "Dixie," but you do not have a method of taking care of the traffic. You can say MTA is going to take care of it. MTA couldn't even, in a ten-year period, get a turnaround movement planned and executed. Very, very terrible.

Boss-1 [GEN-6]

Thank you.

EXECUTIVE ASST. GUERRA: Sir, can you please provide your name?

JOE BOSS: Joe Boss.

EXECUTIVE ASST. GUERRA: Thank you.

PH

RUDY CORPUS: How you doing, Commissioners? My name is Rudy Corpus. I'm born and raised in District 6, South of Market, currently live there.

I run a youth program, United Players Violence Prevention Youth Program, with over a 150 kids run over the summer.

I'm here just in support for the Warriors to be here in our neighborhood and in San Francisco. It would create an enormous amount of opportunity for our people in the community.

Corpus-1 [GEN-5]

South of Market, particularly while I've lived in District 6, has probably the lowest income-paid families in the whole city. I just -- you know, I just want the opportunity -- it would be good for the economy. It would be good for the community, and also, I think it would be good for the City.

I know originally the Warriors was in San Francisco back in the '70's. I think it was the San Francisco Warriors. Then they moved to Oakland, and that's why they called them "Golden State." And so, this gets rightfully their right place where they supposed to be, back here in San Francisco, the San Francisco Warriors.

Thank you.

CHAIRPERSON ROSALES: Thank you.

PH

AL NORMAN: Madam Chair, Madam Director, Commissioners, Al Norman, Bayview Merchants Association, and we're here in support of the EIR for the Warriors, and we think it would be one big jewel of an anchor tenant for all small businesses in and out of the area, and we support it wholeheartedly and support the other associations who are in favor of you passing this EIR so we can go ahead and go to work and establish a relationship that will benefit everyone economically associated with this project.

Norman-1 [GEN-5]

Thank you.

CHAIRPERSON ROSALES: Thank you.

JOHN deCASTRO: Good afternoon, Commissioners. John deCastro from -- past president of Potrero Boosters Neighborhood Association back about 15 years ago. I'm a 37-year resident of Potrero Hill.

And my biggest concerns are, as I look at 6.2, "significant unavoidable impacts, specifically transportation and transit." Those are a mess today.

And I echo the other speaker that suggested that you might want to come down there between 4:00 and 6:00 in the evening and take a look at that 280 and Mariposa interchange -- Mariposa and Pennsylvania Street, 16th and 7th Street. It is a disaster four nights out of five, especially Thursday night. Every

deCastro2-1 [TR-4]

75

PH

time the Giants have a day game, the traffic starts backing up at 2:00 -- 1:30 or two o'clock and never quits.

deCastro2-1 [TR-4] cont.

We talk about a "Transportation Management Plan" in 6.5. Where is it? I don't trust the City or the MTA to come forward with a decent Transportation Management Plan when my wife and I tried to go to a Giants game on Sunday, and we waited -- we checked the next Muni -- 58 minutes to the 10. My wife is disabled. I had to call a taxi so we could make our ballgame. That was the only way we could get there, because she couldn't walk down to the T. It was way too far.

deCastro2-2 [TR-3a, TR-4]

6.2 calls traffic "an unavoidable impact." Today, without a game, the traffic is backed up every night and almost every morning at the 280. I have learned ways around the neighborhood and some way to do that.

deCastro2-3 [TR-4]

The transit doesn't work today. We need better plans in that area if the Warriors are going to come to Mission Bay.

deCastro2-4 [TR-5a]

I agree with the nurses. It is going to be a serious problem. And you're trying to route traffic, I believe, through the Minnesota Street area and through the Dogpatch neighborhood, to get people -- emergency vehicles to the hospital, or people that are in trouble

deCastro2-5 [TR-9]

76

that need to get to the hospital. That is not an acceptable alternative.

Thank you.

CHAIRPERSON ROSALES: Thank you.

OSCAR JAMES: Good afternoon, Commissioners. My name is Oscar James. I'm a native resident of Bayview-Hunters Point and a former Model Cities Commissioner, which this area covered.

The area that you have today, you're talking about doing development, we have a Memorandum of Understanding. Whichever comes into this area hires 50 percent community residents, 35 percent contractors -- minority contractors as a whole.

But I want to just thank the Warriors for doing what they have done. Prior to coming into our community, they've hired peoples in our community, and we hope and we really believe that they will hire minority contractors, 50 percent out of Bayview-Hunters Point, 100 percent citywide, following our Memorandum of Understanding we wrote in 1970, which had a grandfather clause in our community.

I support them 100 percent. I would like the U.C., since the nurses are talking about all they're talking about -- traffic and what have you -- is to come up with some scholarships that they should have done

deCastro2-5 [TR-9] cont.

James-1 [GEN-5]

getting that free property -- for scholarships in our community to train peoples in our community for nursing, being doctors, and what have you. Do the same thing that the Golden State Warriors are doing.

I was living and I was -- I once went to the games at Kezar Pavilion when the Warriors were there a long time ago, and I'm saying today welcome back to the San Francisco Warriors, and I support this 100 percent.

Thank you very much.

CHAIRPERSON ROSALES: Thank you.

PAUL OSMUNDSON: Good afternoon, Chair Rosales, Commissioners, Executive Director Bohee, Deputy City Attorney Bryan. My name is Paul Osmundson.

I am a partner in the East Street Ventures Restaurant, which is located at 295 Terry Francois Boulevard, with John Caine, one of the previous speakers.

I'm also the former Director of Planning and Development for the Port of San Francisco. I've worked with the San Francisco Giants and the Mayor's Office on the AT&T ballpark and on the Transportation Plan.

I've reviewed the EIR, and I can tell you that the -- when the City and MTA has made commitments to manage the traffic to and from the waterfront, these special-event venues, the Giants system works the way

James-1 [GEN-5] cont.

Osmundson-1 [TR-3a]

they said it would -- the way the Giants said it would, the way the City said it would. That system works. It has worked day in and day out, all 81 home games and the playoff games. It works.

Osmundson-1 [TR-3a] cont.

The project is a perfect fit for this neighborhood. Mission Bay was envisioned as a mixed-use development project. The Port worked -- we worked on it for many years in the late '80's and early '90's. It's a mixed-use development project. It's not just a life science center. So, this is use fits into the City's plan for this area.

Osmundson-2 [LU-1]

There's definitely going to be impacts that have to be mitigated or can't be dealt with -- unavoidable impacts. That's always the situation.

Osmundson-3 [ERP-9]

This a great use for this location. I urge you to approve the project, certify the EIR, and move forward.

It's a great -- we're very lucky to have an organization like the Golden State Warriors willing to come to this City and invest in our City.

Osmundson-4 [GEN-5]

Thank you.

CHAIRPERSON ROSALES: Thank you.

EXECUTIVE ASST. GUERRA: I have Ms. Susan Vaughan.

SUSAN VAUGHAN: Good afternoon, Commissioners.

My name is Susan Vaughan, and I am the current chair of the San Francisco group of the Sierra Club.

We will be submitting more detailed comments later. For now, I'm just going to be speaking for myself.

I'm very concerned that a piece of State legislation, AB 900, was extended purely for the reason just to get this project -- and apparently one in L.A. -- through the fast-track process so that there are fewer hearings, maybe, for the public. And I'm very concerned about that.

Vaughan-1 [AB-1]

We don't know, additionally, in terms of the greenhouse gas emissions. It's my understanding that the project sponsors intend to purchase carbon offsets. We don't know what those offsets are, and we need to see that in the EIR.

Vaughan-2 [GHG-2]

To my knowledge, no greenhouse gas comparison has been done between this proposed project and just keeping the project in Oakland.

Vaughan-3 [GHG-2]

And on that line, I want to add that I think that probably most of the people who work that venue in Oakland right now work -- don't live in San Francisco.

Vaughan-4 [TR-5b]

So, I'm wondering about the impact to BART, and I'm wondering about increased greenhouse gas emissions, because employees might be taking the bridge across the

Vaughan-5 [GHG-2]

river -- or, not the river -- the Bay.

And I would add that I don't think a lot of public transit enhancements are happening in this project, and that really does need to happen. We're not interested in seeing more parking. It's got to be -- we're really serious about dealing with climate change. It's got to be public transportation.

Thank you.

OSHA MESERVE: Good afternoon, Commissioners. My name is Osha Meserve and I represent the Mission Bay Alliance.

The Alliance believes the proposed entertainment center will not work for the site and does not warrant the massive public investment planned by the State.

In particular, we're concerned about the compatibility of the center with the existing health and research facilities in Mission Bay, and while health and related biosciences was planned to expand under the Mission Bay Redevelopment Plan, this project takes this area in a completely new and incompatible direction.

In our review of the Draft EIR so far, we have found that the traffic, parking, and associated health impacts of the facility will be even more devastating than disclosed in the EIR, and there's inadequate

Vaughan-5 [GHG-2] cont.

Vaughan-6 [TR-3a]

Meserve-1 [GEN-5]

Meserve-2 [LU-1]

Meserve-3 [ERP-9]

mitigation.

The project is also being mis-advertised as greenhouse gas neutral. Purchasing unverified assets from a broker for 4,000 tons per year of carbon dioxide is not mitigation and doesn't do anything to help the localized air pollution that will become so much worse under the gridlocked conditions.

With analysis scattered throughout the EIR and other documents prepared over the course of 25 years, the fast-tracking of this project's environmental review process is precluding meaningful public participation.

And the document is not -- because it is not thorough, in that people have said it's thorough, but there are important issues that are relegated to these other 1998 and 1990 documents that the public must also review in order to understand the project. Land use, geology, soils, recreation, and hazardous materials are some of those topics.

For this reason, we have requested an extension of the public review period to better match the complexity of this project, and we look forward to further informing the Commission to review this important project.

Thank you.

CHAIRPERSON ROSALES: Thank you.

Meserve-3 [ERP-9] cont.

Meserve-4 [AB-1, GHG-2]

Meserve-5 [ERP-4]

Meserve-6 [ERP-7]

Meserve-7 [ERP-4]

EXECUTIVE ASST. GUERRA: Are there any others that want to speak?

DAVID PAN: Yes. Hi. My name is David Pan, and I'm here on behalf of a lot of people that really do not have a voice.

I live in an SRO. I live on S.S.I. Disability on 6th and Market Street right now. There are a lot of people that are in hardship in this City. We all know that. There is a very divisive line in the economics of the wealthy and the poor.

I have a dream of working on creating a non-profit that can create paid jobs for people coming out of hardship. The idea is to open a café, eatery, and meeting spaces, community spaces where people can use for meet-up groups, conferences, study groups, and have them adjoining a café so it's free, just buy some food and some drinks.

Making it a non-profit would allow people to have a reintegration into the workforce, would allow the community a place to gather.

And the idea of doing something like this would be hugely tremendous, because there aren't a lot of 9- or 10,000-square-foot plates that are available to be custom-built out in San Francisco. We all know the retail spaces aren't available.

Pan-1 [GEN-6]

So, I'm working on trying to propose this with the Warriors, and I've had some very good feedback from members of the community, from Urban Solutions to Cafe La Vie, to Hayes Valley Bakeworks, Delancey Street Crossroads Café, some of the non-profits that have succeeded on a business model similar to this, and others.

I've spoken with Jane Kim, District Supervisor, District 6. I'd like to say thank you very much for your time.

I very much support the Warriors coming to San Francisco. I think it would help a lot of people in a lot of different ways.

Pan-1 [GEN-6] cont.

Thank you.

I'd like to leave this with you, if I may (Indicating).

CHAIRPERSON ROSALES: Yes.

EXECUTIVE ASST. GUERRA: Are there any others that would like to speak?

(No response)

CHAIRPERSON ROSALES: No.

Okay. Thank you, everyone, for giving us your comments. This is not an action item, but the Commissioners are allowed to also provide comment.

Do I have any comments from the Commissioners?

COMMISIONER MONDEJAR: No.

CHAIRPERSON ROSALES: The only comment I'd like to make is consistent with all the comments I have made in the prior workshops regarding this project, and it deals with two things: Primarily, the traffic impacts and the neighborhood impacts, which are related.

Rosales-1 [TR-4]

And we've heard a lot of concerns, and I will continue to read the document, but I want to make sure that the comments here regarding those impacts and the mitigation measures are kind of looked at in depth and to the extent of exploring funding mechanisms or recommended or suggested mechanisms, so that they don't go into the document -- that the Commission be told of potential funding mechanisms that we might be able to recommend to ensure that those mitigations are essentially guaranteed and those impacts are mitigated.

Rosales-2 [GEN-1b]

I think I can't say more on the record than just a comment. This matter will return to the Commission later this fall.

Should we repeat the opportunity for folks to submit written comments?

DEPUTY DIRECTOR OERTH: Thank you, Chair Rosales. I'll just repeat that if people would like to submit written comments, they can submit them via E-mail to warriors@sfgov.org or they may address them to the

Planning Department. The address of the person to contact at the Planning Department is on page 2-9 of the SEIR.

Thank you.

CHAIRPERSON ROSALES: Thank you.

I think Commissioner Mondejar would like to make a comment.

COMMISIONER MONDEJAR: Sally, can you just explain what the process is after you have -- after the office has received further comment, and also the process of all the public comments that we have received this afternoon?

DEPUTY DIRECTOR OERTH: Yes.

All of the comments provided today, as well as all of the comments provided in writing, will be gathered and responded to in a document called the "Response to Comments," which will be brought back before the Commission later this fall.

And so, we'll be reviewing those and working with the various members of the team to provide the responses, and look at any adjustments that need to be made to the Draft SEIR as appropriate.

COMMISIONER MONDEJAR: And all of these will be made public?

DEPUTY DIRECTOR OERTH: Yes.

COMMISIONER MONDEJAR: So, I just wanted to say that I hope that all of the comments will be taken into consideration and carefully examined. I know I have reviewed the documents that have been presented to us as Commissioners.

Mondejar-1 [ERP-9]

And one other thing that just occurred to me -- that the purchasing of carbon offsets is something that was new to me this afternoon. That, I didn't get out of -- I need a little bit more of an understanding of that, but I'm sure that you could respond to that.

Mondejar-2 [AB-1]

I don't know if you can respond now, since we're not on a -- this is simply informational this afternoon, but it's certainly something that I think we should be communicating -- all of these issues and concerns and the responses to these issues and concerns -- to the public.

DEPUTY DIRECTOR OERTH: Thank you.

COMMISIONER MONDEJAR: Thank you.

CHAIRPERSON ROSALES: So, thank you, everyone.

With that, I think that closes this item. It will be again before us later in the year.

(Whereupon, at 3:02 p.m., Agenda Item 5(b) of the Special Meeting of the San Francisco Commission on Community Investment and Infrastructure was concluded.)

CERTIFICATE OF REPORTER

I, KATY LEONARD, a Certified Shorthand Reporter, hereby certify that the foregoing proceedings were taken in shorthand by me at the time and place therein stated, and that the said proceedings were thereafter reduced to typewriting, by computer, under my direction and supervision;

And I further certify that I am not of counsel or attorney for either or any of the parties to said matter, nor in any way interested in the outcome of the cause named herein.

APPENDIX TR-X

Technical Memorandum on Off-site Surface Parking Lots

To: Sally Oerth, OCII
Chris Kern and Bill Wycko, San Francisco Planning Department

From: ESA Consultant Team
Adavant Consulting
LCW Consulting
Orion Environmental Associates

Date: October 21, 2015

Subject: Event Center and Mixed Used Development at Mission Bay Blocks 30-32 SEIR
Supplemental Analysis of Off-site Surface Parking Lots

Purpose

The Draft SEIR Transportation section identified mitigation measures to reduce significant traffic impacts under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. One of the measures identified in Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events involved the use of off-site parking lot(s) south of the event center and provision of shuttles to the event center. This mitigation is one of several measures identified in the SEIR to reduce the severity of this significant impact, but even with implementation of identified mitigation, Impact TR-11 would remain *significant and unavoidable with mitigation*.

The purpose of this Technical Memorandum is to provide a more detailed description of the potential off-site parking lots that could serve the event center and to identify the potential environmental impacts of implementing those off-site surface parking lots. Environmental review and Port approval is required for implementation of these two parking facilities.

Description of Off-site Parking Lots

The SEIR acknowledged that preliminary discussions with the Port of San Francisco (Port) had identified potential parking lot locations at an area northwest of Pier 70 in the vicinity of the intersection of Illinois and 19th Streets (19th Street site) and an area near Pier 80 referred to as the Western Pacific site. Subsequent to publication of the Draft SEIR and consistent with this mitigation measure, the City has pursued discussions with the Port regarding the feasibility of using these sites for this purpose.

Mitigation Measure M-TR-11c states the following strategy:

> The City has identified two off-site parking lots on Port of San Francisco lands to the south of the event center (19th Street and Western Pacific sites) that can accommodate approximately 250 additional parking spaces for all events and up to approximately 800 additional parking spaces for use during dual events of 12,500 or more event center attendees (for a total of approximately 1,050 additional off-site parking spaces). As long as the Port of San Francisco takes all necessary actions to make the land available for public parking, the project sponsor shall: (1) make commercially reasonable efforts to negotiate with the Port of San Francisco or its designee to acquire sufficient rights for the use of such parking lot(s) through lease, purchase, or other means as necessary; and (2) provide free shuttles to the event center from such off-site parking lot(s) that are more than ½-mile from the event center on a maximum 10-minute headway before and after events.

Figure 1 presents the location of the 19th Street site and Western Pacific site in relation to the project site. The following provides a description of each site's characteristics, anticipated construction details, and expected operation. As described below, the 19th Street parking lot would provide up to 250 spaces, and the Western Pacific parking lot would provide up to 800 spaces (a net increase of up to 50 spaces above the number contemplated in Mitigation Measure M-TR-11c).

Off-site Parking: 19th Street Site

Site Characteristics

The 19th Street site is located at the southeast corner of Illinois and 19th Streets, approximately 0.45 miles south of the project site. The approximately 2-acre 19th Street site is located on Port property within the Pier 70 Area, partially within Assessor's Parcel Number (APN) No. 4046001. The 19th Street site is zoned M-2 (Heavy Industrial) and within Height and Bulk District 65-X. The 19th Street site is immediately bounded by Illinois Street to the west, industrial uses to the north and east, and a four-story office building and vacant land to the south. An aerial of the 19th Street site is presented in **Figure 2**.

The 19th Street site is located within the Port Waterfront Land Use Plan' Southern Waterfront Subarea, and is designated as part of the Plan's Pier 70 Waterfront Opportunity Area. The 19th Street site is located just south of the future planned Crane Cove Park, a 9-acre public park currently undergoing schematic design. The nearest residential use is a six-story residential building (820 Illinois Street) is located across Illinois Street just west of the 19th Street site.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 2
Offsite Parking: 19th Street Site

The 19th Street site is largely undeveloped, with the exception of a vacant three-story building (Building 40, described below) that occupies the southwest corner of the site. Ship building support materials were observed on the site. The 19th Street site is relatively level, with the majority of the site occurring at an elevation of approximately 8 feet above sea level (asl). The 19th Street site is up to ten feet below the elevation of adjacent Illinois Street. The 19th Street site is partially paved, and unpaved areas are sparsely vegetated. Fencing is located along the south, west and east sides of site.

The 19th Street site is located within the Union Iron Works Historic District (Historic District), a maritime industrial district listed on the National Register of Historic Places. The approximately 8,300-square foot Building 40 (former Employment Office Annex) located in the southwest corner of the 19th Street site was determined to be a contributing resource to this Historic District, however it was not hierarchically rated as significant or significant among the 41 buildings in the Historic District. The Port plans to remove Building 40 as part of the construction phase of the rehabilitation of the 20th Street Historic Buildings in order to permit the future development of a continuous sidewalk on the east side of the Illinois Street frontage. The Port determined, and the Planning Department concurred, that Building 40's removal would not affect the historic significance of the Historic District.[1,2] If Building 40 were to remain, it would not affect the capacity (number of spaces) or access points of the proposed parking lot.

Construction

At the 19th Street site, a 24-hour parking facility is currently being pursued by the Port as part of a separate environmental review and permitting process, and the facility is proposed to be operational prior to the operation of the event center. Construction would require about six months to one year to complete. As discussed above, Building 40 located on the 19th Street site would be demolished as part of the construction phase of the rehabilitation of the 20th Street Historic Buildings in order to permit the future development of a continuous sidewalk on the east side of the Illinois Street frontage. Construction of the parking lot would include clearing of debris, minor grading, and installation of improvements such as paving, striping, and installation of permanent night lighting, fencing, a pay station, signage and stormwater management features.

Operations

The 250-space parking lot would be operational prior to the opening of the proposed event center. The lot would be available for public parking 24 hours a day, Monday through Sunday. Vehicular access to the facility would be via 20th Street from the planned Georgia Street (i.e., to the west of Michigan Street, Georgia Street would connect the 19th Street extension and 20th Street.). Event attendees would walk approximately 0.45 miles between the parking lot and the event center, or they could take the T Third light rail line between the 20th Street and UCSF/Mission Bay stations. Pedestrian access to the site would be either via 20th Street or via the planned 19th Street extension

1 Carey and Company, *Analysis of Proposed Demolitions within the Union Iron Works Historic District at Pier 70*, February 20, 2015.

2 Richard Sucre, Preservation Planner, San Francisco Planning Department, *Historic Resource Evaluation Response Pier 70 BAE Ship Repair*, February 20, 2015

(as part of the Crane Cove Park project). Due to the proximity to the event center, no shuttle bus service would be provided from this site.

It is expected that the 19th Street site would be used for parking for all events at the project site, and during non-event times would serve as general parking. The Port would develop an event day rate structure (similar to the parking management strategy currently implemented by the SF Giants at Lot A), whereby non-event parkers would be required to vacate the parking lot prior to the event, or be subject to special event rates.

Off-site Parking: Western Pacific Site

Site Characteristics

The Western Pacific site is located adjacent to Pier 80, approximately one mile south of the project site. The approximate 8.74-acre site is located on Port property, partially or fully within APNs No. 4300001, 4301001, 4302001, 4303001, 4308005, 4308006, and 4310004; the majority of the site is also within Seawall Lot 356. The Western Pacific site is zoned M-2 (Heavy Industrial) and within Height and Bulk District 40-X. The northeast and east-most portions of the Western Pacific site are within San Francisco Bay Conservation and Development Commission's (BCDC) shoreline band. An aerial of the Western Pacific site is presented in **Figure 3**.

The Western Pacific site is located within the Port Waterfront Land Use Plan' Southern Waterfront Subarea, and the site is designated as part of the Plan's Western Pacific Waterfront Opportunity Area. Industrial land uses are located west, south and partially east of the Western Pacific site. Warm Water Cove Park is located approximately 700 feet northwest of the Western Pacific site, and is proposed to be eventually expanded south between the shoreline and the north border of the Western Pacific site.

Vehicular access at the south side of the Western Pacific site is provided via Michigan Street, which extends north from Cesar Chavez Street. The Western Pacific site is largely undeveloped, and is relatively level, ranging in elevation between approximately 6 and 12 feet asl. The Port currently uses the site for storage of trailers for the Moscone Center. The Western Pacific site is currently unpaved and sparsely vegetated along the site perimeter.

Construction

It is assumed that the Western Pacific parking lot construction would require six months to one year to complete, although construction activities would not be continuous for the entire period. Minimal construction activities would occur, such as application of organic surfactant to reduce dust, and installation of temporary night lighting stands and signage.

Operations

If approved by the Port, the up-to-800-space Western Pacific parking lot would be operational in 2018-2019. As under existing conditions, vehicular ingress/egress would occur on the south side of the Western Pacific site via Michigan Street to/from Cesar Chavez Street. The parking lot would

SOURCE: Google Maps, ESA, 2015

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3
Off-Site Parking: Western Pacific Site

operate for overlapping events (i.e., events at AT&T Park that would overlap with events at the proposed event center with 12,500 or more event center attendees, on average about nine times per year). Vehicular access to this site would be via Cesar Chavez Street and Michigan Street. The facility would open two hours prior to the start of an event at the event center, and close two hours following the end of an event. Free bus service procured by the project sponsor would shuttle event attendees between the project site and the Western Pacific parking lot. The project sponsor would be responsible for accommodating the passenger demand on the shuttle buses. Service frequencies would be sized to accommodate the anticipated event attendee demand.

Impacts of Mitigation Measures

CEQA Guidelines Section 15126.4 states that "if a mitigation measure would cause one or more significant effect in addition to those that would be caused by the project as proposed, the effects of the mitigation measure shall be discussed but in less detail than the significant effects of the project as proposed." This section presents the environmental effects of the off-site parking lots that would be implemented under Mitigation Measure M-TR-11c, with more detail on the resource topics with the most potential to result in environmental effects.

Transportation Impacts

In assessing the potential transportation impacts of Mitigation Measure M-TR-11c, the Draft SEIR on pp. 5.2-178 – 5.2-179 stated that if an off-site parking lot(s) were to be determined to be feasible, it is possible that use of this off-site parking could reduce traffic impacts in the project vicinity. However, drivers who may use these potential additional parking facilities could travel along different routes, which could result in significant traffic impacts south of the project site such as along Third Street, Cesar Chavez Street, 25th Street or other streets that may be used as access to or from affected freeway on-ramps and off-ramps and approaches in the vicinity of the parking lot(s). Mitigation for such traffic impacts may be available depending on the areas affected to maintain a LOS D or better; however, due to the physical limitations of the City's street grid, land may not be available for City purchase that would allow for the expansion of street width to accommodate additional travel lanes or other design techniques to achieve the standard of LOS D or better, and City policies disfavor expansion of roadway capacity in order to achieve the City's Transit First and other goals that attempt to limit private vehicle use. Consequently, until a site-specific analysis of the identified parking lot(s) is conducted, the assessment described in the Draft SEIR concluded that it cannot be determined what mitigation measures may be available for affected areas, and then whether the measures would be feasible given the physical constraints of the street network and the availability of funding to implement the measures. The City would implement those measures that it deems feasible to achieve a LOS D or better in the affected areas, but regardless, the Draft SEIR determined that secondary traffic impacts associated with Mitigation Measure M-TR-11c,-Additional Strategies to Reduce Transportation Impacts of Overlapping Events, involving the use of one or more off-site parking lot(s) at this time would be considered potentially significant and unavoidable with mitigation.

Traffic

With implementation of the 19th Street and Western Pacific parking facilities, project vehicle trips would be dispersed over a broader area south of the project site, reducing the effect of increased traffic at intersections closer to the project site. Attendees traveling to the facilities from the south would be encouraged to park at these facilities instead of seeking parking closer to the event center. In addition, it is expected that during overlapping events at the project event center and AT&T Park, some project vehicles who would otherwise park at public parking facilities closer to AT&T Park, would instead park at the Western Pacific site.

Intersection LOS analysis was conducted for the Basketball Game scenario for conditions without and with a SF Giants evening game at AT&T Park for the weekday p.m. weekday evening, weekday late evening, and Saturday evening peak hours. In addition to the 22 study intersections analyzed for the proposed project, nine additional study intersections in the vicinity of the two parking lots were analyzed. The additional study intersections were selected because they represent intersections along the likely routes of travel between the closest freeway (I-280) and the parking lots. The selected intersections include 18th/I-280 southbound off-ramp, 18th/I-280 northbound on-ramp, Third/20th, Pennsylvania/I-280 southbound off-ramp, Pennsylvania/I-280 southbound on-ramp, Indiana/25th/I-280 northbound on-ramp, Third/25th, Pennsylvania/Cesar Chavez/I-280 northbound off-ramp, and Illinois/Cesar Chavez. The five intersections with the I-280 ramps on 18th, Indiana, and Pennsylvania Streets are unsignalized intersections, and the other four are signalized intersections. Traffic counts for conditions without and with a SF Giants evening game at AT&T Park were obtained from earlier counts conducted in June 2013 and January 2014, supplemented with new counts conducted in July and August 2015.

Existing plus Project conditions without an overlapping SF Giants Evening Game

Table 1 presents the weekday p.m. intersection LOS conditions, **Table 2** presents the weekday evening peak hour conditions, **Table 3** presents the weekday late evening intersection LOS conditions, while **Table 4** presents the weekday evening peak hour conditions for existing, existing plus project, and existing plus project with Mitigation Measure M-TR-11c for conditions without an overlapping SF Giants evening game at AT&T Park.

For the Basketball Game scenario without a SF Giants evening game at AT&T Park, the analysis assumed that all of the 250 parking spaces within the 19th Street parking lot would be available to event center attendees. For these analyses, vehicles that had been assigned to UCSF parking facilities (i.e., the vehicles assigned to the Medical Center and Community Center garages) were reassigned to the 19th Street parking lot.

The intersection LOS analysis results for the weekday p.m., weekday evening, weekday late evening, and Saturday evening indicate that the nine additional study intersections would continue to operate at LOS D or better, with minimal changes in delay. At the original 22 study intersections, average vehicle delay would change minimally and LOS conditions would generally remain the same as identified in Impact TR-2. Use of the 19th Street parking lot would not result in new significant traffic impacts, or eliminate the significant traffic impacts identified in Impact TR-2 (i.e., at King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp,

Third/Channel, Fourth/Channel, Seventh/Mission Bay Drive, Seventh/Mississippi/16th). Thus, without or with the use of the 19th Street parking lot, the project would result in significant and unavoidable traffic impacts at seven study intersections that would operate at LOS E or LOS F conditions under existing plus project conditions without a SF Giants evening game at AT&T Park. This impact is not more severe than described in the SEIR in Impact TR-2.

Existing plus Project conditions with an overlapping SF Giants Evening Game

Table 5 presents the weekday p.m. intersection LOS conditions, **Table 6** presents the weekday evening peak hour conditions, **Table 7** presents the weekday late evening intersection LOS conditions, while **Table 8** presents the weekday evening peak hour conditions for existing, existing plus project, and existing plus project with Mitigation Measure M-TR-11c for conditions with an overlapping SF Giants evening game at AT&T Park.

For the Basketball Game scenario with a SF Giants game at AT&T Park, the analysis assumed use of both parking lots by event attendees, for an additional parking supply of 1,050 vehicle spaces. Similar to the conditions without a SF Giants evening game, vehicles that were assigned to UCSF parking facilities were reassigned to both parking lots. In addition, vehicles that had conservatively been previously assumed to park at Mission Bay garages that were close to or slightly over capacity, such as the 450 South Street or the 1670 Owens Street garages, were also reassigned to the two lots. Due to the two parking facilities south of the project site, vehicle access to/from I-280 would shift from the Mariposa Street ramps to those located at Pennsylvania Avenue and Cesar Chavez Street. The analysis also assumes that for post-event late evening conditions, one to two PCOs would be stationed at the intersection of Third/Cesar Chavez, and that both travel lanes on the westbound approach of Cesar Chavez Street would be westbound through lanes (i.e., the westbound left turn-only lane would temporarily be reassigned to operate as an additional westbound through lane, and westbound left turns at this location would not be permitted; drivers destined to destinations south on Third Street would be required to make a westbound to southbound left turn at Illinois Street). West of Third Street there are two westbound travel lanes on Cesar Chavez Street, and the temporary post-event travel lane configuration can be accommodated. With implementation of the off-site parking facilities, the intersection LOS analysis results indicate that for conditions with overlapping events, intersections LOS would remain similar to those reported for the proposed project, with the following exceptions:

> *Weekday p.m. peak hour* – Implementation of the off-site parking facilities would cause the intersection of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp to operate at LOS E rather than LOS D; however, with the use of the off-site parking facilities, the intersection of Fourth/16th Street would operate at LOS D rather than LOS E.
>
> *Weekday evening peak hour* - Implementation of the off-site parking facilities would cause the intersection of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp to operate at LOS F rather than LOS D; however, with the use of the off-site parking facilities, the intersection of Mariposa/I-280 northbound off-ramp would operate at LOS C rather than LOS E.
>
> *Weekday late evening peak hour* – With implementation of the off-site parking facilities, intersection LOS conditions and identified impacts would remain the same as described in Impact TR-11. As described above, with implementation of traffic management strategies to provide for two westbound through lanes at the intersection of Third/Cesar Chavez, the intersection would operate at overall LOS D conditions.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

As described above, traffic impacts for the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park were identified as significant and unavoidable at ten study intersections. With implementation of this mitigation measure, the significant project impacts at the intersection of Fourth/16th during the weekday p.m. peak hour, and at the intersection of Mariposa/I-280 northbound off-ramp would not occur. With implementation of this mitigation measure, the proposed project would result in traffic impacts at nine, rather than ten intersections. The change in location of traffic impacts at intersections (i.e., no project impact at the intersections of Fourth/16th and Mariposa/I-280 northbound off-ramp, and a project impact at the intersection of Pennsylvania/Cesar Chavez/I-280) is consistent with the determination noted on TR-X-8 above, that it is possible that use of this off-site parking lots during overlapping events could reduce traffic impacts in the project vicinity, but that drivers who may use these additional parking facilities could travel along different routes, which could result in traffic impacts south of the project site such as along Third Street, Cesar Chavez Street, 25th Street or other streets that may be used as access to or from affected freeway on-ramps and off-ramps and approaches in the vicinity of the parking lots. Use of off-site parking facilities identified in Mitigation Measure M-TR-11c therefore would not result in a substantial increase in the severity of the proposed project's traffic impacts identified in the Draft SEIR for conditions without this measure. With this redirection in impacts at some intersections and increase in others, the overall impact remains essentially the same as described in Impact TR-11 in the Draft SEIR with implementation of Mitigation Measure M-TR-11c, Impact TR-11 conclusion remains the same: the proposed project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under existing plus project conditions with an overlapping SF Giants evening game at AT&T Park. Impact TR-11 would be considered *significant and unavoidable with mitigation.*

2040 Cumulative Conditions. Cumulative traffic volumes at the nine additional study intersections were developed using the methodology presented in SEIR pp. 5.2-110 -5.2-111. The 2040 cumulative traffic volumes take into account cumulative development projects in the vicinity of the two parking facilities, such as build-out of the Candlestick Point-Hunters Point Shipyard area, development at Pier 70, and 900 Marin Street. Intersection LOS conditions at the study intersections for 2040 cumulative conditions are presented in **Table 9** and **Table 10** for the Basketball Game scenario for the weekday p.m. and Saturday evening peak hours, respectively, for conditions without and with implementation of Mitigation Measure M-TR-11c for conditions without an overlapping SF Giants evening game at AT&T Park.

Under 2040 cumulative conditions for the Saturday evening peak hour, the additional study intersections would continue to operate at LOS D or better, and therefore 2040 cumulative traffic impacts during the Saturday evening peak hour would be less than significant.

During the weekday p.m. peak hour, the intersection of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp is projected to operate at LOS F conditions for 2040 cumulative conditions. As noted above, during overlapping events, implementation of Mitigation Measure M-TR-11c would result in significant traffic impacts at this intersection during the weekday evening peak hour, and therefore the project-specific traffic impact at this intersection would also be considered a significant cumulative impact of the project. This impact, however, does not represent a substantial increase in the severity of Impact TR-11.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

At the unsignalized intersection of Pennsylvania/I-280 southbound off-ramp, traffic signal warrants would be met for 2040 cumulative conditions without and with the proposed project, due primarily to development proposed at Pier 70. During the weekday p.m. peak hour, the proposed project would not contribute considerably to the LOS F operating conditions at this intersection for conditions without a SF Giants evening game. However, during overlapping events, implementation of Mitigation Measure M-TR-11c would contribute considerably to LOS F operating conditions, and therefore, would contribute to the 2040 cumulative impacts at this intersection. Signalization of this intersection is not currently contemplated by Caltrans; however, a new signal has been identified as a project-specific mitigation measure in the analysis being conducted for the development proposed at Pier 70.

To address traffic impacts of the proposed project after implementation of the parking facilities at the 19th Street site and Western Pacific site, Mitigation Measure M-TR-11c is augmented as follows:

- In the event that the off-site parking lots at 19th Street and the Western Pacific sites are implemented, Mitigation Measure M-TR-11c addresses potential cumulative impacts under 2040 conditions to improve traffic operations at the unsignalized intersection of Pennsylvania/I-280 southbound off-ramp. As part of that mitigation measures, the SFMTA shall consult with Caltrans in assessing the feasibility of signalizing the intersection of Pennsylvania/I-280 southbound off-ramp. If determined feasible by the SFMTA and Caltrans, the SFMTA and Caltrans shall establish the level of traffic volumes that would trigger the need for a signal, and the project sponsor shall fund its fair share cost of the design and implementation of the new signal, based on project contributions to annual average weekday traffic volumes at this intersection.

  In addition, as part of monitoring of traffic conditions during overlapping events, the SFMTA shall consult with Caltrans regarding the need to deploy an SFMTA PCO or CHP officer to expedite traffic exiting I-280 southbound (i.e., waving vehicles exiting I-280 southbound and turning left onto southbound Pennsylvania Street through the existing stop sign) during overlapping events when the Western Pacific parking lot is used for project event parking. The PCO or CHP officer could be deployed during those events prior to installation of a traffic signal or if signalization of this intersection is determined not to be feasible.

Signalization of this intersection would mitigate 2040 cumulative traffic impacts at this intersection to less than significant. However, because coordination with Caltrans and their approval regarding installation of a new signal at this location has not been conducted, the feasibility is uncertain and therefore cumulative traffic impact at this location would be significant and unavoidable. With implementation of Mitigation Measure M-TR-11c, the proposed project would result in cumulative impacts, or contribute to 2040 cumulative impacts at 16 study intersections; however, significant traffic impacts would not occur at the intersections of Fourth/16th or Mariposa/I-280 northbound off-ramp, and instead would occur at the intersections of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp and Pennsylvania/I-280 southbound off-ramp, and these impacts would be *significant and unavoidable with mitigation.* Thus, under 2040 cumulative conditions, implementation of Mitigation Measure M-TR-11c would not result in a substantial increase in the severity of traffic impacts identified for conditions without this measure.

Transit

The additional parking facilities would serve to reduce the number of attendees seeking and finding parking at parking facilities closer to the project site, and are not expected to result in a quantifiable mode shift for access to and from the event center. Therefore, with the two additional facilities accommodating a total of 1,050 vehicle parking spaces, the transit impact analysis related to capacity utilization would remain the same as presented in Impact TR-4 and Impact TR-5 for conditions without an overlapping SF Giants evening game at AT&T Park, and in Impact TR-13 and Impact TR-14 for conditions with an overlapping SF Giants evening game at AT&T Park.

Shuttle buses would connect the event center with the Western Pacific site. Prior to an event, shuttle buses would travel to the event center via Cesar Chavez Street westbound, Illinois Street northbound, and would return via 16th Street westbound, Third Street southbound, and onto Cesar Chavez Street eastbound. Pre-event, the shuttle buses would drop off passengers on the east side of Illinois Street between 16th and Mariposa Streets. The shuttle bus zone on the east curb of Illinois Street would be used by the Muni Special Event 16th Street BART station shuttle post-event, and therefore, would not result in additional temporary parking displacement during overlapping events, although the parking prohibition would be implemented earlier, so that it is available for the Western Pacific parking lot shuttle bus service during the pre-game period. Approximately 200 feet (five automobile parking spaces) would be required for the Western Pacific parking lot shuttle bus zone.

Following an event, shuttle buses would travel to the event center via Cesar Chavez Street westbound, Third Street northbound, 16th Street eastbound, Illinois Street southbound, and would return via Illinois Street southbound, Mariposa Street westbound, Third Street southbound, to Cesar Chavez Street eastbound. Post-event, buses would use the west curb of Illinois Street between 16th and Mariposa Streets to load passengers. A shuttle zone on the west curb of Illinois Street for bus layover and passenger pick-up would require temporary parking prohibition for a portion of the west side of Illinois Street between 16th and Mariposa Streets during overlapping events (currently there are about 40 on-street parking spaces on this section of Illinois Street).

The project sponsor would be responsible for accommodating the passenger demand on the shuttle buses. The majority of the arrivals and departures would occur within one hour of the start and end of the event, and would be greater during the post-event period. During a maximum capacity attendance event, assuming a shuttle capacity of 60 passengers per bus, about eight buses making three round trips between the event center and the Western Pacific parking lot would be needed to accommodate the peak post-event passenger demand of 1,400 passengers (i.e., 800 vehicles each with an average vehicle occupancy of 2.52 passengers, and about 70 percent of the demand occurring within a one-hour period). If shuttle buses with less capacity are used, more shuttle buses would be required to accommodate the passenger demand. Impacts would be less than significant.

Pedestrians

The 19th Street site is located about 0.45 miles south of the project site, and it is anticipated that given this short distance attendees would walk between the event center and the parking lot. Pedestrian access to the 19th Street lot would be via 20th Street where a sidewalk is currently provided on the north side of 20th Street, or via the planned extension of 19th Street as part of the Phase 1 of Crane Cove Park. Because a sidewalk is not currently provided on the east side of Illinois Street between 20th and Mariposa Streets (it is being built out as development on the east side of Illinois Street occurs), pedestrians would walk on the west side of Illinois Street. At Mariposa Street, pedestrians would most likely continue north on Terry A. Francois Boulevard to access the main entrance to the arena north of 16th Street. Some pedestrians may choose to walk between the event center and the 19th Street site on Third Street. The ultimate configuration of the sidewalk on the west side of Terry A. Francois is 22 feet wide, on the west side of Illinois Street is generally 10.5 feet wide, and on the east side of Third Street is 12 feet wide. Pedestrian volumes during the evening and late evening periods are generally low, and the additional pedestrians walking between the event center and the 19th Street parking lot would be accommodated on the sidewalks and at the crosswalks at intersections without substantially affecting pedestrian flows.

Travel for event attendees between the Western Pacific parking lot and the event center would be via a shuttle bus. Pedestrians would board the bus within the Western Pacific parking lot (e.g., similar to a shuttle bus system at an airport parking lot), and alight at a temporary stop on the east side (pre-event) and west side (post-event) of Illinois Street between 16th and Mariposa Streets. For pre-event and post-event conditions, PCOs would be stationed at the intersection of Illinois/16th to manage pedestrian, transit, traffic, and bicycle flows through the intersection.

The two parking lots would result in fewer pedestrians accessing the project site, particularly from parking facilities located primarily east of the project site (i.e., fewer attendees would park at UCSF parking facilities that were assumed to be available for parking during events at the project site), which would instead travel via shuttle. This would reduce the effect of additional pedestrians at the intersections of Third/South and Third/16th. Impacts would be less than significant.

Bicyclists

Illinois Street in the vicinity of both parking facilities is part of Bicycle Route 5 and a bicycle lane is provided in each direction. The additional vehicles traveling to and from the parking lots would primarily travel on Third Street and turn onto or from 20th Street and Cesar Chavez Street to access the lots. Therefore, it is not anticipated that the parking lots would result in a substantial number of project-generated vehicles on Illinois Street. In addition, the use of the sites would result in a reduction in the number of vehicles on streets in the project vicinity, where bicycle lanes are also located, but it would result in an increase of bus shuttles on 16th Street between Third and Illinois Streets, and on Illinois Street, both of which include bicycle facilities. Pre-event, the Western Pacific parking lot shuttle bus would unload passengers on the east curb of Illinois Street between 16th and Mariposa Streets, and post-event would load passengers at the west curb of Illinois Street between 16th and Mariposa Streets. On both sides of Illinois Street, the passenger loading/unloading zones would be adjacent to existing bicycle lanes. Post-event both the Muni Special Event 16th Street BART shuttle buses and the Western Pacific parking lot shuttle buses would load passengers along Illinois Street between 16th and Mariposa Streets, which could result in an increased potential for bus-bicycle conflicts and bicycle safety concerns. As described in the SEIR, post-event 16th Street between Illinois Street and Terry A. Francois Boulevard, as well as northbound Illinois Street between Mariposa and 16th Streets, would be closed to vehicular traffic to facilitate Muni Special Event Shuttle operations (local access to adjacent building from Mariposa Street would be permitted). As the event center bicycle valet parking would be accessed from the north sidewalk along 16th Street in this segment, signage, cones and PCOs would be used to direct departing bicyclists towards the signalized intersection of Terry A. Francois Boulevard/16th Street, where they can safely mount their bicycles and travel northbound and southbound on Terry A. Francois Boulevard within the planned cycle track. At the intersection of Illinois/16th, a PCO would be stationed to facilitate transit, vehicle and bicycle travel along 16th Street, as well as direct southbound pedestrians and vehicles across 16th Street. Thus, post-event bicyclists traveling southbound would be directed towards Terry A. Francois Boulevard, away from Illinois Street between 16th and Mariposa Streets, which would be extensively used by event shuttle buses and vehicles departing the project garage, and instead directed towards the cycle track on Terry A. Francois Boulevard. Thus, implementation of TMP measures during events would facilitate bicycle access and minimize conflicts. Impacts would be less than significant.

Loading

Implementation of the two parking lots would not affect on-site loading operations. However, the Western Pacific site is currently used to stage semi-trailer trucks serving the Moscone Center. With implementation of the parking lot, the staging of trucks would either continue on-site or be relocated to Pier 96. A conceptual facility layout was prepared for the Western Pacific site that confirmed that the maximum truck staging demand (i.e., 100 trailer plus 60 semi-trailer trucks for the Moscone Center operations and 25 project-generated semi-trailer trucks) and the proposed 800 automobile parking spaces could be accommodated within the Western Pacific site.[3] Therefore, the existing uses on the Western Pacific site related to Moscone Center would continue to be accommodated. During overlapping events when the Western Pacific site is proposed to be used for project parking, all the semi-trailer trucks staging at the Western Pacific site would be parked and not circulating, and therefore conflicts between pedestrians, vehicles, and the staging trucks would not occur. Impacts would be less than significant.

Emergency Vehicle Access

With implementation of the off-site parking lots on Port of San Francisco properties, the project-generated vehicles would be dispersed over a broader area south of the project site, reducing the effect of increased vehicle traffic on the roadway network closer to the project site. The operation

3 Western Pacific Site Conceptual Lot Study, Walter P. Moore and Associates, Inc., October 8, 2015.

of the two facilities would not block access to 20th, Illinois, or Cesar Chavez Streets. Impacts would be less than significant.

Construction-related Transportation Impacts

Construction activities associated with the Western Pacific lot would include minimal construction activities, and would primarily include application of organic surfactant to reduce dust, installation of temporary night-lighting stands, and signage. The improvements would occur over a six months to a year. As noted above, the 19th Street parking lot would be constructed by the Port as a separate proposed project currently undergoing environmental review. Impacts would be less than significant.

Air Quality Impacts

The off-site parking lot refinement does not affect the operational traffic health risk assessment (HRA) as presented in the DSEIR. As shown in the Air Quality Appendix Tables 6.1-3 and 6.1-4, a screening level HRA was conservatively performed assuming that each of the trip generated circled a city block, and the highest possible resulting risk from the four roadways was presented. Since the total number of trips generated does not change, this screening level analysis still represents a hypothetical maximum impact.

Noise Impacts

The additional availability of parking at these locations would result in a subtle redistribution of vehicle traffic on the local roadways which could affect the predicted roadway noise impacts. Consequently roadway noise modeling was conducted to evaluate increases in roadside noise levels along local roadways where sensitive receptors exist. **Table 11** below presents the results of this noise modeling considering only operation of the 19th Street parking lot. In addition to the six roadway segments that were analyzed for the proposed project, two new roadway segments were analyzed to assess potential impacts to Third Street between 20th Street and 23rd Street and to 20th Street between Illinois Street and 3rd Street, both of which have residential uses adjacent to roadways. Roadside noise level increases at these two roadway segments would be less than 5 dBA and less than significant. The severity of the significant and unavoidable noise impact along Illinois Street between Mariposa Street and 20th Street would be marginally decreased with this mitigation measure, but the overall impact would remain significant and unavoidable.

In addition modeling was conducted in the cumulative (Year 2040) scenario assuming a basketball game event and a simultaneous Giants Game event at AT&T Park and operation of both the 19th Street lot and the Western Pacific lot, the results of which are presented in **Table 12**. There would still be significant and unavoidable noise impacts along Illinois Street and Mariposa Street as was identified in the SEIR even with the parking lot mitigation.

TABLE 11
MODELED TRAFFIC NOISE LEVELS,
PROPOSED PROJECT WITH GLEN COVE OFF-SITE PARKING MITIGATION[a]

Roadway Segment	Existing (2015)	Existing plus Basketball Game and 19th St. Lot	dBA Difference	Significant Increase?
Weekday Peak Hour Noise Levels (4 PM – 6 PM)				
Third Street between South Street and China Basin Street	69.1	69.5	0.4	No
Third Street between 16th Street and Mariposa Street[b]	69.9	70.0	0.1	No
Illinois Street between Mariposa Street and 20th Street	60.3	62.9	2.6	No
Terry Francois Boulevard between South Street and China Basin Street	59.8	60.0	0.2	No
16th Street between Third Street and I-280	66.4	67.2	0.8	No
Mariposa Street between Third Street and I-280	65.5	66.4	0.9	No
Third Street between 20th Street and 23rd Street	68.7	69.0	0.3	No
20th Street between Illinois Street and 3rd Street	56.7	57.2	0.5	No
Weekday Evening Noise Levels (6 PM – 8 PM)				
Third Street between South Street and China Basin Street	68.5	69.7	1.2	No
Third Street between 16th Street and Mariposa Street[b]	69.1	69.2	0.1	No
Illinois Street between Mariposa Street and 20th Street	58.2	62.9	4.7	No
Terry Francois Boulevard between South Street and China Basin Street	57.5	57.9	0.4	No
16th Street between Third Street and I-280	65.6	67.0	1.4	No
Mariposa Street between Third Street and I-280	65.4	67.6	2.2	No
Third Street between 20th Street and 23rd Street	66.9	67.5	0.6	No
20th Street between Illinois Street and 3rd Street	55.8	57.7	1.9	No
Weekday Late Noise Levels (9 PM – 11 PM)				
Third Street between South Street and China Basin Street	63.4	62.5	-0.9[c]	No
Third Street between 16th Street and Mariposa Street[b]	63.7	63.8	0.1	No
Illinois Street between Mariposa Street and 20th Street	52.1	62.2	**10.1**	**Yes**
Terry Francois Boulevard between South Street and China Basin Street	53.4	60.3	**6.9**	**Yes**
16th Street between Third Street and I-280	60.2	63.4	3.2	No
Mariposa Street between Third Street and I-280	59.7	64.4	4.7	No
Third Street between 20th Street and 23rd Street	63.0	63.8	0.8	No
20th Street between Illinois Street and 3rd Street	52.5	54.5	2.0	No
Saturday Evening Noise Levels (6 PM – 8 PM)				
Third Street between South Street and China Basin Street	64.7	67.1	2.4	No
Third Street between 16th Street and Mariposa Street[b]	65.1	65.4	0.3	No
Illinois Street between Mariposa Street and 20th Street	54.7	61.7	**7.0dec**	**Yes**
Terry Francois Boulevard between South Street and China Basin Street	54.0	54.9	0.9	No
16th Street between Third Street and I-280	61.4	64.0	2.6	No
Mariposa Street between Third Street and I-280	60.4	64.9	4.5	No
Third Street between 20th Street and 23rd Street	64.7	65.6	0.9	No
20th Street between Illinois Street and 3rd Street	55.5	57.3	1.8	No

NOTES:

[a] Road center to receptor distance is assumed to be 50 feet for values shown in this table. Noise levels were determined using the Federal Highway Administration (FHWA) traffic noise model. The average speed on these segments is assumed to be 25, 30 or 35 miles per hour, depending on the roadway. For all other assumptions, refer to Appendix NO. In an existing ambient noise environment of 65 dBA or greater, an incremental increase is considered significant if the noise increase is equal to or greater than 3.0 dBA. In an existing ambient noise environment below 65 dBA, an incremental increase is considered significant if the noise increase is equal to or greater than 5.0 dBA.

[b] This portion of Third Street would not see meaningful increases in traffic volumes during events due to project access limitations and egress routing during events.

[c] Traffic routing during event egress would be conducted such that volumes on Third Street would be reduced compared to a non-event scenario.

20th Street between Illinois Street and 3rd Street	55.5	55.4	57.3	1.9	1.8	No

NOTES: Road center to receptor distance is assumed to be 50 feet for values shown in this table. Noise levels were determined using the Federal Highway Administration (FHWA) traffic noise model. The average speed on these segments is assumed to be 25, 30 or 35 miles per hour, depending on the roadway. For all other assumptions, refer to Appendix NO. The incremental increase is considered significant if the noise increase is equal to or greater than 3 dBA with an ambient noise environment greater than 65 dBA.

[a] Although cumulative noise impacts would occur along 20th Street and Third Street, because the projects would contribute less than 1.5 dBA to this increase, the projects contribution is not considered cumulatively considerable.

SOURCE: ESA 2015

Cultural Resources Impacts

The 19th Street site is located within the Union Iron Works Historic District, a maritime industrial district listed on the National Register of Historic Places. The approximately 8,300-square foot Building 40 (former Employment Office Annex) located in the southwest corner of the 19th Street site was determined to be a contributing resource to this Historic District; however it was not hierarchically rates as significant or significant among the 41 buildings in the Historic District. The Port plans to remove Building 40 as a part of the construction phase of the rehabilitation of the 20th Street Historic Buildings in order to permit the future development of a continuous sidewalk on the east side of the Illinois Street frontage. The Port determined, and the Planning Department concurred, that its removal would not affect the historic significance of the Historic District.[4,5] The project's use of the 19th Street site would result in no impacts on historic resources because demolition would be conducted before the project is implemented and is not part of the 19th Street Parking Lot project. At the Western Pacific site, there would be no impacts on historic resources because there would be no demolition or excavation required for construction of the parking lot. While construction of either parking lot would only involve minor grading, there would be the potential to encounter archaeological resources in the shallow soils; but this potentially significant impact would be subject to and reduced to less than significant with implementation of the same mitigation measure as the proposed project.

Biological Resources Impacts

The 19th Street site is partially paved, and unpaved areas are sparsely vegetated. The Western Pacific site is currently unpaved, and sparsely vegetated along the site perimeter. Given the sparse, ruderal, and weedy nature of the vegetation currently present at these sites, impacts on biological resources would be less than significant, and no mitigation would be required.

Hydrology and Water Quality Impacts

Water Quality

The 19th Street site is located within drainage area of the City's combined sewer system. Because the project would disturb an area of more than 5,000 square feet and the site is primarily paved, construction of the parking lot would need to comply with San Francisco's Stormwater Guidelines, including the installation of stormwater controls to reduce the volume and rate of stormwater runoff from the site by 25 percent. Thus, impacts related to constructing new stormwater infrastructure, exceeding the capacity of a stormwater system or providing and additional source of polluted runoff would be less than significant. The project would not contribute to an increase in combined sewer discharges during wet weather because it would result in reduction of stormwater flows to the combined sewer system relative to existing conditions. For this site, the project sponsor would be required to obtain a Construction Site Runoff Control Permit and implement an Erosion and

4 Carey and Company, Analysis of Proposed Demolition within the Union Iron Works Historic District at Pier 70, February 20, 2015.

5 Richard Sucre, Preservation Planner, San Francisco Planning Department, *Historic Resource Evaluation Response Pier 70 BAE Ship Repair*, February 20, 2015.

Sediment Control Plan for construction activities, in accordance with the Construction Site Runoff requirements of Article 4.2 of the *San Francisco Public Works Code*, Section 146.

The Western Pacific site is located within an area served by a separate storm sewer system. There would be no changes to the surface conditions that would result in a change in stormwater runoff from the site. Construction activities at the Western Pacific site would be required to comply with the State Water Resources Control Board General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, so construction impacts would also be less than significant.

Flooding and Tsunami Impacts

The 19th Street site is not located within a 100-year flood zone,[6] therefore there would be no impact related to flooding. The Western Pacific site is partially located within a 100-year flood zone,[7] but, the parking lot project does not include construction of any structures that could be damaged by flood flows or impede flood flows. Both sites are located within a tsunami inundation zone,[8] but the parking lots would not include the construction of any structures in this zone that could be damaged. As for the proposed project, activation of the National Warning System and San Francisco outdoor warning system would allow for evacuation of people prior to a seiche or tsunami and would provide a high level of protection to public safety. Therefore, impacts related to tsunami inundation would be less than significant.

Neither site would be permanently inundated with 11-inches of sea level rise by 2050 or with 36-inches of sea level rise by 2100.[9] Even if flooding were to occur in the future, the project does not include the construction of structures that could be damaged. Further, no people would be put at risk because of the intermittent use of the site. Therefore, impacts related to flooding as a result of sea level rise would be less than significant.

Hazardous Materials Impacts

The 19th Street site is also located within the Pier 70 Master Plan Area and soil may have been contaminated as a result of historic land uses. However, similar to the proposed project, impacts related to exposure to hazardous materials in the soil would be less than significant with implementation of the requirements of the Pier 70 Risk Management Plan.[10] The 19th Street site is underlain by fill that was likely obtained from the nearby Irish Hill which was comprised of serpentinite bedrock. While workers and the public could be exposed to naturally occurring asbestos during construction, impacts related to the potential to encounter naturally-occurring asbestos would be substantially the same or less than that of the proposed project, and the same mitigation measure would apply.

---

10 Treadwell & Rollo. Pier 70 Risk Management Plan, Pier 70 Master Plan Area, San Francisco, California. July 25, 2013.

The Western Pacific site was a former switchyard for Western Pacific, and the soil and groundwater are contaminated with inorganic and organic chemicals as a result of past activities. The City and County of San Francisco recorded a deed restriction[11] on the property in 2002, which reports that a 2000 Human Health and Ecological Risk Assessment (approved by the RWQCB) determined that the chemicals in the soil would not pose a human health risk under most land uses. In addition, construction of the parking lot at this site would not involve any excavation so workers and the public would not be exposed to hazardous materials or naturally occurring asbestos in the soil (if present).

Other Impacts

Implementation of these two surface parking lots would result in no impacts on land use, wind/shadow, recreation, utilities, public services, and geology, because none of these resources would be affected. Parking uses at these sites would be compatible with the existing uses at the site, no structures would be developed, and the parking use associated with the proposed project would be transient. Impacts associated with population/ housing, GHG emissions, and energy resources would be substantially the same or less than those disclosed for the proposed project and the same mitigation measures would apply.

Conclusions

Overall, as described above, the use of the parking facilities at the 19th Street site (proposed by the Port of San Francisco) and Western Pacific site (implemented as part of this mitigation measure) during evening events at the project site would not result in any new or substantially more severe transportation impacts associated with the proposed project related to vehicular traffic, transit, pedestrians, bicycles, emergency vehicle access, or construction-related transportation impacts. Potential impacts on other resources would be less than significant, assuming implementation of the same mitigation measures as those identified for the proposed project. However, as discussed above, even with implementation of the off-site parking facilities included in Mitigation Measure M-TR-11c, the identified traffic impacts in Impact TR-11 would remain *significant and unavoidable with mitigation.*

As with the Impact TR-11, without or with implementation of the off-site parking facilities included in Mitigation Measure M-TR-11c, under 2040 cumulative conditions described in Impact C-TR-2, the proposed project in combination with other past, present, and reasonably foreseeable future projects would result in significant cumulative traffic impacts at 16 intersections in the project vicinity. Under 2040 cumulative conditions, implementation of Mitigation Measure M-TR-11c would not result in a substantial increase in the severity of traffic impacts identified for conditions without this measure. To further address traffic impacts of the proposed project after implementation of the parking facilities at the 19th Street site and Western Pacific site, Mitigation Measure M-TR-11c is augmented as described above. With implementation of Mitigation Measure M-TR-11c, cumulative Impact C-TR-2 would remain *significant and unavoidable*.

Re: Response to Philip King, Ph.D. Memo Regarding Proposed Relocation of Golden State Golden State Warriors from Oakland to San Francisco

Dear Mr. Mitchell:

ALH Urban & Regional Economics (ALH Economics) has reviewed the July 13, 2015 memo from Philip King, Ph.D. to Patrick Soluri, Attorney at Law, regarding Dr. King's comments on the EIR for the proposed relocation of the NBA franchise Golden State Golden State Warriors from Oracle Arena in Oakland to San Francisco. Dr. King's opinion is that the EIR did not analyze the potential for urban decay resulting from event reductions at the Oracle Arena, which were referenced in the project's AB900 Application. Further, Dr. King believes that the issue of "urban decay should have been identified in any environmental analysis and mitigated where possible."[1] ALH Economics has prepared the following response to address Dr. King's comments, paralleling the headings in Dr. King's memo where relevant.

SUMMARY OF FINDINGS

The Golden State Warriors EIR did not include analysis of urban decay. In the context of CEQA, economic impacts are not an impact on the physical environment and need not be considered unless as a result of economic impacts, a physical change to the environment results. The probability of a project causing urban decay that requires analysis under CEQA has thus far been largely focused on large-scale retail development, mostly of a big box orientation. These analyses probe whether or not a significant indirect environmental impact of urban decay or deterioration is anticipated to occur in an identified market region due to the large-scale retail development so substantially drawing business away from local retailers that urban decay results. The San Francisco successor agency to the Redevelopment Agency (Office of Community Investment and Infrastructure) has no reason to

[1] Memo to Patrick Soluri, Attorney at Law, from Philip King, Ph.D., regarding Urban Decay Analysis of Proposed Relocation of Golden State Warriors from Oakland to San Francisco, page 9.

anticipate that urban decay would result from the relocation of the Golden State Warriors from Oakland to San Francisco and the development of the proposed Golden State Warriors Event Center.

In Dr. King's summary of his findings, he indicated that there would be a direct loss of $44.9 million in economic activity and 494 jobs in Alameda County when the Warriors move to San Francisco, with even greater indirect and induced economic impacts. Dr. King claims that removing these jobs and economic activity from the East Bay will exacerbate existing conditions of urban decay, and impact the City of Oakland's ability to respond to this decay.

Dr. King does not define urban decay and further does not indicate the extent to which his estimated job losses and economic activity will be localized, and thus associated with localized urban decay. Urban decay may be defined as multiple visible symptoms of physical deterioration that invite such things as vandalism, loitering, and graffiti in a particular location that is caused by a downward spiral of business closures and long-term vacancies. The physical deterioration to properties or structures is so prevalent, substantial, and lasting for a significant period of time that it impairs the proper utilization of the properties and structures and the health, safety, and welfare of the surrounding community.

The ALH Economics analysis conducted in response to Dr. King's memo found that Dr. King greatly overstated the potential jobs and economic impacts that could leave Alameda County with the Golden State Warrior's relocation. Dr. King's analysis is based on the assumption that all Warrior's revenues derive from ticket sales to patrons living in the East Bay, San Francisco, and the Peninsula. However, there are numerous other revenue sources, such as merchandise sales and media revenues, and ALH Economics found that only 76% of ticket sales originate from the areas identified by Dr. King. Further, Dr. King's analysis of a generalized economic impact on Alameda County does not lead to the conclusion that urban decay will result in a specific location.

Other weaknesses in Dr. King's analysis include his assumption that only 21 events will be held annually at the Oracle Arena after the departure of the Warriors. Dr. King based this analysis on the AB900 application, prepared in accordance with the Governor's Office's procedures for the purpose of demonstrating the net change in greenhouse gas emissions that would result from the current operation compared to the proposed development. The EIR contains no such statement. Dr. King also states that there is a strong argument that the Oracle Arena, or any similar venue in a similar situation, will not be viable without a home sports team, citing an example of one facility that closed five years after its last team left the arena. In direct contradiction to Dr. King's statement that it was questionable if similar venues could continue operations, ALH Economics presents case study findings of many indoor arenas in the United States that have continued to operate over an extended period of time. The continued success of these arenas does not necessarily mean that the Oracle Arena will be equally successful, but it demonstrates success when Dr. King said there would be none, refuting Dr. King's position.

Finally, Dr. King mentions that the Oracle Arena is located in a former Redevelopment Project Area, characterized by blight. ALH Economics found that the immediate environs around the Oracle Arena were not characterized by urban decay, whose conditions comprise a subset of blight. While some signs of trash and graffiti on a nearby major road were observed, the presence of existing conditions such as these does not mean that urban decay will prevail at the Oracle Arena or its environs as a result of the relocation of the Golden State Warriors to San Francisco. The Arena has strong locational assets, including highway visibility, highway accessibility, and BART access, which will bode well for future use of the Arena or future use of the Arena site if the Arena is closed.

The City of Oakland adopted the Oakland Coliseum Specific Plan in April 2015, which provides a guiding framework for reinventing the City of Oakland's Coliseum area as a major center for sports, entertainment, residential mixed use, and economic growth. The plan includes provisions for both the retention and demolition of the existing Oracle Arena. Moreover, if one or more of the new sports venues included in the Specific Plan is not constructed, the Specific Plan's allowable development program could provide for non-sports uses, such as science and technology housed within buildings lower in height than the sports venues. Dr. King fails to mention anything about Oakland's proposals for new development in the area of the Arena.

RESPONSE TO DR. KING'S MEMO

Dr. King's memo included analysis on several topics regarding the proposed relocation of the Golden State Golden State Warriors from Oracle Arena in Oakland to San Francisco, including information about the economics of moving a basketball team, implications about reversing directions across the Bay Bridge by fans, economic leakage of Golden State Warriors spending, economic impact of the relocation, and urban decay implications. Each topic starts with a synopsis of Dr. King's analysis, presented in lightly bolded italics, followed by an ALH Economics response. The topics are presented in the same order as in Dr. King's memo.

Dr. King's memo does not include a definition of urban decay. Generally speaking, urban decay is characterized by physical deterioration to properties or structures that is so prevalent, substantial, and lasting a significant period of time that it impairs the proper utilization of the properties and structures, and the health, safety, and welfare of the surrounding community. The focus of CEQA review is on whether a project will result in impacts on the physical environment. CEQA directs the lead agency to consider economic effects, to the extent those effects have the potential to culminate in physical environmental effects (CEQA Guidelines, § 15131). Characteristics of physical deterioration contributing to urban decay include abandoned buildings, boarded doors and windows, parked trucks and long-term unauthorized use of the properties and parking lots, extensive or offensive graffiti painted on buildings, dumping of refuse or overturned dumpsters on properties, dead trees and shrubbery, and uncontrolled weed growth. This is the context of urban decay that ALH Economics deems relevant to the response herein.

Most urban decay analyses prepared for CEQA purposes focus on large-scale retail development projects, and the potential for such projects to cause competitors to go out of business, resulting in vacancies and physical deterioration of buildings. Such analyses include information on the commercial real estate market and other germane real estate conditions. Such analyses rarely if ever focus on sports venues or similar uses.

In his memo, Dr. King makes reference in his response to the West Bay as a geographic area. This is not a standard, recognized geographical reference in the San Francisco Bay Area. Therefore, ALH Economics does not repeat this misnomer in the response to Dr. King. Instead, by context, it appears Dr. King is collectively referring to San Francisco and the Peninsula. ALH Economics makes this reference more explicit in the following response.

Economics of Moving a Basketball Team

Dr. King provides a synopsis of a portion of sports economics literature that addresses the economics of sports teams with the position that sports teams do not have a significant economic impact. The overall position of this literature is that when sports teams relocate, the people who attend games do not increase their leisure time spending, but rather transfer their spending from other leisure time activities. This is the substitution effect. In addition, Dr. King summarizes the literature's view on leakage, which distills down to the expectation that many of the dollars spent by patrons on tickets leak out of the community in the form of payment to players, most of whom do not live in the same areas as their team location, and to investors. Thus funds are transferred out of the metropolitan area where the team is located. Dr. King uses this literature distillation to support statements suggesting that negligible economic impacts result from the relocation of a professional team from one metropolitan area to another. However, Dr. King indicates this is not the case when the relocation occurs within the same metropolitan area, such as the relocation of the Golden State Warriors from Oakland to San Francisco. In this case Dr. King states a belief that economic substitution and leakage will remain the same before and after the relocation, but that the City of San Francisco will take economic activity from the City of Oakland since the same fans will continue to attend Golden State Warriors games.

ALH Economics believes the purpose of Dr. King's summary of the literature is to set the stage for his position that the City of Oakland will incur economic impacts associated with the relocation of the Golden State Warriors to San Francisco. As a general opinion, with no direct bearing on Dr. King's position on urban decay, this section does not warrant any response. Instead, responses are provided to other sections of Dr. King's memo where he further develops this position.

Reversing Directions Across the Bay Bridge

In this section of his memo, Dr. King discusses the substitution effect of leisure spending and the degree to which he anticipates it occurring in association with relocation of the Golden State Warriors from Oakland to San Francisco. He concludes that most fans will continue attending games after the relocation, thus fans will not seek local substitutions for their Golden State Warrior game-related spending, and associated economic activity will therefore be redistributed. Dr. King additionally presents an analysis of the amount of leisure spending he estimates will be redistributed based upon assumptions regarding Golden State Warriors revenues, the distribution of fans, and the associated distribution of revenue originating from the East Bay as one geographic area and San Francisco and the Peninsula as a second geographic area. Dr. King's estimate of Golden State Warriors revenues of $168 million in revenue was obtained from a Forbes.com website. His analysis is then predicated upon the assumption that the revenue is generated by spectators, and that it is sourced proportionate with the distribution of the Bay Area's population in the East Bay, San Francisco, and the Peninsula. Pursuant to his analysis, Dr. King concludes that $99.4 million in Golden State Warriors revenue (59%) is generated by spectators living in the East Bay and $68.6 million (41%) is generated by spectators living in San Francisco and the Peninsula.

ALH Economics believes there are significant fallacies in Dr. King's analysis, which substantially inflate the extent to which he estimates revenues will relocate across the Bay. He is incorrect in assuming all revenues are derived from spectators, and the proportion of spectators from the East Bay. As a result, he errs in assuming the degree to which the relocation affects the location of origin of revenue. More importantly, he fails to demonstrate what any of his calculations have to do with urban decay, as his point seems to be that the East Bay generally will lose jobs and revenue, and not that a particular localized current use, such as existing small retail establishments, will go out of business as a result of his estimated relocation of revenues.

Specifically, Dr. King implicitly assumes that 100% of the Golden State Warriors revenues are derived from spectators, or essentially ticket sales. This is clear from his assumption of $168 million in revenue; with 59% of revenue generated by East Bay residents and 41% generated by San Francisco and Peninsula residents. While Dr. King does not define what he means by the East Bay in his analysis, the typical understanding in the Bay Area is that the East Bay comprises Alameda and Contra Costa counties.[2] Thus, in his discussion of the East Bay, ALH Economics assumes Dr. King is referencing these two counties. Further, the definition for the Peninsula typically includes San Mateo County and the northwestern part of Santa Clara County, including the cities of Cupertino, Los Altos, Mountain View, and Palo Alto.

Ticket sales are only one revenue source for an NBA franchise such as the Golden State Warriors, with many others contributing various levels of revenues. As noted in the Public Offering for the Brooklyn Arena Local Development Corporation PILOT Revenue Bonds, series 2009, home to New Jersey Basketball, other revenue categories in addition to ticket sales include merchandise bearing the team name or logos, media revenues, game day temporary signage and advertising revenues, and other team revenues.[3] In the case of the Golden State Warriors, these other revenues include a share of game day food and drink sales, a share of parking revenues, among others.

There are no public revenue reporting requirements for NBA teams. Information presented by sources such as Forbes therefore cannot be validated by publically available information. Thus, there is no way to validate the Forbes revenue estimate of $168 million on which Dr. King bases his analysis. In like manner, there is no way to validate NBA team net operating income estimates presented in "The Wages of Wins Journal," which in 2011 presented estimated net operating income and franchise value for NBA teams in 2010-2011.[4] For all NBA teams in 2010-2011, this source estimated the following components of net operating income: estimated gate; share of national TV contracts, money going to Spirits of St. Louis, and other revenues. Based upon the estimates presented in this article for all teams, on an average basis these revenues sources are distributed as follows:

- 41.0% Estimated Gate (i.e., ticket sales);
- 25.8% Share of National TV Contracts;
- -0.5% Money going to Spirits of St. Louis; and
- 34.8% Other Revenues.

[2] https://en.wikipedia.org/wiki/San_Francisco_Bay_Area. In addition to the East Bay comprising Alameda and Contra Costa counties, the definition for the Peninsula typically includes San Mateo County and the northwestern part of Santa Clara County, including the cities of Cupertino, Los Altos, Mountain View, and Palo Alto.

[3] "Brooklyn Arena Local Development Corporation, PILOT Revenue Bonds, Series 2009 (Barclays Center Project), page 69.

[4] See "The Wages of Wins Journal," "The Bottom Line on the NBA Finances," November 8, 2011, http://wagesofwins.com/2011/11/08/the-bottom-line-on-the-nba-finances/

While the validity of these figures is indeterminate, they clearly indicate that there are many other sources of revenue beyond ticket sales. And if the figures derived from The Wages of Wins Journal 2011 article are a reasonable indication, ticket sales comprise less than 50% of NBA team revenues. Hence Dr. King's estimation of the magnitude of revenues originating from the East Bay and San Francisco/Peninsula areas from ticket sales appears to be grossly overstated, regardless of the actual volume of team revenues.

Moreover, with a minor locational shift of the Golden State Warriors from Oakland to San Francisco, ALH Economics does not believe there will be a significant shift in the location of origin for other major revenue sources. A media market is a region where the population receives the same or similar television and radio station offerings, and may include other types of media including newspapers. The Bay Area, including the cities of San Francisco, Oakland, and San Jose, comprises a single media market.[5] The geographic source of radio broadcast rights and advertising payments are not likely to change based on the relocation of the Golden State Warriors within the San Francisco Bay Area. Media outlet locations and hence the geographic origin of media revenues are not going to change because the Golden State Warriors move from Oakland to San Francisco. In addition, the Golden State Warriors are already a regional asset, thus corporations that choose to engage in game day and other associated advertising are also not likely to change significantly. In sum, Dr. King's assumptions that all sources of revenue were from ticket sales is unsupported.

Regarding Dr. King's assumption as to the place of residence of Warrior's patrons, ALH Economics obtained information from the Golden State Warriors that shows that his assumption split of 59% patrons from the East Bay and 41% from San Francisco and the Peninsula is overstating patronage for both areas. The information from the Golden State Warriors indicates the following place of residence for patrons:[6]

- Alameda County, 30%
- Contra Costa County, 17%
- San Francisco County, 15%
- Santa Clara County, 12%
- San Mateo County, 10%
- Marin County, 4%
- Solano County, 3%
- Sonoma County, 2%
- Santa Cruz County, 1%
- San Joaquin County, 1%
- Napa County, 1%
- Other, 4%

Thus, based upon this information, the share of patrons from the East Bay, comprising Alameda and Contra Costa counties is 47%. This is lower than Dr. King's 59% assumption. The share of patrons from San Francisco and the Peninsula, assuming this area includes 1/3 of the patronage from Santa Clara County since the Peninsula includes only the northernmost cities in Santa Clara County, totals

[5] https://en.wikipedia.org/wiki/Media_market#United_States
[6] E-mail communication from Clarke Miller of the Golden State Warriors to Paul Mitchell, ESA, August 27, 2015.

29%, compared to Dr. King's 41% assumption. This leaves a balance of 24% of patrons from areas other than the ones referenced by Dr. King and reflected in his analysis. This information indicates that Dr. King is overstating Golden State Warriors patronage from the East Bay, San Francisco, and the Peninsula by a significant factor. Neither of Dr. King's assumptions that all revenues are from ticket sales and that 59% of patrons are from the East Bay is a correct assumption.

ALH Economics believes Dr. King is significantly overestimating the degree to which Golden State Warriors revenues will "reverse directions across the Bay Bridge," as worded by Dr. King. And even if the analysis were done correctly, the fact that some portion of revenues and employment now found in East Bay counties will relocate to San Francisco fails to provide any useful information that urban decay will result in the area of the existing Oracle Arena.

Leakage

In this memo section Dr. King takes the estimated level of Golden State Warriors revenues, estimates how these revenues are expended, and estimates the resulting level of expenditures that are historically spent in the East Bay (versus the dollars that leak out of the region). He then concludes that this level of expenditures will be redistributed from the East Bay to the San Francisco/Peninsula area. In conducting this analysis, while not attributed as such, Dr. King assumes expenditures are distributed pursuant to information included in the aforementioned Forbes.com article. The categories he uses include operating income, player's salaries, and other expenses. Dr. King then assumes that none of the operating income expenditures, comprising funds that go to the owners and investors of the Golden State Warriors, are spent within the region, and thus none will shift geographically following the team's relocation. He similarly assumes that very little of the player's salaries accrue to player's living in the region, as he cites a source indicating that few NBA players live within the same larger metropolitan area as the team they play for, and thus he assumes only 10% will shift geographically. However, Dr. King implicitly assumes that 80% of all other expenditures (e.g., wages, inventory, etc.) accrue to the benefit of people and businesses located in the East Bay, and that all of these expenditures will shift from the East Bay to the San Francisco/Peninsula area with the team's relocation. Based on these assumptions, Dr. King concludes that $7.8 million in player's salaries and $36.1 million in other expenses (wages, inventory, etc.) will shift from the East Bay to the San Francisco/Peninsula area, totaling $43.9 million.

In this section, Dr. King further refines the degree to which employment and revenues of the Warriors will relocate from the East Bay to San Francisco. ALH Economics disagrees with Dr. King's approach. First, Dr. King provides no support for his assumption that 80% of existing "Other Expenses" are spent within the East Bay. Second, Dr. King's assumption that 100% of these expenditures will shift from the East Bay to the San Francisco/Peninsula area when the team relocates to San Francisco is inappropriate because it implicitly assumes all Golden State Warriors employees living in the East Bay would move to San Francisco or the Peninsula, an illogical assumption. And finally, and most importantly, he again fails to demonstrate how his predicted shift in employment and revenue leads to a localized urban decay condition in the location of the Arena in Oakland.

Dr. King does not comment on the composition of the portion of "Other Expenses" that he estimates is spent locally other than to cite that it includes wages, inventory, etc.[7] Other line items that surely would be included in this category for the Golden State Warriors are other employee-related expenses, such as FICA, retirement, unemployment compensation, worker's compensation, and health insurance. Dr. King may or may not have included these costs in his 20% allocation of "Other Expenses" that is not spent locally, but as his assumption was not articulated there is no knowing if this was or was not the case. Regardless, these are expenditures that will be unlikely to be redirected to the San Francisco/Peninsula area after relocation of the Warriors. The same is the case with team expenses (other than salaries), such as travel-related expenses, which are likely substantial given the number and location of away games for the team. Other types of expenses that might be relevant but also unlikely to change geographically could include promotion and publicity and player development.

ALH Economics recognizes there are some team expenses that are likely to be shifted geographically upon team relocation to the Event Center. These will certainly include office-related expenses, such as rent, janitorial service, and office supplies, and any arena-related costs borne by the team. Based upon Dr. King's analysis, however, it is unlikely these costs will total $43.9 million. Thus, ALH Economics believes that Dr. King is overstating by a significant factor the potential shift in economic activity resulting from the relocation of the Golden State Warriors from Oakland to San Francisco.

Moreover, at the very beginning of the next section of Dr. King's analysis, he references that this $43.9 million will comprise a direct loss to the City of Oakland. This is very inconsistent with Dr. King's earlier statements that these expenditures will be redistributed from the East Bay. By making this statement about a loss to Oakland, Dr. King is implicitly indicating that he believes that 80% of all the Golden State Warrior's "Other Expenses" are made in Oakland, including distribution of employee payroll, governmental benefits, and promotion and publicity. Yet in his memo, Dr. King cites "we assume that 80%, or $36.1 million, was spent within the larger metropolitan area."[8] By context, as well as later reference by Dr. King, his analysis at this point is based upon anticipated redistribution of $43.9 million from the East Bay.[9] These are two inconsistent statements, and thus inconsistent assumptions, since Oakland does not meet the definition of "larger metropolitan area." Thus, this reference to Oakland is an inconsistent shift from Dr. King's earlier analysis predicated upon the East Bay.

Finally, Dr. King's analysis of "Other Expenses" implicitly assumes that 80% of non-player wages will be geographically redistributed when the Golden State Warriors relocates its headquarters from Oakland to San Francisco, a relatively minor geographical shift in an office location of approximately 12 miles. The Bay Area workforce is used to substantial work commutes. As reported by KQED in 2013, in reporting on a U.S. Census Bureau study, the San Francisco-Oakland-Fremont metro area[10] has more workers than anywhere else in the country who travel at least 50 miles **and** 90 minutes (one

[7] King, page 5.
[8] Ibid.
[9] King, page 6.
[10] Until 2013 this MSA definition included 5 Bay Area counties, e.g., Alameda, Contra Costa, Marin, San Francisco, and San Mateo counties (see https://en.wikipedia.org/wiki/San_Francisco%E2%80%93Oakland%E2%80%93Hayward,_CA_Metropolitan_Statistical_Area

way) to work.[11] This suggests that a minor relocation of an office location, entailing a potential increase in commute time for some workers, is not likely to prompt employees to change the location of their residence. Moreover, the relocation may instead reduce commute times for those employees who already reside in San Francisco or the Peninsula.

This minor work location shift is compounded by the cost of residential real estate in the San Francisco Bay Area. Relatively speaking, the cost of homes and apartment rents in the East Bay region of Alameda and Contra Costa counties is lower than costs in San Francisco and the Peninsula. For example, as reported by the San Francisco Chronicle in August 2015, and sourced by the Chronicle to CoreLogic,[12] the average price of homes sold for July 2015 and the percent change from the prior July was as follow:

- $491,000 in Contra Costa County, 2.0% increase;
- 656,000 in Alameda County, 12.1% increase;
- $840,000 in Santa Clara County, 16.3% increase;
- $997,500 in San Mateo County, 17.4% increase; and
- $1,075,000 in San Francisco County, 11.4% increase.

A similar pattern is in place for apartment rents. While dated, the average monthly rents by county in October 2014 and increases over the prior year were reported in the Mercury News, sourced to RealFacts, as follows:[13]

- $1,659 in Contra Costa County, 8.8% increase;
- $1,994 in Alameda County, 11.6% increase;
- $2,369 in Santa Clara County, 10.7% increase;
- $2,580 in San Mateo County, 10.7% increase; and
- $3,400 in San Francisco County, 9.8% increase.

As these housing price data indicate, housing costs are lower in the East Bay than in San Francisco or the Peninsula. Thus, it is unlikely that Golden State Warriors employees would choose to relocate their home from the relatively lower cost East Bay region to San Francisco or the Peninsula, which are significantly more costly, to gain a minor reduction in commute time. Further, as noted in the average home sales price findings, year to year increases tend to be greater overall in the combined San Francisco/Peninsula area than in the East Bay. Thus, the cost differentials are likely to become more extreme over time, making it relatively more affordable for Golden State Warriors employees that live in the East Bay to remain in the East Bay.

In sum, Dr. King's "Leakage" analysis provides no support that the local area of the Arena will experience urban decay from some shift in revenue from the East Bay to San Francisco.

Economic Impact

Dr. King uses the IMPLAN Input/Output software model to assess the economic impacts of the $43.9 million in Golden State Warriors expenditures that he believes will shift from Alameda County to San Francisco and the Peninsula. By inputting the $43.9 million in expenditures he derives an employment impact in Alameda County from the Golden State Warrior's operations of 805.6 jobs (including 494.3 direct jobs), $45.3 million in labor income (including $28.5 million in direct labor), and $86.6 million in output. He further identifies, through the IMPLAN model, which industries the IMPLAN model indicates comprise the job impacts and their associated labor income and output.

IMPLAN Model Application. ALH Economics has several comments on this analysis conducted by Dr. King. First, ALH Economics replicated the analysis to ensure proper implementation by Dr. King. ALH Economics concludes that Dr. King implemented the IMPLAN model appropriately, relative to applying the model input and reporting the outputs. However, Dr. King did not use the most current model, and thus misrepresented his findings by allusion as current to the time period reflected by his Forbes.com revenue source.

ALH Economics identified a fallacy regarding the $43.9 million estimate used as the primary model input. As stated earlier, the validity of the revenue figure used as a basis for Dr. King's analysis is not known. Further, Dr. King's analysis assumes this expenditure level will be shifted to San Francisco and the Peninsula. It is unclear what jurisdiction Dr. King anticipates these expenditures will be shifted from, as he variously refers to them as expenditures in the East Bay, in Oakland, or in Alameda County.[14] Even if this level of expenditures does occur in one of the geographies assumed by Dr. King, ALH Economics demonstrated that only a portion will shift when the Golden State Warriors relocate.

In like manner, Dr. King also confuses his reference to geography for his IMPLAN findings. The ALH Economics replication determined that Dr. King's analysis was conducted for Alameda County; however, Dr. King variously refers to the IMPLAN study area as the City of Oakland, Alameda County, or the East Bay (i.e., Alameda and Contra Costa counties). Thus his data presentation is confusing.

As is true of all models, the results will only be as good as the data used in the analysis. As already demonstrated, the basic revenues attributable to the East Bay from Warrior's operations by Dr. King are not supportable. Consequently, the results of the modeling exercise performed by Dr. King, although apparently modeled correctly, provide no useful information as to the amount of revenues from Warriors operations that might shift from the East Bay to San Francisco. And, most importantly, provide no support that urban decay in the area of the Arena will occur.

IMPLAN Model Outputs. The way IMPLAN works, the data one uses as inputs to the model comprise the economic stimulus that is the basis for the analysis. In this case, the economic stimulus is the Golden State Warrior's operations. The findings generated by the model labeled "direct" are then the estimated characteristics associated with just the stimulus. Thus, based on the findings reported by Dr. King, the IMPLAN analysis indicates Golden State Warriors employment excluding most of the players (i.e., King only includes 10% of player's salaries in the $43.9 million) totals at least 494.3 people, with $28.5 million in wages. Examination of the EIR for the Golden State Warriors relocation indicates that

[14] See reference to Alameda County in King, page 6.

existing employment is estimated at 150 FTEs, or full-time equivalents. This is less than one-third the level of staff employment estimated by IMPLAN. This indicates that IMPLAN is either not an appropriate medium for analysis of the Golden State Warriors or the inputs were not appropriate for the analysis. Thus, the inappropriateness of this fundamental finding pertaining to the Golden State Warriors suggests there is limited validity to Dr. King's IMPLAN analysis and his corresponding conclusions regarding the Golden State Warriors' economic impact upon relocation to San Francisco.

Finally, as with his earlier "Reversing Directions Across the Bay Bridge Analysis," Dr. King fails to explain how his IMPLAN analysis is related to concerns regarding urban decay, as urban decay is a very site or area specific condition. The findings from IMPLAN are only specific to the geography matching the dataset included in the IMPLAN modeling, which in Dr. King's analysis is all of Alameda County. Dr. King does not refine his findings specific to the Oakland Coliseum Area, thus they have no merit relative to concerns regarding urban decay associated with the Golden State Warriors no longer playing at the Oracle Arena.

Urban Decay

In this section of his memo, Dr. King claims that the AB900 Application conclude that the Oracle Arena will continue to operate with approximately 21 events per year, and that this will result in one of two possible outcomes. One outcome is that the Oracle Arena will continue to operate and the other outcome is that it will close without the Golden State Warriors. Dr. King references speaking with an expert on the subject of the business and financing of sporting arenas, and cites that, based on the information obtained, a strong argument exists that without a sports team the Oracle Arena will not be viable. Dr. King further cited an example of an arena that lost its NBA basketball team in 2010 (IZOD Center) and shut down earlier in 2015 because of a lack of demand by other events. In addition, Dr. King states that the issue of urban decay was not addressed in association with reduced events at Oracle Arena, and that an economic impacts analysis should have been included to assess the impacts to the physical environment. Dr. King states that if the Arena closes he believes it would be difficult to repurpose the Arena and that it would be shuttered and possibly demolished, comprising a magnet for signs of urban decay. Dr. King further cites crime statistics in Oakland, claims that the need to mitigate urban decay would require the City of Oakland to divert funds from the General Fund, especially if the City defaults (jointly with the County) on its portion of the bond funds remaining to be repaid on a Lease Revenue Bond for the Arena. He further claims that the area is blighted by virtue of being a Redevelopment Project Area, and that even with the cessation of Redevelopment the blight issues remain, especially since there are no more tax increment revenues available to fund project area improvements.

Dr. King's memo demonstrates a misinterpretation of the relevancy of the AB 900 application to the EIR. The AB process is a separate process from the preparation of an EIR under CEQA, with separate and distinct review and approval requirements, and the analyses conducted under the AB 900 and EIR satisfy different requirements and consequently use different assumptions. Contrary to Dr. King's statement that "the EIR and AB900 Application conclude that that [*sic*} Oracle Arena will continue to operate with approximately 21 events per year,"[15] the EIR does not conclude that the Arena will continue to operate with only 21 events a year. Rather, the EIR assumes that, while Warriors' games

[15] King, page 7.

will relocate from Oracle Arena to the Event Center, other programming at the Oracle Arena will remain the same as its current level of use. This assumption used in the EIR air quality analysis represents a conservative forecast of what is expected to occur if the Golden State Warriors relocate for the purposes of CEQA. The actual level of activity at Oracle Arena may prove to be different – some uncertainty is unavoidable when forecasting future events. Thus, the number of non-sporting events at Oracle Arena may instead decline by 50% if the Warriors move, as assumed in the AB 900 application. The AB 900 application was prepared for a different purpose, for a different decision-maker, and the assumptions set forth in the AB 900 application may or may not be the same as those set forth in the EIR. Because this analysis is being prepared as part of the City and County of San Francisco's CEQA analysis, the appropriate assumptions to rely upon are those that form the basis of the EIR. Those assumptions are considered a reasonable, albeit conservative, prediction of what will occur if the project is approved. As noted above, the EIR assumes the number of non-sporting events at Oracle Arena will not decline if the Warriors move. As discussed further below, case studies from other sports arenas indicate that this is a reasonable assumption. Moreover, Dr. King's premise that this would be a static level of events at the Arena may not be correct, with the potential for a greater number of events to occur pending market supportability.

In his discussion of urban decay, Dr. King references a discussion with an expert on the business and financing of sporting arenas. No mention of the content of this discussion is provided, just Dr. King's statement that based on this conversation a "strong argument exists that the Oracle Arena (or indeed any similar venue in a similar situation) will not be viable without the Golden State Warriors and there are no other sports teams in the offing for this venue."[16] ALH Economics sought out Dr. King's expert, Alexander Michael, to gain an understanding of the nature of his communication with Dr. King. These advances were met with a suggestion that substantive questions might be better addressed by a recommended attorney who has represented National Basketball Association Players in their historic antitrust lawsuit against the NBA. This referral puts into question how much Mr. Michael, who has worked for LivingSocial since 2011, considers himself an expert on the subject referenced by Dr. King. In any event, as summarized below, Dr. King fails to provide support for an assumption that the Arena will host only 21 events a year or that the area will experience urban decay.

As Dr. King touched upon several issues or topics in this section of his memo, ALH Economics includes several sub-topics to best address his topics. These sub-topics are reviewed below, and include Case Studies of Arenas Lacking a Sports Team, Redevelopment Context for the Oracle Arena, and Coliseum Area Specific Plan.

Case Studies of Arenas Lacking a Sports Team. In his memo, Dr. King provides information on only one arena that lost its last sports team in 2010. This was the IZOD Center in East Rutherford, New Jersey. Dr. King presents information on this facility as the sole example of an arena that could not continue to function in the long-term after it lost its sports team. Thus, on the basis of this example, he suggests the Oracle Arena will also shut down after the Golden State Warriors leave the arena for San Francisco. Further, as quoted above, Dr. King believes there is a strong argument that no indoor arena will be viable after losing its sports team, especially if no other sports team will take their place.

At this point in time it appears likely that once the Golden State Warriors leave the Oracle Arena no additional sports team will claim the Arena as its home. This is after a long history of being home to

[16] King, page 8.

many sports teams. The Oracle Arena, originally called the Oakland Coliseum Arena, opened in November 1966 with approximately 13,500 seats, shortly after the opening of the adjacent outdoor Coliseum in September 1966.[17] The Arena, the neighboring Coliseum, and the associated 10,000 parking spaces are located on 132 acres.[18] Thirty years after its development the Arena underwent a major interior renovation, valued at $100 million and increasing the maximum seating capacity to 19,200 and adding 72 luxury suites and three exclusive clubs.[19] Owned by the Oakland-Alameda County Coliseum Authority, collaboration between Alameda County and the City of Oakland, the Arena has successively been home to a multitude of professional sports teams. These teams include the following:

- Golden State Golden State Warriors (NBA) from 1966 to 1967, 1971 to 1996, and 1997 to present;
- Oakland Oaks (ABA) from 1967 to 1969;
- California Seals (WHL) from 1966 to 1967
- California Golden Seals (NHL) from 1967 to 1976
- San Francisco Golden Gaters (WTT) from 1974 to 1978
- Golden Bay Earthquakes (NASL/MISL) from 1982 to 1984
- Oakland Skates (RHI) from 1993 to 1995
- San Jose Sharks (NHL) from 1992 to 1993; and
- California Golden Bears from 1974 to 1985 (NCAAB), part-time from 1966 to 1997, and full-time from 1997 to 1999.[20]

The Arena has also hosted events such as concerts, ice skating shows, circuses, boxing, rodeos, and religious speakers.[21]

When the Golden State Warriors leave the Oracle Arena it will join the company of other indoor arenas throughout the country that are no longer home to sports teams, many after similar strong sports team use over the course of decades as the Arena. Many of these arenas continue to be operational years after losing their last sports team, demonstrating that Dr. King's IZOD Center example is not characteristic of all such arenas and in direct contradiction to Dr. King's argument about viability. As proof of this new life for arenas ALH Economics prepared a number of case studies to demonstrate that roughly similarly-sized indoor arenas can continue to function after losing a major sports franchise. The case studies were selected for their size comparability to the Oracle Arena, as well as their older age, again comprising a match to the Oracle Arena. The purpose of these case studies is not to say the Oakland Arena will perform exactly like the case studies, but rather to show that indoor arenas do not necessarily cease operations after losing their sports teams similar to the IZOD Center example presented by Dr. King. The case studies are presented in order of year built, which ranges from 1955 to 1999, recognizing that the Oracle Arena opened in 1966, and was renovated in the 1996/1997 timeframe. The case studies also reference seating capacity, especially for basketball, which range from 13,800 to 18,000, recognizing that the Oracle Arena was built with approximately 13,500 seats, increasing to a maximum of 19,200 with the renovation. The case study

review also includes two arenas that lost their sports teams to newer facilities built nearby, similar to what will happen to the Oracle Arena when the Golden State Warriors relocate to the Event Center.

- **Community Choice Credit Union Convention Center (formerly Veteran's Memorial Auditorium) (Des Moines, Iowa) (built 1955; seating capacity 18,000)**

The Community Choice Credit Union Convention Center (the "Auditorium") was built in 1955 as the Veteran's Memorial Auditorium, an auditorium with a seating capacity of approximately 18,000. The venue has hosted concerts, wrestling, and various sports teams including the Drake Bulldogs (NCAA) from 1957 to 1992, the Des Moines Dragons (basketball) from 1997 to 2001, and the Iowa Barnstormers (football) from 1995 to 2001. In 2005, the Wells Fargo Arena was built adjacent to the Auditorium and took over the major events leading to the closure of the Auditorium in 2010. The Auditorium was renovated with an additional 28,000-square-foot ballroom and 25 meeting rooms and reopened in 2012 as a convention facility.[22]

The new Convention Center, with the addition of Wells Fargo and Hy-Vee Hall, is known as the Iowa Events Center. The facility is owned by Polk County and operated by Global Spectrum. In the past Polk County subsidized the operations of the Auditorium and Convention Complex at over $800,000 a year. After the development of the Wells Fargo Arena and Hy-Vee Hall, Polk County hired Global Spectrum to manage all of the Events Center facilities. Since taking over operations, Global Spectrum has managed to bring in a profit, significantly lessening the amount of subsidy paid by the County.[23] In addition to the new operator, the County sold the naming rights to Community Choice Credit Union to help pay for maintenance and operations, to help lessen any subsidies the County will have to pay.[24] In fiscal year 2014-2015, Global Spectrum presented the County with a 58% increase in profit from the previous year with 534 events at the three venues within the Iowa Events Center, 388 of them being at the Convention Centers. This profit enabled 2014-2015 to be the first year of operations without any subsidy from the County.[25]

- **Arizona Veterans Memorial Coliseum (built 1965; seating capacity14,870)**

The Arizona Veterans Memorial Coliseum (the "Coliseum") located in Phoenix, AZ was built in 1965 by the Arizona State Fair Commission as a multi-purpose arena to be used during the State Fair as well as year-round. The Coliseum has a maximum seating capacity of 14,870 and was host to the Phoenix Suns (NBA) from 1968 to 1992, the Phoenix Roadrunners (hockey) from 1974 to 1977, the Phoenix Inferno (indoor soccer) from 1980 to 1984, the Phoenix Mustangs (hockey)

from 1997 to 2001, the Phoenix Eclipse (basketball) from 2001 to 2002, and the Arizona Thunder (indoor soccer) from 1998 to 2000.[26]

As a part of the Arizona Exposition and State Fairgrounds, the Coliseum is a self-supporting state agency and no tax monies are used in its operations.[27] In addition to the State Fair, the Coliseum is home to a roller derby team and hosts events such as concerts, gun shows, garden shows, the state fair, and dog shows.[28] The Coliseum is booked on average 60-80 days a year; some of these days include events such as a month of a world tour concert rehearsal. The fairgrounds hold around 320 events a year, being located in Phoenix allows for many outside events due to the warm weather.[29]

In 1992 the Phoenix Suns relocated to a brand new arena called the America West Arena, now the Talking Stick Resort Arena. The new arena is a scant 2.9 miles away from the Coliseum. The last year of Coliseum use by the remaining professional sports teams was 2002. The Coliseum is an example of an indoor arena that has continued to successfully operate after the professional sports teams relocated to a nearby venue.[30]

- **The Forum (built 1967; seating capacity 17,500)**

The Forum, located in Inglewood, CA, was built in 1967 by the then-owner of the Lakers. The indoor arena has a maximum seating capacity of 17,500 and was home to the LA Lakers and the LA Kings from the time it opened until 1999, when both teams moved to downtown LA into the newly built Staples Center. The LA Sparks (WNBA) also called the Forum home until 2001, when they also moved to the Staples Center.[31] The Faithful Central Bible Church bought the Forum in 2000 and utilized the space for church services as well as continuing to lease the space for sporting events, concerts, etc., until the Church sold the facility in 2012.

The Madison Square Garden Company (MSG) purchased the Forum in 2012 and renovated and reopened it in 2014. In 2014 the Forum was placed on the National Register of Historic Places.[32] With a multi-million dollar makeover, MSG took a risk dedicating a former sports arena into a music-and entertainment-oriented venue. The gamble paid off as the Forum hosted 32% of the arena-sized concerts in the LA area in 2014, with 50 shows and an estimated 80 shows for

2015.[33] The venue also hosts wrestling, boxing, awards ceremonies, etc. In early 2015, LA Curbed named Inglewood LA's Neighborhood of the Year for 2014, citing the renovation of the Forum as one of the contributors to the up-and-coming neighborhood. In addition work is being done on a Crenshaw line for LA Metro, as well as much new development, including a proposed NFL stadium.[34]

When they left the Forum in the 1999-2001 timeframe, the LA Lakers, LA Kings, and LA Sparks professional sports teams moved 10 miles away to the Staples Center. Today, the Forum continues to operate lucratively even after having lost the professional sports teams to the nearby Staples Center.[35]

- **Hampton Coliseum (Virginia) (built 1970; seating capacity 13,800)**

The Hampton Coliseum (the "Coliseum") is located in Hampton, VA and was built in 1970. The City of Hampton owns and operates the Coliseum.[36] To help promote and develop the area adjacent to the Coliseum the City created the Coliseum Central Business District, Inc. in 1996. The commercial properties within the district pay an additional tax to help pay for economic development, the City levies this tax to help pay for Coliseum operations.[37] With a maximum seating capacity of 13,800, the multipurpose arena hosted the Virginia Squires (basketball) from 1970 to 1976, the Virginia Wings (hockey) from 1971 to 1975, the Hampton Gulls (hockey) from 1974 to 1978, the Hampton Aces (hockey) from 1978 to 1981, and the Old Dominion Monarchs basketball from 1970 to 1995.

The Coliseum currently hosts events such as concerts, conventions, wrestling, and Disney on Ice. The City of Hampton is currently in the process of updating the Coliseum Central Master Plan. The City recognizes the value of the Coliseum; the master plan vision includes the development of indoor sport facilities in addition to the Coliseum and Convention Center to take advantage of the growing sports tourism industry. The City also wants to, "Create a festival park to support these civic facilities and provide an outdoor event space to serve the overall Coliseum Central Business Improvement District. In addition, there are opportunities to include additional hotel and entertainment/dining opportunities."[38]

- **Mississippi Coast Coliseum & Convention Center (built 1977; seating capacity 15,000)**

The Mississippi Coast Coliseum & Convention Center (the "Coliseum) is located on the beach in Biloxi, MS. The Coliseum opened in 1977 as a multi-purpose facility and provides a maximum

seating capacity of 15,000.[39] This venue is owned and operated by the Mississippi Coast Coliseum Commission, a political subdivision of the State of Mississippi. The State of Mississippi imposes a 2% tax on the gross proceeds on room rentals of all hotels and motels in Harrison County to help subsidize the Coliseum.[40] The Coliseum has hosted sports teams such as the Mississippi Coast Gamblers (professional basketball, spring season) in 1994, the Mississippi Beach Kings (indoor soccer) in 1998, the Mississippi Fire Dogs (indoor football) from 1999-2000, the Mississippi Sea Wolves (AA Hockey) from 1999-2009, the Mississippi Fire Dogs (indoor football) from 2001-2002, the Gulf Coast Bandits (World Basketball) in 2005, the Mississippi Blues (American Basketball Association) from 2009-2010, and the Mississippi Surge (hockey) from 2009-2014.[41] The venue is currently home to a local radio station and hosts events such as an annual crawfish festival, rock festival, concerts, wrestling, monster truck shows, and conventions.[42] In fiscal year 2012-2013 the Coliseum held 124 events, 142 events in fiscal year 2013-2014, and 152 events in fiscal year 2014-2015.

The City of Biloxi Comprehensive Plan envisions the Mississippi Coast Coliseum & Convention Center area to be:

> a high-quality, walkable visitor destination with multi-modal transportation access and connections to Sand Beach, the Biloxi Peninsula Path, and other attractions and anchor uses in the West Biloxi Regional Business District. Hospitality uses that support the Coliseum and Convention Center, such as hotels and restaurants, are encouraged. The scenic quality of Highway 90 should be maintained and buffers and transitions provided to lower density residential uses.[43]

Examples of how to achieve this vision are included in the Neighborhood Improvement Strategies in West Biloxi, which includes items such as a proposed street car line in the Coliseum district, a transit hub near the Coliseum, improved pedestrian facilities, sand beach improvements, and provide development plan that includes incentives and design standards to boost hotel and retail development within walking distance to the Coliseum.[44]

- **Tacoma Dome (built 1993; basketball seating capacity 17,100)**

The Tacoma Dome (the "Dome") is an indoor arena located in Tacoma, WA. The Dome was built in 1983 and is owned, operated, and paid for by the City of Tacoma. The maximum seating capacity ranges from 5,000-23,000, with 20,824 for indoor soccer, 17,100 for basketball, and 10,000 for American football.[45] The Dome hosted the Seattle Supersonics from 1994-1995 while

their stadium was undergoing renovations. The Dome was the permanent host to the Tacoma Rockets Western Hockey League team from 1991-1995, the Tacoma Sabercats of the West Coast Hockey League from 1997-2002, the Tacoma Stars indoor soccer team of the MISL from 1984-1992, the Tacoma Express Football in 1990, and the Seattle Sounders Soccer team in 1994. The Supersonics have since moved to Oklahoma City and the other teams are either defunct or have moved locations as well. In addition, the Dome has also hosted other major sporting events such as the 1990 Goodwill Games and the 1987 United States Figure Skating Championships.[46]

In 2012 the City of Tacoma had a study completed on the feasibility of bringing back a professional sports team to the Dome. The study determined that it was not a financially feasible idea based on a multitude of reasons such as competition from other area arenas, the area's small population base, the city's financial position, and the area's lower national profile. The study did allow that a more affordable plan existed for the Dome to exist successfully, "Modernize the arena so it's more competitively viable for amateur sports, concerts and events other than pro hoops or hockey."[47] Following this advice, the Dome is currently used for events such as concerts, comedy shows, beer festivals, wedding expos, gun shows, circus, monster trucks, motocross, conventions, etc.[48] The number of booked events at the Dome increased 22% between 2011 and 2014 and is estimated to continue to increase in 2015 and 2016.[49] Moreover, various improvements to the Dome and the area are underway. The Tacoma City Council recently approved plans for the outside of the Dome to be adorned in an Andy Warhol flower, an idea that was brought to the City before the Dome was even built.[50] In addition, Sound Transit is working on a potential expansion to the Tacoma line that would link the Tacoma Dome station with downtown Tacoma.[51] Also, Sound Transit and Amtrak are demolishing the existing single-track Tacoma trestle and are rebuilding a larger double-track one, which can support more passengers and keep up with increasing demand; construction is estimated to be complete in 2018.[52]

- **Verizon Arena (North Little Rock) (built 1999; seating capacity 18,000)**

The Verizon Arena (the "Arena"), formerly called Alltel Arena, is located in the City of North Little Rock, AR across the river from the City of Little Rock. The Arena, which opened in 1999, has a seating capacity of 18,000 and conference space of 28,000 square feet. The venue is publicly

owned by the Multi-Purpose Civic Center Facilities Board for Pulaski County.[53] The Arena hosted the Arkansas Diamonds (indoor football) from 2000-2010, Arkansas RimRockers (NBA D-League) from 2004–2007, Little Rock Trojans (NCAA men's basketball) from 1999–2005, and the Arkansas Riverblades (AA Hockey) from 1999–2003.[54] The Arena no longer hosts a permanent sporting team; it holds events such concerts, rodeos, auto racing, professional wrestling, trade shows, meetings, banquets, and conventions. In 2013 the Arena hosted 50 events, 43 events in 2014, and a total of 50 scheduled events in 2015.[55]

The Arena was fully funded by a mix of local, state, and private firms as a sports and entertainment facility. The Arena does not receive any regularly scheduled public funds to operate; in the past they have received some small amounts from the state for capital improvements.[56] The Arena is situated on the Arkansas River across from Downtown Little Rock with adjacent pedestrian and automobile bridges connecting the cities of Little Rock and North Little Rock. The Arena played a large part in the development of Little Rock's River Market and the expansion of Little Rock Convention Center. The district the Arena is located in also features other attractions such as the Arkansas State Capitol, the Clinton Presidential Library, and the North Little Rock Main Street Restaurant Row and Art District.[57]

The preceding seven case studies provide examples of indoor arenas that continued to meet with success after losing sports teams that were historically associated with the arenas. The case studies include a wide mix of characteristics, such as geographic location, ownership, and facility management, all of which provide examples of arenas that were repositioned to achieve facility success without being home to a sports team. Until the Oracle Arena is certain that the Warriors will be leaving the facility it is premature to actively market the space to attract other events and venues. However, the examples above indicate that market success is possible for similar types of facilities. The Arena has several assets to its advantage. These include highway visibility, easy highway access, strong public transit access, and inclusion in an area with a long-range vision for improvement in the form of the Coliseum Area Specific Plan.

As noted above, two of the case studies include arenas that lost their sports teams to newer facilities built nearby, similar to what will occur in Oakland when the Golden State Warriors relocate to the Event Center. These arenas include the following: the Arizona Veterans Memorial Coliseum in Phoenix, AZ, whose sports teams relocated to a new area less than 3.0 miles away; and The Forum in Los Angeles, whose sports teams all relocated to the Staples Center approximately 10 miles away. These two case studies demonstrate that an arena that loses sports teams to another nearby arena can continue to be successful, and thus not fall into disrepair and indirectly result in the physical condition of urban decay.

Redevelopment Context for the Oracle Arena. In 1995 the Arena and its environs became part of the City of Oakland's Coliseum Redevelopment Area totaling approximately 5,700 acres.[58] The main objective of the redevelopment area was, "Abating physical and economic blight by redeveloping vacant and underutilized properties and replacing obsolete infrastructure."[59] The redevelopment area comprised four target areas: Fruitvale BART Station area; Coliseum City/Oakland Airport Area including Coliseum BART Station area; International Boulevard Infill area; and an expanded focus on neighborhood capital projects. In 1995 approximately 75% of the Coliseum Redevelopment Project Area consisted of commercial, industrial, and airport-related uses. The remainder of the area was residential. In a similar timeframe to the creation of the Coliseum Redevelopment Project Area, the Arena underwent a major interior renovation in June 1996, although this was not achieved with Redevelopment funds. The $100 million renovation increased the maximum seating capacity to 19,200 and added 72 luxury suites and three exclusive clubs.[60]

Since inception of the Coliseum Redevelopment Project Area there were a number of executed redevelopment projects designed to enhance the area. Some of these improvements were near the Arena while others were in other portions of the Project Area. Up until the dissolution of Redevelopment agencies in the State of California in 2012 the City of Oakland classified the following projects as successes within the Coliseum Redevelopment Area:

- **Fruitvale Transit Village Phase I**—Mixed-use transit-oriented development
- **Hegenberger Gateway Shopping Center**—240,000-square-foot retail and restaurant space
- **Oakland Unified School District (OUSD) Cesar Chavez Education Center**—Community-based complex
- **Coliseum Lexus and Infiniti of Oakland Dealerships**—26,000-square-foot auto center
- **Zhone Technologies Corporate Campus** —Research and development facilities
- **Damon Slough / MLK Shoreline Public Access Park**
- **81st Avenue Branch Public Library**— New 21,000-square-foot library
- **East Oakland Sports Center**— New recreational indoor pool facility
- **Airport Gateway Street Improvement Project** — Improvements to Hegenberger Road, 98th Avenue, Airport Access Road and Doolittle Drive included extensive landscaping and widening of some roads, new lighting, colorful banners, new sidewalks and palm trees.
- **Coliseum Transit Hub Streetscape and Coliseum Amtrak Station**— Improvements to San Leandro Street and construction of commuter rail station near Coliseum BART
- **Sunshine Court Street Improvements**— Improvements to existing residential area
- **66th Avenue Streetscape Project**— Improvements along 66th Avenue between San Leandro Street and International Boulevard.[61]

[61] City of Oakland, "Coliseum Project Area," http://www2.oaklandnet.com/Government/o/CityAdministration/d/NeighborhoodInvestment/o/Coliseum/index.htm

Following the dissolution of redevelopment in 2012, the City of Oakland created the Redevelopment Successor Agency, which is part of the City's Project Implementation Division.[62] A portion of The Coliseum Redevelopment Area (800 acres) subsequently became the focus of the Coliseum Area Specific Plan, which was adopted in March 2015 along with the Environmental Impact Report (see following section).[63]

Dr. King states that even though Redevelopment Areas have been disbanded, the blight issues in the former Coliseum Redevelopment Project Area remain. ALH Economics toured the area immediately surrounding the Oracle Arena. This area is a mixture of industrial, service, and commercial uses, with extensive residential land uses several blocks to the east of the Oracle Arena, primarily including affordable housing. The industrial, service, and commercial uses include businesses engaged in printing, upholstery, auto and truck parts, truck and auto repair, restaurant supply, structural steel, solar power, party rental, and distribution, among others. San Leandro Street is a major north south road in the area, with access to the Coliseum BART station. This roadway was littered with some trash at the time of ALH Economics' area tour, and ALH Economics saw one visible incidence of graffiti on a portion of San Leandro Street somewhat close to the Oracle Arena. There were very few visible commercial or industrial vacancies, thus the area appears to be relatively well-occupied.

The land uses in the area most proximate to the Oracle Arena do not appear to be dependent upon events occurring at the Arena. There is only one small food vendor, a taqueria, within walking distance of the Arena, across the street from the BART Station. Thus, ALH Economics anticipates that any diminution in use at the Oracle Arena attributable to relocation of the Warriors to San Francisco will not impact any of the existing businesses around the Oracle Arena. Thus, no existing businesses are anticipated to experience a decline in business or risk closure, minimizing the risk of urban decay, which is a condition different from the blight conditions upon which redevelopment project area designation is predicated. Blight conditions include many of the characteristics of urban decay, but go beyond these characteristics, and include conditions such as poor or overcrowded housing conditions, unsafe or unhealthy vacant and underutilized properties, functionally obsolete structures, and obsolete infrastructure. Many of these issues were addressed by the projects identified above during the life of the Redevelopment Project Area, but any residual conditions would be considered pre-existing, and not attributable to any changes in operations or function of the Oracle Arena.

In summary, the land uses proximate to or adjacent to Oracle Arena do not appear to rely on activity at the arena in order to be economically viable. Nor are these uses 'in competition' with those that occur at the Arena. In both of these respects, the current circumstances differ from those that can typically arise in the context of urban decay analysis. Generally, urban decay analysis focuses on economic harm to marginal businesses caused by competition from lower-priced, high volume retailers competing in the same retail market. Neither of those conditions exists here. The Warriors do not 'compete' with any other businesses in the region. Nor is there evidence that the relocation of the

[62] City of Oakland, "Project Implementation Division," http://www2.oaklandnet.com/Government/o/CityAdministration/d/NeighborhoodInvestment/index.htm

[63] City of Oakland, "Coliseum Area Specific Plan," http://www2.oaklandnet.com/Government/o/PBN/OurOrganization/PlanningZoning/OAK040453

Warriors will have a substantial impact on any businesses located near Oracle Arena, insofar as those businesses do not appear to rely on Warriors' fans as a significant source of revenue.

Most importantly, Dr. King states that once the Oracle Arena is shut down, "it would be difficult and expensive to repurpose the arena for other activities and thus it will almost certainly be shuttered and perhaps demolished at some future date."[64] Yet there is no certainly that the Arena would close down. As the preceding case studies demonstrated, in most cases arenas find new life after the departure of their last active sports team. The Oracle Arena already houses events other than Warriors games. This suggests the venue is usable by other users, with the potential to ramp up these additional uses over time. The Arena's locational advantages are a strong asset to support these additional uses. However, if the Arena does close, these locational advantages will work to the benefit of the site, with the long term potential for site reuse, in accordance with the Coliseum Area Specific Plan (see below).

Relative to the operations of the Arena after the Warriors relocation, Dr. King expresses concern that a reduction in economic activity would reduce the City's tax base and hence reduce revenues available to maintain upkeep at the closed Arena and constrain the City's ability to provide other services. As ALH Economics demonstrated earlier, Dr. King overestimated the extent of economic activity that would likely shift away from Alameda County. And since he did not tie or demonstrate the extent of this activity exclusive to Oakland it is specious to comment upon how City finances might change, and the City's expenditure pattern. Moreover, the City of Oakland's General Fund expenditures are over $500 million, thus costs to monitor conditions near the Oracle Arena are likely to comprise a very insignificant portion of the City's budget. [65]

Coliseum Area Specific Plan. One of the goals of the Oakland Coliseum Redevelopment Project Area was to continue to support a Coliseum City project in an effort to retain sports teams and create an entertainment, retail/mixed-use destination.[66] Toward this end, the City of Oakland worked for many years on the formulation of a Coliseum Area Specific Plan. In April 2015, after the end of Redevelopment in California, the City of Oakland adopted the "Coliseum Area Specific Plan," focused on providing a guiding framework for reinventing the City of Oakland's Coliseum area as a major center for sports, entertainment, residential mixed use, and economic growth.[67] This plan includes provisions for both the retention and demolition of the existing Oracle Arena. The Specific Plan establishes the basis for land use and regulatory policies and public and private investment that will coordinate phased development in the area over the next 20 to 25 years. Accordingly, the plan is a guide for decision-makers in determining the nature, scale, type and functional relationships among future land uses in the Specific Plan Area.

The Coliseum Area Specific Plan was developed as a mechanism to help the City of Oakland maximize the retention of the professional sports franchises in the area that they do not control (the Oakland A's and the Raiders, in addition to the Golden State Warriors) with a politically and financially feasible plan that includes new sports facilities plus retail, restaurant, hotel, office, R&D and

[64] King, page 8.

[66] http://www2.oaklandnet.com/Government/o/CityAdministration/d/NeighborhoodInvestment/o/Coliseum/index.htm
[67] See "Coliseum Area Specific Plan," Final Adopted Plan, City of Oakland, April 2015.

residential development. However, given the uncertainty regarding the future of the sports teams (made real by the current Golden State Warriors plans to relocate to San Francisco and the A's stated desire to relocate to San Jose) the Specific Plan, of necessity, is a flexible strategy that can accommodate all - or none - of the sports facilities. The Specific Plan establishes a land use and development framework, identifies transportation and infrastructure improvements, and recommends implementation strategies. While the proposed Project presents one vision for how the Coliseum Area might ultimately be developed, it also provides flexibility for other potential land use outcomes.

In October 2014 the City of Oakland entered into an Exclusive Negotiating Agreement (ENA) with New City Development LLC, led by Floyd Kephart, to spearhead development of Coliseum City, a planned 120-acre development that would combine new housing and retail and a stadium for the Raiders. This ENA was extended in April 2015, but just recently was not extended further given the lack of developer progress formulating a financing plan, thus removing New City Development from the planning process for the area. This puts future retention plans of the Raiders and the Oakland A's into continued flux, as alternative locations for each team have been under investigation for a number of years in the midst of negotiations with the City of Oakland. The flexibility of the Specific Plan, however, includes strategies that will be able to adapt to future decisions regarding the sports franchises and respond to changes in market conditions. Accordingly, the Plan allows for a variety of alternative development scenarios within the limits of available and future infrastructure. For example, if one or more of the new sports venues included in the Specific Plan is not constructed, the Specific Plan's allowable development program could provide for non-sports uses, such as science and technology housed within buildings lower in height than the sports venues.[68]

The existence of the Specific Plan is not a guarantee that the Plan's vision will be realized. However, the City's formulation of the Coliseum Area Specific Plan demonstrates a vision and long-term commitment to creating a guiding structure for area revitalization. The existence of this plan was not acknowledged by Dr. King in his memo.

CLOSING

It is ALH Economics' conclusion that the area of Oracle Arena is not currently experiencing urban decay and there is no information that is currently available for ALH Economics to conclude that urban decay is likely to occur. While the future use of the Arena area is uncertain, in the event the Warriors relocate to San Francisco, many arenas throughout the country have been repurposed under similar circumstances, the site is well-positioned geographically to attract new uses, and the City of Oakland is actively committed to implementing a flexible use specific plan that would bring new uses to the area. In light of this analysis, ALH Economics is of the opinion that urban decay at the Arena site is not a reasonably foreseeable consequence of the relocation of the Golden State Warriors to San Francisco.

ASSUMPTIONS AND GENERAL LIMITING CONDITIONS

ALH Urban & Regional Economics has made extensive efforts to confirm the accuracy and timeliness of the information contained in this study. Such information was compiled from a variety of sources, including review of City, County, and State documents, and other third parties deemed to be reliable. Although ALH Urban & Regional Economics believes all information in this study is correct, it does not warrant the accuracy of such information and assumes no responsibility for inaccuracies in the information by third parties. We have no responsibility to update this report for events and circumstances occurring after the date of this report. Further, no guarantee is made as to the possible effect on development of present or future federal, state or local legislation, including any regarding environmental or ecological matters.

The accompanying projections and analyses are based on estimates and assumptions developed in connection with the study. In turn, these assumptions, and their relation to the projections, were developed using currently available economic data and other relevant information. It is the nature of forecasting, however, that some assumptions may not materialize, and unanticipated events and circumstances may occur. Therefore, actual results achieved during the projection period will likely vary from the projections, and some of the variations may be material to the conclusions of the analysis.

Contractual obligations do not include access to or ownership transfer of any electronic data processing files, programs or models completed directly for or as by-products of this research effort, unless explicitly so agreed as part of the contract.

APPENDIX AQ2

Supplemental Air Quality Supporting Information

This page intentionally left blank

Air Quality Appendix

1 Introduction

At the request of Environmental Science Associates (ESA), on behalf of the Golden State Warriors (GSW or Sponsor), ENVIRON International Corporation (ENVIRON) conducted a California Environmental Quality Act (CEQA) analysis of criteria air pollutants (CAPs) and precursor emissions associated with the proposed construction of a multi-purpose event center and ancillary development Mission Bay Blocks 29-32 in San Francisco, CA (“Project” or “Site”).[1] The analysis prepared by ENVIRON will be used to inform preparation of the Subsequent Environmental Impact Report (SEIR) on the project. This Air Quality Protocol describes the methodology used for evaluation of air quality impacts from construction and operational sources.

The proposed project is not located in an Air Pollution Exposure Zone (APEZ) as defined by the San Francisco Planning Department, Environmental Planning Division (SFEP). However, in the event that the proposed project could result in increased emissions over those assumed for prior approved development for the site in the Mission Bay Final Subsequent Environmental Impact Report (FSEIR), the project impacts could be substantial enough to create a new APEZ. Therefore, preparation of a construction health risk assessment (HRA) and operational HRA are included as part of the air quality impact analysis to demonstrate that the Project will not create an APEZ at nearby sensitive receptors.

1.1 Project Understanding

The proposed Project would be located at Blocks 29-32 of Mission Bay, as designated in the Mission Bay Redevelopment Area. The Mission Bay Redevelopment Area has a Final Supplemental Environmental Impact Report (FSEIR) from1998.

Two alternatives to the project are also considered, as discussed below.

1.1.1 Proposed Project

The Project would be located at Blocks 29-32 of Mission Bay within the Mission Bay Redevelopment Area of San Francisco. The rectangular site is bound by Third Street to the west, South Street to the north, Terry Francois Boulevard to the east, and 16th Street to the south. Blocks 29-32 are approximately 11 acres, which are currently vacant. Currently, there are residential land uses to the northwest and south of the proposed Project site, but none immediately adjacent to the site.

The GSW, the Project proponent, propose to create a new approximately 18,000-seat multi-purpose event center and ancillary development including multiple office buildings, retail, restaurants, structured parking, plaza areas, and other amenities. Based on data provided by the GSW, the Project build-out for Blocks 29-32 would include approximately 750,000 gross square feet (gsf) for a multi-use events center and 25,000 gsf for the GSW offices; 580,000 gsf of non-GSW office space; 475,000 gsf of parking (950 spaces); 125,000 gsf of retail space including sit-down restaurants, quick-service restaurants, and soft goods retail.[2] The privately

---

Truck Loading Access

financed events center would host the Bay Area's National Basketball Association (NBA) basketball team, the GSW, during the NBA season, as well as provide a year-round venue for a variety of other uses, including, but not limited to, concerts, cultural events, family shows, conferences, and conventions. The preliminary, conceptual layout is shown in Figure 1 of this Air Quality Protocol. The Project will also include new back-up engines.

Construction of the Project is anticipated to proceed with the offices and arena being built concurrently. The air quality analysis used the construction schedule and phases proposed by the Project Sponsor to estimate construction impacts.

1.1.2 Project Alternatives

The SEIR alternatives analysis included the No Project Alternative (the currently approved development on Blocks 29-32) and one other alternative, a reduced intensity project. These alternatives are analyzed qualitatively in this study.

Alternative A: No Project

- Under the first alternative, all aspects of the current operation at Oracle Arena in Oakland are retained.
- In Alternative A, the No Project Alternative, 1,056,000 square feet of office space would be constructed at the Project site instead of the proposed arena plus office buildings and other uses. As part of the 1998 Mission Bay Redevelopment Area SEIR, Blocks 29-32 are entitled for up to 1,056,000 square feet of office space. Alternative A also includes up to 31,700 gsf of retail use.
- ENVIRON evaluated construction and operation of Alternative A to an equal level of detail as the Project. ENVIRON modeled construction emissions using accepted methodologies such as modeling with California Emissions Estimator Model (CalEEMod®). Because there is no change at the Oracle Arena in Alternative A, the sole impacts come from the office and retail space at Blocks 29-32. As such, only the office and retail space is considered in the impacts analysis.

Alternative B: Reduced Intensity at Blocks 29-32

- Under Alternative B, Blocks 29-32 adjustments will be made to retail uses, office uses, and parking spaces at Blocks 29-32. All other aspects of the proposed Project will remain unchanged.
- From an air quality perspective, this Alternative is expected to have reduced impacts from those of the Project because of its reduced scope.

1.2 Objective

The purpose of the air quality analysis is to assess potential criteria pollutant emissions and ozone precursor emissions that would result from construction and operation of the proposed Project consistent with guidelines and methodologies from air quality agencies, specifically, the Bay Area Air Quality Management District (BAAQMD), the California Air Resources Board (ARB), and the US Environmental Protection Agency (USEPA).

Consistent with CEQA requirements, this Air Quality Analysis evaluates mass emissions of CAPs from both construction and operational activities (including traffic generated from the proposed Project). The scope of this Air Quality Analysis also includes a construction HRA and operational HRA to determine whether the Project contributes to cumulative effects at nearby receptors over the significance thresholds used by SFEP.

1.3 Project Methodology

Construction emissions associated with the Project would be from off-road construction equipment and on-road mobile sources. There would also be operational emissions associated with the Project from traffic-related sources and stationary sources such as boilers and five standby emergency generators. An equivalent level of detail was used in analyzing the Project and the Alternatives. To that extent, the "Project Methodology" discussed throughout this document applies to all Alternatives.

The City of San Francisco, in conjunction with the BAAQMD, has recently completed a City-wide HRA to evaluate cumulative cancer risks and fine particulate matter less than 2.5 micrometer in diameter ($PM_{2.5}$) concentrations from existing stationary and mobile sources. The construction HRA and operational HRA in this Air Quality Analysis was conducted to be consistent with the City-wide HRA.

1.3.1 Project Impacts

The following three sources of emissions were analyzed in the Project build-out year of 2018. For the construction years, ENVIRON assumed uncontrolled emissions based on the construction fleet statewide average for that year. For example, in 2015, the fleet-average emission factor for 2015 were used, and in 2016 the fleet-average emission factor for 2016 were used. Estimation of trip lengths relied on state survey data and season ticket holder addresses.

The three sources of emissions considered are:

1. Project construction (both without implementation of measures to reduce Project impacts and with such measures in place as per Section 5 of this Analysis);
2. Project stationary source emissions in the first Project operation year; and
3. Project traffic emissions in the first Project operation year.

2 Emissions Estimates

The methods used to estimate the emissions of CAPs and Toxic Air Contaminants (TACs) from the Project are described here. Because estimation techniques are different for construction and operation, they are discussed separately below.

2.1 Calculation Methodologies for Construction Emission Sources

Construction emission calculation methodologies cover off-road equipment, which is primarily diesel-fueled, on-road vehicles, and architectural coatings. Calculation methodologies for each type of emissions are explained separately. The methodology used to calculate emissions from each category is presented in Table 1: Emissions Calculations Methodology.

2.1.1 Off-road Diesel Equipment

Project-specific construction equipment inventories that include details on the type, quantity, construction schedule, and hours of operation anticipated for each piece of equipment for each construction phase were provided by the Sponsor. For the diesel-fueled equipment, ENVIRON used methodologies consistent with CalEEMod® to estimate emissions.[3] Where Project-specific equipment information is not available, CalEEMod® default values were used. Load factors for each piece of equipment were based on the default load factor in ARB's 2011 Off-Road Equipment Model (OFFROAD2011).

2.1.2 On-road Haul Trucks and Delivery Trucks and Vans

On-road truck emissions were calculated using the total number of trucks provided by the Sponsor as part of the SEIR project description and emission factors from ARB's EMission FACtor model (EMFAC2011) model. For haul trucks, a 20-mile one-way trip length was used, based on CalEEMod® default truck trip lengths, and for vendor trucks a 7.3-mile trip length was used, based on the regional default vendor trip length from CalEEMod®. The emission factors for running emissions for criteria pollutants were generated with the last version of the EMFAC2011, released on September 30, 2011, and updated in January 2013. The model includes updated information on California's car and truck fleets and travel activity.

Emissions reported by the model were converted to units of grams of pollutant emitted per vehicle mile traveled (VMT) using the daily VMT for running emissions, or grams of pollutant emitted per trip for idling, starting, and evaporative emissions.

2.1.3 Construction Worker Commuting Vehicles

Worker commute trip emissions were included in the emissions inventory for construction. The number of trips by workers was estimated based on data received from ESA in coordination with the Sponsor with regard to construction phasing. ENVIRON used emission factors from EMFAC2011 and default construction worker trip lengths from CalEEMod® to estimate worker trip emissions.

2.1.4 Architectural Coating and Consumer Products Emissions

ENVIRON used CalEEMod® to estimate reactive organic gas (ROG) emissions from architectural coating. Compliance with BAAQMD regulations restricting the volatile organic compound (VOC) content of commercial paints was assumed. ENVIRON used the San Francisco-specific area source emission factors developed by SFEP for ROG from consumer products which is 1.51E-05 lb/ROG/sqft/day.

2.1.5 Summary of Project Construction Criteria Pollutant Emissions

CAPs from Project construction phases were added and then normalized over the number of days in the construction period.

2.2 Calculation Methodologies for Operational Emission Sources

Operational emission calculation methodologies are divided into stationary, area, and mobile sources. For each category, emissions are estimated based on data from the Project Sponsor. The methodology used to calculate operational emissions from each category is presented in Table 1: Emissions Calculations Methodology.

2.2.1 Stationary Sources

The proposed Project will include new natural gas-fired boilers and five diesel back-up engines. Emissions were calculated based on information provided by the Project Sponsor and assume Tier 4 ARB and USEPA off-road diesel engine standards (ARB 2013). It should be noted that these stationary sources will be permitted with the BAAQMD and all sources are expected to comply with applicable Best Available Control Technology (BACT) and Best Available Control Technology for Toxics (TBACT) requirements.

2.2.2 Area Sources

The proposed Project includes area sources such architectural coatings, landscape equipment, and consumer products use. These emissions were estimated using CalEEMod®, based on the type and size of land uses associated with the Project. ENVIRON used San Francisco-specific area source emission factors developed by SFEP for ROG from consumer products.

2.2.3 Mobile Sources

The proposed Project would generate vehicle trips, which were provided by SEIR transportation analysts in coordination with ESA. Project traffic was evaluated using EMFAC2011 for the vehicle fleet mix in the San Francisco Bay Area. Additionally, Project-specific types of traffic such as delivery trucks were evaluated using vehicle-type specific emission factors from EMFAC2011, based on Project-specific traffic data as provided by ESA in coordination with the Sponsor. Fugitive road dust emissions are estimated using methodologies consistent with CalEEMod®. The methodologies used to calculate operational mobile emissions can be found in Table 1: Emissions Calculations Methodology.

3 Health Risk Assessment

3.1 Introduction

The objective of the HRA is to evaluate the potential impacts of construction and operation of the Project on off-site receptors in the Mission Bay neighborhood of San Francisco. The criterion for whether or not the Project presents a significant air quality impact under the CEQA is if the Project will "expose sensitive receptors to substantial pollutant concentrations," from Appendix G of the CEQA Guidelines.[4] To evaluate impacts in San Francisco, SFEP requires an HRA for an Environmental Impact Report (EIR) if a project is within an APEZ,[5] defined as an area in which modeled air pollution exceeds "either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) $PM_{2.5}$ concentrations in excess of 10 microgram per cubic meter (µg/m^3) (including ambient)."[6]

The Project is not in an APEZ, based on air dispersion modeling performed by the San Francisco Department of Public Health in conjunction with SFEP and the BAAQMD.[7] The Project is not bounded by an APEZ, either, with the nearest APEZ falling over the University of California, San Francisco (UCSF) Mission Bay campus, to the west of the Project. The parcels immediately surrounding the Project have average excess cancer risks below 50 in one million persons, with lower risks to the east of Third Street. The nearest residential parcel is the UCSF dormitory to the northwest of the Project; risks at this parcel are below 26 in one million, although the average period of residence in the dormitory is less than the 70 years assumed in excess cancer risk calculations. Another sensitive receptor is located at the UCSF Medical Center at Mission Bay to the southwest of the Project; risks at this parcel are below 45 in one million, but again the average period of residence is less than 70 years. At the dormitory, background $PM_{2.5}$ concentration from the City-wide modeling is 8.5 µg/m^3. At the UCSF Medical Center, background $PM_{2.5}$ concentration is 8.6 µg/m^3.

Since the Project is not in an APEZ, the subsequent criterion of significance is whether or not the Project will create an APEZ. The Project's excess cancer risk and $PM_{2.5}$ contribution is evaluated for contributions from two schemes, construction and operation. A lifetime cumulative risk and annual average $PM_{2.5}$ concentration including both construction and operation is considered and compared against the APEZ thresholds. Annual average $PM_{2.5}$ concentration

6 Department of Public Health, Environmental Health, City and County of San Francisco. 2014. Memorandum to file Re 2014 Air Pollutant Exposure Zone Map. April 9.

7 See Air Pollutant Exposure Zone map (http://www.sfdph.org/dph/files/EHSdocs/AirQuality/AirPollutantExposureZoneMap.pdf) and DPH website (http://www.sfdph.org/dph/eh/Air/Article38.asp).

For parcel-specific information, see the Zoning designation for Mission Bay South Redevelopment Plan Blocks 29-32; Assessor's Block 8722, Lots 001 and 008. This is the parcel bounded by South Street on the north, Third Street on the west, 16th Street on the south, and roughly by the future planned realigned Terry A. Francois Boulevard on the east.

The Project is not in a "health vulnerability layer" as defined in the 2014 Air Pollutant Exposure Zone Map memorandum, either, as it is not in the affected zip codes or within 500 feet of a freeway.

during both construction and after operation of the Project as considered individually and compared against the APEZ thresholds.

To show that the Project will not create an APEZ at nearby residential or sensitive receptors, ENVIRON performed a construction HRA using the USEPA AERMOD model[8] and performed an operational HRA using the BAAQMD screening tools and the USEPA SCREEN3 model.[9]

Many elements of the HRA are designed to provide conservative (that is, health protective) overestimates of impacts to off-site receptors. For residential receptors, the assumption of 24 hours per day of exposure represents a maximum exposure, since based on USEPA activity studies people spend on average 58 to 82% of their time at home, depending on age group (USEPA 2011). In addition, indoor air concentrations are not the same as outdoor air concentrations, however this analysis assumes that there is no filtration or attenuation in the indoor air. ~~Other conservative assumptions made here include the use of BAAQMD screening tables for on-road traffic and the maximum generator risk of 30 in one million, assuming the generators are permitted as three separate projects.~~ The BAAQMD HRA guidelines are also designed to be protective of human health, for example relying on the 80th percentile breathing rate for adults rather than the average and the upper 95th percentile breathing rate for children rather than the average (BAAQMD 2010).

3.2 Estimated Air Concentrations for Construction HRA

Consistent with the City-wide HRA, the air toxics analysis evaluated health risks and $PM_{2.5}$ concentrations resulting from the Project upon the surrounding community. Project construction is planned for a 27-month period starting in late 2015. The Project Sponsor provided ENVIRON with the proposed construction off-road equipment list, count, and activity; and on-road vehicle traffic. ARB tools and methods were used to estimate emissions of diesel particulate matter (DPM) and other TACs from the off- and on-road equipment list.

3.2.1 Chemical Selection

The cancer risk analysis in the construction HRA is based on DPM concentrations and total organic gases (TOGs) from diesel equipment and on-road vehicles. Diesel exhaust, a complex mixture that includes hundreds of individual constituents (California Environmental Protection Agency [Cal/EPA] 1998), is identified by the State of California as a known carcinogen (Cal/EPA 2014). Under California regulatory guidelines, DPM is used as a surrogate measure of carcinogen exposure for the mixture of chemicals that make up diesel exhaust as a whole (Cal/EPA 2014). Cal/EPA and other proponents of using the surrogate approach to quantifying cancer risks associated with the diesel mixture indicate that this method is preferable to a component-based approach. A component-based approach involves estimating risks for each of the individual components of a mixture. Critics of the component-based approach believe it will underestimate the risks associated with diesel as a whole because the identity of all chemicals in the mixture may not be known or exposure and health effects information for all chemicals identified within the mixture may not be available. Furthermore, Cal/EPA has concluded that "potential cancer risk from inhalation exposure to whole diesel exhaust will exceed the multi-

8 Available at http://www.epa.gov/ttn/scram/dispersion_prefrec.htm#aermod.

9 Available at http://www.epa.gov/ttn/scram/dispersion_screening.htm.

pathway cancer risk from the speciated components (Cal/EPA 2003)." The analysis of DPM for this Project is based on the surrogate approach, as recommended by Cal/EPA.

3.2.2 Project Sources

Near-field air dispersion modeling of DPM and $PM_{2.5}$ from Project construction sources was conducted using the USEPA AERMOD model.[10] For each receptor location, the model generates average air concentrations that result from emissions from multiple sources.

Air dispersion models such as AERMOD require a variety of inputs such as source parameters, meteorological parameters, topography information, and receptor parameters. When site-specific information was unknown, ENVIRON used default parameter sets that are designed to produce conservative (i.e., overestimated) air concentrations.

3.2.3 Meteorological Data

Air dispersion modeling applications require the use of meteorological data that ideally are spatially and temporally representative of conditions in the immediate vicinity of the site under consideration. For this HRA, BAAQMD's Mission Bay meteorological data for the year 2008 was used, which aligns with the San Francisco City-wide HRA Methodology (BAAQMD 2012).

3.2.4 Terrain Considerations

Elevation and land use data was imported from the National Elevation Dataset (NED) maintained by the United States Geological Survey (USGS 2013). An important consideration in an air dispersion modeling analysis is the selection of whether or not to model an urban area. Due to the urban nature of San Francisco, the site was modeled with the urban population of 805,235, corresponding to the 2010 US Census.

3.2.5 Emission Rates

Emitting activities were modeled to reflect the actual hours of construction. Emissions were modeled using the χ/Q ("chi over q") method, such that each phase has unit emission rates (i.e., 1 gram per second [g/s]), and the model estimates dispersion factors (with units of [$\mu g/m^3$]/[g/s]).

For annual average ambient air concentrations, the estimated annual average dispersion factors are multiplied by the annual average emission rates. The emission rates will vary day to day, with some days having no emissions. For simplicity, the model assumed a constant emission rate during the entire year.

In the construction model, modeled meteorological hours of the day are restricted to 7:00 am to 1:00 am, the likely hours for emissions to occur. This way, only representative meteorological data was considered in determining the dispersion factors. Emission rates are adjusted such that on average, unit emission rates are modeled, i.e. 1 g/s for 24 hours a day, 7 days a week. Thus, the model provides an annual average concentration that can be incorporated directly into the health risk calculations assuming 24 hours of daily exposure.

[10] On November 9, 2005, the USEPA promulgated final revisions to the federal Guideline on Air Quality Models, in which it recommended that AERMOD be used for dispersion modeling evaluations of criteria air pollutant and toxic air pollutant emissions from typical industrial facilities.

3.2.6 Source Parameters

Source location and parameters are necessary to model the dispersion of air emissions. The duration of construction on Blocks 29-32 is anticipated to be up to 27 months, with arena and office building construction proceeding concurrently. At any given time there will be multiple emissions sources associated with construction equipment within the construction zone.

Table 2: Modeling Parameters summarizes the source parameters associated with the construction HRA. The construction area was modeled as an Area source encompassing the entire Project site, following City-wide HRA Methodology. The Area source model included emissions from both off-road construction equipment and off-site trucks (trucks going to and from construction zones[11]). A release height of 5 meters was used, with an initial vertical dimension of 1.4 meters. Emissions were distributed uniformly throughout the area source representing construction of that phase.

Table 2: Modeling Parameters
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Period	Source	Source Dimension	Number of Sources[1,2]	Release Height[3]	Initial Vertical Dimension[4]	Initial Lateral Dimension
		[m]		[m]	[m]	[m]
Construction	Construction Equipment and On-Road Trucks	Project Area	2	5.0	1.4	N/A

Notes:
1. Due to lack of specific instructions on modeling of construction emissions from BAAQMD, ENVIRON used methodology from the City-wide HRA when setting up the model. According to the City-wide HRA methodology, construction sources are modeled as area sources.
2. The number of sources is to be determined based on the geometry of the truck routes.
3. According to the City-wide HRA methodology, release height of the modeled construction was set to 5 meters
4. According to the City-wide HRA methodology, initial vertical dimension of the modeled construction sources was set to 1.4 meters.

3.2.7 Receptors

Offsite receptors were placed at locations collocated with the grid receptors used in the City-wide HRA and within 2,000 feet of the Project site. Receptors were modeled at a height of 1.8 meters above terrain height, a default breathing height for ground-floor receptors, consistent with the City-wide HRA analysis. As discussed previously, average annual dispersion factors were estimated for each receptor location.

3.2.8 Modeling Adjustment Factors

Cal/EPA (2003) recommends applying an adjustment factor to the annual average concentration modeled assuming continuous emissions (i.e., 24 hours per day, 7 days per week), when the actual emissions are less than 24 hours per day and exposures are concurrent with construction activities occurring at the Project.

Off-site residents are assumed to be exposed to construction emissions 24 hours per day, seven days per week. This assumption is consistent with the modeled emission rates (24 hours per day, 7 days per week), even though actual construction operations may occur for fewer than 24 hours per day and fewer than 7 days per week. Thus, the annual average concentration need not be adjusted. This approach simplifies the model set up, yet does not underestimate exposure since ENVIRON is evaluating chronic health risk impacts and follows City-wide HRA Methodology.

3.3 Risk Characterization Methods for Construction HRA

The following sections discuss in detail the various components required to conduct the HRA.

3.3.1 Exposure Assessment

3.3.1.1 Potentially Exposed Populations

The Construction HRA conservatively evaluated impacts at the off-site receptors assuming child residents.[12] As the residential exposure assumptions are more conservative than those for other sensitive receptor types, a conservative approach of considering all receptors as residential receptors was used. In addition, for the purposes of the cumulative APEZ analysis, the HRA also evaluated impacts at the UCSF Medical Center at Mission Bay assuming a child receptor. The impacts at the hospital consider outdoor air concentrations only, although indoor air at hospitals is filtered to lower indoor air particulate matter concentrations versus outdoor air.

3.3.1.2 Exposure Assumptions

The exposure parameters used to estimate excess lifetime cancer risks for all potentially exposed populations for the construction and operation scenarios are based on risk assessment guidelines from Cal/EPA (2003) and BAAQMD (2010), unless otherwise noted, and are presented in Table 3: Exposure Parameters.

---

[12] As Child Resident exposure assumptions are more conservative than those for Adult Residents, a conservative approach of considering all off-site receptors as Child Residents during Construction scenario is used in this HRA.

Table 3: Exposure Parameters
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Construction	
		Child Resident	Hospital Child
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24
Exposure Frequency (EF)[3]	[days/year]	350	365
Exposure Duration (ED)[4]	[years]	2	1
Averaging Time (AT)	[days]	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.016	0.0083

Notes:
1. Daily breathing rate for child resident reflects default breathing rate from BAAQMD 2010.
2. Exposure time for child resident reflects default exposure time from BAAQMD 2010.
3. Exposure frequency for child resident reflects default exposure frequency from BAAQMD 2010.
4 The exposure duration was assumed to be 2 years for child resident reflecting the actual construction duration. Exposure time was conservatively assumed to be 1 year for hospital child.

Abbreviations:
BAAQMD = Bay Area Air Quality Management District; L = liter; kg = kilogram; m^3 = cubic meter

Reference:
BAAQMD. 2010. Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines. January.

3.3.1.3 Calculation of Intake

The dose estimated for each exposure pathway is a function of the concentration of a chemical and the intake of that chemical. The intake factor for inhalation, IF_{inh}, can be calculated as follows:

$$IF_{inh} = \frac{DBR * ET * EF * ED * CF}{AT}$$

Where:

IF_{inh}	=	Intake Factor for Inhalation (m^3/kg-day)
DBR	=	Daily Breathing Rate (L/kg-day)
ET	=	Exposure Time (hours/24 hours)
EF	=	Exposure Frequency (days/year)
ED	=	Exposure Duration (years)
AT	=	Averaging Time (days)
CF	=	Conversion Factor, 0.001 (m^3/L)

The chemical intake or dose is estimated by multiplying the inhalation intake factor, IF_{inh}, by the chemical concentration in air, C_i. When coupled with the chemical concentration, this calculation is mathematically equivalent to the dose algorithm given in Office of Environmental Health Hazard Assessment (OEHHA) Hot Spots guidance (Cal/EPA 2003).

3.3.2 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure.

Following City-wide HRA Methodology for cancer risk calculations, ENVIRON included toxicity for DPM for all source categories, and additionally included organic gases from on-road gasoline-powered vehicles. Toxicity values are summarized in Table 4: Carcinogenic Toxicity Values.

Table 4: Carcinogenic Toxicity Values
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Source	Analysis	Chemical	Cancer Potency Factor $[mg/kg\text{-}day]^{-1}$
Construction Diesel Vehicles	Cancer Risk	Diesel PM	1.1
Construction Gasoline Vehicles	Cancer Risk	1,3-Butadiene	0.6
		Acetaldehyde	0.01
		Benzene	0.1
		Ethylbenzene	0.0087
		Formaldehyde	0.021
		Naphthalene	0.12

Abbreviations:
ARB: Air Resources Board; Cal/EPA: California Environmental Protection Agency; mg/kg-day: per milligram per kilogram-day; OEHHA - Office of Environmental Health Hazard Assessment; PM: Particulate Matter

Reference:
Cal/EPA. 2014. OEHHA/ARB Consolidated Table of Approved Risk Assessment Health Values. July.

3.3.3 Calculated Age-Specific Sensitivity Factors

The estimated excess lifetime cancer risks for a resident child were adjusted using the age sensitivity factors (ASFs) recommended in the Cal/EPA OEHHA Technical Support Document (TSD) (2009) and the cancer risk adjustment factors (CRAFs) recommended by BAAQMD (2010). This approach accounts for an “anticipated special sensitivity to carcinogens” of infants and children. Cancer risk estimates are weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an ASF of one, which is equivalent to no adjustment) is applied to ages 16 to 70 years.

3.3.4 Estimation of Cancer Risks

Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (*e.g.,* lungs) by the chemical-specific Cancer Potency Factor (CPF).

The equation used to calculate the potential excess lifetime cancer risk for the inhalation pathway is as follows:

$$Risk_{inh} = C_i \times CF \times IF_{inh} \times CPF \times ASF$$

Where:

$Risk_{inh}$	=	Cancer Risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a particular potential carcinogen (unitless)
C_i	=	Annual Average Air Concentration for $Chemical_i$ ($\mu g/m^3$)
CF	=	Conversion Factor (mg/μg)
IF_{inh}	=	Intake Factor for Inhalation (m^3/kg-day)
CPF_I	=	Cancer Potency Factor for $Chemical_i$ (mg chemical/kg body weight-day)$^{-1}$
ASF	=	Age Sensitivity Factor (unitless)

3.4 Operational Traffic Screening

BAAQMD on-road traffic tools were used along with Project-specific data to estimate $PM_{2.5}$ and health-risk impacts from on-road traffic. The BAAQMD San Francisco County Surface Street Screening Tables[13] provide screening risk estimates for this level of traffic for north-south roadways and east-west roadways in San Francisco County. All traffic generated by the Project was assumed to travel along the four segments surrounding the Project Site, resulting in a conservative estimate of impacts from mobile sources, as all Project traffic may not take these routes.

3.5 Operational Stationary Sources

The Project will include new natural gas-fired boilers to provide heating to the proposed arena. According to the BAAQMD,[14] non-diesel boilers are regarded as minor, low-impact sources that can be excluded from the CEQA process. The Project will also include 5 stationary emergency diesel engines which will require stationary source permits from the BAAQMD. ~~BAAQMD Rule 2-5-302 limits project risks to 10 in one million, so for screening purposes incremental risk from the generators is assumed to be 10 in one million. In the worst case, the generators might have up to 3 different owners, resulting in 3 permits with risks of up to 10 in one million each, for a total potential generator risk of 30 in one million.~~

$PM_{2.5}$ impacts were modeled using the USEPA SCREEN3 model. SCREEN3 is a Gaussian air dispersion model that uses a worst-case, not site-specific, meteorological dataset to estimate maximum impacts.

4 Measures to Reduce Project Impacts

Based on the analysis above, a consultation was conducted with OCII, EP, ESA, and the Project sponsor to identify and develop feasible control measures that would reduce Project impacts. For construction emissions two compliance levels of emissions control measures were assessed: use of construction equipment with EPA Tier 2 engines with Level 3 Verifiable Diesel Emission Control Strategy (VDECS) and EPA Tier 4 engines. While use of equipment with Tier 4 would be the most effective emissions control strategy, the analysis also considers a minimum compliance scenario using use of equipment with EPA Tier 2 engines with Level 3 VDECS, acknowledging that there may be instances where a particular piece of off-road equipment with a Tier 4 engine is: (1) technically not feasible, (2) would not produce desired emissions reductions due to expected operating modes, or (3) there is a compelling emergency need to use off-road equipment that do not have Tier 4 engines.

Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 2 + ARB NOx VDECS Mitigated scenario)	No	No	No
Operational			
$PM_{2.5}$ Concentration from Operational Traffic	0.32	0.32	0.32
~~$PM_{2.5}$ from Emergency Diesel Generators[3]~~	~~0.055~~	~~0.055~~	~~0.055~~
$PM_{2.5}$ from South Street Tower Emergency Diesel Generator[4]	0.0012	3.8E-04	0.0027
$PM_{2.5}$ from 16th Street Tower Emergency Diesel Generator[4]	4.5E-04	0.0011	5.0E-04
$PM_{2.5}$ Concentration from GSW Arena Emergency Diesel Generators[4]	0.0018	0.0033	0.0022
2014 Background $PM_{2.5}$ Concentration[2]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Operational)	~~8.9~~ 8.8	~~9.0~~ 8.9	8.7
Cumulative Threshold[3]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Operational)	No	No	No

Notes:

1. The concentration associated with generators reflect Tier 4 engine assumptions.

~~1.~~ 2. 2014 background risk from the Citywide HRA database for all receptors.

~~2.~~ 3. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

~~3. Back-calculated assuming a cancer risk of 10 in a million for each of the three generators (total of 30 in a million). The cancer risk of 10 in a million is the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, and exposure assumptions for a 70-year resident.~~

4. Generators were modeled using source parameters for standby generators published in SF-CRRP (BAAQMD 2012).

Exposure Parameters and Cancer Risk Adjustment Factors
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Child Resident		Adult Resident		Hospital Child		Daycare Child	
		Construction	Operation	Construction	Operation	Construction	Operation	Construction	Operation
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	302	302	302	581	581	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24	24	24	24	24	11	11
Exposure Frequency (EF)[3]	[days/year]	350	350	350	350	365	365	253	253
Exposure Duration (ED)[4]	[years]	2.0	70	2.0	70	1.0	1.0	0.67	5.9
Averaging Time (AT)	[days]	25,550	25,550	25,550	25,550	25,550	25,550	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.016	0.29	0.0083	0.29	0.0083	0.0083	0.0018	0.016
Cancer Risk Adjustment Factor[5]	[-]	10	1.7	1.0	1.0	10	10	10	5.2
Modeling Adjustment Factor (MAF)[6]	[-]	N/A	N/A	N/A	N/A	N/A	N/A	3.15	N/A

Notes:

1. Daily breathing rate reflects default breathing rate from BAAQMD 2010.

2. Exposure time reflects default exposure time from BAAQMD 2010.

3. Exposure frequency reflects default exposure frequency from BAAQMD 2010.

4. Assumes all construction-related emissions will be emitted within the first two years. Operation of the daycare center is not expected to take place until mid- to late-2017; since Project construction will be largely completed by that time, an exposure duration of 8 months was used as a conservative estimate. Operation is assumed to continue for 70 years. A hospital child is assumed to be present for one year during operation, and a daycare child assumed to present from age 6 weeks to 6 years old during operation.

5. Based on BAAQMD 2010.

6. Construction emissions are conservatively assumed to occur concurrently with the operation of the daycare center. As such, a modeling adjustment factor of (365/253)*(24/11) = 3.15 is applied for the daycare child receptor. Since operational emissions are assumed to occur throughout all hours of the day, a modeling adjustment factor is not needed.

Calculation:

IF_{inh} = DBR * ET * EF * ED * CF / AT

CF = 0.001 (m^3/L)

Abbreviations:

BAAQMD: Bay Area Air Quality Management District
L: liter
kg: kilogram
m^3: cubic meter
MAF: Modeling Adjustment Factor

Notes:

1. From Cal/EPA 2013.

2. Represent health impacts for a residential receptor at the dormitory, hospital, or daycare.

3. The health risk associated with generators reflect Tier 4 engine assumptions, the MAF is not applied for the daycare receptor for emissions from the dewatering generators as they run 24 hours a day.

~~3.~~ 4. The screening values reflect a 70-year cancer risk with age sensitivity factors applied (BAAQMD 2012a).

~~4. A cancer risk of 10 in a million, the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, is conservatively assumed.~~

5. Generators were modeled using source parameters for standby generators published in SF-CRRP (BAAQMD 2012b).

~~5.~~ 6. 2014 background risk from the Citywide HRA database for all receptors.

7. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

Calculation:

Cancer Risk = [AnnualConc] × [CF] × [IF_{inh}] × [CPF] x [CRAF] x [MAF]

CF = 0.001 (mg/µg)

Abbreviations:

BAAQMD: Bay Area Air Quality Management District
Cal/EPA: California Environmental Protection Agency
CRAF: Cancer Risk Adjustment Factor
HRA: Health Risk Assessment
IF_{inh}: Intake Factor, Inhalation
kg: kilogram
MAF: Modeling Adjustment Factor
mg: milligram

Construction Area Emissions Estimates

Table 6.1-19

Venue	Floor Area	Building Surface Area[1]	Architectural Coatings: Reapplication Rate	Architectural Coatings: Indoor Paint VOC EF[2]	Architectural Coatings: Outdoor Paint VOC EF[2]	Architectural Coatings: Architectural Coating VOC emissions[3]
	[ft^2]	[ft^2]		[g/L]	[g/L]	[lb/yr]
Event Center	750,000	1,500,000	100%	100	150	7,823
GSW Office Space	25,000	50,000				261
Office Space	580,000	1,160,000				6,050
Retail Space	125,000	250,000				1,304
Parking and Loading	475,000	950,000				4,955

Notes:

1. Consistent with CalEEMod, residential building surface area is assumed to be 2.7 times the floor area, and non-residential 2 times the floor area.
2. Based on BAAQMD paint VOC regulations, 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings. Building area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod.
3. Uses CalEEMod assumptions of 1 gallon of paint covers 180 square feet.

Area Sources	Total Emissions [ton/yr]				
	ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
Architectural Coatings	10.20	--	--	--	--
Total Project Emissions:	10.20	0.00	0.00	0.00	0.00

Notes:
1. From EMFAC2011, calendar year 2017, San Francisco Bay Area. Emission factors are weighted by VMT for all vehicle categories.

Mobile Source CAP Emissions Estimates

Table 6.1-21

Project CAPs Emission Calculations

Trip Type	Scenario	Daily One-way Vehicle Trips[1]			Days Per Year[2]	Weighted Trip Length [mile][3]	Emissions				
		Arena	Retail	Office			ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
							[ton/yr]				
Mission Bay, Weekend Trips	Basketball Event Days	8,715	3,106	509	30	20.1	1.4	14	3.9	0.47	0.22
	Concert Event Days	8,715	3,106	509	55	20.1	2.6	26	7.1	0.86	0.40
	No Event Days	55	5,313	509	19	7.8	0.21	1.9	0.49	0.055	0.026
Mission Bay, Weekday Trips	Basketball Event Days	8,589	2,560	2,542	30	18.7	1.5	15	4.0	0.49	0.22
	Concert Event Days	8,589	2,560	2,542	45	18.7	2.2	22	6.1	0.73	0.34
	Convention Event Days	3,921	2,560	2,542	61	15.4	1.7	16	4.5	0.54	0.25
	No Event Days	55	4,393	2,542	125	7.9	1.6	15	3.9	0.44	0.20
						Total Emissions:	**11**	**110**	**30**	**3.6**	**1.6**

Notes:

1. Daily vehicle trips provided by Adavant Consulting in a final memorandum titled "Travel, Parking, and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 - Case No. 2014.1441E". Office use includes GSW offices.

2. The maximum number of home games (60) in a season was conservatively assumed. Furthermore, it is assumed that half of the games will take place on weekends. Vehicle generation associated with all concert and family show events is approximated by concert trips, while the other 61 events are assumed to be convention events on weekdays.

3. Trip length for each scenario is weighted by the number of trips in each land use category. Arena vehicle trips are assumed to have a trip length of 25 miles/trip based on season ticket holder addresses. Season ticket holders account for approximately 60% seating at Warrior games. Vehicle trips from retail and office space are assumed to have a trip length of 11.98 miles/trip, based on 2006 average commute trip length in the Bay Area (MTC 2008).

Mobile Source CAP Emissions Estimates

Table 6.1-22

Road Dust Calculations

Total Annual VMT

Trip Type	Scenario	VMT [mile/yr]
Mission Bay, Weekend Trips	Basketball Event Days	7,418,424
	Concert Event Days	13,600,444
	No Event Days	870,239
Mission Bay, Weekday Trips	Basketball Event Days	7,688,333
	Concert Event Days	11,532,500
	Convention Event Days	8,457,295
	No Event Days	6,891,904
	Total VMT	**56,459,139**

Pollutants	Emissions Factor [lb/VMT]	Emissions [ton/yr]
Fugitive PM_{10}	0.00063	17.84
Fugitive $PM_{2.5}$	0.00016	4.38

Road Dust Equation[1]

E = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

where:

E = annual average emission factor in the same units as k	
k = particle size multiplier for particle size range and units of interest	
PM_{10} (lb/VMT)	0.0022
$PM_{2.5}$ (lb/VMT)	0.00054
sL = road surface silt loading (grams per square meter) (g/m^2)	0.1
W = average weight (tons) of all the vehicles traveling the road	2.4
P = number of “wet” days with at least 0.01 in of precipitation during the averaging period	64
N number of days in the averaging period	365

Notes:

1. Road dust equation and parameters are based on CalEEMod defaults for the San Francisco Bay Area Air Basin.

Table 6.1-23
Mobile Source CAPs Emission Reduction

Oracle Arena and GSW Oakland HQ Vehicle Trips Calculation

Employee Commute/ Non-Commute Trips

Scenario	Total Employees[1]	Total Driving Employees[2]	% SOV[3]	% Carpool[3]	Carpool Density [people/ vehicle][4]	Trips/ Roundtrip	Total Vehicle Trips per Day	Average operating days per year[5]	Total Vehicle Trips per Year
Oracle Arena Operations Employees	71	55	86%	14%	2	2	103	260	26,859
GSW Headquarters Employees	150	128	94%	6%	2	2	248	260	64,350

Notes:

1. Oracle Arena Operations employees assumed to be the same as the estimated number of employees at the proposed event center. Number of existing GSW employees at the Oakland headquarters is based on the Project Notice of Preparation dated 11/19/2014.
2. A 78.1% driving rate was assumed for the Oracle Arena employees according to the most recent Bay Area Census data (http://www.bayareacensus.ca.gov/bayarea.htm). GSW employees who drive based on a 85% driving rate according to Ben Draa, Senior Financial Analyst, GSW.
3. Oracle Arena employees SOV and carpool rates from Bay Area Census data. GSW Headquarters SOV and carpool rates from Ben Draa, Senior Financial Analyst,
4. A carpool density of two people per vehicle is assumed to be conservative.
5. Assumes 5 days per week for 52 weeks per year.

Spectator Trips

Scenario	Total Spectators Per Event[1]	Total Driving Spectators[2]	% SOV[3]	% Carpool[3]	Carpool Density [people/ vehicle][3]	Trips/ Roundtrip	Total Vehicle Trips per Event	Event Days per Year[4]	Total Vehicle Trips per Year
Oracle Arena Game Spectators	18,250	16,250	20%	80%	3	2	15,167	47	712,833
Oracle Arena Non-game Event Spectators	9,125	9,125	20%	80%	3	2	8,517	42	357,700

Notes:

1. Average spectator count and transit riders from Ben Draa, Senior Financial Analyst, GSW.
2. Ben Draa, Senior Financial Analyst, GSW, estimated that 2,000 of the total spectators take public transit or taxis per event.
3. The carpool assumptions are conservative in that 20% of the driving spectators would drive alone, while the remaining 80% would carpool at a density of 3 people per vehicle.
4. Number of GSW games is based on the 2013-2014 season and number of non-game events is based on four-year averages (2010-2013).

Vendor and Event Staff Trips

Scenario	Total Event Staff Per Event[1]	Total Driving Staff[1]	% SOV[2]	% Carpool[2]	Carpool Density [people/ vehicle][3]	Trips/ Roundtrip	Total Vehicle Trips per Event	Event Days per Year[4]	Total Vehicle Trips per Year
Oracle Arena Game Event Staff	1,013	791	86%	14%	2	2	1,474	47	69,274
Oracle Arena Non-game Event Staff	645	504	86%	14%	2	2	939	42	39,419

Notes:

1. A 78.1% driving rate was assumed for the vendor and event staff according to the most recent Bay Area Census data (http://www.bayareacensus.ca.gov/bayarea.htm). GSW employees who drive based on a 85% driving rate according to Ben Draa, Senior Financial Analyst, GSW.
2. SOV and carpool rates from Bay Area Census data.
3. A carpool density of two people per vehicle is assumed to be conservative.
4. Number of GSW games is based on the 2013-2014 season and number of non-game events is based on four-year averages (2010-2013).

Table 6.1-24

Total		**3.7**	**10**	**1.2**	**0.57**

Notes:
1. CalEEMod Default Trip Length for Commercial-Worker trips in the San Francisco Bay Area Air Basin.
2. Non-commute trips are assumed to have a trip length of 3 miles.
3. Trip length is an estimation based on season ticket holder addresses. Season ticket holders account for approximately 60% of seating at Warrior games.
4. Annual vehicle trips based on number of vendors at each event and total number of event days per year.
5. Annual vehicle trips based on 1.5 bus trips per game, 2 trips per round trip and 44 events per year. Count of opposing team bus trips from Ben Draa, Senior Financial Analyst, GSW. Event days per year includes 3 preseason games and 41 regular-season games.
6. Trip length is the driving distance from Union Square, San Francisco, where the Opposing Team is assumed to stay, to Oracle Arena.
7 Annual vehicle trips based on a daily delivery count of 8 from Ben Draa, Senior Financial Analyst, GSW. Assume 5 days per week for 52 weeks per year.
8. CalEEMod Default Trip Length for Commercial-Nonwork trips in the San Francisco Bay Area Air Basin.
9. Represents reduction in regional VMT-related emissions due to relocation of Warriors games from Oakland to San Francisco only.
10. From EMFAC2011, calendar year 2017, San Francisco Bay Area. Emission factors are weighted by VMT for all vehicle categories.

Table 6.1-26
Mobile Source CAPs Emission Reduction

Reduction in Road Dust Emissions

Road Dust Equation[1]
E = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

where:
E = annual average emission factor in the same units as k
k = particle size multiplier for particle size range and units of interest

PM_{10} (lb/VMT)	0.0022
$PM_{2.5}$ (lb/VMT)	0.00054
sL = road surface silt loading (grams per square meter) (g/m^2)	0.1
W = average weight (tons) of all the vehicles traveling the road	2.4
P = number of "wet" days with at least 0.01 in of precipitation during theaveraging period	64
N number of days in the averaging period	365

Pollutants	Emissions Factor [lb/VMT]	VMT Reduction [mile/yr]	Emission Reduction [ton/yr]
Fugitive PM_{10}	0.00063	19,458,556	6.1
Fugitive $PM_{2.5}$	0.00016		1.5

Notes:
1. Road dust equation and parameters are based on CalEEMod defaults for the San Francisco Bay Area Air Basin.

Generator Emissions Estimates

Project Emission Calculations **Table 6.1-27**

Location	Size		Fuel Type	Operation[1] (hrs/yr)	Emission Factors[2,3]					Emissions			
					NMHC	ROG	CO	NOx	PM	ROG	CO	NOx	PM
	[kW]	[hp]			[g/bhp-hr]					[ton/yr]

Marketplace	500	671	diesel	50	0.14	0.15	2.2	0.30	0.015	0.0055	0.081	0.011	0.0006
									Total Emissions:	0.055	0.95	0.18	0.0072

Notes:

1. Operation is conservatively assumed to be 50 hours per year, the maximum allowable by the Bay Area Air Quality Management District.
2. Criterial Air Pollutants emission factors based on Tier 4 standards from the ARB and USEPA Off-Road Compression-Ignition (Diesel) Engine Standards (ARB 2013). Emission factors for PM_{10} and $PM_{2.5}$ are conservatively based on the PM emission standard.
3. The emission factors for ROG were calculated from the NMHC emission factors using conversion factors for diesel engines (USEPA 1997) and assuming that VOC and ROG are equivalent (ARB 2009).

Project Emission Calculations

Table 6.1-28

Quantity[1]	Fuel Type	Size Per Boiler[1]	Higher Heating Value[2]	Fuel Consumption[3]	Operation[4] (hrs/yr)	Emission Factors[5,6,7]						Emissions			
						CO	NOx	CO	NOx	ROG	PM	CO	NOx	ROG	PM
		Btu/hr	Btu/scf	scf/hr		ppmv (dry at 3% O_2)		lb/MMBtu		lb/10^6 scf		[ton/yr]			
4	Natural Gas	4,000,000	1,020	3,922	8,760	400	30	0.30	0.037	5.5	7.6	21	2.6	0.38	0.52

Notes:
1. Quantity and Size based on Project Sponsor estimate and is consistent with the total estimated heating load.
2. Higher heating value is the average natural gas heating value in AP-42 Section 1.4.
3. Fuel consumption calculated from size and higher heating value.
4. The boiler is assumed to operate for every hour of the year.
5. CO and NOx emission factors in ppm from BAAQMD Regulation 9 Rule 7.
6. CO and NOx emission factors converted from ppm to lb/MMBtu using the F-Factor method described in USEPA Method 19 for natural gas fuel (USEPA 2001).
7. ROG and PM emission factors from AP-42 Section 1.4 Table 1.4-2.

Muni Variant Table 6.1-2
Construction Particulate Matter Emissions
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Emissions	Units	Uncontrolled Scenario	Controlled Tier 4 Scenario	Controlled Tier 2 + ARB NOx VDECS Scenario
Project construction $PM_{2.5}$ emissions[1]	[lb/project]	4,078	592	705
Project construction DPM emissions[1]	[lb/project]	4,073	586	699
Dewatering generator $PM_{2.5}$ emissions[2]	[lb/project]	15	15	15
Dewatering generator DPM emissions[2]	[lb/project]	15	15	15
Muni platform construction $PM_{2.5}$ emissions[3]	[lb/project]	12	7.1	12
Muni platform construction DPM emissions[3]	[lb/project]	12	7.1	12
Construction duration	[years]	2	2	2
Annual Project DPM emissions	[lb/year]	2,036	293	349
Annual dewatering generator DPM emissions	[lb/year]	7.4	7.4	7.4
Annual muni platform DPM emissions	[lb/year]	6.2	3.6	6.2
Average Project $PM_{2.5}$ emissions	[g/s]	0.029	0.004	0.005
Average Project DPM emissions	[g/s]	0.029	0.004	0.005
Average dewatering generator $PM_{2.5}$ emissions	[g/s]	1.1E-04	1.1E-04	1.1E-04
Average dewatering generator DPM emissions	[g/s]	1.1E-04	1.1E-04	1.1E-04
Average muni platform $PM_{2.5}$ emissions	[g/s]	9.0E-05	5.1E-05	9.0E-05
Average muni platform DPM emissions	[g/s]	9.0E-05	5.1E-05	9.0E-05

Notes:

1. Includes emissions from off-road equiment and on-road sources. Emissions in the controlled scenario reflect the use of Tier 4 or Tier 2 + ARB NOx VDECS off-road equipment. The pug mill generator (with Tier 4 engine) is included in each scenario.

2. Includes emissions from nine small generators that will operate 24 hours/day during the first six months of construction. The Project Sponsor has committed to Tier 4 engines for all generators used during construction, so those emissions are presented for all scenarios.

3. Includes emissions from 20 weekends of construction for the Muni Variant, or 8 additional weekends as compared to the Muni Platform extension evaluated in the Project.

Abbreviations:
DPM: Diesel particulate matter
lb: pound
g: gram
m^2: square meter
s: second

Muni Variant Table 6.1-5
AERMOD Construction Screening Inputs and Outputs
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Parameter	**Inputs and Outputs**						
Source	Construction			Dewatering Generators[1]	Muni Platform		
Source Type	Area				Area		
Emission Rate (g/s-m^2)	2.19869E-05				3.32E-04

Muni Variant Table 6.1-6
Screening $PM_{2.5}$ Concentration Results
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Scenario	Concentration [μg/m^3]		
	Dormitory Receptor	Hospital Receptor	Daycare Receptor
Construction			
$PM_{2.5}$ Concentration from Uncontrolled Construction Emissions[1]	0.32	0.31	1.2
$PM_{2.5}$ Concentration from Tier 4 Controlled Construction Emissions[1]	0.052	0.046	0.19
$PM_{2.5}$ Concentration from Tier 2 + ARB NOx VDECS Mitigated Construction Emissions[1]	0.066	0.055	0.23
2014 Background $PM_{2.5}$ Concentration[2]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Construction, Uncontrolled scenario)	8.8	8.9	9.6
Total $PM_{2.5}$ Concentration (Construction, Tier 4 Controlled scenario)	8.5	8.7	8.5
Total $PM_{2.5}$ Concentration (Construction, Tier 2 + ARB NOx VDECS Controlled scenario)	8.6	8.7	8.6
Cumulative Threshold[3]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Uncontrolled scenario)	No	No	No
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 4 Controlled scenario)	No	No	No
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 2 + ARB NOx VDECS Mitigated scenario)	No	No	No
Operational			
$PM_{2.5}$ Concentration from Operational Traffic	0.32	0.32	0.32
$PM_{2.5}$ from South Street Tower Emergency Diesel Generator[4]	0.0012	3.8E-04	0.0027
$PM_{2.5}$ from 16th Street Tower Emergency Diesel Generator[4]	4.5E-04	0.0011	5.0E-04
$PM_{2.5}$ Concentration from GSW Arena Emergency Diesel Generators[4]	0.0018	0.0033	0.0022
2014 Background $PM_{2.5}$ Concentration[2]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Operational)	8.8	8.9	8.7
Cumulative Threshold[3]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Operational)	No	No	No

Notes:
1. The concentration associated with generators reflect Tier 4 engine assumptions.
2. 2014 background risk from the Citywide HRA database for all receptors.
3. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.
4. Generators were modeled using source parameters for standby generators published in SF-CRRP (BAAQMD 2012).

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
HRA: Health Risk Assessment
m^3: cubic meter
SF-CRRP: San Francisco Community Risk Reduction Plan
μg: microgram

Muni Variant Table 6.1-7
Exposure Parameters and Cancer Risk Adjustment Factors
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Child Resident		Adult Resident		Hospital Child		Daycare Child	
		Construction	Operation	Construction	Operation	Construction	Operation	Construction	Operation
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	302	302	302	581	581	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24	24	24	24	24	11	11
Exposure Frequency (EF)[3]	[days/year]	350	350	350	350	365	365	253	253
Exposure Duration (ED)[4]	[years]	2.0	70	2.0	70	1.0	1.0	0.67	5.9
Averaging Time (AT)	[days]	25,550	25,550	25,550	25,550	25,550	25,550	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.016	0.29	0.0083	0.29	0.0083	0.0083	0.0018	0.016
Cancer Risk Adjustment Factor[5]	[-]	10	1.7	1.0	1.0	10	10	10	5.2
Modeling Adjustment Factor (MAF)[6]	[-]	N/A	N/A	N/A	N/A	N/A	N/A	3.15	N/A

Notes:

1. Daily breathing rate reflects default breathing rate from BAAQMD 2010.

2. Exposure time reflects default exposure time from BAAQMD 2010.

3. Exposure frequency reflects default exposure frequency from BAAQMD 2010.

4. Assumes all construction-related emissions will be emitted within the first two years. Operation of the daycare center is not expected to take place until mid- to late-2017; since Project construction will be largely completed by that time, an exposure duration of 8 months was used as a conservative estimate. Operation is assumed to continue for 70 years. A hospital child is assumed to be present for one year during operation, and a daycare child assumed to present from age 6 weeks to 6 years old during operation.

5. Based on BAAQMD 2010.

6. Construction emissions are conservatively assumed to occur concurrently with the operation of the daycare center. As such, a modeling adjustment factor of (365/253)*(24/11) = 3.15 is applied for the daycare child receptor. Since operational emissions are assumed to occur throughout all hours of the day, a modeling adjustment factor is not needed.

Calculation:

IF_{inh} = DBR * ET * EF * ED * CF / AT

CF = 0.001 (m^3/L)

Abbreviations:

BAAQMD: Bay Area Air Quality Management District
L: liter
kg: kilogram
m^3: cubic meter
MAF: Modeling Adjustment Factor

References:

Excess Cancer Risk from Tier 2 + ARB NOx VDECS Controlled Construction Emissions[2,3]	[in a million]	11	0.59	5.0	13
Excess Cancer Risk from Operational Traffic Emissions[4]	[in a million]	7.2	7.2	7.2	7.2
Excess Cancer Risk from South Street Tower Emergency Diesel Generator[5]	[in a million]	0.085	0.050	0.0045	0.033
Excess Cancer Risk from 16th Street Tower Emergency Diesel Generator[5]	[in a million]	0.033	0.019	0.013	0.0059
Excess Cancer Risk from GSW Arena Emergency Diesel Generators[5]	[in a million]	0.12	0.072	0.038	0.025
2014 Background Risk[6]	[in a million]	26	26	44	20
Total Excess Cancer Risk (Uncontrolled Scenario)	[in a million]	89	36	79	101
Total Excess Cancer Risk (Tier 4 Controlled Scenario)	[in a million]	42	34	56	38
Total Excess Cancer Risk (Tier 2 + ARB NOx VDECS) Controlled Scenario)	[in a million]	45	34	56	41
Cumulative Threshold[7]	[in a million]	100	100	100	100
Total Risk Exceeds Threshold? (Uncontrolled Scenario)	-	No	No	No	Yes
Total Risk Exceeds Threshold? (Tier 4 Controlled Scenario)	-	No	No	No	No
Total Risk Exceeds Threshold? (Tier 2 + ARB NOx VDECS Controlled Scenario)	-	No	No	No	No

Notes:
1. From Cal/EPA 2013.
2. Represent health impacts for a residential receptor at the dormitory, hospital, or daycare.
3. The health risk associated with generators reflect Tier 4 engine assumptions, the MAF is not applied for the daycare receptor for emissions from the dewatering generators as they run 24 hours a day.
4. The screening values reflect a 70-year cancer risk with age sensitivity factors applied (BAAQMD 2012a).
5. Generators were modeled using source parameters for standby generators published in SF-CRRP (BAAQMD 2012b).
6. 2014 background risk from the Citywide HRA database for all receptors.
7. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

Calculation:
Cancer Risk = [AnnualConc] × [CF] × [IF_{inh}] × [CPF] x [CRAF] x [MAF]
CF = 0.001 (mg/µg)

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
Cal/EPA: California Environmental Protection Agency
CRAF: Cancer Risk Adjustment Factor
HRA: Health Risk Assessment
IF_{inh}: Intake Factor, Inhalation
kg: kilogram
MAF: Modeling Adjustment Factor
mg: milligram
PM: Particulate Matter
SF-CRRP: San Francisco Community Risk Reduction Plan
µg: microgram
